was a zealous reformer of abuses. In 1673 he became secretary for the affairs of the navy, and in the same year became M.P. for Castle Rising, exchanging his constituency for that of Harwich in 1679. A popular but erroneous estimate of P. as an official is that of 'a painstaking departmental official.' But in truth, P. carried out, at the Admiralty, in the teeth of opposition, drastic and far-reaching reforms. In 1679 the Admiralty Commission was dissolved and replaced by men wholly incompetent for their work. P. and Sir Anthony Deane, his close friend and former commissioner of the navy, having become involved in the unpopularity of the duke of York, were accused

of selling information to France led to his retirement. His library was left to Magdalene College, Cambridge, where his *Diary* remained until 1819, when the Rev. J. Smith began to decipher it, and it was pub. by Lord Braybrooke in 1825. This *Diary* remains one of the most vivid and minute authorities for the events of the Restoration period, of the manners and scandals of the court, and of P.'s own interests and weaknesses. An ann. P. commemorative service is held at St. Olave's, Hart Street, where he was buried. He pub. *Memoirs of the Navy* (1690).

The original MS. of the *Diary* is preserved in Magdalene College, Cambridge, to which P. bequeathed it, together with other papers; it is in six vols., containing upwards of 3000 pages, closely written in Rich's system of shorthand, which P. doubtless adopted lest his jour. should fall into unfriendly hands during his life or be rashly pub. after his death. These facts are stated in the preface to the original and partial ed. of the *Diary* produced by Lord Braybrooke. Other eds. followed in 1828, 1848-49 (enlarged), 1854; a fuller ed. was pub. in 1875-79 by Dr. Mynors Bright, and in 1893-99 came H. B. Wheatley's practically complete ed. See H. B. Wheatley, *Samuel Pepys and the World he Lived in*, 1880, 1905; Sir F. Bridge, *Samuel Pepys, Lover of Music*, 1903; P. Lubbock, *Samuel Pepys*, 1909; and life by E. H. Moorhouse, *Administrator, Observer, Gossip*, 1909. Later works of reference are J. R. Tanner, *Samuel Pepys and the Royal Navy*, 1920, *Mr. Pepys: an Introduction to the Diary, together with a sketch of his later life*, 1925, and (ed.) two vols. of the correspondence of Pepys, 1926-29; and A. Ponsonby, *Samuel Pepys*, 1928. See also lives by J. Drinkwater, 1930, and A. Bryant, 1933-35.

Perak, most northerly of the Federated Malay States, on the W. coast of the Malay Peninsula. Area, 7980 sq. m. From Kalantan (q.v.) and from Pahang (q.v.) on the E. it is separated by the main range of granite mts. that forms the backbone of the peninsula. The R. P. (170 m. long), the chief riv., flows between two parallel ranges (7000 ft.) which traverse the state from N. to S. The chief exports are tin and rubber. Taiping is the cap. Iron ore, wolfram, kaolin are among the minerals besides tin. In 1938 there were over 563 000 ac. under rubber and the yield of rubber in the years immediately preceding the Second World War ranged between 45,000 and 60,000 tons. Other crops are tea, the oil-palm (a better quality of oil than is produced even in Nigeria) (average 18,000), and rice (over 90,000 ac.), grown exclusively by Asiatics on small holdings. There are aerodromes at Ipoh (opened for all types of aircraft in 1938), Taiping, and Sitiawan. P. is ruled by a dynasty that claims descent from the last Malay sultan of Malacca (q.v.). The thirty-second sultan was installed in 1939. From 1650 onwards, the Dutch tried to obtain a monopoly of the tin exported from P., establishing near the mouth of the P. R. sev. factories,

SAMUEL PEPPS

of being Papists and were arrested and imprisoned in the Tower. They were acquitted, but after their release they had the mortification of being impotent spectators while the navy, in Anthony Deane's phrase, 'went to ruin.' And to P. a ruined navy meant a ruined England. Things went from bad to worse. From the 76 ships and 12,000 men of 1679 the navy dwindled to 24 ships and 3000 men by 1684, with empty yards, depleted stores, and sailors on the point of mutiny on being defrauded of their pay. P. urged, first on Charles II. and then on James, the project of a special commission for the recovery of the navy. James acceded, and P. overcame one difficulty after another, compelled Sir Anthony Deane from his retirement to assist, and in less than three years the effective strength was increased by ninety-two ships and the spirit and discipline of the men were restored. It is worthy of record that an Admiralty minute of 1805 spoke of P. as 'a man of extraordinary knowledge, of great talent, and the most indefatigable industry.' In 1689 a new charge

which the Malays destroyed. In 1765 the sultan made a treaty with the Dutch. Brit. influence began in the nineteenth century. A treaty with Penang (q.v.) in 1818 secured to Brit. subjects the right to free trade in P. In 1826 the sultan ceded to the Brit. the Dindings and the Is. of Pangkor as posts for the suppression of piracy, and agreed to rely solely on the protection of Great Britain. Anarchy prevailed for a time owing to fighting between rival Chinese factions over the tin deposits and, in 1874, Sir Andrew Clarke, governor of the Straits Settlements, induced the P. chiefs to sign the Pangkor Treaty, and to accept a Brit. resident whose advice should be taken on all questions other than those concerning religion or Malay religion and custom. By an Act of 1934 the ter. of the Dindings was restored to P. and has formed part of the state since Feb. 1935. In Dec. 1841 the state was overrun by the Jap. invaders and held till the surrender of 1945. With traditional Malay ceremonial Rajah Yusoff Abdul Jalil was installed (April 18, 1949) as thirty-second sultan of P. (See MALAY STATES.) Pop. (including the Dindings) 992,000, Malays, Chinese, Tamils, and Europeans (under 1000).

**Perameles**, see BANDICOOT.

**Percentiles**, see under MENTAL TESTS.

**Perceval**, Sir, hero in one of the legends of the Arthurian cycle. According to the oldest version, a Fr. poem of the thirteenth century, which is only known in its Eng. adaptation, P. was the son of a widowed mother brought up in obscurity, but fired with a love of knightly deeds by an accidental meeting with Arthur's knights. This legend probably first became confused with the legend of the Holy Grail in the romance of *Perceval le Gallois*, begun by Chrétien de Troyes, continued by Wauchier de Denain and Gerbert, and finished by Manessier (see GRAIL). It is this version which is used in by far the finest setting of the legend, Wolfram von Eschenbach's *Parzival*, c. 1216, on which Wagner based the libretto of the last of his operas. For the Welsh theory see Sir J. Rhys, *Studies in the Arthurian Legend*, 1891; for the P. legend, as distinct from the Grail, see *Syr Percyelle of Galles* (ed. J. Halliwell), 1884; 'Peredur, Son of Ewrawc, in the *Mabinogion* of Lady C. Guest, 1879; W. W. Newell, *Legend of the Holy Grail*, 1902; J. L. Weston, *Legend of Sir Perceval*, 1906; J. D. Bruce, *Evolution of Arthurian Romance to 1300*, 1923-1924; W. Gother, *Perceval und der Grail in der Dichtung des Mittelalters*, 1925; and E. G. Gardner, *The Arthurian Legend in Italian Literature*, 1930.

**Perceval**, Spencer (1762-1812), Eng. statesman, educated at Harrow and Trinity College, Cambridge; he practised at the Bar until 1796, when he entered Parliament. He held office under Addington, and was chancellor of the Exchequer under Portland (1807). He became Prime Minister in 1809, and was assassinated on May 11, 1812, in the lobby

of the House of Commons by John Bellingham, a merchant, who attributed his bankruptcy to the gov. measures. See life by Sir Spencer Walpole, 1874.

**Perch** (*Perca fluviatilis*), common Brit. type of a large family of spiny-finned fishes. It prefers still waters, and only in them is it able to spawn. But it sometimes descends estuaries, and then is confused with the sea-P. or bass, a much larger fish, with eight to ten, instead of fourteen to fifteen, spines in the front dorsal fin. The greatest weight of *P. fluviatilis* on reliable record is 4½ lb.; 3 lb. is a rare weight. It is a bright-looking fish, and very conspicuous from above by the vertical, dark bars extending from the back down the sides. It is rough to the touch. The flesh, though firm and white and free from a muddy flavour, is not appreciated in Britain as it is in Russia and elsewhere.

**Perch (measure)**, see ROD, POLE, OR PACE.

**Perch**, Climbing, or *Anabas scandens*, fish which is allied to the mullet, and is noted for its ability to travel overland by means of its spines. It was believed to climb trees by the same organs, and has been found up a tree in India, but it was probably left there by a receding flood.

**Percheron Breed**, see HORSE.

**Perchloric Acid** (HClO<sub>4</sub>) is prepared by distilling strong sulphuric acid with potassium chlorate under reduced pressure. It is a colourless, volatile, strongly turning liquid (sp. gr. 1.782 at 15° C.), and is a powerful oxidising agent, a drop of the liquid instantly decomposing if dropped upon wood or charcoal, sometimes explosively. The salts of this acid are the perchlorates, all of which are soluble in water. Potassium perchlorate is prepared by heating the chlorate, 4KClO<sub>3</sub> = KCl + 3KClO<sub>4</sub>. The salt is purified from the chloride by crystallisation, the solubility of the perchlorate being about 0.7 part in 100 parts of water at 0° C.

**Percival**, John (1831-1918), Eng. headmaster and bishop. Son of a Westmorland farmer, he had a strenuous boyhood. In his twenty-first year he won an open scholarship to Queen's College, Oxford, of which later he was a fellow. P. accepted a post as master at Itingy (1860) and in 1862, on the recommendation of Frederick Temple (q.v.), he was appointed first headmaster of Clifton College, which was then a struggling foundation. P., who shared Arnold's views, soon raised the college to be one of the great public schools. When looking for a master for the modern side of the school, he chose the poet and divine, Thomas Edward Brown (q.v.). His success was due in no small measure to his large-heartedness and public-spirited character, and his ascendancy over the parents was as great as that over the boys. He was also prime mover in the foundation of Somerville College. In 1879 he left Clifton to become president of Trinity College, Oxford, but though he was too impatient for reforms he left a strong impress on the college. He was also a pioneer of the Univ. Extension

movement. In 1886 he accepted the head-mastership of Rugby. Nine years later he was offered by Lord Rosebery, and accepted, the bishopric of Hereford. A strong Liberal, his opinions on eccles. and political questions were not necessarily shared by the diocesan clergy and P. was almost too earnest an advocate of all that appealed to him. See life by W. Temple, 1921.

**Percussion** (massage), see **TAPOTEMENT**. **Percussion Caps**, small copper cylinders which hold a detonating powder, e.g. a mixture of fulminate of mercury with potassium chlorate. These can then be exploded by percussion, and so are used in firearms. See **FULMINATES**; **FIREARMS**.

**Percussion**, Centre of, see **CENTRE**.

**Percussion Instruments**. All instruments played by being beaten are called P. I., including all varieties of drums, bells, cymbals, triangles, gongs, etc., also some in which the percussion is produced by the intermediary of a keyboard, such as the celesta. These last instruments, as also bells, xylophone, and kettledrums, produce notes of definite pitch; others produce sound without pitch and thus, strictly speaking, merely a kind of refined and organised noise.

**Percy**, noble Anglo-Norman family. Its head, Wm. de P., accompanied the Conqueror to England. The wealth and importance of the Ps. was early enhanced by marriage with the heiress of Brabant, whose arms they subsequently used. One of the family assisted in obtaining Magna Carta, and the ninth lord (the first to be summoned to Parliament) signed the barons' letter to the pope (1301). His great-grandson became marshal of England under Richard II., and was made earl of Northumberland (1377). He distinguished himself against the Scots, and took Berwick. Some years later, the Scots, by corrupting the governor, again made themselves masters of it, on which the duke of Lancaster brought an accusation against the earl in Parliament, and he was sentenced to lose his life and estates. But the king having revoked the sentence, the earl laid siege to Berwick and took it. When Holingbroke assumed the crown, with the title Henry IV., he created the earl constable of England. In the fourth year of that reign, the earl and his son, Sir Henry P., nicknamed Hotspur, defeated the Scots at Halidon Hill, and took the earl of Douglas prisoner. Having demanded his dues as keeper of the Marches, and not receiving a satisfactory answer, the earl took up arms against the king, and put Hotspur at the head of his troops; but he was slain at the battle of Shrewsbury in 1403; upon which P. made his submission and received the royal pardon. Later, however, he collected another army, but was defeated and slain in Yorkshire in 1408. Henry V. restored the title to a son of Hotspur. The second earl was slain at the battle of St. Albans in 1455; and the third at Towton, in 1460. The fourth earl was murdered while trying to collect a subsidy on behalf of Henry VII., the fifth and sixth earls d. in 1521 and

1537 respectively. The seventh was beheaded in 1572, the eighth found shot in the Tower, 1586. The ninth earl spent fifteen years imprisoned in the Tower. The tenth earl fought first against Charles I. and then helped in the Restoration. The P. family is now represented only in the female line, the male line having died out with the eleventh earl, who left an only daughter who married the duke of Somerset, the title duke of Northumberland (created in 1786), then passing through their son Algernon to his son-in-law, Sir Hugh Smithson, who became duke in 1786. His son Hugh took the name of P.; from him the present tenth duke is descended. See G. Brennan, *History of the House of Percy* (ed. W. A. Lindsay, 1902).

**Percy, Esmé** (b. 1887), Eng. actor and theatrical producer, b. in London, studied at the Brussels Conservatoire and first appeared with F. R. Benson's company at Nottingham in 1904. His début in London was in *Romeo and Juliet* in 1905 and in New York in *The Red Planet* in 1932. He has played prominent roles in a large number of productions and is particularly remembered for his interpretation of the leading parts of many of Shaw's plays, having acted and produced over a number of years for Charles Macdonald's Bernard Shaw Repertory Company in London and the provs.

**Percy, Thomas** (1728-1811), Eng. scholar, antiquary, and poetical collector, B. at Bridgnorth and educated at Christ Church, Oxford, he became bishop of Dro-more, Ireland, in 1782. The friend of

BISHOP PERCY

Johnson and Goldsmith, he pub. trans. from the Icelandic, a new version of the Song of Solomon (1764), *The Household Book of the Earl of Northumberland* in 1518 (1765), and a trans. of Mallet's *Northern Antiquities* (1770). His most popular and famous work was the *Reliques of Ancient Poetry* (1765), which was composed of old

heroic ballads and songs, together with a few modern imitations by the editor. This work, which was warmly and justly praised by the critics, was chiefly obtained from an old folio MS., together with additions from the Pepps collection at Cambridge, the Ashmole Library at Oxford, the Brit. Museum, and works of early poets. The collection was of great value to our literature, recalling the public taste to the rude energy, picturesqueness, and passion of the old chivalrous minstrels and Elizabethan songsters. The work inspired Sir Walter Scott's *Minstrelsy of the Scottish Border*. See A. C. C. Gausson, *Percy, Prelate and Poet*, 1908, and T. Shearer and A. Tillotson, *Percy's Relations with Cadell and Davies*, 1934.

*Percy Anecdotes*, originally pub. in forty monthly parts, commencing in 1820, were compiled by 'Sholto and Reuben Percy, brothers of the Benedictine Monastery of Mount Bengier.' This was really a *nom-de-plume*. 'Reuben Percy' was Thomas Byerley, the first editor of the *Mirror*, and 'Sholto Percy,' Joseph Clinton Robertson, the founder and first editor of the *Mechanics Magazine*. The name originated from the fact that the two authors used to meet and talk over the book at the Percy coffee house, in Rathbone Place. The idea is supposed to have come from Sir Richard Phillips, who suggested that anecdotes should be collected from the files of the *Star*, of which Byerley was assistant editor.

*Perdiccas*, four Macedonians:

*Perdiccas I.* was a native of Argos in the eighth century B.C. With two of his brothers he conquered a large part of Macedonia and founded the Macedonian dynasty.

*Perdiccas II.* reigned in Macedonia from about 454 to 413 B.C. During the Peloponnesian war he allied himself first with the Athenians and then with the Spartans, betraying both parties.

*Perdiccas III.* reigned in Macedonia from 364 to 359 B.C. Aided by the Athenian Iphicrates, he overthrew the regent Ptolemy. Later he made war against the Athenians, and fell in battle against the Illyrians.

*Perdiccas IV.*, one of the most famous Macedonian generals under Alexander the Great, whom he accompanied into Asia. He became chief minister of Alexander's successor, Arrhidaeus, but his rivals, Antipater, Antigonos, Craterus, and Ptolemy, conspired against him. While marching against Ptolemy he was murdered at Memphis by his own soldiers (321 B.C.).

*Pereda, José María de* (1833-1906), Sp. novelist, b. at Polanco, near Santander, became a civil engineer. His novels, written in excellent and virile style, are pictures of the follies and humours of his contemporaries, more particularly descriptions of persons and places of his native Santander. His novels include *Escenas Montañesas* (2 series, 1861, 1871); *El Sabor de la Tierruca* (1882); *La Puchera* (1889); and *Penas arriba* (1895). His *Don Gonzalo Gonzales de la Gonsalera* (1879) is a politico-social satire. See

J. M. de Cossio, *La obra literaria de Pereda*, 1934, and a life by J. Camp, 1937.

*Peregrine Falcon*, see *FALCON*.

*Pereira*, tn. of Colombia, cap. of the dept. of Caldas, 40 m. by rail from Manizales. It is a centre of the coffee and livestock industries. Pop. 65,000.

*Perekop* (anc. Gk. Taphros), tn in Kherson Region of the Ukrainian S.S.R., at the N. end of the isthmus of the same name, which joins the Crimea to the mainland. Some traces of Gk. fortifications still remain; the fortress was built in 1518. Pop. 7000. There was heavy fighting here during the Ger. invasion of Russia in Oct. 1911. See under *EASTERN FRONT OR RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR*.

*Père-Lachaise*, or Cemetery of the East, Montilmont, Paris, opened in 1804, has numerous gravestones of persons of note and is situated on an anc. property of Père la Chaise, confessor of Louis XIV. Here is the tomb of Abélard and Héloïse, whose ashes were re-interred in 1817.

*Perennials* are plants with roots that are able to live for a number of years by storing up a supply of reserve food. Usually the part above ground dies down. Trees and shrubs store their reserves in the parenchyma of the cortex and medullary rays in the stems.

*Pérez de Ayala, Ramón*, see *AYALA*.

*Pérez de Guzman, Fernán* (1378-c. 1460), Sp. poet and chronicler, nephew of Ayala (q.v.). Among his works are *Cronica del rey Juan II.* (pub. 1779); *Generaciones y semblanzas* (pub. in 1779), an account of the illustrious men of his time, in terse and brilliant style; *Loores de los claros varones de España*, a rhymed chronicle. His poetical works consist mainly of hymns and moral pieces: *Coplas de bien vivir*, *Coplas de vicios y virtudes*, *Confesión rimada*. A large number of them will be found in the *Cancionero general* of Baena.

*Pérez de Montalván, Juan* (1602-38), Sp. dramatist, b. at Madrid, entered the priestly congregation of St. Peter there. Under the influence of his friend, Lope de Vega, he wrote *Orfeo* (1624). His prose *Vida y purgatorio de San Patricio* (1627) was the foundation of Calderón's play. The best known of his plays is *Los Amantes de Teruel* (1638).

*Pérez Galdós, Benito*, see *GALDÓS*.

*Perfectionibility* of Christians, doctrine held by the Wesleyan Methodists (see *METHODISTS*) of a Christian perfection attainable in this life. It is not a perfection of justification, but a perfection of sanctification, which John Wesley, in a sermon on 'Christian Perfection' from the text Heb. vi. 1, 'Let us go on to perfection,' earnestly contends for as attainable in this life by believers. Theosophists and Buddhists generally believe that absolute perfection can (under certain very stringent conditions) be attained to in the course of the one life.

*Perfectionists*, sect founded at Putney, Utah, in 1842 by John Humphrey Noyes (1811-86), a former Congregational minister. He maintained that Christ had already come again and that he was

absolved of all past and future sin. After some litigation at Putney, he removed with his followers to Oneida, New York, where they purchased a property and carried out their experiment in communistic living. Financially they prospered, but were unpopular with their neighbours on account of their rejection of monogamy, and purely scientific attitude to marriage as a means of producing improved offspring. For this reason Noyes with a few close followers moved again into Canada in 1880, and the others, abandoning their experiment in communistic living, formed an ordinary joint-stock company. See G. W. Noyes, *Religious Experiences of John Humphrey Noyes*, 1923.

#### Performance Tests, see MENTAL TESTS.

**Performing Right Society**, association of composers, authors, and publishers of copyright musical works, estab. in 1914 to collect fees for the public performance of such works, and to restrain unauthorised performances thereof. The constitution is that of a company limited by guarantee.

It makes no profits for itself, pays no dividends, and charges its members no agency commission, no entrance fees, and no subscriptions. All fees collected, and all receipts from other sources, are distributed among the composers, authors, and publishers concerned, in proportion to the relative popularity of their works. No expenses are deducted from the fees beyond the cost of administration, which is less than 10 per cent of the gross sum collected. By virtue of affiliations with twenty-four similar societies in other countries the society is able to grant to those concerned with public performances of copyright music in the Brit. Isles and overseas Brit. ters. comprehensive licences which cover a repertoire comprising not only the works of its own members, but also those of members of the affiliated societies, numbering more than 75,000 composers, authors, and music publishers of all nationalities. The same affiliations ensure the protection of P. R. S. members abroad. The society's policy and administration are controlled by a board of directors elected by the members from among their own number. The board (unpaid) consists of twelve representative Brit. composers and authors and an equal number of music publishers. The operations of the society extend only to musical works. It is not concerned with the performance of non-musical plays or sketches, nor with operas, musical plays, or other dramatico-musical works when performed in their entirety by living persons on the stage.

**Perfumery.** Perfumes are the essences, obtained from plants chiefly, to which the flowers, leaves, etc., owe their fragrant odours; the art of P. deals with the extraction and properties of those essences and their preparation in convenient form for toilet purposes or industrial use. Gum resins have been in use from very ancient times; they are widely used as fixatives in perfume compounds to give a uniform smell throughout to the finished blend, and so stop any volatiles escaping into the

atmosphere. The true perfumes are essential or volatile oils (fr. *otó*), contained in minute sacs in the leaf, as in mint; in wood, as in sandalwood; in bark, as in cinnamon; in seeds, as in nutmeg; in rind of fruit, as in lemon; in petals of flowers, as in rose and lavender; or, as in the case of orris, in the rhizome. The extraction of the oil is performed in several ways. The process known as *enfleurage* consists of exposing the flowers in contact with purified lard or with fine olive oil in suitable frames, whereby the fatty substances take up and become impregnated with the essential oil. Like the process of maceration *enfleurage* depends for its efficacy upon the remarkable property which fats and oils possess of absorbing odours. In other cases the aroma is caught in pure olive oil contained in felt placed above the flowers. Jasmine and tuberose are best prepared by *enfleurage*. In the process of maceration, warm oil or melted fat is prepared, and the blossoms infused for several hours. Rose, orange, and acacia are best prepared by maceration, the jonquil and violet by the combined processes. The oils and fats produced are treated with pure absolute alcohol, which absorbs the essential oils and is decanted. In other cases the flowers are placed in water in a still, when the oils are carried off with the steam and collect on the surface of the water, from which they are siphoned off. This is the method employed with woods, barks, seeds, etc. Oil may in some cases, where it is present in large quantities, as in lemon and orange peel, be pressed out. The amount of perfume obtained varies with the species of flower and also with the season. More than one odour may be obtained from the same plant; in the case of the orange, the fruit yields Portugal oil, the flower a distinct odour, neroli, and the leaves, *petit grain*. The essential oils are all soluble in alcohol (usually acetone free), and this solution, care being taken that the alcohol is itself odourless, forms the usual 'scent.' Sometimes the oils and alcohol are distilled together. The best perfumes, however, are produced by steeping the pomades and oils from the *enfleurage* process for several weeks at a gentle warmth. In the case of ambergris, castor, civet, musk (qq.v.), etc., the oils are formed into a tincture by solution in alcohol. Several terms are in common use. *Extraits* are strong solutions of the oils in alcohol after the process of infusion. They may be simple or blended. *Espritis* are weaker solutions. *Essences* may be the volatile oils themselves, or strong solutions of them. The terms *bouquet* and *nosegay* are applied to blended perfumes which have no one distinctive flower odour. Of animal perfumes there are only four in use: musk, civet, ambergris, and castor (qq.v.). All are extremely powerful; musk, for example, will impart odour to polished steel, though it will itself lose all fragrance within a year. Civet is even more potent than musk, and both are insupportable when strong. Castor (qq.v.) is reddish-brown, and is used in the dilute state. Ambergris from the

whale has a musky odour. They are all used in very dilute states, or merely to provide a base for bouquets.

**Artificial Perfumes and Flavours.**—Synthetic chem. has been successful in the preparation of artificial substances with practically the same perfumes and other characteristics as the natural products; in other cases products with similar perfumes but in many respects different. Terpineol, one of the commonest aromatic synthetics used in P., is the basis for lilac, lily, and many other compounds, the proportion being as much as 60 to 80 per cent in lilac. It is made synthetically by the action of diluted acids on oil of turpentine with continued stirring for many hours to yield terpin hydrate and afterwards terpineol. Oil of cassia is mainly cinnamic aldehyde,  $C_9H_7CH=CH\cdot CO\cdot OH$ , which may be prepared from benzaldehyde or by heating the formate and cinnamate of calcium together. Vanilla, from the pod of the vanilla bean, can now be synthesised in the laboratory. From phenol, through salicylic aldehyde, is prepared the essence of the tonka bean; anisic aldehyde is a substitute for the perfume obtained from hawthorn. From the esters and ethers other substitutes are prepared; from toluene and xylene through their isoamyl and isobutyl derivatives trinitro-isobutyl toluene with a musky odour is produced and used in soap manuf. Chlorostyrolene is a substitute for hyacinth oil; from naphthalene the methyl ether or naphthol,  $C_{10}H_7(OCH_3)$ , or nerolin, is produced as a substitute for neroli oil; other substitutes for this are methyl anthranilate from benzoic acid and the ethyl ether of naphthol, bromella; nobile oil is substituted by the synthetic methyl benzoate; jasmine oil by styrolyl acetate from benzene. Other synthetic perfumes of great importance are the aldehydes ranging from C.6 to C.20. A few examples are: C.6, hexyl aldehyde (fruity note); C.10, decyl aldehyde (intense sweet odour); C.12, methylnonyl lactol aldehyde (when diluted smells of oranges and amber); C.14, peach aldehyde (gives a lasting odour of ripe peaches); C.16, strawberry aldehyde (powerful smell of strawberries); C.20, raspberry aldehyde (raspberry odour and used as such in flavouring). These possess, in concentrated form, a very powerful odour and should be used in 1-10 per cent solution. Sometimes as little as 1:10,000 can alter the original note of a perfume blend.

As perfumes such substitutes are quite satisfactory, but as flavours they are rather to be deprecated, since they replace, though probably the main active constituent, none of the secondary organic constituents and micro-organisms present. Beyond the general use as scents, perfumes are in use in various powders and dentifrices, in the manuf. of tobacco, as well as for flavours in some cases. In recent years much attention has been paid to methods of synthesising some of the more complex natural perfumes such as musk and violet perfumes. Mention may be made of Ruzieda's work on musk

and irone (1926-47). See G. Plesse, *Art of Perfumery*, 1863; also trans. of K. Khristov, *Rose Industry of Bulgaria*, 1890; G. W. Askinson, *Perfumes and their Preparation*, 1892; E. J. Parry, *Chemistry of Essential Oils and Artificial Perfumes*, 1899; T. Koller, *Cosmetics*, 1903; W. A. Poucher, *Perfumes and Cosmetics*, 1923; E. Sagarin, *The Science and Art of Perfumery*, 1946, *Natural Perfume Materials*, 1947; and *The Perfumery Journal* (passim).

**Perga**, anct. city, the ruins of which are situated in the prov. of Konla, Asiatic Turkey, 12 m. N.E. of Adalia. An important city of Pamphylia. It was famous for the worship of Artemis; was visited by St. Paul.

**Pergamino**, tn. of Argentina, in the dept. of Buenos Aires, 141 m. from the city of Buenos Aires and 75 m. from Rosario. It is an important railway centre and sev branches of the Bartolome Mitre Railway radiate from the tn. Pop. 30,000.

**Pergamum**, or **Pergamus**. The former is by far the most usual form in the classical writers, though the latter is more common in Eng., probably on account of its use in our version of the Bible, Rev. ii. 13. The word is significant, connected with *πίργος*, a tower. (1) The citadel of Troy, and used poetically for Troy itself; the poets also use the forms *Perrama* and *Pergamia*. (2) Celebrated city of Asia Minor, the cap. of the kingdom of Pergamus, and afterwards of the Rom prov. of Asia. The kingdom reached its greatest extent after the defeat of Antiochus the Great by the Romans, in 190 B.C., when the Romans bestowed upon Eumenes II. the whole of Mysia, Lydia, both Phrygia, Lycania, Pisidia, and Pamphylia. It was under the same king that the celebrated library was founded at Pergama, which for a long time rivalled that of Alexandria, and the formation of which occasioned the invention of parchment, *charta Pergamena*. On the death of Attalus III. in 133 B.C., the kingdom, by a bequest in his will, passed to the Romans. Among the celebrated natives of the city were the rhetorician Apollodorus and the physician Galen. The altar of Zeus and the statue of the dying Gaul were fine examples of stonework. The modern name is *Bergama*.

**Peri**, Jacopo (1561-c. 1633), It. composer, b. in Florence and flourished in the time of the Medici and was an intimate of the coterie of artists and writers who sought to revive the Grk. drama. In music this group of progressives discarded counterpoint and cultivated the harmonic a-pest of music. P., with Caccini, experimented in musical declamation to a suitable accompaniment and thus became the earliest composers of recitative. They may also be claimed to have been the world's first operatic composers. P.'s opera *Daphne* (1597) is lost but his *Euridice* (1600) is extant.

**Peri**, in Persian folk-lore a class of supernatural beings of beneficent character; in anct. Persian folk-lore, on the contrary, a female demon of malignant character. The Persian *Pa* are of both sexes, although the female is more popularly

used in legend, of surpassing beauty and immortal. They were created after the Dece, with whom they are in perpetual warfare. Moore's *Lalla Rookh* tells how a P obtained admission to paradise.

**Periander**, statesman of Corinth, son of Cypselus, whom he succeeded as tyrant 625 B.C., and reigned forty years, to 585 B.C. His rule was mild and beneficent at first, but afterwards became oppressive. He was commonly reckoned among the Seven Sages. He was responsible for the foundation of Macedonian colonies, and was a patron of literature and art. See also CORINTH.

**Perianth**, strictly the envelope or non-essential parts of a flower, even when these parts are clearly separable into calyx and corolla, but commonly used where calyx and corolla so closely resemble one another as not to be distinguishable, as for instance in the tulip and other Liliaceae. The function of the P. is to protect the stamens and pistil from wind and rain until after pollination. Usually it is brightly coloured to indicate to insects the presence of nectar. It is absent from a number of wind-pollinated plants, e.g. grasses.

**Pericarditis**, see PERICARDIUM.

**Pericardium**, see under HEART.

**Pericarp**, see FRUIT.

**Pericles** (490-429 B.C.) Athenian statesman, b. in Athens. He was the son of Xanthippus and Agariste and was connected with the noblest families in Athens. The most advanced teachers of his time assisted in his early training, and the philosopher Anaxagoras became his closest friend. His first recorded public act was to help in the prosecution of Cimon after the Euboean campaign. The beginning of his political ascendancy was marked by a wide expansion of Athenian power. With the aid of Ephialtes he reformed the Areopagus. After the death of Ephialtes he assumed the leadership of the state. In 444 he defeated the Sicilians and made a descent upon Euboea. In 448 he led an army to Delphi, in 445 he crushed the Euboean revolt and induced the Spartans to retreat. From 445 his foreign policy underwent great changes, losing much of its aggressiveness. His attitude towards the Pelican League was that of making subjects out of allies. His home policy was to make the Athenian people self-governing. He introduced payment for the performing of public duties, such as serving on juries, etc. Through his measures the archonship became opened to the third class of citizens, also money was provided to enable the poorest people to attend theatrical displays. Towards the close of his life fresh foreign troubles arose, and Athens and Sparta commenced hostilities in 431. His adversaries chose this period of stress to attack his greatest friends, being afraid of P. himself, they prosecuted Phidias, the sculptor, and threatened Anaxagoras, and made insulting charges against Aspasia, with whom P. lived after being divorced from his wife. At the end of the first year of the war he used his great gift of oratory in his famous funeral speech.

He appealed to the pride of his countrymen, the appearance of the plague combined with the trouble abroad demoralised the people, and they no longer listened to him. He died shortly afterwards. He was frequently compared to Zeus, partly because of his dignified bearing and his thundering eloquence. He was a man of the highest honour and courage, and under the leadership of P. Athens reached her zenith of commercial and imperial prosperity. See also GREECE, History; PELOPONNESIAN WAR. See Thucydides I and II, W. W. Lloyd, *The Age of*

PERICLES

*Pericles*, 1875. E. Abbott, *Pericles and the Golden Age of Athens*, 1901. Study by C. Mackenzie, 1937. and A. R. Burn, *Pericles and Athens*, 1919.

**Peridotites** are coarsely crystalline, ultra basic igneous rocks occurring generally as intrusive masses. They contain little or no felspar, but consist chiefly of olivine (peridotite), with augite, eustatite, diopside and magnetite. In composition they approximate to some meteorites. Special varieties have received distinctive names such as picro-dunite, serpentine. Although holocrystalline when fresh the rocks are generally altered, the altered rock being known as serpentine.

**Perigee**, position of the moon's orbit in which she is nearest the earth. See APOTHEON; APOGEE.

**Périgord**, former prov. of France, in the N. of Guyenn. It was united to the Crown by Henri IV. in 1589. It now forms part of the depts. of Dordogne and Lot et Garonne.

**Périgueux**, cap. of the dept. of Dordogne, France. It is 79 m. N.E. of Bordeaux and is situated on the r. b. of the R. Isle.

An important building is the cathedral of St. Front, of Romano-Byzantine architecture. The tn. is noted for its truffles and canned foods. Pop. 40,800.

**Perihelion**, point in the orbit of a comet or planet (including the earth) at which it is nearest to the sun. See **APHELION**.

**Perim**, ls. in the strait of Bab-el-Mandeb, 14 m. from the coast of Arabia, and 90 m. W. of Aden, its administration being connected with that of Aden. It became a Brit. possession in 1857. Said to have received its name from Pori Pasha, a Turkish ruler, its alternative name is **Barim**. See also under **ADEN**.

**Perineum**, external floor of the pelvis (q.v.). It is a tough sheet of ligaments and muscles, through which pass the genital tracts, urethra, and rectum.

**Perinthus**, or **Perinthus**, see **ERFGL**.

**Perinthus**, see under **HERACLEIA**.

**Period** and **Periodicity**. The word **P**. is often used in a limited sense to denote a definite length of time, e.g. a **P**. of hr.-l. In its wider sense it denotes a continuous cycle of events which continually repeat themselves in a definite order. Thus take three events A, B, and C, A always occurring before B, and B before C, and then A, B, C again. The time, say, which elapses between the performance of A and its next performance is called the **period** of the events, which are termed **periodic**. Thus the succession of days may be termed periodic, the beating of the heart and breathing may also be termed periodic. The revolution of the astronomical bodies is treated as periodic. These illustrations are not strictly periodic owing to influences which vary in their action, but for all practical purposes they may be considered so. In electricity the term is applied to the repetition of an alternating voltage; in mechanics to the phases of a vibration or oscillation. The abstract science of mathematics supplies us with strictly periodic events. Thus in trigonometry the sine function goes through a series of values as the angle increases from 0° to 360°, and is then repeated in the same order from 360° to (360 + 2)°, and again to (360 + 3)°, the period in this case being 360°. This idea of periodicity, or the state of being periodic, is of paramount importance in the study of mathematics, simplifying the subject in a remarkable degree. The idea underlies all the theories of wave motion in sound, light, and electricity.

**Periodicals**, see **MAGAZINES**; **NEWS-PAPERS**.

**Periodic Functions**, see **FUNCTION**.

**Periodic Law**. Newlands (1861) in formulating his 'law of octaves,' pointed out that if the chemical elements are arranged in order of their atomic weights, every eighth element shows strong resemblances to it. Lothar Meyer stated that 'the properties of the chemical elements are periodic functions of their atomic weights,' being led to this conclusion by a study of atomic volumes and chemical properties of elements. Mendeleeff boldly enunciated the **P. L.** to cover the observed data. The so-called law has been extremely useful in the correction of

inaccurate atomic weights (e.g. glucinum, beryllium) and as a stimulus towards the discovery of new elements (see **GALLIUM**). Exceptions to the law were suspected (e.g. tellurium and iodine); the position of hydrogen was uncertain, etc. Recent work has shown that the law should be: 'The properties of the chemical elements are periodic functions of their atomic numbers' (q.v.). (See **CHEMISTRY**, **ELEMENT**.)

**Periodic System** (elements), see under **CHEMISTRY**.

**Perioch Tau**, see **PETER THE GREAT MOUNTAINS**.

**Periostitis**, inflammation of the periosteum or fibrous membrane investing the greater part of the surface of the bones. It may be due to injury or infection. In acute cases swelling and suppuration occur with considerable constitutional disturbance; the blood may rapidly be charged with septic organisms, and efforts should be made to keep the condition purely local. Chronic **P**. may be due to infection from syphilis, tuberculosis, actinomycosis, or may be arthritic in origin. There is increased blood pressure in the neighbourhood, and considerable swelling and pain, which is worse in the night time. The treatment includes rest and fomentations for the relief of pain. Potassium iodide is the best medicine. Osteitis and osteomyelitis are more severe conditions, affecting respectively the bone substance and the bone marrow.

**Peripatetics** (Gk. *περιπατητικοί*, walking about), name given to an ancient philosophical sect; so designated, it is said, from the circumstance of its founder, Aristotle, being accustomed to deliver his doctrines while walking in the grove of the Lyceum in the suburbs of Athens. Aristotle had a series of successors who taught his doctrines with some modification. The Peripatetic philosophy was introduced into Rome probably by Carneades, and from that time, or at least from the time of Sulla the dictator, it continued to be studied by a few learned men of leisure.

**Peripatus**, genus of worm-like, many-legged creatures, whose structural features suggest an intermediate character between worms and the higher Arthropods. They are found in Australia, Tasmania, New Zealand, S. America, and Africa, but are absent from Madagascar. They bear a number of short fat legs, and on the head are a pair of antennae and two simple eyes. From papillae at the sides of the mouth slime is emitted in jets to catch the prey and also for defensive purposes. See **ONYCHOPHORA**.

**Peripheral Paralysis**, see under **PARALYSIS**.

**Periscope**, instrument that came into prominence during the First World War, when it was necessary for submarine and trench observers to see without being seen. The diagram shows a toy **P**. consisting of two plane mirrors, A and B, each mounted at 45° to the axis of the tube in which they are fixed. An aperture enables light from an object to travel along OA to the mirror, where it is reflected to strike the

mirror B. The light is reflected from this lower mirror to an observer E, who looks through an aperture in the tube. The mirrors A and B are generally replaced by totally reflecting prisms that perform the same function of reflecting the light as shown in the simple diagram. In addition, there is incorporated a telescopic system of lenses between the prisms that increases the field of view and produces

PRINCIPLE OF THE PERISCOPE

usually small Ps. used on the midge sub-marines which crippled the *Tirpitz* in the Second World War. Submarine Ps. may have means of estimating the course, speed, and distance of ships and may act as torpedo directing telescopes. As they have necessarily a large number of optical parts, the use of anti-reflection films ('bloming') has effected a considerable increase in light transmission. See P. in *Dictionary of Applied Physics*.

**Perissodactyla**, one of the sub-orders of the Ungulata or hoofed quadrupeds, characterised by the possession of an odd number of toes on the hind foot, and by the presence of a third trochanter in the femur or thigh bone. There are three living families of P.: (1) Equidae or Horses; (2) Tapridae or Tapirs; and (3) Rhinocerotidae or Rhinoceroses. In addition there are a number of extinct forms. When horns occur in this sub-order they are always in the middle of the skull. See H. F. Osborn, *The Extinct Rhinoceroses*, 1898, and 'Monograph of the Titanotheres,' U.S. Geological Survey, 1928.

**Peristalsis**, rhythmical muscular contractions which occur in successive circles in certain organs under the control of the involuntary nervous system and propel the contents along, e.g. in the alimentary canal during digestion and in the womb during childbirth.

**Peristyle** (Lat. *peristylum*, Gk. *περιστύλιον*, from *περι*, about, and *στυλος*, a pillar or

column), in architecture, an open court within a house, with a colonnade around it, by which the prin. apartments were reached. A building having a single P. or row of pillars surrounding it, such as a Gk. temple, was called a peripter or periptere (Gk. *περιπτερον* (*περι*+*πτερον*, a wing).

**Peritoneum**, serous membrane, the largest in the body, forming a double-walled sac completely closed in the male. The visceral layer clothes all the viscera of the abdomen and pelvic cavities, and the parietal layer lines the inner walls of the abdomen, the space between the layers being filled with a film of fluid. The various organs or parts are enclosed in folds or ligaments of the P.; the *mesenteries* connect the vertebral column with the intestines; the greater or lesser *omenta* are also folds of P. Blood and lymph vessels are carried in the connective tissue of the membrane, which has a layer of pavement-shaped epithelial cells, between which are numerous openings through which the fluid, indistinguishable from lymph, escapes when in excess into the lymphatics. The great omentum contains some adipose tissue, which, when present in excess, causes abdominal corpulency; the omentum also acts as the 'abdominal policeman' by localising infection. The serous fluid may also accumulate to a large extent, e.g. in dropsy.

**Peritonitis**, inflammation of the peritoneum. It occurs in the acute and chronic form, and may be local or general. The onset is sometimes difficult to distinguish from colic. Commencing with a local pain, it spreads all over the abdomen and becomes intense; the breathing is shallow and rapid, the pulse rapid, the temp. raised, and vomiting is an early symptom. The knees are often drawn up, and the face pinched, drawn, and anxious; cold sweats, thirst, and diarrhoea are other symptoms. The abdomen becomes tense and swollen, due to fluid. P. may be fatal in a few days or even hours. The inflammation may arise from cold; it more commonly extends from inflammation of the organs, and is often caused by local wounds or perforations of the abdominal organs (e.g. of the stomach in gastric ulcer, or of the intestine in typhoid fever). Rupture of tumours and abscesses, an aneurysm, or any such cause of septic poisoning gives rise to general P. Bright's disease, erysipelas, appendicitis, and child-bearing may be followed by P. Surgical operation in bad cases is generally necessary. Local chronic P. is susceptible to treatment with penicillin and the sulpha group.

**Perityphilitis** (Gk. *περι*, around, *τιφλος*, the caecum), inflammation of the peritoneum (q.v.) or serous membrane, of the caecum, or blind portion of the large intestine. The term formerly included all those cases of intestinal inflammation now known as appendicitis (q.v.).

**Periwig**, see under Wig.

**Periwinkle**, or Winkle (*Littorina*), genus of peccinibranchiate gastropods found on most shores, where they feed on marine

vegetation. Some occur at low-water mark, and others on rocks where the sea rarely reaches them. The common *P. (L. littorea)* is a popular article of diet, and some 2000 tons of it are consumed annually in London alone. This species hatches its young from jelly-like eggs laid on seaweed, but *L. rudis*, another Brit. species, retains its young until they have reached a considerable stage of development. The shell of *P.* is thick, spiral, few-whorled, and top-shaped, with a circular mouth or aperture.

**Periwinkle** (*Pincta*), genus of hardy perennial plants and stove evergreen shrubs (family Apocynaceae). The large *P. (V. major)* and the lesser *P. (V. minor)* are handsome blue-flowered plants of considerable value for adorning shady positions in gardens where few flowering plants will grow. A number of handsome varieties with variegated leaves and purple or white flowers have been introduced.

**Periyar, River**, chief riv. of Travancore, India. It rises on the W. face of the Ghat range and is navigable for 60 m. For the P. R. irrigation scheme see *under* MADRAS.

**Perjury**, crime of wilfully making a false statement on oath as a witness (or interpreter) in a law court, such statement being *material* to the question in issue and made deliberately or without belief in its truth. It is for the judge to decide whether the statement was *material*, and for the jury to say whether the intention of the accused was to deceive. There can be no conviction for *P.* as a general rule upon the evidence of one witness alone as to the falsity of the accused's statement; there must be either two witnesses to contradict the accused, or one to contradict together with some other evidence materially corroborating the contradiction. The whole law of *P.* was consolidated in the Perjury Act of 1911. The punishment is penal servitude up to seven years or imprisonment for two years with or without hard labour, or (and) a fine. The term *false swearing* applies to false oaths *not* taken in the course of judicial proceedings, e.g. false declarations with reference to marriages, births, or deaths, in bankruptcy matters, by a voter, etc. Such false oaths are punishable as *P.*

**Perkin Warbeck**, see WARRECK, PERKIN. **Perkin, Sir William Henry** (1838-1907), chemist, b. in London and educated at the City of London School and the Royal College of Chemistry. He turned his knowledge of chem. to commercial uses. He is best known for his researches in the direction of dyes and coal-tar colourings and sev. processes were invented by him. He may be said to have founded the coal-tar colour industry.

**Perlis**, one of the Unfederated (see MALAY) Malay States under Brit. protection; lies on the N.W. coast of the Malay Peninsula. Area about 310 sq. m. with a coast-line of 13 m. *P.* is bordered on the W. by a range of mts. running N. and S., which separate it from the Siamese prov. of Setul; on the E. it is bordered by

another Siamese prov. and by the Malay state of Kedah; and on the S. by Kedah. Padang Besar on the main trunk line to Bangkok is the frontier railway station between Siam and Malaya. Striking features of the landscape are the isolated limestone hills which rise steeply from the plain. The *P. R.* is the only one of any size, and is navigable by small craft as far as Kangsar, the cap. The rajah resides at Arau. Rice and tin are the chief products and exports. Until 1821 *P.* was subject to Kedah, but when in 1841 Siam allowed the sultan of Kedah to reassume the government, *P.* was made an independent state under an Arab rajah. In 1905, at the request of the rajah, a European adviser was appointed to advise him in the finances and general management of the state. By a subsequent treaty, between Britain and Siam, his duties were transferred to a Brit. adviser of the Malayan civil service. By a treaty of 1930 between Britain and *P.* the latter agreed to continue under the protection of Great Britain as suzerain and to accept a Brit. adviser. Pop. 57,800 (Malays 46,100; Chinese 8400; Indians 1200).

**Perlite Structure**, structure found in volcanic glasses, such as obsidian. By the contraction (on cooling) of the homogeneous mass, a system of reticulated and spiral cracks has been set up, giving the rock a finely globular character.

*Perm.* see MOLOTOV.

*Permalloy*, see *under* NICKEL.

**Permanent Court of International Justice**, see INTERNATIONAL JUSTICE, PERMANENT COURT OF.

**Permanent Debt**, see *under* PUBLIC DEBT.

**Permanganic Acid** ( $\text{HMnO}_4$ ) is obtained in the form of purple crystals by evaporating its aqueous solution under reduced pressure. The aqueous solution itself is made by the addition of dilute sulphuric acid to barium permanganate and filtering off the precipitated barium sulphate:  $\text{Ba}(\text{MnO}_4)_2 + \text{H}_2\text{SO}_4 = 2\text{HMnO}_4 + \text{BaSO}_4$ . *P. A.* is an unstable compound readily decomposing to form manganese dioxide, water and oxygen:  $4\text{HMnO}_4 = 4\text{MnO}_2 + 2\text{H}_2\text{O} + 3\text{O}_2$ . It is very reactive and has powerful oxidising properties.

**Permian**, name given to the lower div. of the New Red Sandstone, which is derived from Perm in Russia, where the strata are well developed. The Brit. *P.* strata consist of red sandstones, corals, limestones, shales, marls, volcanic and limestone breccias, and beds of gypsum and rock-salt. These strata are in general found connected with the areas of Carboniferous rocks, either fringing the coal-fields conformably or resting unconformably on the millstone grit or mt. limestone. On the E. side of the Pennines the *P.* rocks occupy a narrow stretch of country from the Tyne through Durham and York to the Trent. The *P.* on the W. side of the Pennines occurs in the Vale of Eden. In the midlands a coarse volcanic breccia rests upon a lower series of corals and sandstones, and is overlain by sandstones and marls. This breccia has been assigned

by some to glacial action, and by others is believed to be due to torrential deposition. In Devonshire and Scotland the rocks are made up of breccias and sandstones, while those of N. Ireland are mainly marls and fossiliferous magnesian limestones. The fossils of the P. are chiefly Palaeozoic in type. The invertebrates include Brachiopods, Lamellibranchs, and Gasteropods, which become stunted in the higher beds and finally disappear. The Amphibia, as in the Carboniferous period, belong to the Labyrinthodontia. Fishes such as *Palaeoniscus* also occur, and reptiles appear for the first time in these beds, e.g. *Protosaurus* and *Pariasaurus*. The flora of the P. is closely allied to the Carboniferous. *Pecopteris* and *Ondopteris* ferns of Carboniferous genera are common, as also are lepidodendrons and calamites. Cycads first appear in the P. rocks, and the strata contain characteristic plants such as *Psaronius* and *Walcchia*. The P. of India and the S. hemisphere is characterised by *Glossopteris* and other Mesozoic types. In Germany the P. receives the name 'Dyassic,' being made up of two groups, the Zechstein and Rothliegendes, the former having a bed of rock salt at Spereberg which is 4000 ft. thick. A vast area of P. is found in the Perm. dist. in Russia, and near the Uralis the beds are of marine type. In Carinthia and Sicily the entire series is marine, containing a rich and peculiar fauna which is also found in the salt ranges of the Punjab. The *Glossopteris* flora of the P. of S. India, S. Africa, and Australia is often so abundant as to afford seams of coal. The existence of boulder beds in these rocks is evidence of glaciation in P. time. In N. America a fresh-water series is found in the Alleghenies and Appalachians and a marine development in Texas. The P. period was one of great earth movement, which brought about the isolation of the coal-fields. Continental conditions prevailed over the S. hemisphere, and inland seas were formed over W. Europe from which beds of gypsum and rock salt were derived. See R. L. Sherlock, *The Permian-Triassic Formations*, 1918.

**Permutations and Combinations.** A combination in mathematics is a selection without reference to order of a given number of elements from a given group. Thus of the group *abc* the combinations taken two at a time are *ab*, *ac*, *bc*; of the group *abcd* the combinations taken three at a time are *abc*, *acd*, *bcd*, *abd*. In general the number of combinations of *n* different things taken *r* at a time, written  ${}^nC_r$ , is  $n(n-1)(n-2) \dots (n-r+1)/1, 2, 3 \dots r$ , which may be written  $n!/(n-r)!$  where *n!* means the continued product of all numbers from unity up to *n* inclusive. Permutation considers not merely selection but arrangement, so that the permutations of *abc* taken two at a time are *ab*, *ba*, *ac*, *ca*, *bc*, *cb*. The number of permutations of *n* things taken at a time, i.e.  ${}^nP_r$ , is  $n!(n-r)!$ . Example: A telephone exchange has 40 subscribers; in how many ways may two be put into communication? Any one can ring up 39

others, and this can be done in  $40 \times 39$  ways. (Permutations.) But A may ring up B, or B A, and each pair occurs twice. If combination only is required  $20 \times 39$  is the number. In this article reference can only be made to the simpler results of combinatorial analysis that are obtained in algebraical theory dealing with P. and C. Each of the arrangements which can be made by taking some or all of a number of things is called a permutation, e.g. How many different numbers can be found by using five out of the nine digits 1, 2, 3, . . . 9? The problem is to find the number of permutations of 9 different things taken 5 at a time. One arrangement is 12345; another is 96231.

The first number in any arrangement may be any one of the nine. When it is chosen the next number may be any of the remaining eight, and so on, so that the total number of arrangements is  $9 \times 8 \times 7 \times 6 \times 5 = 15120$ . In general the number of arrangements of *n* dissimilar things taken *r* at a time is written  ${}^nP_r$ , the symbol for  $n(n-1)(n-2) \dots (n-r+1)$ .

Each of the groups or selections which can be made by taking some or all of a number of things is called a combination. Referring to the previous example, while 12345 and 54321 are both different arrangements they are counted as the same combination. The number of combinations of *n* dissimilar things taken *r* at a time is written  ${}^nC_r$ , which is the symbol for

$$\frac{n(n-1)(n-2) \dots (n-r+1)}{1, 2, 3, \dots r}$$

e.g. From a total of 15 cricketers how many ways can an eleven be chosen? The required number is  ${}^{15}C_{11}$ .

$$\frac{15 \times 14 \times 13 \times \dots \times 5}{1 \times 2 \times 3 \times \dots \times 11} = 1365 \text{ ways.}$$

See W. W. Ball, *Mathematical Recreations* (5th ed.), 1911; H. E. Dudeney, *Canterbury Puzzles* (2nd ed.), 1919; J. Degrazia, *Maths is Fun*, 1919; and M. Kraitshik, *Mathematical Recreations*, 1949.

**Pernambuco**, state of Brazil, on the Atlantic coast. The coast regions are low-lying, while the inland areas rise in a plateau. The former, known as *Mattas*, are the forest regions. The chief productions of the state are sugar, fruit, tobacco, cotton, coffee, all of which, with rum and rubber, are exported. The average yield of sugar from the P. cane is 65 tons per hectare, or 2½ ac. Maize, manioc or cassava, and other foods are cultivated for local consumption by the labouring classes. The chief port is P., consisting of three parts, Recife (*q.v.*), this name also being used for the whole port, São Antonio, and Boa Vista. There is an airline to Rio de Janeiro. Area 49,580 sq. m. Pop. 2,993,000; (tn.), 350,000. P. wood is a variety of Brazil wood, which as a dye wood is exported in large quantities. This variety is the product of *Cesalpinia echinata*. The Sp.-Brazilian trade with the wealthy sugar prov. of P. was at its height in the first quarter of the seventeenth century, when the Sp. and

Portuguese crowns were united, and before the renewal of the Dutch war drove Sp. shipping from the S. Atlantic.

**Pernov** or **Pernau** (Estonian, *Pärnviigi*), tn. of the Estonian S.S.R. on the N. part of the gulf of Riga at the estuary of the P. R. It trades chiefly in linseed, wood-pulp, fish, oil, and flax. Pop. 21,500.

**Pérogas**, **Baron de**, see VAUGELAS, **CLAUDE FAYRE DE**.

**Perón**, **Juan Domingo** (b. 1895), Argentinian statesman, b. near Lobos, a tn. S. of Buenos Aires. Educated at military schools, he became a lieutenant at twenty. Between then and 1943 he was not heard of outside his own country; but on June 4 of that year he led a party of young Nationalist military officers in a successful coup d'état against President Ramón Castillo. From that time he was the power behind the president, although for a time he held no conspicuous office. In 1944, however, President Farrell appointed him to be war minister and then vice-president. This, however, did not satisfy P.'s ambition and in the following year he still further strengthened his hold over the gov., and though after an abortive attempt at another coup he was driven out for a brief period, he returned stronger than ever. In Feb. 1946 he was elected president on the Labour party platform and inaugurated in the following June. In 1947 he called on his adherents to crush his opponents as 'oligarchs and politicians and native communists,' an appeal, perhaps, more in the nature of propaganda than practical politics. With the ratification by the Argentine Congress of the United Nations Charter P. seemed to modify his intransigence, declaring that the era of 'misunderstandings' with the other W. hemisphere countries was closed. In the same year his gov. took a full part in the Inter-Allied Amer. Defence Conference at Rio. A characteristically worded attack on the opponents of his regime was made by P. at Santa Fé in Sept. 1948, with prin. reference to the opposition of the Radical party to proposals for the reform of the constitution which had been passed by the 'Peronista' majority in Aug. 1948. He identified his opponents as 'all who are rich, those who do not work, those who are professional politicians, and those who defend the interests of foreign capitalistic trusts,' adding that though for the past two years he had called for 'peace and co-operation' he would 'speak with a firm voice on the day he ordered them' (his opponents) 'to be hanged.' The Argentine Gov. announced that a plot had been discovered to assassinate P. and his wife after a performance in the Colón Opera House in Buenos Aires on Oct. 12, 1948. Later, charges were preferred against some seventeen persons including Cipriano Reyes, a former deputy and labour leader. See also ARGENTINE REPUBLIC, *History*.

**Péronne**, tn. in the dept. of Somme, France, 22 m. S.E.W. of Cambrai. It was the scene of the signing of a treaty forced by Charles the Bold of Burgundy on Louis XI. in 1468, and was captured in 1515 by Wellington, and in 1871 sur-

rendered to the Gers. In the First World War, the tn. soon fell to the Gers.; was recaptured by the Fr. in 1917, lost again a year later, and then finally recaptured by the Australians in Sept. 1918. During the struggle most of the buildings were destroyed. Pop. 4000.

**Perosi**, **Lorenzo** (b. 1872), It. priest and composer, b. at Tortona. He studied music at the conservatory of Milan, and after his study took holy orders. He became choirmaster at St. Mark's, Venice, in 1894, and afterwards director of the Sistine Chapel in Rome in 1898. In 1905 he was nominated perpetual master of the Pontifical Chapel. Most of his music is sacred, his fame resting principally on his masses and oratorios. Among his works are *La Passione di Cristo* (1897); *La Trasfigurazione del Nostro Signore Gesù Cristo* (1898); *La Risurrezione di Lazzaro* (1898); *Dies Iste* (1912), and *Giorni di Tribolazione* (1916). See studies by A. Danerini, 1921, and Z. Muzameel, *Don Lorenzo Perosi e le sue opere*, 1932.

**Pérouse**, **La**, **Jean François de Gálup**, Comte de (1741-88), Fr. navigator, b. near Albi. He served with distinction during the war with England (1778-83), especially on the E. coast of Canada and in Hudson Bay, where he captured Forts Prince of Wales and York (1782). In 1785 he set out from Brest to discover the N.W. passage and also to explore the N.W. coasts of America and the N.E. coasts of Asia, as well as the China and Japan seas, the Solomon Is., and Australia. He reached Mt. St. Elias in Alaska and visited the Hawaiian Is., discovered Necker Is., and then crossed over to Asia, where after exploring the coasts of Japan, Korea, and Chinese Tartary, he discovered La P. Strait between Saghalien and Yezo. In 1788 he sailed from Botany Bay, after which all trace of him was lost until 1828, when wrecks were discovered N. of the New Hebrides by Dumont d'Urville. They were brought back to France, and are in the marine museum of the Louvre. See M. Mureau, *Voyage de la Pérouse autour du monde* (4 vols.), 1797.

**Pérouse Island**, **La**, see under LORD HOWE ISLAND.

**Perowne**, **John James Stewart** (1823-1904), Eng. divine and scholar, b. at Burdwan, Bengal. Bishop of Worcester from 1891 to 1901. He was a biblical scholar and exegetist and wrote a work on the Book of Psalms. He lectured on theology at Trinity College, Cambridge, and ed. the *Cambridge Bible for Schools*. He was made canon of Llandaff in 1869, and dean of Peterborough in 1878. Other works of his were *The Labours and Strength of the Christian Ministry* (1847); *Immortality* (1869); and *The Doctrine of the Lord's Supper* (2nd ed. 1887). He also ed. the *Letters and Remains of Bishop Thirlwall* (1877).

**Perpendicular**, see ARCHITECTURE, *Gothic*.

**Perpetual Cure**, see CURATE.

**Perpetual Motion** has been sought by many genuine experimenters in the past, in spite of its scientific impossibility. A

P. M. machine is one that will move and continue to move for ever without receiving any supply of energy from an external source. The requirements of such a machine are either that it shall be perfectly frictionless, or if friction is present, that the machine shall create energy in order to overcome the friction. The first requirement, complete absence of friction in a real machine, is impossible, and the second violates the law of conservation of energy, which states that the total energy of an isolated system is constant; it can neither be increased nor decreased. In other words, energy can neither be created nor destroyed. The only hope of discovery of P. M. lies in the discovery of an exception to the law of conservation of energy, and although no scientific law is dogmatic, this law is based on the reliable and patient experiments of generations of scientists. Many examples of attempts to produce P. M. are given in M. da C. Andrade's book, *Engines* (1928). One attempt was made by Bishop Wilkins.

**Perpetuity.** Eng. law regards as null and void any tying-up of property, real or personal, beyond the period of a life or lives in being and twenty-one years (together with a further period for gestation, where, in the particular case, it actually exists) afterwards. Or, in other words, any marriage settlement, will, or other instrument providing for the future destination of property must ensure that the property shall in any conceivable event ultimately vest in possession within the above-stated period, e.g. a gift by will in trust for X for life, and after his death to such of his children as shall reach twenty-one years of age to vest in them respectively at that age, is valid; but to A for life, and after his decease to such of his children and grandchildren as shall reach twenty-one, is void as a P.; for though any children of A, must, if they reach twenty-one, necessarily do so within twenty-one years of A's death, some of the grandchildren might not. Any limitation void as a P. fails altogether, and hence, in the above example, the whole devise to the class made up of both children and grandchildren would fail. *See also LIMITATION OF ESTATES; LAND LAWS.*

**Perpignan**, cap. of the dept. of Pyrénées-Orientales, France, on the R. Têt, 35 m. S.W. of Narbonne. It has an eccles. college and sev. other educational buildings, and a museum. It possesses also a strong citadel of the counts of Roussillon, and an old cathedral founded in 1324. The chief articles of trade are Roussillon wine, silk, and cigarette papers. Pop. 72,000.

**Perranzabuloe**, par. of Cornwall, England, 5½ m. N.W. of Truro. In 1835 a church, which had been buried in sand for hundreds of years, was discovered. The remains of this building, now known as 'St. Piran's Oratory', are enclosed in a concrete shell for preservation. A second church was built in the same area about 1150. This also became enveloped in sand and the present par. church, built between 2 and 3 m. inland, was erected in

1804, largely from parts removed from the second church. Perranporth, the largest vil. in the par., is now a well-known and flourishing summer resort. Pop. 3300.

**Perrault, Charles** (1628-1703), Fr. writer, b. in Paris. In 1651 he became a member of the Paris Bar, and obtained a considerable measure of success as a pleader, but having made the acquaintance of the minister Colbert, he was diverted from the practice of his profession by being appointed controller-general of the royal buildings. In 1671 the influence of Colbert procured for him an entrance into the Fr. Academy, into which learned body he introduced sev. important reforms. His name was first made well known by his famous controversy with Boileau regarding the comparative merits of the ancients and moderns, which originated in a poem of P.'s entitled *Le Siècle de Louis le Grand* read before his confrères of the Academy in 1687, and was intended to prove that modern authors were superior to Homer, Herodotus, Plato, Aristotle, Virgil, etc. It was followed up by *Parallèles des anciens et des modernes* (4 vols. 1688-97). P.'s attention was turned still more closely and critically to his contemporaries, the result of which was an admirable work, *Hommes illustres du siècle de Louis XIV.* (1696), containing 200 critical biographies. But the work that has far more than any other preserved his name is his *Histoires du temps passé*, or fairy tales. These were first pub. in a miscellany during 1696-97, the individual titles being *La Belle au Bois Dormant*, *Petit Chaperon Rouge*, *La Barbe Bleue*, *Le Chat Botté*, *Les Fées*, *Cendrillon*, and *Riquet à la Houppe*. It is hardly necessary to observe that these are all traditional titles and that P. has no claim to the invention of the subjects; but his skill in adjusting style to matter could not easily be rivalled, much less exceeded.

*See* P. Saintyves, *Les Contes de Perrault*, 1923.

**Perrault, Claude** (1613-88), Fr. architect, b. in Paris. He was the son of Pierre P. and brother to Charles. He was by profession a physician, but abandoning this in order to study art, became the architect of the Louvre, his colonnade ranking among the finest erections of the seventeenth century. He also trans. Vitruvius's *De Architectura libri decem* (1673), and helped his brother in the writing of his *Mémoires*. *See* A. Hallays, *Les Perrault* (2nd ed.), 1926.

**Perrin, Claude Victor**, *see* VICTOR.  
**Perrin, Jean Baptiste** (1870-1942), Fr. physicist, b. at Lille, noted for his studies of the structure of matter and the equilibrium of sedimentation. In 1924 he received the Nobel prize for his work on these subjects. His works include *Traité de chimique physique* (vol. 1, 1903); *Les Atomes* (1913); and *Les Éléments de la physique* (1930).

**Perry, Frederick John** (b. 1909), Eng. lawn tennis player, b. at Stockport. In 1929 he was the world table-tennis champion. Turning to lawn tennis he won the Wimbledon singles championship in 1934,

1935, and 1936, and became the champion of the U.S.A. in 1931. In 1937 he turned professional, and became an Amer. citizen in 1940. He wrote *My Story* (1934).

**Perry, Matthew Calbraith** (1794-1858), Amer. naval officer, b. at Newport, Rhode Is., U.S.A. As commander of the *Fulton*, the earliest steam warship (1837), he is sometimes called the 'father of the steam navy' of America. In 1843 he served on the W. African coast in putting down the slave trade, and in 1848-49 he served in the Mexican war, in which his squadron seized Frontera and Tabasco. But his chief title to fame is that he led an expedition in 1853 to Japan and negotiated a treaty which in effect reopened communication between that country and the rest of the world after 250 years of isolation. This treaty between Japan and America, which was signed on March 13, 1854, granted America trading rights at Hakodate and Shimoda. It was ratified at Shimoda on Feb. 21, 1855. See also JAPAN, *History*.

**Perry, Oliver Hazard** (1786-1819), Amer. naval captain, who held various commands during the war of 1812. He had charge of the Lake Erie squadron, and defeated Capt. Robert Barclay, who had served with Nelson, at the battle of Lake Erie. P. took an important part in the operations of Detroit, and at the battle of the Thames. He was honoured by the thanks of Congress.

**Perry, William James** (1887-1949), Brit. anthropologist educated at the City of London School and at Selwyn College, Cambridge. Later he came into association with Elliot Smith (later Sir Grafton Elliot Smith (q.v.)), who was then at Manchester pursuing anthropological studies initiated by his experience as an orientalist. With him, P. became a champion of the diffusionist school in anthropology, whose revolutionary doctrines so stirred the anthropological world. In 1919 he became reader in comparative religion in the Victoria Univ. of Manchester. His anthropological concepts were formulated in *The Origin of Magic and Religion* (1923), and *The Children of the Sun* (1923). In that year he was appointed reader in cultural anthropology in the Univ. of London but had to retire through ill-health in 1939. His other works are *Megalithic Culture of Indonesia* (1918), and *The Primordial Ocean* (1935).

**Perry**, alcoholic liquor which is manufactured from certain varieties of pears as cider is from apples. It is sweet and of a pale colour, and is sometimes mixed with champagne of an inferior quality. It contains from about 3 to 8 per cent of alcohol. It is made chiefly in England in the cos. of Gloucester, Hereford, Worcester, Somerset, and Devon.

**Perryville, Vt.** in Boyle Co., Kentucky, U.S.A., the scene of Gen. Bragg's unsuccessful campaign.

**Persea gratissima**, see AVOCADO PEAR.  
**Persecution**, attempt to suppress obnoxious opinions, chiefly in the field of religion, by temporal punishment, carried usually as far as the death penalty. During the first days of Christianity the

Christians underwent much P. from the Jews, and the Rom. Gov. also visited them with great severity. The number of Ps. suffered under the Rom. emperors is usually somewhat artificially reckoned as ten; under Nero, A.D. 61; Domitian, 95; Trajan, 107; Hadrian, 135; Marcus Aurelius, 165; Septimius Severus, 202; Maximinus, 235; Decius, 249; Valerianus, 257; Diocletian, 303. Others omit Hadrian and insert Aurelian, 275. When Christianity became the state religion there was much P. of the Catholics by the Arians, and by the Catholics of the various heretical sects. In the Middle Ages P. was freely used as a weapon against the spread of heretical opinions, as in the case of the Cathari and Albigenses. The Protestant reformers used the same method. The case of Servetus at Geneva, and of the Quakers in New England, are classic examples. The Jews (q.v.) have suffered severe Ps. throughout Europe at different times, many being massacred in the occupied Europe during the Second World War, anti-Semitism being a distinguishing feature of National Socialism, and it is met with in almost all missionary endeavours.

**Perseid Meteors**, popularly designated as 'sparks from St. Lawrence's gridiron,' are a swarm of meteors moving round the sun in a retrograde and elongated orbit. This orbit is intersected by that of the earth about Aug. 10 each year, with the result that a shower of 'shooting-stars' comes from a *radiant* in the constellation Perseus. An intermittent dropping of Perseids continues for about three weeks after that date, showing that the swarm must be about 30,000,000 m. in width. It was shown in 1666 by the It. astronomer, Schiaparelli, that the orbit of the P. M. is probably identical with that of Tuttle's comet (Aug. 1862) and that the meteors are debris from the comet striking the earth's atmosphere. See METEORS.

**Persephone**, see PROSERPINE.

**Persepolis**, cap. of Persia (Persia) and of the Persian empire. It appears to have been seldom used as the royal residence. Neither Herodotus, Xenophon, Ctesias, nor the sacred writers during the Persian period mention it at all, though they often speak of Babylon, Susa, and Ecbatana as the caps. of the empire. It is only from the Grk. writers after the Macedonian conquest that we learn its rank, which appears to have consisted chiefly in its being one of the two burial places of the kings (the other being Pasargadae, q.v.), and also a royal treasury; for Alexander found in the palace immense riches. It preserved its splendour till after the Macedonian conquest, when it was burnt; Alexander, as the story goes, setting fire to the palace with his own hand at the end of a revel at the instigation of the courtesan Thais, 331 B.C. It appears frequently in subsequent hist., both ant. and mediev. It is now deserted, but its ruins are considerable. See also PERSES, *Antiquities*. See E. F. Schmidt, *The Treasury of Persepolis*, 1939.

**Perse School**, Cambridge, was founded in 1615 under the will of Stephen P.

(1648-1615). Additions were made in 1842, and a girls' school estab. in 1881. The original site was bought by the univ. in 1890, when the school was moved.

**Perseus**, in Gk. legend was a son of Zeus and Danaë, the daughter of Acrisius, king of Argos. Polydeutes, king of Soriplios, being in love with Danaë, sent P. on the quest for the head of Medusa the Gorgon (q.v.). The youth succeeded in his object through the help of Athena and Hermes. On his way home P. rescued Andromeda from a sea-monster and married her. He then rescued his mother from the persecutions of Polydeutes,

PERSEUS HOLDING THE HEAD OF MEDUSA  
Statue by Benvenuto Cellini.

whom he turned into stone. Later he inadvertently slew his grandfather when hurling a quail, thus fulfilling a prophecy made at his birth. P. became successively king of Argos and Tiryns; the foundation of Mycenæ (q.v.) is attributed to him. There is a statue of P., holding the Gorgon's head, by Benvenuto Cellini (q.v.) in Florence. See C. Kingsley, *The Heroes*, 1875; E. S. Hatland, *The Legend of Perseus*, 1894-96; and J. M. Woodward, *Perseus: a Study in Greek Art and Legend*, 1937.

**Perseus**, anet. N. constellation (between Taurus and Cassiopeia) rich in astronomical interest. For a brief account of the nova which appeared on Aug. 22, 1901, in Caput Medusæ, see NOVÆ, and for the meteoric stream which radiates from a point near  $\gamma$  Persel, see PERSID METEORS. In the head of Medusa (in the left hand of P.) is the well-known short period variable Algol or  $\beta$  Persel. Its changes from

magnitude 2.3 to 3.5 are repeated regularly after a period of 2 days 20 hrs. and 49 min.  $\alpha$  Persel is a star of the solar type, its magnitude being 1.9.

**Perseverance of Saints**, doctrine necessarily resulting from the most essential parts of the Calvinistic system, and held by almost all who adopt the Calvinistic or so-called Augustinian doctrines. It is advocated not only by arguments from other doctrines, as those of election, atonement, the intercession, and mediatorial dominion of Christ, imputed righteousness and regeneration; but also from many texts of Scripture, as those which declare eternal life to be always connected with believing, and those which encourage the believer to depend on the faithfulness, love, and omnipotence of God. To an objection very commonly urged against it, that it tends to make men careless concerning virtue and holiness, its advocates reply that this objection is only valid against a doctrine very different from theirs, the true doctrine of P. of S. being one of perseverance in holiness, and giving no encouragement to a confidence of final salvation which is not connected with a present and even an increasing holiness.

**Pershing, John Joseph** (1860-1948), Amer. soldier, b. at Laclede, Missouri; memorable in U.S. hist. as commander-in-chief of Amer. forces in France in the First World War. He was the son of a foreman platelayer on the railway. On leaving the normal school at Kirksville he worked in a general store, and after successfully competing in an examination for cadetships to the U.S. Military Academy he was posted to the 6th U.S. Cavalry. He was then assigned as military instructor at the univ. of Nebraska, and, later, as teacher of tactics at the U.S. Military Academy. Having served in Cuba and the Philippines, he was promoted brigadier-general in 1906 and major-general in 1913. When the U.S.A. broke off diplomatic relations with Germany early in 1917, P. was given command of the Amer. forces. He found himself in disagreement with the allied commanders as to the distribution of his troops. But so grave had the military situation become during the great German offensive on the Somme and Lys in March-April 1918 that he was compelled for a time to place his troops unreservedly at Foch's disposition. P. conducted two major operations. In Sept. 1918, in one battle he 'flattened' the famous salient at St. Mihiel (q.v.) where the Germans had held throughout the war. He then wished to advance on Metz, but was overruled by Foch and assigned the difficult terrain of the Meuse-Argonne where the battle raged through the autumn months until, on Nov. 7, 1918, Amer. troops were in sight of Sedan. On Sept. 1, 1919, the administration showed its appreciation of his services by making him a full general of the Amer. Army, a rank which had only been held by four men before, Washington, Grant, Sherman, and Sheridan. In 1921 he became chief of staff of the army, and retired in 1924. P.'s greatest quality was

resolution: as a strategist he had little subtlety, nor did he at first appreciate the resilience of the Ger. defensive system. His organising ability was high, and his confidence unshakable. His own story has been told in his book, *My Experiences in the World War* (1931).

**Pershore**, murt. tn. in the co. of Worcester, and 9 m. S.E. of the city of that name, on the Avon. It contains two churches, that of St. Andrew's, small and anct., and the church of the Holy Cross, in Norman and Early Eng., with a lofty square tower. This church is the only remaining portion of the anct. abbey-church of the same name. The inhab. are chiefly employed in manufacturing agric. implements, and in raising fruits and vegetables for the markets of the large manufacturing tns. in the vicinity. Pop. 4,000.

**Persia** (Iran), extensive kingdom of W. Asia, called by the natives Iran, is bounded W. by Kurdistan (Turkey) and Iraq, S.W. and S. by the Persian Gulf and the Arabian Sea, E. by Baluchistan and Afghanistan, and N. and N.W. by the Turkmen Republic (U.S.S.R.), the Caspian Sea, and Russian Transcaucasia (Armenia and Azerbaijan). The name was changed from P. to Iran on March 21, 1935, and it reverted to P. in 1942. The surface presents the appearance of a vast tableland, skirted on the N. by mt. masses known as the Kiburz range, whose peaks in many cases rise to a height of over 12,000 ft., culminating in Mt. Demavend, a dormant or extinct volcano, which has an altitude of over 18,500 ft. This range continues on the E. flank, where it is known as the Ala-Dagh, and varies from 8,000 to 10,000 ft. above sea level, with many valleys interspersed; it joins the Paropamisan (Paropamisus) range in Afghanistan. This great range sweeping from the Caucasus to Baluchistan (1100 m.) was known to the ancients as the Zagros. Numerous parallel ranges in the N.W. trend in a S.E. direction towards Baluchistan, the highest peaks (11,000 ft.) being in the Bakhtiyari dist. The S.W. portion of the country is fairly level and fertile, producing fruit in abundance, excellent wine, and mulberries; also pistachio nuts, dates, and trees which produce mastic. Although there are many rivs. of considerable size when in flood, very few of them are navigable; some dry up in the summer, and, owing to the shifting sand, blown by the terrific wind storms, sifting up their beds, they change their course in the winter, when the freshets come down from the mts. The Karun is the prin. riv.

At the N.W. extremity of the Zagros range the peaks are grouped round the great salt lake of Reza'ye (or Urmieh), the area of which varies from 1700 to 2300 sq. m. at various times of the year. This lake is the centre of a drainage area of 20,000 sq. m., one of the most fertile regions of P.; silk, cotton, rice, tobacco, melons, grapes, and fruit of many kinds are grown here, and the mineral wealth includes gold, copper, lead, iron, and oil. There are numerous other smaller salt

lakes, some of which are fringed with swamps. Owing to its comparatively high fertility the countryside of the prov. of Azerbaijan gives the impression of being more thickly covered with vegetation than other parts of P., excepting the shores of the Caspian Sea. Further S. the appearance of the land begins to change. Instead of wooded slopes there is bare and rugged mt. scenery and the prevailing colour is grey with huge outcrops of slate, forming part of a fanged mass of rock. Towards the W. the hills slope away towards the plains of Iraq. After crossing the valley of the Abe-dez R., which flows into the Karun R. and eventually therefore joins the Tigris and Euphrates, the highest point of P. is reached, the huge snow-capped Zard Kuh or Yellow Mts. of Lorestan (11,000-14,000 ft.), a region which attracts few but the hardy Lori tribesmen. Roads here are scarce and the surface structure of the landscape is fantastically broken and jagged, weathering having apparently had very little effect on the rock formations. The colour of the rocks varies from grey and whitish-grey to the reddish-ochre of the *gach* or sandstone of the S. hills. Permanent vegetation is almost unknown, and in the rainless summer the rocks are hot and lifeless; but in spring, after the autumn and winter rains, the scene changes to a mass of luxuriant grass, wild scarlet poppies, and other flowers. Here the summer temp. is 120° F.; yet man and beast contrive to live on a bare subsistence level. Mt. sheep, wolves, jackals, hyenas, and even bears and leopards, are found here, besides the meagre-looking cattle and sheep of the Lori and Bakhtiyari tribesmen. These tribesmen are notable for their fine physique and independent outlook born of their harsh existence. Only in recent years have they gradually abandoned raiding for settled agriculture. The triangular shaped piece of ter. cut off by the edge of the mts., the Iraq frontier, and the Persian Gulf, is a flat alluvial plain, watered by the Karun R., on which gazelle and game birds abound. This area (including the Bakhtiyari Mts.) was once the heart of the Persian Empire, as may be inferred from the ruins of palaces and abandoned irrigation trenches. The inhab. mainly Arab, are here poverty-stricken and dwell in mud vils., on scanty crops. The discovery of oil in the mts. and the Abadan refinery have, however, restored a measure of importance to this part of the country, while a railway has given to Ahwaz once more the dignity of a trade centre. The E. slopes of the Zagros range are far less abrupt than the Zard Kuh and form part of a great plateau extending as far as Afghanistan. The strip nearest the mts. is very fertile and in it are Kashan, Kerman, and the holy cities of Yazd and Kumm. Some of these tns. now have modern carpet or other factories; copper, opium, and tobacco are its chief products; lead and silver are also mined. Here too is Isfahan (or Istahan), the old cap., whose gardens are famous. Yazd and Kerman are further

to the S.E. and in less fertile country. Teheran (or Tehran) lies on this plain near the junction of the two main ranges of P., the Zagros and the Elburz, which latter forms a wall along the low-lying coast of the Caspian. The S. slopes of these mts., like those of the central ranges, are rocky, bare, and rainless. But on the other side of the passes the country changes to a fertile land of high rainfall, its whole appearance not unlike the Eng. countryside, apart from some terraced rice-fields. Most of the timber of P. comes from the Elburz forests of oak, elm, ash, beech, willow, and cypress.

summers warm. On the plains and coast lands the heat is almost unbearable in summer, while biting cold winds prevail in the winter. Ispahan, which lies at an altitude of 5000 ft., is cooler than Teheran (3800 ft.), whose ann. mean temp. is about 60°, fluctuating between 110° in summer and 3° in winter. The rainfall is scanty and very irregular. At Bushire, on the Persian Gulf, about 12 in. of rain fall annually, mainly in Nov. The average rainfall may be put at 9½ in.

AREA, POPULATION, ETC.—According to the most reliable sources, the country has an area of 623,000 sq. m., and extends

PERSIA: KURASHAN WILDERNESS

E V 4.

In these forests are found many wild carnivora—including bears, wolves, leopards, and sometimes tigers. Between the two arms of the Elburz range lies the Dasht-i-Kavir, the Great Desert of P., a barren area of 150,000 sq. m. or nearly one-quarter of the total area of P., with an average elevation of 2000 ft. Date palms are grown in a few cases. Such little water as exists drains into salt swamps but dries up in summer. In the N.E. is a fertile strip of country on the edge of the desert, on which lies Meshed, the holy city of P. The S.E. extension of the desert is known as the Dasht-i-Lut or Salt Sea, with an average elevation of 1000 ft. Along the seashore of the Caspian are grown such exotic products as dates, sugar-cane, and opium. The temp. here is high in summer and malaria occurs. The only tns. here of any size are Bushire and, further inland, Shiraz.

The climate varies with the elevation. In the N. and mountainous parts the winters are exceedingly severe, but the

about 900 m. from E. to W., and 700 m. from N. to S., with a p.p. of some 15,000,000, of whom 3,000,000 are nomads. P. is divided into ten provs. (*ostan*), each under a governor-general. These are subdivided into a total of forty-nine covs. (*shahrestan*), centred on some important tn., with a governor in each; further sub-divs. are municipalities (*bakhsh*) and rural dists. (*dehستان*). Teheran, a walled city, 11 m. in circumference, is the cap., and the pop. with the dist. is 699,000. Other large cities are Tabriz (214,000), Ispahan (205,000), Meshed (176,000), Shiraz (129,000), Resht (122,000), Hamadan (104,000), Kermanshah (89,000), Ardebil (63,000), Yazd (60,000), Kazvin (60,000), Sul'zabad (55,000), Kerman (50,000), Ka'an (4,000), Abadan (40,000), Pallevi (37,000), and Ahwaz, Karamshahr, Babul, and Kum, with pops. of about 30,000.

DIPOSIERS, PRODUCE, ETC.—P. is rich in mineral deposits, which include gold, silver, lead, copper, antimony, nickel,

cobalt, zinc, manganese, borax, ochre, iron, and coal; but the scarcity of water and fuel, combined with the bad roads and the great distance from the ports, has prevented their exploitation to any considerable extent. Salt pits are numerous, and oil is being obtained from wells in the N.W. provs. The country is noted for its turquoises and other precious stones, the former being worked at Nishapur. The chief productions are wheat, barley, rice, gum, fruit, drugs, silk, cotton, and wool. Native industries are mainly of the handicraft class. Persian carpets are famous and the old methods of manu. are still maintained. Isfahan is the centre for metal work, embroidery, lacquer, and wood-carving. Shiraz is the centre for wines and Hamadan for blue-glazed earthenware. Fabrics and textiles of many kinds (including silk brocade, gold tissues, gold velvet, and silk mixed with goat's hair) are made at sev. places, and modern methods are displacing handicraft. There are cotton mills at Shahi (12,000 spindles), Yazd, Isfahan, Bandar Abbas, Kerman, Tabriz, and Teheran. There are also silk, wool, and beet and cane-sugar factories. Yet other industries include jute mills, leather goods factories, and vegetable oil refineries. The heavy industries include shipbuilding at Pahlevi (formerly Enzeli), iron foundries and blast furnaces at Mazanderan, aircraft, and munition factories. Coal-mines are worked at Zirab and Elburz, iron at Semnan, and copper at Abasabad. Chemical products are also being made in increasing quantities, notably glycerin and tar products. Oil, of course, is still the leading industry, but inasmuch as the Persian Gov. has been allowed little part in its development, they have been somewhat unwilling to give the industry its due measure of recognition. The refinery at Abadan is one of the largest in the world. Persian requirements are supplied by the refinery at Kermanshah. On the Caspian the chief port is now Bandar Shah, the terminus of the railway, where there is a jetty 1 m. long. Pahlevi is, however, still important for the trade with Russia and there are other smaller ports, Bandar Gaz, Mashhadar, Noshahr, and Astara on the Persian-Russian frontier and Lingah on the Persian Gulf. P. has a small merchant fleet, but most of the shipping is in Russian hands. Imports for 1946-7 were valued at \$26,139,000 and exports at \$53,189,000.

**COMMUNICATIONS.**—Trade routes between E. and W. have since early times passed through P., but only in late years have railways been built to any extent. The Trans-Iranian Railway (total length 865 m.) from Bandar Shah, on the Caspian Sea, to Bandar Shapur, on the Persian Gulf, was officially inaugurated in 1938, the cost being \$30,000,000. The line runs through Teheran and opens up the fertile prov. of Mazanderan. A branch line was carried to Meshed in May 1941; new lines are being constructed from Teheran to Tabriz, from Semnan to Meshed, and from Qum to Yazd. As a fact the original

plans were designed to link up Russian and Indian systems and the Trans-European, Iraqi, and Iranian systems, and it was a great disappointment to the great powers when Riza Shah decided to plan his railway with purely national ends in view. Yet, actually, the line follows very closely a route suggested twenty years earlier, and surveyed in part by Brit. engineers. After crossing the Karun, the line begins to climb rapidly and, after Andimeshk, twists in spectacular manner for about 100 m., reaching its highest point in a pass over 7200 ft. up; in this section alone there are 127 tunnels, one over 1½ m. long. The anc. caravan routes have been improved, and motor roads run between the chief tns. The 117 km. from Teheran to Qum was asphalted in 1947. Aerial transport was instituted in 1926, and before the Second World War was practically monopolised by the Ger. Junkers firm. Brit. Overseas Airways operates a line from London to Teheran by way of Rome and Lydda. In 1932 the concession granted to Junkers for the monopoly of the air mail and passenger services was cancelled and the Persian Gov., in 1937, organised its own regular services to Bagdad via Kermanshah and to Bushire. Iranian Airways operates a line to Paris, as does Air France via Beirut. There are numerous aerodromes, but many are in a poor state of repair. The most important are those near Teheran, at Ghazvin (opposite Pahlevi), Tabriz, Meshed, Hamadan, Kermanshah, Isfahan, Bushire, and Shiraz. The Anglo-Persian Oil Company runs its own fleet of planes, with good aerodromes at Abadan and elsewhere on the oil-fields. The telegraph system covers about 11,300 m.: telephones are controlled by sev. small companies but principally by the Société Anonyme de Téléphones, Persia. There are also stations for wireless telegraphy. The Teheran broadcasting station was opened in 1910, the first of a network to be distributed over the whole country.

**GOVERNMENT.**—Various minor alterations have taken place in the constitution and gov. of P. since 1906, and the administration is at present carried on by a Cabinet of fourteen ministers. The Kajar dynasty, having been in existence since 1779, ended in 1926, when the Pahlevi dynasty was introduced by Riza Shah. The latter abdicated in 1941 and, in 1944, being succeeded by his son, Mohammed Riza Pahlevi. The constitution estab. a national assembly, an elective body which numbers 136 members, which remains in office for two years and is not affected by changes of gov. The franchise is extended to all adult males, but as there are no political parties elections arouse no great interest and candidates are judged mainly on their personal merits. The assembly is really an advisory body in principle; all legislation is initiated by the gov. depts., and submitted to an appropriate committee of the assembly and finally sent to the shah for signature. In practice the deputies do little more than confirm the decisions of

the shah promulgated through ministers. The executive functions are entirely separated from the legislature. Besides the Cabinet there is also a Ministry of Court, concerned with the management of the households of the shah and the crown prince. The constitution also provides for an upper House of some thirty members appointed by the shah and thirty elected by the voters. In practice this body only meets when for some reason the assembly could not be convened.

**DEFENCE.**—The army's peacetime strength is about 90,000, consisting of twelve divs. of all arms, and one cavalry brigade, and its wartime strength is probably three or four times this figure. The regular army is supported by a fairly comprehensive system of conscription. The main garrisons are at Teheran and Ahwaz. Artillery forms a large part of its armament. In 1941 the army had 100 Skoda tanks and some other modern weapons. The small air force (attached to the army) numbered (1941) four squadrons totalling about 200 machines, mostly Brit.-built. There are three flying schools at Ahwaz and Meshed. Ger. influence in army training was noticeable before 1941. The gendarmes consist of about 21,000 men. In thirteen regiments organised territorially; it is in process of reorganisation. There are U.S. military missions attached to it, and to the army. The navy consisted in 1941 of two gunboats with 1-in. guns (one was sunk on Aug. 27, 1941) and four sloops with 2-in. guns and two anti-aircraft guns. A few conscripts, mostly Arabs, are taken into the navy. The cost of the services is about £2,000,000 annually.

**JURISPRUDENCE.**—Persian law is founded on the Code Napoléon and the judicial system is also based on that of France. The old *Shari'ah* law was replaced by civil and criminal codes, based on Fr. law, in 1927-1928, but in 1939 a new penal code, based on the It. model, was introduced. The highest court is situated at Teheran, and a minister of justice superintends the administration of justice. The hierarchy of justice is built up on the summary courts; above these are the co. courts and the appeal or prov. courts. In 1928 P. formally announced the abolition of the Capitulations (q.v.).

**RELIGION AND EDUCATION.**—The religion of the country is Mohammedanism, of the Shi'ah sect, which is embraced by 7,500,000 of the inhab., while 850,000 belong to the Sunni sect, the remainder being Armenians, Jews, Parsees, and Nestorians. There is a small number of those who preserve the anct. Zoroastrian beliefs. The power of the Persian priesthood has disappeared in recent years, owing to the enhanced power of the central gov. The highest authority, the chief priest, is the leading *mullahid*, who resides at Najaf or Kerbela, near Bagdad. Some consider him the vice-regent of the Prophet Mohammed, the representative of the Imâm. All mosques and shrines have endowments (*waqf*), which are now administered by the Ministry of Public Instruction and devoted to charitable

institutions. The shrines of some cherished saints are so lavishly endowed as to maintain an immense staff of priests, servants, and dependants.

Education in recent years has made rapid progress; the old system of instruction, generally religious, has been entirely changed in favour of schools on European lines. Official schools are subsidised by the gov.; foreign schools are maintained by missions. In 1940 there were 8200 schools of all kinds (as compared with 512 in 1922) with nearly 500,000 pupils and 13,600 teachers. Of these 1316 were state primary and 200 secondary and higher schools, the remainder being 'private' institutions. The general trend of educational reorganisation under the gov. of Riza Shah Pahlavi was to bring all education under direct state control, and non-state schools are subjected to many restrictions and their teachers must have the qualifications required of state teachers. Foreign schools may not take primary pupils of Persian nationality. Kindergarten schools are part of the national system (ages 4-7). At the age of seven the child comes under the compulsory scheme and enters a primary school (7-13). Secondary education is not compulsory. Like primary, the course is for six years, after which entrance to the univ. is possible. Education in many branches of art and science is given at Teheran Univ. (founded on Feb. 5, 1935). Students come to this univ. from all over P., and also from Iraq, Istanbul, India, and Russia. Primary importance is attached to the faculties of medicine and industry. The Anglo-Iranian Oil Company has sent a number of Iranian students to England for technical training. Many Iranians, prominent in public life, studied at the Amer. univ. of Beirut. The Higher Teachers' College in Teheran supplies most of the secondary teachers. Women students were admitted on equal terms after the 'emancipation' of 1936. There is also a Teheran college of art, various technical colleges under appropriate ministries, and a girls' technical school, also in Teheran. In P.'s modern educational system comparatively little importance is attached to religious instruction, and a great deal to ethics particularly of citizenship and patriotism.

**FINANCE.**—The revenue is derived mainly from land tax, crown lands, customs duties, and from monopolies of sugar, opium, matches, tea, and tobacco. The oil royalties are kept separate from the general revenue. Gov. expenditure has risen very considerably between 1924 and 1942, and with it taxation and the cost of living. Thus in 1923-24 budget revenue was only £5,250,000 and expenditure £5,500,000; in 1941-42 the totals were respectively £39,000,000 and £38,800,000. The biggest item of expenditure in recent years is accounted for by roads and the railway. The Persian rial was tied to the Amer. dollar in 1939.

**ANTIQUITIES.**—P. contains the ruins of many cities which were of great importance in anct. times. Ecbatana, once a

city of great splendour, and the Median cap., was the summer residence of the Persian rulers. It is now a shapeless mound, near which is built the modern tn. of Hamadan. Persepolis (q.v.) in the plain of Mervdasht is known to the Persians as the throne of Jamshid. Here the great terraces are covered with bas-reliefs, remains of palaces, and Zoroastrian fire-temples. The house of Darius and the house of Xerxes stood here, the hall of a hundred columns, fired by Alexander, once lifted its roofs of cedar; pillars without roofs and human-headed bulls are in

at a prehistoric site near Rezaiyyeh in Azerbaijan revealed a stratified sequence of material, chiefly pottery, dating from the beginning of the third millennium to about 1000 B.C. A number of previously unknown types were found, as well as varieties similar to the earliest material found at Cr. in the Aegean, and in Minoan Crete.

**DYNASTIES.—Pre-Islamic:** The Achæmenids, 559-331 B.C.; the Seleucids, 323 B.C.—A.D. 129; the Parthians, 248 B.C.—A.D. 226; the Sassanians, A.D. 226-641. **Islamic:** The Caliphs of Damascus, 661-750; the Caliphs of Bagdad, 750-1258;

SASSANIAN GRAVE TOWER, VARAMIN

INA

existence, the site having been a ruin for 2000 years. In sev. places are rock-hewn tombs. Perhaps the best examples are at Naksh-e Rostum, covered with carvings and reliefs. The remains of Pasargade, the cap. of Cyrus, are interesting. The tomb of Cyrus lies at no great distance, resembling a small Gk. temple, now in ruins. Inscriptions carved on rocks are plentiful, and Rom. remains are scattered all over the country. At Behistun, E. of Kermanshah is a ridge of rock carved with the inscription of Darius the Great; this inscription gave us the key to cuneiform writing, deciphered by Sir Henry Rawlinson. The mounds of rubbish that mark the site of Shapur, the cap. of the Sassanian dynasty, contain sev. fine rock sculptures, and on one side of the valley is a cave containing a ruined statue of Shapur, one of the few statues discovered in P. Excavations during 1918

the Samanids, 874-999; the Buwayhids, 932-1056; the Ghaznavids, 962-1186; the Seljuks, 1037-1300; the Khwarazmshahs, 1077-1220; the Mongol Il-Khans of P., 1258-1336; the Jalayirs (Iraq), 1336-1411; the Mazaffarids (Fars, Kerman), 1313-93; the Karts (Herat), 1241-1389; the Sarbadars (Khurasan), 1337-81; Tamerlane and the Timurids, 1369-1500; the Kara-Koyunlu or Black Sheep, 1378-1469; the Ak-Koyunlu or White Sheep, 1378-1502; the Safavids, 1502-1736; the Afghans, 1722-29; the Zends, 1750-94; the Kajars, 1770-1926. **Pahlavi, 1926.**

**HISTORY.**—The origin of the inhab. of Iran is wrapped in legend. That they were Aryans, but at what date they migrated to the plains of Iran from the E., it is difficult to state. They were closely related to the Indians, with whom they must have previously formed a single people known as Arya. It appears that

these people made a movement westward about 1700 B.C.; they introduced the horse into W. Asia, where it was previously unknown. There are records of Shalmaneser II., the Assyrian king, battling with the Medes in 836 B.C., and of Sargon gaining tribute from Median princes whose names are unmistakably Iranian. These people were divided into sev. tribes, the prin. being the Medes in the N.W., the Persians in the S., and the Parthians in Khorassan, the Bactrians on the N. line of the Hindu-Kush. The beginning of the Median monarchy probably goes back no further than 650 B.C., about which time the Medes threw off the yoke of Assyria. The first king whose name we know is Phraortes, probably the first independent king of Media. In 553 B.C. the Persian Cyrus of the Achaemenids dynasty, king of Anshan in Elam, defeated the Medes, obtained their cap. Ecbatana, and took Astyages, king of the Medes, prisoner. Cyrus combined the two tribes and founded the nation of P. His disregard for the treaties made by Media with other nations caused a coalition to be formed against him. Nabonidus of Babylon, Croesus of Lydia, the Spartans, and Amasis of Egypt, co'nt. to attack him. Croesus was defeated at Pteria in Cappadocia and driven back to Lydia. The victorious Persians continued to defeat all their enemies. Sardis fell next, then the Gk. littoral tns., the Carians and Lycians followed, and then Cyrus conquered Babylon and destroyed the Chaldean Empire. He d. in a war against the E. nomads, 528 B.C.

His son Cambyses succeeded him. He had little of the genius of his father. His cruelty was abominable, and his habits could only have been those of one half insane. His brother Smerdis was murdered secretly on suspicion of conspiring against him. This deed caused numerous insurrections that were brutally crushed by Cambyses' relative, the Gen. Darius. In 525 B.C. Cambyses conquered Egypt, but his expeditions against the Ethiopian kingdom of Napata and Meroe, and against Carthage, failed. He d. in 522 B.C., and left no heir.

Darius I. (521-485 B.C.) succeeded him. He was a member of the noble family of Achaemenids. Having organised his empire on broad lines he enlarged the boundaries of P. as far eastward as the Indus. He then marched N. into Russia, but found the climate impossible for his soldiers. Darius next invaded Greece (see GREECE, *History*), but his army of some 50,000 men was defeated on the plains of Marathon.

At his death (485 B.C.) his son Xerxes succeeded to the throne. He continued the war against Greece but was defeated at Salamis (480) and finally at Plataea in the following year. A period of decadence followed. Xerxes was murdered by his vizier, Artabanus, who attempted to seize the throne (465). Artaxerxes I. succeeded him (465-425), followed by Xerxes II. (425-424), both weak and amiable potentates, with little influence. Darius II. (424-404) was a man of dif-

ferent temper, and an inhumanly cruel tyrant. His wife, Parysatis, is said to have surpassed him in bloodthirsty cruelty. Artaxerxes II. (404-359) was a ruler of weak character. He was succeeded by Artaxerxes III. (Ochus) (359-338). This king was remarkable for his ruthlessness. Every revolt was crushed with great brutality, but he succeeded in uniting the empire once more and in restoring a certain amount of greatness to Persia.

The last king of the Achaemenian dynasty was Darius III. (336-331). He was defeated by Alexander the Great at Issus and assassinated, and P. became a part of the Macedonian Empire. Alexander's early death in 323 B.C. prevented complete order being restored to P., and fierce strife commenced at once among the generals for the possession of the empire. Seleucus managed to seize Babylon and its prov., and founded the Seleucid dynasty. He subdued the whole of Persia as far as the Indus. In 301, at the battle of Ipsus, he won Syria and the E. portion of Asia Minor.

A confusion of names of leaders and chiefs follows. Chief among the monarchs of Parthia was Mithridates the Great (171-138). He conquered Media and Elam, and seized the kingdom of Armenia. His son, Phraates II., added Margiana to his kingdom and defeated Antiochus VII. of Syria. Phraates III., who allied himself with Pompey, was murdered (57 B.C.), and his sons, Mithridates III. and Orodes I., fought for the succession. The former died and Orodes became king. He took the met. Achaemenian title of king of kings. (For his famous defeat of the Romans, see ROMAN.) His son, Phraates, murdered him and became king. This man moved his cap. to Ctesiphon, which remained the seat of government till the Muslim conquest. Mark Antony invaded Parthia in 33 B.C., anxious to avenge Crassus, slain by Orodes at Carrhae, but was forced to retreat to Armenia with the loss of 30,000 men. Rome now ceased to trouble the Parthian and Persian ter. and the lack of a formidable enemy to unite these people became the cause of P.'s undoing through revolts and civil wars.

During the reign of Artabanus IV. (A.D. 209-26) the satrap Artashir revolted and defeated Artabanus in three great battles (A.D. 226); took possession of Ctesiphon, and assumed the title of king of kings of the Persians. He was the founder of the Sassanian dynasty. He restored the religion of Zoroaster, and the Magi became the great influence in the country. His son, Shapur I., succeeded him (240-273); he defeated the Romans at Edessa, taking the Emperor Valerian prisoner (A.D. 260). During his reign the unfortunate Mani f.uled his new cult (see MANICHEISM). After Shapur's death sev. incapable kings followed. Khosro Parvez, 'the Conqueror,' succeeded in 590. He carried his arms to the gates of Constantinople, where he was defeated by the Emperor Heraclius (617). He was

finally murdered by his nobles, led by his well-loved son, Siroes.

With the accession of Yazdigird III. (634), grandson of Khosru II., peace was finally concluded with Rome. But a more dangerous foe was rapidly advancing upon P., fierce with religious enthusiasm. The Arabs defeated the Persians in the battle of Kadiyaya (636). The conquerors forced their faith on the Persians, and Zoroastrianism was almost stamped out everywhere except in Yazd and Kerman, which still remain the waning strongholds of the faith. P. finally became a part of the dominions of the caliphs, and was governed first from Medina, and afterwards from Bagdad. The coinage became Muslim, and Arabic was used as the official language of the country. One caliph of little importance succeeded another until the reign of Mahmud (971-1030), the son of Sabuktigin. His love of learning brought cultured men to Ghazni. Firdausi wrote his patriotic epic, *The Book of Kings*, during his rule. His successful wars against surrounding tribes and his invasions of India have made him famous. His descendants retained a certain amount of authority until the Seljuks seized Khorassan (1055).

These Turks were the founders of the Ottoman Empire. Togrul the Seljuk was the first of the dynasty, and for the first time since the Arab conquest one real authority ruled P. Alp Arslan succeeded him, followed by his son, Malik-Shah. His Prime Minister was Nizam-ul-Mulk, famous to us as the friend of the poet Omar Khayyam. In the thirteenth century the Mongols invaded P. and the Persian caliphate ended. Sev. Mongol rulers succeeded and these in their turn were conquered and swept away by Timur the Lame (Tamerlane) (q.v.) (1355-1504), who with his hordes of Tatars overran P. and invaded India. P. became merely a proxy of his Asiatic empire. In 1499 Ismail, ruler of the tn. of Ardabil, descended from the Sassanian dynasty, raised an army, and seized the throne. The Persians were ready to follow him and drive out the Tatars, not only because he was descended from the Sassanians, but because he was a Shah and a descendant from Ali, the son-in-law of the Prophet. The divinto Sunnites, or Sunnis, and Shahs had arisen after the death of Mohammed, the Sunnis upholding the Caliph Abu-Bekr as the rightful successor of the Prophet, he being the Prophet's friend and father-in-law, and the Shahs regarding him as a usurper, and Ali, the son-in-law of Mohammed, as the lawful successor. In 1499 Ismail was proclaimed the founder of the Safavi dynasty. His fourth and greatest successor was Shah Abbas. After the centuries of misery and conflict his rule, from 1586 to 1628, appeared as the 'golden age.' To-day every good building or every road or bridge is attributed to him. At his death feeble and inefficient men succeeded him. In 1722 the Afghans invaded the country and dethroned Husain. A Persian robber chief, Nadir Shah (q.v.), defeated and drove

out the Afghans. Nadir became ambitious and, dethroning the young son of Husam (1732), seized the throne and led his conquering armies through Afghanistan into India, where he sacked Delhi. He was murdered in 1747. (Till wars followed till Karim Khan (1759-1779) became king and founded the Zend dynasty, making Shiraz his cap. The last of the Zend dynasty was Lutf Ali Khan. Agha Mohammed Khan, a Kajar chieftain, attacked Lutf Ali, and at length conquered and seized the throne. Lutf Ali was tortured to death, the city of Kerman was the scene of a massacre, and Mohammed Khan demanded 70,000 pairs of eyes to satisfy his lust of cruelty. They were brought to him on plates. He was murdered (1797) by his own attendants, and succeeded by his nephew, Fath Ali Shah, in 1798.

Russia was encroaching, and Fath Ali engaged in a war with that country and lost his Circassian provs. His successor, Mohammed Shah, was not an able monarch. He left the throne to his son, Nasiruddin (or Nasr-ed-Din) Shah (1848), famous as the first shah to visit Europe. This man, by trying to take heat from the Afghans, became involved in a war with England (1836). The Eng. seized Bushire and defeated the army of the Shah. After the Shah's first visit to Europe (1874) he granted a concession to the Indo-European Telegraph Company. The Imperial Bank of P. was also founded, under Brit. management. The shah was murdered (1896) by a tradesman of Kerman. His successor was Mazaflaruddin Shah, a younger son of Nasr-ed-Din. He was a good-natured man, in delicate health, and possessed with the idea of being absolute monarch. The people, however, were beginning to feel the need for progress and freedom. The birth of the Russian Duma was watched with interest and in 1906 the shah granted his subjects a constitution. He died in 1907, and was succeeded by his son, Mohammed Ali Shah. He swore to uphold the constitution; but, refusing to believe his country was struggling towards W. progress, he bombarded his Parliament by way of getting rid of it. He was urged by both Brit. and Russian representatives to uphold his constitution, but he apparently could not grasp the situation, and in July 1909 he was deposed. His son, a boy of eleven, was elected in his stead. This child, Sultan Ahmed Shah, ascended the throne in 1909, but was not crowned until five years later. In 1911 Mohammed Ali, the ex-shah, returned to P., and attempted to reclaim his throne, but was defeated. Russian and Brit. interference still continued in P. Financial difficulties increased, and in 1911 the Cabinet (Democrat) invited Amer. financiers under Morgan Shuster to visit P. Little was accomplished, as Russia opposed Shuster's reforms. Meanwhile Salur-u-Dola, brother of the ex-shah, caused intermittent trouble by plundering and fighting. In 1912 he occupied Kurdistan and threatened Hamadan, but was defeated, and eventually expelled from the

country. During the First World War he was arrested in Transcaspiya by the Brit. when about to attempt the throne once more. The regent returned to P. in 1914 to the coronation of the young shah, but left P. again immediately. On the outbreak of the First World War P. was in a miserable condition, and proclaimed strict neutrality, but this was departed from many times and variously by herself, the Central Powers, and the Entente. The year 1914 found the Russian forces, including the Cossacks, in P. numbering 8000, and the Persian gendarmerie 7000. The Persian Gov. troops, whose officers only wore Persian at this time, were useless, and only assisted with robberies and blackmail. In Jan. 1915 Russo-Turkish operations took place in Azerbaijan. These were followed by fighting at Ahwaz, in which the Brit. opposed the Turks in order to save the pipe-line carrying oil from Madan-i-Naftun to Abadan. In the Middle E. Ger. influence was prevalent, and in 1915 further fighting took place near Mashila. In Oct. 1915 the Brit. Consulate and the whole Brit. colony were forced to surrender. In Nov. the frightened shah wished to join the Central Powers. Luc was persuaded to remain neutral by Farman Fama. In E. P. Russian and Brit. defences were organised to prevent Germany from entering Afghanistan or Baluchistan, but such an attempt was made before the cordon was completed. In 1916 a struggle between the Russians and the Turks took place in W. P., and in that year a Persian force, the S. Persian Rifles, was organised by the Brit. In Nov. 1916 the Brit. took over the gendarmerie force, and many miles of route suitable for camel and light-car traffic were built or repaired. In June 1917 the Cabinet of Vusugh-u-Dona fell, and a new cabinet hostile to the Brit., under Ala-u-Saltana, was formed. In the spring of 1917 the Russian troops were successful against the Turks in W. P. In March Bagdad was occupied, but this was followed by the collapse of the Russian constitution. Russian troops withdrew, leaving the whole country to the Brit., with the Persians outwardly neutral. The new Soviet republic of Azerbaijan was formed, with Baku as its cap. Brit. troops marched from India via Baluchistan to Kurasan, while other Brit. troops occupied N.W. P., holding Baku for a short time. In 1918 Britain had complete possession of the country, and in 1919 was about to assume the protectorate of P., but the Persian nationalists, with Soviet encouragement, refused this. The Brit. withdrew and P. regained complete independence. Ministries rose and fell, until finally the Sipahdar Azami, who was then Premier, was ousted in 1921 by a military *coup d'état*, organised by Riza Khan, colonel of the Persian Cossacks. The Cossack regime was accepted by the shah, and was pro-Brit., relations with England improving. Later P. became anti-Brit. owing to conflict with the Iraq Gov. At length Riza Khan, who had been minister of war through

six successive govts., became Premier in 1923. He suppressed a republican movement as well as a revolt of the sheikh of Mohammerah. A commercial treaty with Russia was signed on Aug. 11, 1924. The movement against the shah, who resided in France, made headway during 1925; he was deposed, and the Kajar dynasty came to an end. A new constituent assembly was elected and Riza Khan was elected shah by 257 votes to three. He accepted the throne on Dec. 16, 1925, and was formally crowned as Riza Shah Pahlavi on April 25, 1926. In the same month elections for the new Majlis were held. A revolution to restore the Kajar dynasty was suppressed in Oct. In internal affairs the nominal pacification of the tribes was completed in 1925, by the use of force combined with a true remedying of grievances (e.g. the dismissal of corrupt officials) and a policy of settlement. This latter was achieved by the construction of roads and the building of wells in the Bakhtiyari, Khorrambad, and Kurdistan dists., in which the nomads were induced to live. This policy has not been without good results, though outbreaks have since occurred (as recently as 1937) and isolated acts of brigandage are not unknown in the remoter parts. Shah Riza, once firmly estab., used his power largely to enrich himself at the expense of his subjects, and he also sought to strengthen his own position by crushing out of existence all powerful semi-independent Persian magnates, including the sheikh of Mohammerah, who had been firm friends of the Brit. during the war. There were signs of material progress in P. during the regime of Shah Riza but they tended only to obscure the mental retrogression of the people due to the fact that when by 1912 Riza had at length abdicated a whole generation of Persians had been suppressed morally and intellectually. Doubtless, in that period, women had forsaken the veil; new hospitals had extended the work of the Brit. and Amer. missionaries; labour laws had improved the condition of the workers; a new unit, had been founded and the educational system reorganised; and a Persian national bank had been created. But a succession of puppet govts. had included only second-rate ministers content to yield to their ruler's every wish. The Parliament had become a negligible factor, for the shah decided who should be members and what legislation should be enacted. The press, strictly controlled, sold their advocacy to the highest bidder after the abdication.

In foreign affairs P. vacillated between friendship with Great Britain and with Russia. Friction with Great Britain was ended by a treaty recognising the Persian decision to abolish capitulations, abrogated on May 19, 1928. In Sept. 1928 P. was made a permanent member of the League of Nations. Not until 1929 did the Brit. Gov. induce P. to recognise the Iraq Gov., but relations between Great Britain and P. again became strained, as P. claimed the is. of Bahrain, then under Brit. protection. In May

1929 the Russian-Persian frontier was shaken by an earthquake, causing death to over 3000 persons and destroying eighty vils. A second earthquake in the following year caused further considerable loss of life. In April 1930 the currency was altered from a silver to a gold basis, the silver *kran* being replaced by the gold *rial*. A Ger.-Persian treaty of friendship was ratified in Dec. 1930.

A dispute with the Anglo-Persian Oil Company over royalties ended in the Persian Gov. cancelling the D'Arcy concession. The Brit. Gov., after making a show of naval force in the Persian Gulf, eventually arrived at an amicable settlement with P. and a new concession was ratified in 1933, valid for sixty years. Despite regulating treaties, Soviet economic penetration has continued steadily and from 1936 Russian engineers and technicians poured into the country. Disputes arose in 1939 but, on March 25, 1940, a new commercial treaty was signed covering agriculture, industry, and sea and rail traffic. Ger. infiltration was also on a large scale, notably in the control for a time of the air mail and passenger services. Ger. propaganda immediately before the Second World War and after its outbreak was intensified, but not to much practical purpose. Persian policy towards the blandishments of the W. powers was a combination of 'a plague on all your houses' and apprehension as to the possible outcome. In 1935 the Shatt-el-Arab, the common channel through which the Tigris and Euphrates drain into the Persian Gulf, became the subject of a frontier dispute with Iraq before the League of Nations, but was settled in 1937 by a compromise which recognised the old frontier, except opposite Abadan, the Shatt-el-Arab to remain open to all ships, commercial or war, of both parties. Two treaties, important in Near E. politics, were signed in 1937, one on July 12 between P. and Iraq providing legal machinery for settling disputes within the covenant of the League; the other, the Saadabad Treaty, on July 8, which brought together the four neighbours, Iraq, Turkey, Afghanistan, and P., in a mutual pact of friendship and non-aggression. Whether this pact was a triumph for Brit. or Russian diplomacy or neither must be left to future historians to decide. The marriage of the crown prince of P. to Fawzia, sister of Faronk, king of Egypt, in 1939, was perhaps a symbol of P.'s hopes of closer co-operation between the various Middle E. nations. The infiltration of Ger. nationals was an indication of Ger. hopes of carving out spheres of influence, but when the Second World War broke out, P. declared her neutrality, though the Persian Gov. would seem to have been impressed by the early Ger. victories and by Ger. pretensions to be fighting a holy war against Communism and, to some extent, by the suggestion that Germany would save P. from her old enemies, Britain and Russia. There is evidence that the Nazis were in touch with disaffected elements in P. and were planning a *coup d'état*.

*Anglo-Soviet Invasion of Persia.*—After the Brit. invasion and occupation of Syria, the Brit. and Russian Govs. turned their attention to the dangerous situation which was arising in P., through the large number (about 2000) of Ger. agents who occupied key positions in that country. Sev. times, in Aug. 1941, the two allied govts. requested the Iranian Gov. to send these agents out of P., a country whose safety was a vital interest of Great Britain and Russia alike, particularly by reason of Brit. interests in the Anglo-Persian oil-fields and of the proximity to P. of Russia's great oil-fields in the Caucasus. The danger was the more obvious from the pressure of the Ger. invading armies through the Ukraine and the possibility that, at any moment, Germany might, if thwarted in the Ukraine, attempt to force a passage to P. through Turkey (Anatolia). In many respects the situation in P. represented a return of the conditions which prevailed during the First World War when, as now, an important section of Persian public opinion regarded Germany in the light of a set-off of Russian influence in N., and Brit.-Indian influence in S., P.

During the diplomatic exchanges in Aug. 1941 the P. Gov. were slow to admit the danger. Faced with their vacillating reply and with the urgency of the problem, the Brit. and Russian Govs. decided to act without further delay. On Aug. 25, Brit. and Soviet forces crossed the Persian frontier, the operations on the Brit. side being under the direction of Gen. Sir Archibald Wavell, commander-in-chief in India, and the naval forces under Sir Geoffrey Arbuthnot, commander-in-chief, E. Indies station. Some opposition was encountered by the forces which were landed at Bandar Sappur, at the head of the Persian Gulf. The Brit. and Soviet authorities indicated that neither Britain nor Russia had any territorial design in P., and referred to the terms of the Atlantic Charter (*q.v.*) drafted by President Roosevelt and Mr. Winston Churchill, in confirmation of this policy. As an earnest of their intentions steps were taken to supply the people of P. with corn, food-stuff, and other essentials which Axis demands had seriously depleted in their country. The Persian forces consisted of about 150,000 men, fairly well trained and equipped, an armoured brigade, and some 200 aircraft. The Russians crossed the N. frontier and advanced in the direction of Ashkezar and Tabriz. The allied double advance continued on Aug. 26, and met with only perfunctory resistance. The Brit. and Indian troops, who crossed the frontier early on Aug. 25, consisted of two forces, one operating from the S., with Basra as its base, and the other taking as its starting-point Klianikin, 100 m. N.W. of Bagdad. The more northerly force passed through Quas-i-Sidrin and along the Kermanshah road, encountering but little opposition, though strong resistance was expected at the famous Pallak Pass. The head of the column, comprising Ghor-khas, had already met with some long-range machine-gun and rifle fire as it approached Quas-i-Shirin, but the

Persians soon melted away into the mts. to the N. Brit. hussars of an Indian armoured brigade crossed the frontier N. of Chosroes in a long procession of tanks and armoured cars, and, passing between Qasr-i-Shirin and Kermanshah, joined forces with the Ghirkhas and led a further advance towards the Paitak Pass. Another column crossing at Chosroes marched across country to the S.E. towards Gilan, whence they could threaten the rear of any Iranian forces attempting to hold the pass. Yet another column was sent out from Naft-i-Khana to occupy the oil wells. This operation was quickly completed against the opposition of a small Persian force. The inhab. manifested an entirely friendly attitude towards the advancing forces. The following day the Abadan oil installations were cleared of Persian troops and Brit. naval forces sank two Persian sloops and captured four gunboats and eight Axis vessels. The Russians captured Tabriz and a number of other tns. in the N. A Persian admiral was killed but the Allies suffered negligible casualties. The Persian Cabinet now resigned and a new gov. was formed under Ali Foroughi (or Farouhi), who told the Persian Parliament of his gov.'s decision to cease fighting. But although this decision of the Persian Gov. was welcome, the allied objects were not yet attained, and the double advance from N. and S. continued. The Brit. forces now reached and occupied Shahabad, having covered 100 m. of mountainous country in three days. The Russians occupied Urmia, in W. P., near the Turkish frontier and about 110 m. from the Caucasus. At the end of Aug. Persian envoys met the forward Brit. troops with the message that the shah had ordered his forces to cease hostilities. The Russian southward advance had now reached Dilman, W. of Lake Urmia. Two anti-tank guns captured by Brit. troops proved to be of the most recent Skoda (Austrian) manuf. The Brit. forces in the N. area continued to advance on Kermanshah along the same route followed by Dunsterforce in his advance on Haku twenty-three years previously. Throughout these operations the R.A.F. fighters played a prominent part by providing protection for forward troops and by dropping leaflets. Some thirteen Persian aircraft were destroyed.

On Sept. 10 the Persian Gov. accepted the Brit. and Soviet armistice terms. These included the closing of the Ger., It., Hungarian, and Rumanian legations, and the handing over to the Brit. and Soviet authorities of Ger. subjects. The terms also provided for the withdrawal of Persian troops from certain parts of the country. There were found to be in P. some 1600 Gers., a number having left before the invasion, and some of these made good their escape, while others were arrested by the Russians at Tabriz. Yet others were found at Isfahan, whither they had fled when they heard that the Russians had come as near Teheran as Kazvin. Among the Gers. were two who had been concerned in the Iraqi revolt

under Rashid Ali. The obligations which the Persian Gov. now undertook added but little to previously existing treaty obligations. But they included the promise of specific collaboration for the forwarding of war material, a useful provision enabling Britain and America to supply arms to Russia in the ensuing winter when access to that country would otherwise be possible only through Vladivostok. But the rounding up of Ger. and other Axis agents was obstructed at every turn by the shah and his chief of police and this involved them in difficulties with the Brit. and Russian Gvs. The shah was now fast losing any hold he might have still had on the sympathy of the Majlis and of the people, especially as it seemed clear that he had actually sent the greater part of the crown jewels, which are national property, out of the country, besides amassing a fortune of millions (some estimates put it at £9,000,000). He abdicated (Sept. 16) in favour of his son, Mohammed Reza (or Reza). His abdication was the sequel to his futile attempts to evade the terms of the agreement with Britain and Russia, and was forced upon him by Persians who had long been dissatisfied with the harshness and rapacity of his absolutist regime. The next day allied troops were on the outskirts of Teheran and the new shah began his reign with promises to amend past wrongs and to govern according to constitutional principles.

P. declared war on Germany on Sept. 9, 1913. After the Teheran Conference (Nov. 28) President Roosevelt, Marshal Stalin, and Mr. Churchill issued a declaration in which their three gvs. recognised Persian assistance, undertook to give P. economic aid where possible, and confirmed their desire for the maintenance of Persian independence, sovereignty, and territorial integrity. Relations between P. and Great Britain and the U.S.A. remained amicable throughout the following year and the legations of those two countries at Teheran were raised to the status of embassies. But friction with Russia arose in Oct. as a result of P.'s refusal to grant oil concessions in the N. of the country, a refusal supported by Britain and America. In April 1946 negotiations between Russia and P., conducted on the Persian side by the Premier Qavam-es Sultaneh, resulted in an agreement by Russia to evacuate all Persian ter. within a few weeks in consideration of exclusive rights during the succeeding fifty years to exploit the oil resources of N. P., and on P.'s side to carry through much needed reforms in the prov. of Azerbaijan (q.v.). The agreement left Qavam, who had succeeded Hakim as Premier, free to deal with the problem of Azerbaijan, which was loth to give up its newly won independence. Negotiations between Azerbaijan and P., however, were successfully concluded in June 1946 whereby the former became once more a prov. of P. but with a certain amount of autonomy. The governor-general was henceforth to be appointed by the central gov. and the local army was to come under the command of the Persian Army. The withdrawal

of Russian forces was completed by May 9 1916. In July Qavam enacted the first labour legislation in P. in the shape of a law which provided for compulsory arbitration in industrial disputes. Parl. elections were held however, in an atmosphere of unrest with Kurdish risings and a dispute with Russia over the oil concessions. The elections of Feb. 1947 ended with the return of all the democratic candidates including Qavam but at the same time there was widespread opposition to the holding of elections at all and the unrest became serious enough for martial law to be imposed. One of the prin. causa of div. in the country was the objection of all political parties to the agreement of April 1946 concerning concessions to Russia. The Majlis contended that the right to grant concessions was vested in them alone and that Qavam's notion was *ultra vires*. Though Qavam offered to resign he was re-elected Member by the Majlis but at first declined to accept office on the ground that all the Azerbaijan deputies had voted against him. Meanwhile notes came from Moscow accusing P. of violating the oil agreement. Qavam in reply admitted that his own previous discussions with the Soviet were null and void because a law of Dec. 1944 prohibited the granting of concessions to foreigners. None the less Qavam lost popular support because all the schemes for social reform of which there had been much talk during the year remained untouched. On Dec. 30 the Majlis passed a vote of no confidence in Qavam and soon afterwards Mohsen Ned Ibrahim Hakim became Premier. In Jan. the Majlis rejected the oil agreement in Jan. 1948. There was however continued unrest and Hakim resigned in June 1948 and was succeeded by Hajj foreign minister in the Qavam Cabinet of 1946-47 who was supported by the Democratic party led by Qavam. The extremist left wing (Futuhi) party was dissolved in Feb. 1949 after an attempt on the shah's life.

A seven-year plan for economic reconstruction costing £22,000,000 was proposed to be financed partly by oil royalties and partly by the Bank for World Reconstruction and Development and the U.S. Import Bank. The Shah visited America at the end of 1949.

**ART**—Persian art (date from 500 B.C. and the early period) shows many influences, particularly that of the Assyrians. Pre-Islamic art in Persia and its best achievement in architecture. (See under **ARCHITECTURE** *Persia* and above, **ARTS** *quarries*). Later, during the Islamic dynasties, fine work developed that of the twelfth and fifteenth centuries being particularly fine and formed an important part of architectural decoration.

The arts and crafts of the country have suffered greatly from the state of anarchy. The Persians have always been artistic by nature and many art forms have existed the secret of which has been forgotten through the years of civil war and trouble. Pottery and carpets are the greatest forms of Persian art. Persian pottery

is not so technically perfect as the Chinese but excels in its decoration and ornament. Rhagras (Ravy) bowls and vases are particularly beautiful. Ware made at Rhagras probably in the twelfth century is creamy white and has beautifully designed decorations of animals and figures sometimes in intense colours. Rhagras was also noted for lustre ware and tiles. The enamel work for which the Leshans were once famous is a lost art, many tiles jugs and basins of this work, exquisite in colour and beautiful pattern, have been preserved.

Carpets were of two kinds, *gelen*, or woven, and *quah*, or knotted. I almost

1. The drawing is not a photograph.

of Persian carpets date probably from the sixteenth century. The designs are many, including garden, hunting scenes, medallion patterns, flowers, and various designs. Animal forms are used a great deal in Persian carpet designs as also in all forms of Persian art. To day Persian carpets are made mostly by the nomads, and Sultanabad is the main centre. Persian textiles are important. Sassanian fabrics were very beautiful and were perhaps made by Syrian workmen. Early Islamic textiles were of formal design. Early Islamic textiles were of silk tissue with animal designs, while later a greater elegance in design was reached followed by the use of scrolls and arabesques. Under the Safavids Persian textiles were noted for their various and intense colouring. Silver work and brass work were ancient industries, very little is done now. Carved wood mixed with ivory and mother of pearl is still made to some small extent.

also seal-cutting. Persian painting, although limited by Islamic restriction, is of extraordinary beauty. Miniature painting forms the greater part of Persian painting, and illustrated MSS. were the treasure of kings. A great sensitiveness and flow of line were reached, but it is in their marvellous use of colour that Persian artists most excel. Calligraphy was practised in connection with painting and artistic decoration, but in even greater degree as an art by itself. The Persian art which flourished in art, times influenced (Gk., Rom., and Byzantine art, and was the father of Saracenic art and architecture, which has travelled far since its birth. In recent years there has been little development in art, except in architecture and sculpture in so far as it serves as ornament for buildings. In conformity with the nationalist spirit, new design in building is modelled, not on Islamic tradition, but on the pillars and carving of the Achaemenid palaces at Persepolis and the Sassanid arch of Ctesiphon in Iraq.

**LANGUAGE AND LITERATURE.** The Persian or Iranian language forms a sub-branch of the Indo-Iranian or 'Aryan' main branch, belonging to the Indo-European (q.v.) linguistic family. The most important common characteristics of the language making it differ from Sanskrit, belonging to the other sub-branch of the Indo-Iranian main branch, are as follows: change of the original *s* into the spirant *h*; change of original aspirants, such as *gh*, *dh*, into corresponding medials; *k*, *t*, *p*, before a consonant changed to spirants *x* (*kh*), *θ* (*th*), *φ* (*ph*), and the development of soft sibilants. Persian may be distinguished into Early Persian, used on the monuments of the Achaemenid dynasty (middle sixth century to the second half of the fourth century B.C.), Middle Persian of the Parthian or Arsacid period (250 B.C.-A.D. 225), and of the Sassanian period (A.D. 225-651), terminated by the Arab conquest and domination; with the Persian Renaissance (ninth century A.D.) Modern Persian began to flourish.

The anc. Persian inscriptions were written in cuneiform character, which, however, was not a natural development from the Sumerio-Assyro-Babylonian cuneiform writing (q.v.) but an artificial creation probably drawn up on official order—externally based on the neo-Babylonian cuneiforms and—as a system of writing being a quasi-alphabet suggested by the already widely circulating Aramaic alphabet (see under ALPHABET). This early Persian writing, which was the official script of the Achaemenid dynasty, and was employed from the middle of the sixth century B.C. until the destruction of the Persian Empire by Alexander the Great, consisted of forty-one symbols. Four of them were ideograms (for 'king,' 'province,' 'country,' and 'Avra-Mazda') and one a sign of div. between words; three vowels (*a*, *i*, *u*); thirteen consonants (*kh*, *ch*, *th*, *p*, *b*, *f*, *y*, *l*, *s*, *z*, *sh*, *hr*, *h*) having either the value of a pure consonant or a consonant + *d*; ten symbols for consonants (*k* or *q*, *g*, *t*, *n*, *r*) in two forms: (1)

pure consonant or consonant + *d*, (2) consonant + *u*; four symbols for consonants (*dj* and *r-m*), also in two forms, but (1) pure consonant or consonant + *d*, (2) consonant + *i*; six symbols for consonants (*d*, *m*) in three forms: (1) pure consonant or consonant + *d*, (2) consonant + *u*, (3) consonant + *i*.

The early Zoroastrian Scriptures were called *Avesta*, a term which comes from the Middle Persian or Pahlavi (q.v.) form *aristak* (or, as some scholars prefer to read, *apastak*) or the Pāzand form *arasta*; the Sanskrit term is *arista*. The origin of this word is uncertain. The Avesta literature was composed in a dialect now called 'Avestic' or simply 'Avesta'; its original home is unknown. The Avesta literature is a complex collection of writings, containing the liturgies, the 'law,' solemn invocations, prayers, and so forth, and is still in use amongst Parsis as 'Bible' and 'Prayer-book' in India and in Persia. The script of the Avesta, known as the Pāzand or the Avesta alphabet, is a most cursive writing of fifty signs, probably an artificial creation based on the local scripts. These books, with their later commentaries, constitute the bulk of pre-Islamic Persian literature.

Under the Arsacids the Gk. tongue appears to have been widely used, but after the rise of the Sassanians, Persian again became cultivated, and inscriptions and literature in the Pahlavi language have come down to us. Pahlavi, or rather Middle Persian, consists of Parsik of the Sassanian inscriptions, of Pārsik of the later Zoroastrian literature up to the ninth century A.D., and of the S.W. Iranian dialect known from texts found in Tūrān (E. Turkestan). They are written in Pahlavi scripts, which seem to have been a natural development from local cursive Aramaic scripts.

Modern Persian is a direct descendant of the S.-central middle-Persian dialect, but the Arabic conquest brought such a revolution in the material and spiritual life of the Persians, that, to mention only one sphere of cultural life, although it did not change the fundamental structure of the language, it influenced it enormously. The Pahlavi script was forced to give way to the Arabic (although the pronunciation of some Arabic letters has been changed: Arabic *d* is pronounced in Persian as *z*; and new letters were created, by employing diacritical marks, for representing the sounds *p*, *ch*, *sh*, and *gh*), and a knowledge of the Arabic language became indispensable to the converts to Islam, for religious worship and the correct reading of the Qur'ān, their new Bible were impossible without it. In consequence Arabic speech and writing have so largely influenced modern Persian, that numerous Semitic words have become 'part and parcel' of the language. Daqiqi, who began the famous *Shāh-nāma* ('Book of Kings'), employs about forty Arabic words in a thousand lines of Persian poetry, and even the great Firdausi (see below), who represents a national spiritual reaction against foreign influence, uses a

certain number of Arabic words. Besides, many Persian savants employed Arabic, which made a ready appeal to them from the time of their conversion to Islam. The influence of the Qur'ān and the tendency, manifested especially in the higher social classes, to consider the employment of Arabic words as more distinguished than vulgar speech, certainly did not foster the cultivation of the Persian. Sa'dī (see below) employed both languages, and 'Omar Khayyām (see below) wrote scientific works in Arabic. The incomparable physician and philosopher Avicenna (Abū 'Alī ibn Sīnā) (see below) could even write excellent poems in Arabic. Indeed much of the best of Arabic literature was the work of Persian writers.

Modern Persian returns as a literary language in the early ninth century. The earliest neo-Persian literary document is a fragmentary poem attributed to 'Abbās of Merv, perhaps of A.D. 809, but the first great modern Persian poet was Rūdāgī (d. c. A.D. 954). With him began what may be called the court poetry of modern Persia. He was followed during the tenth to the sixteenth centuries by Firdawsi (d. 1020), who completed the *Shāh-nāma* (the result of thirty-five years' labour), Anwārī (d. between 1180 and 1191), 'Omar Khayyām ('Omar ibn Ibrāhīm al-Khayyām) of Nishāpūr, a free-thinker, poet, astronomer, and mathematician (d. c. 1123), Nizāmī (d. perhaps 1203), Khāqānī (d. 1190-1200), Sa'dī of Shirāz (d. 1291), Jalāl ad-dīn Rūmī (b. at Balkh in 1207, d. at Konya in 1273), Hāfiz (d. 1389), and Jāmī (d. 1492). In more or less chronological order. A later poet, of epic fame, is Hāfiz of Jām (d. 1521), and later still is Hāfiz of Isfahān, known as the singer of sweet songs (d. 1781). Nineteenth-century poems of importance are Qā'ānī (Mirzā Habib'ullāh) of Shirāz (d. 1853), Yāghmā, and Mirzā Serūsh, whose elegant work almost equals that of the classic poets.

An early prose work of a direct style, rare in P., is the *Chahār Maqālāh* ('Four Discourses'), written in A.D. 1157-61 by Nizāmī 'Arāzi Samarqandī. Another early prose work is the *ẖatā'at* of Bal'ami's trans. of the *Universal History* of Abū Ja'far Mahommed ibn Jarir at-Tabarī (d. 923). The already mentioned philosopher Avicenna (d. 1037) wrote in Persian a vast encyclopaedia, a kind of scientific manual, entitled *Dānish-nāma i 'Alā'* ('Book of Knowledge of 'Alā,' 'Alā' being the shortened form of 'Alī' 'Dawla of Isfahān, for whom this work was written), besides many characteristic Persian songs of wine, flowers, and love. The most celebrated prose works are Sa'dī's (see above), *Bustān* ('Garden'), and *Gulistan* ('Rose Garden'), written in ornate prose with verse interpolations. In lyric poetry the outstanding work is the thirteenth-century *Mathnawī*, by Jalāl ad-dīn Rūmī (see above), revered as a bible. Many historians have added their learning to the literature of the country, sev. curious and interesting hist. of India being among their works. The

Persian drama delights chiefly in religious passion plays and melancholy tragedies and lately not a few Christian legends have been dramatised, but they have not excelled in this branch as in poetry and religious philosophy. Poetry remains to-day the most flourishing form of literature. One of the main inspirations of poetry has always been the beauty and facility of the language, but the verse-forms are restricted, with few exceptions, to (1) the *rubā'iy* or quatrain; (2) the *ghazal*, a poem in couplets, interlocked by a single rhyme at the end of each couplet; (3) the *qasida*, a dedicatory poem, similar in form to the *ghazal*, but longer; and (4) the *mathnawī*, an epic or narrative poem in rhymed couplets. The recent revival of literature in P. has taken the form of hist., eds. of the classics, and poetry. Interest in novels is restricted to trans. of European works, generally Fr. Persian poetry is frequently didactic and naive; some poems are based on classical models, and are all concerned with modern topics, especially the burning questions of the day.

**Persian Gulf**, inlet from the Indian Ocean, running northwards through the strait of Ormuz between Arabia and Persia. Its area is about 75,000 sq. m., its average depth only 25 fathoms. The climate is exceedingly hot, the temp. of the water rising above 90° F. at times. The Shat-el Arab, formed by the union of the Tigris and the Euphrates, flows into the head of the P. G. There are sev. is. dotted about; the largest are Bahrein, Ormuz, and Kishm. Bahrein is interesting, possessing hundreds of mounds, tombs of some ant. people whose identity has not yet been proved. Date-groves flourish, and springs of clear, fresh water flow through the is.; pearls are diverged for in the surrounding sea, the divers risking their lives against the sharks and sword-fish. Bushire is the most important port; Shiraz, the ant. cap. of the Zend dynasty, being within reach, made Bushire in early times a prominent place. From here the P. G. is policed and order kept among the fierce and ignorant people who inhabit the fringe of the coast. Indian steamers come to trade here, the date trade being very extensive, also the pearl fisheries are valuable, and a certain amount of dried fish is exported.

Further N. is the tn. of Basra, once the landing-place for jewels, spices, and materials brought from India, while the little is. of Ormuz was the distributing centre of this trade in the Middle Ages. One of the benefits accomplished by the Brit. was the suppression of the slave trade, which at one time flourished in the P. G. All along the coast are to be found nomad tribes of all kinds, whose greatest possessions are their horses. See Sir A. Wilson, *The Persian Gulf*, 1928.

**Persicaria**, see POLYGONUM.

**Persimmon**, see DRYO PLEUM.

**Personality**, in philosophy, denotes that a substance is constituted a person, that is, a substance perfectly subsistent, master of its own acts, and incommunicable. A human person, therefore, is neither the body nor the soul, but the rational being arising from the substantial union of both. It is an individual able to direct itself by its intelligence and will, and is accordingly the proper object of attribution of its acts. It is the person who eats, walks, talks, speaks, loves. While the reality of self has been denied by Hume and Bradley modern philo-

sophers have been principally concerned with four questions regarding the person: (1) Whether and how it knows itself; and the general opinion is that it knows itself by perception, i.e. by that species of awareness which we have of the existence of particulars, by a direct cognitive relation to them, and not by description. (2) The relation of P. to time; and it is agreed by most that the identity of the person persists through time, whatever theory of time be held. (3) Whether P. be simple or compound. The definition given above involves the simplicity of P. (4) Whether P. involves self-consciousness. Opinion on this is divided, though it would appear that differences are largely differences of terms, and it is safe to hold that the person is at all times fundamentally self-conscious.

P. in psychology (*q.v.*) has a somewhat wider connotation, signifying those collections of attributes or qualities which vary from person to person, rather than those which distinguish personal from non-personal existence. For P. in the God-head see TRINITY. See also HALLUCINATION; HYPNOTISM; ILLUSION; MEMORY. See A. Binet, *Illustrations of Personality* (trans., 1896); T. A. Ribot, *Diseases of Memory* (trans., 1882); C. A. Mervier, *Psychology, Normal and Morbid*, 1901; C. G. Jung, *Psychological Types or the Psychology of Individuation*, 1923; R. Martin, *Alfred Binet*, 1925; F. L. Bertrand, *Alfred Binet et son œuvre*, 1930; C. R. Stockard, *The Physical Basis of Personality*, 1931; F. Aveling, *Personality and Will*, 1931; M. B. Greenble, *Personality*, 1933; and V. M. Bechterev, *General Principles of Human Reflexology; the Objective Study of Personality*, 1933.

**Personal Property**, in Eng. law, comprises all chattels or movables such as jewels, money, documents, furniture, and personal effects or belongings as opposed to real estate (*q.v.*) or interest in land (see PERSONALTY; REALTY; INCORPORAL HEREDITAMENTS; CORPORAL HEREDITAMENTS). Leaseholds or chattels real (*q.v.*) are, as their secondary name implies, a hybrid species of property; for though derived out of real estate, they have been ranked as such and always devolve in intestacy as personality (see DISTRIBUTIONS, STATUTES *op.*). P. P. is said to be either in action or in possession as to which distinction see under CHOSE IN ACTION. In Scots law the classification into heritable and movable property is almost parallel to the Eng. real and personal.

**Personality**, synonymous with personal property (*q.v.*). The div. into realty and P. is traceable to a time when legal process was not sufficiently advanced to secure to a person wrongfully deprived of property other than freehold land its specific recovery as a cause to an action for damages against the person; but action to recover land was said to be a real action (Lat. *res, thing*), because the law issued process of execution against the thing demanded instead of putting the claimant off with damages.

**Personation**, see under ELECTIONS.

**Personnel Selection, see under MENTAL TESTS**

**Persons, Robert, see PARSONS**

**Perspective** The method of drawing by radial projection to show the apparent size and shape, or eye appearance of an object is called linear P. It considers all points in a view as sending straight rays of light to the eye the actual condition of things which produces the photograph in a camera. Since all lines converge to the eye if two be drawn from the top and bottom of a telegraph post a 100 yds distant smaller and smaller posts would fit the lines the nearer they approach the eye and posts of the same size would overrun them thus appearing larger the distant post much smaller. Hence the great rule of P. receding parallel lines converge to a point on the horizon or eye level. Aerial P. has no mathematical basis and deals with the eye effect of brightness and colour and other accidents due to atmosphere. See W. L. Wyllie *Nature's Laws and the Making of Pictures* 1905; G. A. T. Middleton *The Principles of Architectural Perspective* 1904; R. V. Cole *Perspective* 1921; V. Cornish *Security and the Sense of Sight* 1943; F. Midworth *Perspective* 1946 and works by J. W. Miller (1887) and H. A. James (1885).

**Perspiration, see THERMOPHORESIS SKIN**

**Persulphuric Acid or Perdisulphuric Acid** ( $\text{H}_2\text{S}_2\text{O}_8$ ) acid formed at the anode by the union of the ions  $\text{HSO}_4$  during the electrolysis of moderately strong sulphuric acid. The pure acid forms colourless crystals that are stable up to 60°C. It is dilute and its salts have the general formula  $\text{M}_2\text{S}_2\text{O}_8$ . The potassium salt is obtained by the electrolysis of a strong solution of potassium hydrogen sulphate. The persulphates are stable salts in the solid state but aqueous solutions evolve oxygen and pass into sulphates. Free acid and salts are oxidising agents and give no reaction with barium chloride. Free sulphuric acid or Caro's acid has the formula  $\text{H}_2\text{SO}_5$  and is prepared by the reaction of sulphur trioxide upon anhydrous hydrogen peroxide  $\text{H}_2\text{O}_2 \cdot \text{SO}_3 \cdot \text{H}_2\text{SO}_5$ . It forms white crystals melting at 4°C and is a powerful oxidising agent. The acid finds commercial use in the dye industry.

**Perth, Sir James Eric Drummond, sixteenth Earl of (b. 1876)** British diplomat, b. at Kulford near York second son of tenth Viscount Strathairn and half brother and heir presumptive to the fifteenth earl of P. Educated at Bedford Grammar School and Eton entered the Foreign Office in 1900. Deputy secretary to under secretary of state for foreign affairs, 1906-8 and 1908-10. He was the principal writer to the foreign secretary 1908 and 1910-11. One of Asquith's private secretaries 1912-13, and private secretary to the foreign secretary 1913. 1919, from 1919 to 1933 he was the first secretary general to the League of Nations. British ambassador to Italy 1933-39. He was chief adviser on foreign publicity at the Ministry of Information 1919-40. He became a Scottish representative peer in 1941.

**Perth** 1 Cap. of Perthshire Scotland, a royal burgh 43 m N N W of Edinburgh. It is beautifully situated on the banks of the Tay with a fine background in the Grampians. The riv. is spanned by two fine bridges, and along its banks are two public parks known as the N and S. Inches. Reputed to have been founded in c. 70 by Agricola the oldest building is the cruciform church of St John of the thirteenth century. The city was the scene of the murder of the duke of Cornwall by his brother Edward III of England (1336) of the famous battle between the clans Quhele and Chattan, described in Scott's *Four Maid of Perth* and of Knox's Reformation sermon.

Perth, Australia  
ST CLAIRS TERRACE, PERTH, AUSTRALIA

There are many manuf. distilleries iron foundries dye works glass ware and gauge glasses. Pop. 40,500. 2 Cap. of W. Australia on the Swan R. near its mouth 12 m N E of the port of Fremantle. It has two cathedrals (Roman Catholic and Anglican) a free university an observatory a branch of the royal mint, and many substantial public edifices. There are many parks racecourses and sport grounds etc. nearby. Founded in 1829 it was created a municipality in 1846 and its more rapid growth commenced following the discovery of gold in 1891 at Kalgoorlie. Since then its expansion has been based on the export of primary products such as wool wheat fruit, timber dairy produce and also gold. Pop. (with suburbs) 272,500. 3 Cap. of Lanark co., Ontario, Canada on the R. Tay, 141 m S W of Montreal. It has manuf. of machinery, woollens etc. Pop. 6000. **Perth Amboy**, port of Middlesex co., New Jersey, U.S.A., at the mouth of the Raritan R. It has an excellent harbour.

and manufs. bricks, terra-cotta, corks, drain pipes, and chemicals. Settled in 1683, and named after the earl of Perth, it was the cap. of the prov. from 1684 to the time of the revolution. Pop. 41,000.

**Perthshire**, inland co. of Scotland, bounded on the N. by Inverness-shire and Aberdeenshire, S. by Clackmannanshire and Stirlingshire, E. by the co. of Angus, and W. by Argyllshire. It is extremely mountainous; in the N. are the Grampian Mts., of which the greatest elevations are Ben More (3984 ft.) and Ben More (3843 ft.), while in the S. are the Ochil and the Sidlaw Hills. The prin. rivs. are the Tay, the longest riv. in Scotland, with its numerous tribs., and the Earn and the Forth. The scenery, wild and picturesque, has been immortalised in *The Lady of the Lake*. The lakes are numerous and include Loch Tay, Loch Earn, and Loch Katrine. Only a small portion of the co. is under cultivation, but agriculture flourishes and sheep are extensively reared. Granite, freestone, limestone, and slate are quarried, coal and copper are found in the Ochil Hills. Perth (q.v.) is the co. tn. Communication is good, and the co. is fit for its sport, and the Tay fisheries are important. Woollen and furtaun stuffs, cotton goods and linen are manufactured. P. and Kinross form two parl. divs., each returning one member. It includes such famous places as scene, where the Scottish sovereigns were crowned (the Coronation Stone was removed to Westminster in 1296), Dunshune, where Macbeth was defeated (1057), and Killecrankie, the scene of Dundee's great victory (1689). There are many remains of prehistoric stone circles and standing stones, and sev. Rom. sites of interest. Dunkeld Cathedral is of interest. Area 2194 sq. m. Pop. 128,700. See T. H. Marshall, *History of Perthshire*, 1849.

**Pertinax, Helvius**, Rom. emperor from Jan. 1 to March 28, A.D. 193, was reluctantly persuaded to accept the purple on the death of Commodus. But having attempted to check the licence of the praetorian troops, he was slain by the latter, who then put up the empire for sale.

**Perturbations** are deviations from the main mathematical orbits of motion of the heavenly bodies due to smaller or irregular attractions. A periodic perturbation is an inequality produced in the orbit due to the temporary nearness of an attracting body. The solar system having a settled 'average system' of orbits with calculable disarrangements due to alteration of relative positions, periodic P. are temporary disturbances which pass and recur. They are of very great use in determining mass, density, and distance. Secular P. are changes in the elements of orbits (see OMBURT), which continue in the same direction for centuries; they are themselves periodic in long cycles of scores of thousands or hundreds of thousands of years. One of sev. important secular P. is the alternate increase and decrease in the eccentricity of the earth's orbit; at the beginning of 1850 its value was 0.0187301 and it decreases by 0.0000004

each year, so that the earth's orbit is slowly becoming more circular. This decrease will continue for 24,000 years but will not reach zero, and then will begin to increase. Although Lagrange and Laplace found that P. in the solar system are oscillatory so that our system is stable, Poincaré's work suggested that this need not necessarily be true. While this question cannot be decided at present it is possible that in an immensely long period of time the present conditions may not be preserved, and some of the planets may gradually disappear from the sun's attraction while others may be drawn in by and finally fall into the sun. Lunar P. are of particular importance to us, they are: (1) effect on the length of the month; (2) the revolution of the line of apsides; (3) the regression of the nodes; (4) the evection; (5) the variation; (6) the ann. equation; (7) the secular acceleration of the moon's mean motion; besides many others, theoretically infinite, but about seventy of importance.

**Peru**, republic of S. America, bounded on the W. by the Pacific Ocean, N. by Ecuador and Colombia, E. by Brazil and Bolivia, S. by Chile. It includes the basin of the Ucayali, with a large portion of the basin of the Marañon or Amazon as far as the Javari trib. The Pacific coast rises steeply for 150 m. inland to the plateaus 6000 to over 12,000 ft., and ranges of the Andes. Area 1,82,258 sq. m. Pop. (1910 census) 6,208,000 (exclusive of the pop. of forests which is estimated at 815,000). Of the total pop. 3,283,400 were white, 2,817,000 Indian, 12,000 Asiatics, 29,000 Negroes. Lima, the cap., had (1910) a pop. of 223,000. Other tns. are Callao, 75,000; Arequipa, 46,000; Cuzco, 10,000; Iquitos, 10,000; Chiclaya, 35,000; Trujillo, 50,000; Chancha, 20,000; Ica, 20,000; Huancayo, Huánuco, Ayacucho, and Piura, each about 20,000. The area of the republic was long a matter of uncertainty owing to boundary disputes with Chile and Bolivia. Since 1883 Chile had retained the provs. of Arica and Tacna, and all attempts at settling the dispute had failed. In 1929 Tacna was returned to P. and Arica was kept by Chile, but P. received 6,000,000 Amer. dollars compensation, and some 6 sq. m. in the neighbourhood of the port of Arica were also ceded.

**NATURAL DIVISIONS.** P. falls naturally into three clearly defined and diverse regions. (1) The coastal strip, between the Pacific and the Maritime Cordillera, a sandy desert intersected by fertile valleys and now itself largely made fertile by irrigation. It produces sugar and many other crops. (2) The vast triple chain of the Andes, 250 m. wide, with its great plateaus and rich valleys, grazing land, coffee plantations, and mineral wealth. (3) The Montaña, of the E. Andean slope, with its tropical forests and rivers, but little explored. Of the total arable area of 29,500,000 ac., only 3,600,000 are under active cultivation. In the arid coast region the gov. has brought under irrigation over 60,000 ac. during the last few years.

**CLIMATE.**—P. is in the lats. of the S.E. trade winds, which, blowing in warm and moisture-laden off the Atlantic, precipitate some of their rain in passing over the pampas, but discharge the body of it on the E. slopes of the Andes, then descending cold and dry on the W. side. Hence there is little or no rainfall on the coastal strip of P. On the Pacific near shore the prevailing wind is parallel to the coast or away from it. In Lima the extreme summer maximum temp. is 82°, winter minimum 56°, the corresponding means being 66° and 59°. The Puna is cold, the lower Montaña is typically tropical, but the higher region is delightful. Light malaria, *paludism*, is common, but yellow fever and plague are rare. The people of pure Sp. blood are not numerous, having so intermingled with the Indians that they are now mestizos or people of mixed race, but their language is Sp., and the higher classes have much culture. Negroes and Asiatics together form between 1 and 2 per cent of the pop. The bulk of the pop. of the uplands, who are known as Cholos, are descended from the original Quechuas and Aymaras of the Inca Empire. They are strong and hardy, and make excellent miners, and the greater part of the work of the country is done by them. Many of them are small peasant proprietors.

**OCCUPATIONS, PRODUCTION, AND COMMERCE.**—About 80 per cent of the pop. is dependent on agriculture, mainly with the help of irrigation. The chief agric. products are, in the order named, cotton, sugar, wool, hides, skins, and coffee. In the coast region sugar, cotton, maize, alfalfa, and various fruits are grown. Peruvian cotton is of very high quality. Here also is the more modern and energetic life of the country. Callao, Chimbote, and Paita have good harbours, Chimbote being a port for minerals, Paita for cotton. The Lobitos oil-fields have a commercial outlet at Tumbes, and salaverry is the port of Trujillo and the sugar dist. A new port has been developed at Maturani. The forests of the dept. of Loreto have plantations of the coco-nut, and in this remote place the sugar-cane, cotton, coffee, grapes, figs, oranges, pineapples, and bananas grow abundantly, but trade is hampered by lack of transport. Mollendo, one of the worst ports is the outlet for Arequipa, the Titicaca dist., and the Montaña. Huanacavilca is the centre of the quicksilver mines. The uplands are the home of the potato. Lake Titicaca (q.v.), with Lake Poopo and the R. Desaguadero, is a good waterway. Coffee is produced chiefly in Chanchamayo, Perené, Pucallambo, and Huanuco. Cocoa is extending in Perené. Caca is chiefly grown in Otuzco for the Indian pop., and cocaine is manufactured in Lima, Callao, and Otuzco, chiefly for export. Dyes, cinchona, and other medical plants are found; alpaca sheep and llama wool are exported. Rubber is shipped from Iquitos on the Amazon. The gathering of wild rubber, once the most important industry in the Amazon region, was stimulated under pressure

from the U.S. Gov., which agreed to take all surplus rubber for five years from 1912. Copper and petroleum are the chief minerals exploited. The chief copper mine is at Cerro de Pasco, the highest in the world at an elevation of over 11,000 ft. It has been operated for three centuries. P. is one of the world's largest sources of vanadium. Other minerals exported include antimony, lead, tungsten, and bismuth. Gold is widely found, but transport and labour difficulties hinder mining. There are large, mostly unworked, iron deposits, but an iron and steel plant is under construction.

In 1917 the imports were valued at 1,091,357,000 soles, and the exports at 1,002,943,000 soles (the gold sol is worth 47.50 cents (U.S.A.), or 17.38 to the £ (i.e. 13s. 8d.). This was the first unfavourable trade balance in Peruvian hist. Imports are cotton and woolen goods, electrical goods, arms and munitions, dyes, machinery, etc. Exports include cottons, hides, copper bars, petroleum, sugar, wool, mineral concentrates, and precious metals. In 1917 P. exported to the United Kingdom goods valued at £1,102,192, and United Kingdom imports to P. were valued at £2,298,768. In 1918 the estimated revenue and expenditure of P. balanced at 927,000,000 soles. The total debt of P. (1916) amounted to 1,671,720,000 soles, of which the internal debt was 521,000,000. Brit. investments in 1917 amounted to £27,023,000, of which 76 per cent was in default. Amer. direct investments in 1910 were \$81,500,000. Amer. holdings of Peruvian dollar bonds in 1911 were \$51,000,000, all in default.

**COMMUNICATIONS.** There are about 21,700 m. of roads suitable for motor traffic. The central highway over the Andes was completed in 1935; the rich E. part of P. was made accessible by the Callao Huancayo-Pucallpa highway, opened in 1913; Lima was linked with Iquitos by the Lima Pucallpa highway, completed in 1914. There are good railways, which are carried to remarkable heights, Cerro de Pasco being served by a broad-gauge railway. P. has 2758 m. of railway. Since 1912 the administration of posts, telegraphs, and wireless service has been in the hands of the gov. There is a short wave and long wave national broadcasting station of modern type. Private stations were suspended in 1912. Air mail and passenger service between Lima, New York, Rio de Janeiro, and Santiago was estab. in recent years.

**GOVERNMENT.**—P. is governed by a president, who is elected for a term of five years, a senate of forty-nine members, and a chamber of deputies of 183 members, one-third renewable at general elections every two years. Voting is compulsory for all adult literate males. Women have only the municipal franchise. The executive power is vested in the president. Under the constitution of 1933, as amended in 1939, he is advised by an economic advisory council of specialists in various fields. The president exercises

his executive functions through a cabinet holding office at his pleasure. The twenty-four depts. of P. are divided into 124 provs., each dept. being administered by a prefect and each prov. by a sub-prefect.

**JUSTICE.**—There is a supreme court at Lima composed of eleven judges and five fiscals, and eighteen superior courts. The judges of the supreme court are chosen by Congress from lists of names presented by the gov.; those of the superior courts and of the minor courts by the gov. from lists of names presented by the supreme and superior courts respectively.

**EDUCATION AND LITERATURE.**—Education is well organised in P. and is free and compulsory. The system is highly centralised. In 1914 there were 7647 elementary schools, and 61 secondary state schools giving five-year courses. About 100 secondary schools were conducted by religious orders and other bodies. There are also rural schools for Indians, commercial and industrial schools, etc. Besides an excellent univ. at Lima, there are three others, at Arequipa, Cuzco, and Trujillo. Few of the republics equal P. in culture and literature. Felipe Pardo y Aliaga (*d.* 1868) was a brilliant man of letters and the author of sev. sparkling comedies. Manuel A. Segura (*d.* 1871) was also a distinguished dramatist. Among many poets Pedro Paz Soldán y Umanue (*d.* 1895) was the chief in the nineteenth century. Ricardo Palma (1833-1919) was an important writer of Peruvian hist.; José Santos Chocano (*c.* 1875-1931) is perhaps the most powerful of all Sp.-Amer. poets. Religious liberty exists, but the Rom. Catholic faith is protected by the State. A decree of 1929 allowed only Rom. Catholic religious instruction in schools. There is a Rom. Catholic archbishopric at Lima, dating from 1515, and eighteen bishops and vicars-general.

**DEFENCE.** Military service is compulsory and universal, but, ordinarily, only a limited number of the yearly quota of conscripts is called up for active duty with the colours. The term of service is two years in the active army, ten years in the reserve, and twenty years in the National Guard. The authorised estab. of the army in 1940 was 2000 officers and about 30,000 other ranks. Aviation, civil and military, is controlled by the Ministry of Marine and Aviation. The U.S. Gov. sent fifty aeroplanes in Lend-Lease terms in 1942. The Peruvian Navy comprises two obsolete cruisers (1906) of 3200 tons with 6-in. guns, two destroyers, four submarines, and six riv. gunboats. There is a naval cadet school near Callao and a submarine base on San Lorenzo Is., opposite Callao.

**HISTORY.**—P. was conquered (1531-1541) by Francisco Pizarro, and remained under Sp. rule till 1821. The country enjoyed an uneventful and prosperous hist. Lima was the centre of Sp. rule and trade, and in every respect the chief city of the New World. Here, in 1551, was founded the univ. of San Marcos, the first on the Amer. continent. From early times Jesuit missionaries were at work,

spreading culture and enlightenment. The War of Independence lasted some three years, and the Spaniards were finally defeated at Ayacucho (1821). When P. became independent, for a long time its record was one of perpetual civil strife. After the middle of the century prosperity was being established, but it was shattered by a disastrous war with Chile (1879-83). The nitrate fields of Tarapaca, which were the main subject of dispute, were lost, and Arica and Tacna were also retained by the victors; as shown above, that matter was afterwards settled. Financially P. was ruined, and in 1890 the Peruvian Corporation took over the foreign debt in return for a sixty-six years' lease of railways and many other valuable concessions. Boundary disputes between S. Amer. states are, however, a frequent source of armed conflict, and in 1932, Peruvian filibusters from Iquitos occupied Letícia on the Colombian frontier, demanding a revision of the treaty settlement ratified by P. in 1927. The Peruvian Gov. supported the filibusters and broke off diplomatic relations with Colombia. The League of Nations, on Colombia's appeal, pronounced against P.; after a few months' skirmishing and bombing, a League commission was appointed to administer Letícia until a settlement was reached between the two countries at Rio de Janeiro in 1934. In 1939 98 per cent of the electorate approved amendments to the constitution of 1933 by which proportional representation was abolished and general elections replaced by a renewal of one-third of the chamber biennially. In 1911 fighting took place between Peruvian and Ecuadorian troops for some weeks over a boundary dispute, respecting the region N. of the Marañon from the Pongo de Manseriche, which, however, was settled. P. broke off diplom. relations with the Axis powers on Jan. 21, 1942, and the U.S. Gov. made a loan to P. of \$29,000,000 for defence purposes. A trade treaty was also concluded with the U.S.A. for the disposal of Peruvian cotton and rubber surpluses. P. declared war on Germany and Japan in Feb. 1945. Though taking no active part in the war, the country supplied valuable raw materials to the Allies. It became a foundation member of the United Nations.

**ANCIENT CIVILISATION.**—Archaeological remains of the country take us to much earlier forms of culture than those of the Inca. Geographically P. can be divided into three zones, the Coast, the Sierra, and the Montaña. The most discussed problem of Peruvian archaeology is whether the cultural priority goes to the prehistoric culture of the Sierra or to that of the Coast zone. According to J. C. Tello, the priority is to be given to the 'autochthonous' people of the Sierra, to the culture of early Tiahuanaco and Chavin. Accord. to him archaeological traces of the Chavin culture may also be found at Lambayeque, Anón, and Paracas. On the other hand M. Uhle distinguishes the following five phases of prehistoric Peruvian cultures, of which the first three are in the Coast zone: (1) S.

valleys: Early Nasca or Nasca I. and the two Inca periods; (2) central valleys: Proto-Lima (Nieveria) and Recuary; (3) N. valleys: Early Chimu or Chimu I. (Trujillo) and Late Chimu or Chimu II. (Chanchán); (4) the Sierra, with the cultures of Havin and Tiahuanaco I., followed by Tiahuanaco II.; and (5) the Inca or Cuzco culture. The chronological problems are still open. Reliable dates the Coast cultures from A.D. 700, the Sierra culture from 500 to 1000, and the Inca culture, in its zenith, from 1300 to 1500. According to other scholars (e.g. E. Seler) the two cultural groups (Coast zone and the Sierra) were roughly contemporaneous. The Inca Empire flourished from the first Inca, Manco Capac (Capac), about A.D. 1000 till Pizarro's arrival and the defeat and death of Atahualpa in 1532. It extended over P., Bolivia, and Ecuador, and its influence extended even to the Gran Chaco. The cap. was at Cuzco (q.v.), and Quito was another important centre. A complete system of roads was estab. It is their buildings which make the Incas chiefly worthy of admiration, of which the most remarkable are at and around Cuzco, including the great fortress of Sacahuaman, the Temple of the Sun, the palaces of Huayna Capac and of Pachacuti. The ruins of Machu Picchu (q.v.) are of great beauty, and it is believed that the city was the traditional Tampu-tocco, cradle of the Incas. A road was opened in 1948 by which access to the site is gained. They are composed mainly of most remarkable monoliths, some nearly 20 ft. high, and were fitted into their place by workmen who knew no mechanical contrivance and used no mortar. They had considerable proficiency in astronomy, as we find from the remains of their observatories. Bronze and copper cutting tools were used, but iron was unknown. Skilled and beautiful metal work in gold and silver, pottery, and textile fabrics have been preserved.

**Religion.**—There are temples of the sun and moon; their 'unknown God,' a supreme spirit, all-pervading, was worshipped without idols or human sacrifices. The image of the Creator was represented at Cuzco by a large flat plate of fine gold, of an oval or elliptical form. The sacred fire of the sun was attended by vestal virgins. Manco Capac, the first legendary Inca, was, according to legend, born of a virgin and came as a redeemer of mankind and a teacher of civilisation.

**Agriculture** was advanced, and the system of terrace culture was admirably adapted to the mts. Land was held on a communal system, one part being reserved for the Sun temples and priests, another for the Inca, and a third for the people. Each Indian was given a measure of land, and, as soon as he had a family, a further allowance was given to each member. Idleness was punished. Poverty and destitution were unknown, old and infirm being cared for by their neighbours.

The Inca Gov. estab. storehouses as a precaution against famine and to secure that the common produce of the people's labour should be equitably distributed.

In all respects, as far as we know it, the social and political system was admirable. The gov. was a benevolent despotism, interfering with the lives of its subjects at every turn with sumptuary laws and all manner of regulations in the minutest matters of daily life, and such a system was well suited to the docile nature of the people. Conquered peoples were well treated and induced to join in the Incan system. Garcilasso, the Sp. chronicler to whom we are indebted for the greater part of our knowledge of the Inca regime, declares that no anct. kings, whether of Asia, Africa, or Europe, have even shown such wise and benevolent treatment of their subjects.

**Peru:** 1. Co. seat of Miami Co., Indiana, U.S.A., on the Wabash R., 16 m. E. of Logansport. Pop. 13,000. 2. Tn. of LaSalle co., Illinois, U.S.A., on the Illinois and Michigan Canal. It is the centre of valuable coal-fields, and has foundries and zinc-rolling mills. Pop. 10,000.

**Peru Balsam**, see BALSAM.

**Perugia:** 1. Prov. of Central Italy, forms the compartimento of Umbria. Area 3770 sq. m. The region is traversed by the Apennines, and is watered by the R. Tiber. The soil is productive, the chief products being wine, wheat, oil, and fruits; coal and iron are found. Pop. 713,000. 2. Cap. of the above, situated between the Tiber and Lago Trasimeno, at an altitude of 1700 ft. above the sea level. It contains many buildings of interest, including the Gothic cathedral of San Lorenzo (fifteenth century), the univ. (thirteenth century), palazzo del Municipio (1281), and the collegio of San Severo. The tn. possesses many art treasures, and has a romantic hist. In the Second World War the city escaped damage but the Gers. blew up the thirteenth-century Ponte S. Giovanni. Pop. 82,000. See W. Heywood, *History of Perugia*, 1910, and M. Symonds and L. Duff-Gordon, *Perugia* (Medieval Tns. series), 1898.

**Perugia Lake**, see TRASIMENO LAKE.

**Perugino**, Pietro, properly Pietro Vannucci (1446-1523), It. painter, one of the masters of the Umbrian school, b. at Città

della Pieve, near Perugia. He was a pupil of Lorenzo di Lorenzo, and his first public work was the execution of the frescoes in the Palazzo Comunale in Perugia (1475). In 1480 he was one of the group of artists chosen by Sixtus IV. to embellish his newly finished chapel, and painted the 'Delivery of the Keys to St. Peter,' a work which particularly shows his method of bringing out in accurate perspective, and with true feeling of the value of distance, the effects of space and atmosphere, a method which his pupil Raphael carried to perfection. P. led a wandering life; in 1499 he painted the beautiful frescoes in the Sala del Cambio of Perugia, but after 1502 he worked mostly at Florence. His 'Virgin Child, Michael and Raphael,' and four other works are in the National Gallery, London. See lives by G. C. Williamson, 1900, and F. Causti, 1931.

**Peruvian Bark, or Jesuit's Bark**, bark of various trees of the genus *Cinchona*, of the natural order Rubiaceae, introduced into Europe from Peru by the Jesuits as a cure for fever. *C. Ledgeriana* is chiefly grown in Java, which produces nine-tenths of the world's bark requirements. See further under CINCHONA; CINCHONA BARK ALKALOIDS.

**Péruwelz**, tn. in the prov. of Hainaut, Belgium, 12 m. S.E. of Tournai, near the Fr. border. It is engaged in manufs. of leather, ropes, knitted goods, and footwear. Pop. 1600.

**Peruzzi, Baldassare** (1481-1536), It. architect and painter, b. near Siena. His early work was in imitation of Pinturicchio, but later he was influenced by Raphael. In 1504 he went to Rome, and, aided by Agostino Chigi, was enabled to study its art treasures and the principles of architectural design. In 1516 he designed for Chigi the Villa Farnesina, for which Raphael painted the frescoes. In 1520 he was appointed architect of St. Peter's, in succession to Raphael, by Pope Leo X., and in 1525 he designed the Osoli Palace. Among his frescoes and panel paintings executed at Siena is the famous 'Augustus and the Sibyl' in the church of Pontegustata. Becoming city architect at Siena on the sack of Rome in 1527, in 1532 he returned to Rome, where he built the Vidoni and Orsini palaces, and his architectural masterpiece, the Massimi Palace. See A. Donati, *Elogio di B. Peruzzi*, 1879; A. Weiss, *B. Peruzzi: Anteil an dem niederrheinischen Schmuck der Villa Farnesina*, 1894; and monograph by W. Kent, 1925.

**Pesaro** (and *Pisaurum*), cap. of the prov. of Pesaro e Urbino, Italy, on the Adriatic, at the mouth of the Foglia, 19 m. N.E. of Urbino. It is an episcopal see, with an old and a new cathedral. The tn. possesses sev. anc. palaces, a musical lyceum, founded by Rossini, who was b. here in 1792, public library and museum. It is a manufacturing centre, the chief products being majolica earthenware, silk, and glass. Eggs, wine, oil, cheese, and wax are exported. The tn. suffered much damage from allied bombing and shelling in the Second World

War, and yet more from Ger. mining and deliberate vandalism. The church of S. Antonio was burned out, but its paintings had been previously removed to safety. The cathedral was little damaged. The ducal palace was slightly scarred and the tiers looted the interior. The Palazzo Toschi-Mosca, which housed the public museum, was destroyed by Ger. mines. No damage was done to the bp. of Rossini, and the Rossini MSS. in the Liceo Rossini were unharmed. Some parts of the Villa Imperiale were badly damaged by artillery fire, some of its sixteenth-century frescoes being damaged. Pop. 31,600.

**Pesaro e Urbino**, prov. of Italy in the Marche, bordering on the Adriatic. The chief products are fruits, wine, wheat, iron, and silk. 1,411 sq. m. Pesaro (cap.), Urbino, and Lano. Area 1120 sq. m. Pop. 336,700.

**Pescadores, or Bokoto**, group of about twelve basaltic is., off the W. coast of Formosa, China Sea. They were ceded by China to Japan in 1895, and returned to China in 1945. Mills and rice are grown and there are good fisheries. Area 50 sq. m. Pop. about 70,000. See FORMOSA.

**Pescara, Fernando Francesco d'Avales**, Marquis of (c. 1459-1525), Neapolitan general in the service of Spain. At the battle of Ravenna (1512) he was taken prisoner by the Fr., but was soon ransomed; he served in the war in Lombardy (1515) and was severely wounded at Pavia (1522). He was placed in command of the army of Italy, and was approached by Morone to join the duke of Milan's party in a plot against Charles V. P., however, betrayed the conspiracy to Charles.

**Pescara**, port on the Adriatic coast in Abruzzi e Molise, Italy, at the mouth of the P. R. It is the cap. of the dpt. of P. (pop. 196,000). P. was occupied by Ger. forces during the advance of Montgomery's Eighth Army in 1943, and was entered by the Brit. forces in 1944. On May 5, 1944, R.A.F. dive bombers smashed the great P. dam, 12 m. S.W. of Chieti, thus destroying the P. hydro-electric works which supplied current to the railways of a great part of central Italy. Pop. 52,000.

**Peschiera**, fortified tn. in the prov. of Verona, Italy, on the Mincio, at the S.E. corner of the Lago di Garda. 21 m. N.N.W. of Mantua. Pop. 2500.

**Peseta**, tn. in the prov. of Lucca, Italy, 10 m. E.N.E. of Lucca. It has a fourteenth-century cathedral and an anc. castle. Its chief products are silk, hats, oil, and paper. Pop. 18,000.

**Peseta**, Sp. silver coin, of the approximate value of 54d., containing 100 centesimos.

**Peshawar**, cap. of the N.W. Frontier Prov., Pakistan, 10 m. E. of the Khyber Pass. It is an important military station, and an important centre of Asiatic trade. P. is connected with Kabul by telegraph, and wireless telegraph connects Kabul with E. Europe. P. was, in the second century, a Buddhist

cap., and from the fifth to the seventh centuries a resort of Chinese pilgrims. Pop. 130,900.

**Peshawarun**, former great Muslim city in the plain of Seistan, Afghanistan. There is no hist. of it otherwise than in legend, but it is supposed to have had at one time between 50,000 and 100,000 inhab. and, in a much earlier period, to have been garrisoned by troops of Alexander the Great. Conjecture explains its abandonment some twelve centuries ago as due to a climatic change involving water famine and a mass migration. According to some views, the people of P. and the surrounding region travelled 700 m. across mt. and desert to India to found what is now the modern city of Peshawar. An archaeological expedition of the Amer. Museum of Natural Hist. in Oct. 1919 found by chance in the desert 280 m. S. of Herat remains which they assumed were probably those of P. (other great cities in the plain of Seistan which were similarly abandoned were Pulki and Lakh). These remains consist of a great fortress, the domes of mosques, and a massive wall with towers. The buildings, aqueducts, and fountains were found to be in good preservation but the surrounding walls had been eroded by blown sand. Articles brought back included glazed pottery of fine workmanship, iron and bronze tools and utensils, fabrics, and bracelets. In 1949 the museum planned to send a large expedition to Afghanistan in 1950 for study and excavation work.

It is on record that a young Brit. officer, Capt. Charles Christie, travelling through Afghanistan disguised as a horse dealer in 1810, followed the route from Jalalabad on the Helmand through P. to Herat. The site of P. seems to have been sufficiently well attested for it to appear on the map appended to H. H. Wilson's *Antiquities and Coins of Afghanistan* (1841); while H. W. Bellw. writing in the 1870's, devotes two pages to its remains, which were later visited by members of the Russo-Afghan Boundary Commission.

**Peshwa**, or **Peishwa**, anc. head of the *Mahrattas* (q.v.). The title was annulled by the Brit. in 1818, owing to the continued hostility of the *Mahrattas*, and their ter. was annexed.

**Pessimism**, attitude of mind, which, confronted by the prevailing irrationality, misery, and worthlessness of life, despairs of finding any real happiness, dignity, purpose, or beauty therein. Often the world weariness expressed by, for example, Homer and Sophocles, is in fact but a transient subjective mood. Usually, as for instance in the Heb. Koheleth, in the Gospel, and in some forms of Pantheism (e.g. Brahmanism), the sense of frustration is transcended by a loftier estimate, and it is seen that 'God will bring every work and secret thing . . . into judgment.' When this view is not taken P. results. P. finds its earliest systematic development in Buddhism wherein consciousness can convey only suffering. The existence not only of a supreme Goodness but also of a supreme absolute Being is denied, and the

only refuge offered is that of self-alienation from all desire, hope, and aesthetic sentiment. In this final comatose indifference, when one has realised the vanity and futile nothingness of life, and has overcome susceptibilities to all emotional stimuli, Buddhism finds the greatest expression of human wisdom; it is praise-worthy because it anticipates death, the great relief from all wretchedness. Buddhism is thus the origin of all modern European P. Epicureanism is closely related to Buddhism, since it regards happiness as accidental in life, existing as a temporary negation of sorrow rather than as a positive emotional or rational circumstance. P. appears in the W. with David Hume's *Treatise of Human Nature* and *Discourse*; but its chief modern exponents are Schopenhauer (q.v.) and von Hartmann (q.v.). The P. of Nietzsche (q.v.) is only incidental to his optimistic ideal of the Superman. Schopenhauer perceives in life only a blind will, an irresponsible and unguided force, which works heedlessly in all directions, and so causes the incongruities, the irreconcilable conflicting impulses of which existence consists. He advocates suicide and deprecates love as helping to propitiate misery. Hartmann prefers the expedient of continuing as things are until mankind has been educated to perceive the significance of oblivion and to take the necessary action. See also STOKES. See J. Sully, *Pessimism, a History and a Criticism*, 1877; E. M. Curo, *Le Pessimisme au 19ème siècle*, 1878; H. Oldenburg, *Buddha* (trans.), 1892; A. Schopenhauer, *Die Welt als Wille und Vorstellung*, 1883-86; C. R. E. von Hartmann, *Philosophie des Unheimlichen*, 1881; and H. Diels, *Der antike Pessimismus*, 1921.

**Peso**, name of the monetary unit of sev. Lat. Amer. countries, the par value of which varies from 1s. or more in Paraguay and Colombia to 2s. or less in Mexico and the Argentine. It is usually divided into 100 centavos. Following Brit. devaluation of sterling in 1949 the Argentine Gov. readjusted the exchange rate of the P. in relation to the £, the previous rate of 13:53 being changed to 9:10.

**Pestalozzi**, Johann Heinrich (1716-1827), Swiss educational reformer, b. at Zurich. He studied theology, law, and scientific agriculture, not putting his educational views into practice until he was of middle age. In his attempt to educate his own child 'according to Nature' after the manner of Rousseau's *Emile*, P. discovered the value of the fundamental principles of his master while rejecting his extravagances. In 1775 he gathered together a number of destitute children, to whom he proposed applying his theories; the scheme proved a financial failure, but when adapted in 1798 to an orphan asylum at Stanz, in 1799 at Burgdorf, and in 1805-25 to the institute which he founded at Yverdon (Neuchâtel), his ideas were spread through the various foreign teachers who came to him and influenced the whole course of modern education. He wrote *Abendstunden*

eines Einsiedlers (1780); *Lienhardt und Gertrud* (1781); and *Wie Gertrud ihre Kinder lehrt* (1801). See also EDUCATION. See works on P. by Krüsi, 1875, G. Seyffarth, 1881, De Gulpms, 1889, and Philoche, 1901; also the book compiled in Switzerland under an official committee on the centenary of P.'s death, trans. into Eng., 1928, as *Pestalozzi and His Times*.

**Pesto**, see PESTUM.

**Pests, Insect**, see INSECTIDES; INSECTS.

**Pétain, Henri Philippe Benoni Omer Joseph** (b. 1856), marshal of France; b. at Cauchy-la-Tour (Pas-de-Calais). Educated at the military school of St. Cyr, 1876-78, after a course at the school of War, he became a lieutenant in the Alpine Chasseurs, and later a captain attached to the general staff of the 15th Corps at Marseilles. He was successively military governor of Paris, instructor of the Ecole Normale de Tir at Châlons, 1902, and assistant-instructor at the school of War, 1906. Although his fame as instructor was great, he was not made colonel till 1911, when he was placed at the head of the 33rd Infantry at Arras. At the opening of the First World War he was a temporary brigadier-general commanding the 4th Brigade, part of the 1st Army Corps. After being in the retreat from Belgium, 1914, P. was placed in command of the 6th Div., which fought at the Marne, and was soon afterwards in command of the 33rd Army Corps, which covered Arras. After the ineffective 'Champagne offensive,' which he severely criticised, P. was relieved of active command until 1916, when Joffre placed him in command of the army formed to relieve Verdun. Before the middle of March the Ger. advance was checked. In April P. surrendered this command to Nivelle, and took command of the armies of the centre. In May 1917 he became commander of the armies in the N. and N.E. In July 1918, the supreme command of Brit. and Fr. being how vested in Foch, P. was entrusted with the general attack by all Fr. forces. Marshal, Nov. 19, 1918, P. became a member of the Academy, 1920. Vice-president, Council of War, 1920-39, was on Council of National Defence from 1931, and war minister in Doumergue's Gov., 1931. After the Sp. civil war he became Fr. ambas. to Spain. In May 1940 Reynaud called him into his cabinet as Vice-premier, but P. had become a tool in the hands of the pro-Ger. Laval (q.v.) clique, though in June, in response to Brit. proposals, he gave an assurance that the Fr. fleet would not fall into Ger. hands. On June 16, convinced that Britain faced defeat, he asked Hitler for an armistice, but it was not until June 25 that he told the Fr. people of its humiliating terms. After this he became 'chief of the Fr. state,' abolished the republican constitution, and substituted a dictatorial system of gov. for that part of France which remained unoccupied until the allied

landings in N. Africa towards the end of 1942. Thereafter P.'s Gov. at Vichy became a mere echo of Ger. will, though in April 1941, when the Brit. forces had conquered the It. E. African Empire, he broadcast a statement that honour forbade France to take any action against her former ally. From April 1942 P.'s position as head of the state was nominal, all effective authority having passed to Laval and Adm. Darlan. He retired from the active political scene by the end of 1943. When the allied invasion of Europe began he appealed to Frenchmen to remain quiescent. Under Ger. threats P. left Vichy and was taken to Belfort and later to Sigmaringen. In April 1945 he voluntarily returned to France, where he was arrested and interned. On a charge of treason he was tried and sentenced to death, this being commuted to life imprisonment. He was taken to the Isle d'Yeu, off the Vendian coast. See G. Suarez, *Le Maréchal Pétain, 1914-40*, 1940; P. L. Michel, *Le Prince Pétain*, 1945; and A. Fabre-Luce, *Le Mystère Pétain*, 1946.

**Petaluma**, city in the co. of Sonoma, California, U.S.A., 34 mi. N.N.W. of San Francisco. Pop. 5850.

**Petch**, see PEK.

**Petchora**, or **Pechora**, riv. of Russia, rising in the Ural Mts., after a northerly course turns S.E. and then N. again, finally entering the Arctic Ocean. Its length is about 990 mi. Area of basin 130,000 sq. mi.

**Petoorde**, see PETWORTH.

**Peter, St.**, one of the twelve apostles, b. at Bethesda, on the W. side of the lake of Genesareth; during the period of Christ's ministry his residence was at Capernaum. He was married, but we are not told whether or not he had children. His name was at first Simon (or Symeon, Acts xv. 14), which was changed by our Lord into Cephas, an Aramaic word signifying a stone or rock, in *ak pe-pa*, whence Peter. In conjunction with Andrew, his brother, he followed the occupation of a fisherman. Both were disciples of John the Baptist (John i. 40 f.), by whom they were taught that Jesus was the Messiah. While following their occupation on the sea of Galilee, Jesus called them to be his disciples, promising that he would make them 'fishers of men.' P. received from Christ the 'commission of the keys' and the first place in the apostolic college. The earliest account of the Resurrection (1 Cor. xv. 5) tells of Christ's appearing 'first to Cephas, then to the twelve,' and the early chapters of the Book of the Acts show how P. continued in his position as leader. It was he who punished Ananias and Sapphira. He converted Cornelius, a Rom. centurion, the first Gentile to be admitted into the Church without circumcision. It is supposed that he afterwards preached through Pontus, Galatia, Cappadocia, Asia Minor, and Bithynia. The tradition that he then came to Rome is now generally admitted, not only by Rom. Catholics but also by the best Protestant authorities. Here he is said to have

suffered death under Nero, being crucified head downwards. See W. M. Taylor, *Peter the Apostle*, 1900; A. S. Barnes, *The Martyrdom of St. Peter and St. Paul*, 1933; A. T. Robertson, *Epochs in the Life of Peter*, 1933; and L. C. Douglas, *The Big Fisherman* (life in novel form), 1944.

**Peter I., Alexeivich** (1672-1725), tsar of Russia, generally known as Peter the Great, b. in Moscow; son of the tsar Alexis (Alexi Mikhailovich). The previous tsar, Feodor, P.'s half-brother, died in 1682 without issue, after naming P. as his successor, to the exclusion of his own full brother, Ivan. This step immediately provoked an insurrection, which resulted

PETER THE GREAT  
After Kneller.

in the coronation (July 1682) of Ivan and P. as joint rulers, with the appointment of Ivan's sister Sophia as regent. P., though brutal and suspicious, was of studious habits, and this probably protected him from the jealousy of his half-sister, the regent Sophia, who, seeing him absorbed in military exercises and other studies, had no uneasiness in regard to his ambitions. She, however, soon discovered her error, for P., contrary to her wishes, married (Feb. 1689), by his mother's advice, Eudoxia Feodorovna, and in October of the same year called upon the regent to resign. In the ensuing contest P. was at first worsted but he was speedily joined by the foreigners in the Russian service, with a Scotsman named Patrick Gordon and the Swiss Lefort at their head, the soldiery, who were his antagonist's mainstay, also flocking to his standard. Sophia was shut up in a convent, where she died in 1704. On Oct. 11, 1689, P. made his public entry into Moscow, where he was met by Ivan,

to whom he gave the nominal supremacy and precedence, reserving the sole exercise of power for himself. Ivan only enjoyed his puppet sovereignty till 1696. P.'s first care, on assuming the gov., was to form an army disciplined according to European tactics, in which labour he was greatly aided by Gordon and Lefort. He also strove to create a navy and a merchant fleet. P., thinking the possession of a portion of the Black Sea would best supply the required facilities of accessible sea-board and port, declared war against Turkey, and took the city of Azov after a long siege in 1696. Eager for knowledge he left Russia in April 1697, in the train of an embassy of which Lefort was the head. In the guise of an inferior official of the embassy he visited the three Baltic provs., Prussia, and Hanover, reaching Amsterdam, where he worked for some time as a common shipwright. To his other studies he added the study of astronomy, natural philosophy, geography, and even anatomy and surgery. On receipt of an invitation from William III., king of England, he visited that country, and for three months, spent partly in London and partly in Deptford, laboured to amass all sorts of useful information. He left England in April 1698, carrying with him Eng. engineers, artificers, surgeons, artisans, artillerymen, etc., to the number of 500. He was about to visit Venice also, when the news of a formidable rebellion of the soldiery recalled him to Russia, but before he arrived Gen. Gordon had already crushed the revolt. The Tsarina Eudoxia, suspected of complicity in the conspiracy, was divorced and shut up in a convent.

In 1700 P. entered into an alliance with the kings of Poland and Denmark to make a combined attack on Sweden. Taking advantage of the Swedes being employed elsewhere, he quietly appropriated a portion of Ingria, in which he laid the foundation of the new cap., St. Petersburg May 27, 1703, which in a few years became the Russian commercial depot for the Baltic. In the long contest with Sweden the Russians suffered a series of defeats, but P. had his revenge at last, totally routing the Swedish king at Poltava, July 8, 1709. He next prepared for war with the Turks, who at the instigation of Sweden had declared war against him. In this contest P. lost his previous conquest, the port of Azov and the ter. belonging to it. On March 2, 1712, he married his mistress, Catherine. At the end of 1710 and beginning of 1717, in company with the tsarina, he made another tour of Europe. Soon after this time he ordered the execution of his son Alexei. In 1721 peace was made with Sweden. In 1722 P. commenced a war with Persia and compelled the shah to hand over the three Caspian provs. along with the tns. of Derbend and Baku. On P.'s return to his cap., in Feb. 1722, he promulgated his celebrated law of succession, which enjoined that each tsar should nominate his successor (see PETER II.). See lives by K. Wallisowski (Eng. trans.), 1898; S. Graham, 1929;

G. Oudard (Eng. trans.), 1930; A. Tolstol (Eng. trans.), 1936; and B. H. Sumner, *Peter the Great and the Russian Empire*, 1950.

**Peter II., Alexsievich** (1715-30), tsar of Russia, b. at Moscow; grandson of Peter the Great by his only son Alexei. On the death of the tsarina, Catherine I., he ascended the throne in 1727, in accordance with a decree of Peter the Great. He died of smallpox at St. Petersburg. During his reign the three Caspian provcs., Asterabad, Gilan, and Mazanderan, which had been seized by Peter the Great, were recovered by Persia.

**Peter III., Feodorovich** (1728-62), tsar of Russia, b. at Kiel, succeeded the Tsarina Elizabeth on her death in 1762, and his first act was to withdraw from the league of France, Austria, and Russia against Prussia, restoring to Frederic II. the provcs. which had been conquered during the Seven Years war. A formidable conspiracy broke out on July 8, 1762, headed by his wife Catherine, who was proclaimed tsarina as Catherine II. by the guards, the clergy, and the nobility. P., then at Oranienbaum, was compelled to submit. He abdicated on July 10, and four days later was put to death by Orlov, one of Catherine's favourites.

**Peter II.** (1813-51), prince of Montenegro, ruled from 1830 to 1851. A statesman and a reformer, he was also a poet. He instituted a senate in 1831, revived the national printing press, and did much to civilize his people. He was the last of the Vladikas.

**Peter I., Karageorgevich** (1844-1921), king of Serbia, b. in Belgrade. He was the son of Alexander Karageorgevich and grandson of Black George, who headed the Serbian insurrection of 1804 against the Turks and who was murdered in 1817 by his rival Milosh Obrenovich, who by guile obtained his recognition by the Porte as supreme chief of Serbia. In 1883 he married Princess Zorka, daughter of the king of Montenegro. He was proclaimed king of Serbia (1903) after the murder of King Alexander Obrenovich and Queen Draga and crowned in 1904. In the First World War he was an inspiration to his troops whom he visited in the field. He shared in the disastrous Serbian retreat across Albania in 1915 and only returned to the cap. in Nov. 1918, being invited, shortly afterwards, to accept the crown of Yugoslavia, the trine kingdom of Croats, Serbs, and Slovacs. See also *SERBIA, History*.

**Peter II.** (b. 1923), king of Yugoslavia 1934-1945. On the assassination of his father, P. ruled under his uncle's (Prince Paul) regency. The latter planned to join the Axis powers in 1941, but P. led a revolt and assumed power. The Ger. invasion compelled him to seek refuge in England, where he married Princess Alexandra of Greece in 1944. Conflict with other allied govts. was caused by P.'s support of Mihailovich (q.v.) and his hostility to Tito (q.v.), and in 1945 the new Yugoslav regime abolished the monarchy. P., who had gone to Egypt as a result of his disagreement with the Allies, had his

property confiscated and was deprived of his nationality.

**Peter Canisius**, see under CATECHISM.

**Peter Damian**, see DAMIANI, PIERO, SAINT.

**Peter Lombard**, see LOMBARD.

**Peter Martyr** (1206-52), canonised in 1253, was remarkable for his zeal against heretics, against whom he worked vigorously as Grand Inquisitor. He was murdered near Como by catharists.

**Peter Martyr (Vermiglio)** (1500-62), early Protestant divine. He was in succession appointed abbot of Spoleto, principal of a college in Naples, and later prior of a rich abbey at Garcia. Becoming imbued with Protestant views, and fearing for his life, he refused to attend a council at Genoa and fled to Pisa and then to Zurich. Afterwards he became prof. of divinity at Strasburg. In 1547, at the invitation of Crammer, he came to England and was appointed to the chair of theology at Oxford. On Queen Mary's accession he returned to Strasburg, and in 1556 went to Zurich, at which place he d.

**Peter of Blois**, or **Petrus Blesensis** (1135-1205), eminent ecclesiast of the twelfth century. He was b. in Brittany and went to Paris and Bologna to study law, poetry, and oratory. On his way from the latter place to Rome, in 1163, he was taken prisoner by the partisans of the anti-pope, Victor IV. After a period as tutor to the young prince, who was afterwards William II. of Sicily, P. came to England and was made, first, chancellor to the see of Canterbury, and then appointed to the archdeaconry of Bath. On the death of King Henry P. remained in the employment of Queen Eleanor and afterwards was appointed archdeacon of London. His letters and other writings were collected by the order of King Henry II., and are interesting from the notices they contain of contemporary events and manners.

**Peter the Cruel**, see PIETRO I.

**Peter the Hermit** (c. 1050-1115), the preacher of the first crusade, was a native of Amiens. It is said that he had already visited the Holy Land before he began his tour of preaching throughout Europe, and that the work was begun on account of a vision he had received in the church of the Holy Sepulchre. He led a somewhat disorderly army eastward, and on its defeat at Nicea in 1096, he joined Godfrey of Bouillon. At the end of the crusade he returned to Belgium, where he founded a monastery of Augustinian canons at Liege. See CRUSADES.

**Peter the Venerable**, or **Peter of Montboissier** (c. 1092-1156), I. monk, and abbot of Cluny from about 1122 to his death, after which the order is said to have rapidly declined. In about 1130 he wrote his *Enchiridion seu Tractatus adversus Pictrobus*, was against the disciples of Peter of Arnyas and Henry of Lausanne, whom he charged with preaching heresy in the S. of France. He took part in the council of Pisa (1134) and is said to have been influential in securing the papal throne for Innocent II. P. is noted for befriending Abelard in his last days.

**Peterborough and Monmouth, Charles Mordaunt, third Earl of (1602-1735),** Eng. general and statesman. He began his adventurous life at seventeen by serving in the Eng. Mediterranean fleet against the Barbary corsairs. Owing to the hostility of the Eng. court he retired to Holland in 1686, returning two years later with William of Orange, whose cause he had early espoused. On the accession of William III., P. was in succession made privy councillor, first lord of the treasury, and earl of Monmouth. He was one of the Council of Nine appointed to advise Queen Mary during William's absence in Ireland (1690), and in the following year served with distinction in Flanders. After this he retired for a while into private life, mixing with the wits of that Augustan period. From retirement he returned first to politics, and by his duplicity in connection with the proceedings against Sir John Fenwick landed himself in the Tower. His detention there was short, and on the death of William he regained favour. His greatest achievement was his brilliant campaign in Spain during the Sp. War of Succession. His repeated victories were, however, nullified by the stupidity of the archduke Charles and the jealousy of his colleagues. P.'s chequered career continued into the reign of George I., and he d. at Lisbon in his seventy-third year. Macaulay has said of him that he was 'the last of the knight-errant.'

**Peterborough:** 1. City and municipal bor., situated in the administrative co. of the soke of P. mainly in Northamptonshire, but partly in Huntingdonshire, England, on the Nen, 42 m. N.E. of Northampton. It is a bishop's see and has a fine cathedral, which was formerly the church of the Benedictine monastery of Burgh. The cathedral, the third to be erected on the site, was begun in 1116. Its three-arched W. front gives it a most imposing appearance. There is every kind of architecture from the Norman to the Perpendicular period, and prior to the Reformation it was considered one of the most magnificent in the kingdom. The first monastery, called Medeshamstede, was founded by the Mercian kings Penda, Wulfhere, and Ethelred, assisted by their sisters Kyneburgh and Kineswith and by Oswy, king of Northumbria in the year 635. This building was totally destroyed by the Danes in 879 and the place lay desolate for 100 years. In 972 a new monastery, founded by Ethelwold, bishop of Winchester, was endowed by Edgar the Peaceful. Being fortified with a wall by Abbot Kenulf it acquired the name of Burgh, and so rich did it become that it was referred to by the monks as *Gildenburgh*, the golden borough. The second church was destroyed by fire in 1116 and in the following year the building of the third church was begun by Abbot John de Sais. One of the prin. builders was a former prior of Canterbury and friend of Becket, Benedict, who built the nave. The W. front was completed in the reign of John, and many additions and alterations to the building were made almost up to the time

of the surrender of the monastery in 1539, when the church was selected as one of the six cathedrals to be refounded from monastic churches in 1541 by Henry VIII., on the advice of Crommer. The city was created by letters patent of Henry VIII. on Sept. 4, 1541. Before the monastery was dissolved there had been a small mesne bor. dating back to the Norman era, the tn. growing up around the monastery. Its local administration has contained sev. unusual features, the powers of local gov. being divided formerly between the dean and chapter as lords of the manor, whose steward presided over a court leet held in and for the city, and a rival parochial authority, holding certain tn. estates, known as the *feoffees* and governors of the tn. lands and stock. In 1871 the city became a municipal corporation. It is now governed by a mayor, seven aldermen, and twenty-one councillors. There is a separate co. council for the soke of P. estab. in 1888 with ten aldermen and thirty councillors. The justices of the liberty of P., who exercise their jurisdiction in the city and soke, when sitting in quarter sessions, claim all the powers of a judge of assize but would not exercise their right to try a case of murder. The marquess of Exeter is hereditary lord paramount, an office equivalent to that of lord lieutenant in another co. He also holds the office of *custos rotularum* for life by a grant from the Crown. He is the chairman of the co. council and chairman of the justices in quarter session, though he has appointed the P. co. court judge as his deputy to preside at the sessions.

Amongst events in the early hist. of P. may be mentioned the sacking of the tn. and monastery by Hereward and the Danes in 1071, and the share of the abbey tenants in the peasants' revolt during the reign of Edward II. Catherine of Aragon, the wife of Henry VIII. lies in the cathedral, and Mary Queen of Scots lay buried here for a quarter of a century. In 1643 the cathedral was despoiled by Cromwell and his soldiers, who destroyed most of the monuments and stained glass.

P. is a well-built city, containing many fine buildings and is kept remarkably neat. There is a large market place, markets being held on Wednesday and Saturday. The chief trade of the city is engineering, and the manuf. of acric. machinery, turbines, and Diesel oil engines. There are cattle and corn markets, the well-known fair known as Bridge Fair held during the first week in Oct., and also a famous acric. and hound show in July. The city is a junction of the Midland Region and the N.E. Region railways, and in connection with the latter has large workshops for the manuf. of railway plant. There are also manufs. of bricks in the city at Dogsthorpe and in the dist. adjoining the city in Fletton, Whittlesey, and Etc., besides minor industries. P. formerly sent two members to Parliament but it now forms part of the P. Northamptonshire parl. div. Its pop. is about 45,000.

2. City of Ontario, Canada, adminis-

trative centre of P. co., on the Otonabee R., 70 m. N.E. of Toronto and 28 m. N. of Lake Ontario. It is an important manufacturing centre, with eighty-five industries employing 10,000 persons, with ann. production valued at more than \$90,000,000. It has the largest cereal mill in the Brit. Commonwealth (Quaker Oats) and the largest electrical apparatus plant (Canadian General Electric). It specialises also in the manu. of canoes and boats, motors for watercraft, and clocks and watches. Other products include dairying equipment, yarns, rugs and carpets, woven labels, locks and hardware, food beverages, meat products, canned foods, electrical motors, and finished wood products. The largest deposit of nepheline, used in the manu. of glass, in the world is being mined N. of the city and the refined product is shipped to the glass industry over the world. It is the centre of a beautiful lake dist. which annually attracts thousands of visitors from the U.S.A. and Canada for summer recreation. It is on the Trent Canal, an inland waterway, joining Lake Ontario with Georgian Bay, and the largest lock in the world is at P. It is the chief commercial centre for central Ontario and its stores supply a marketing area containing more than 150,000 persons. Much of the electrical power is developed near by along the Otonabee R. Pop. 35,500.

**Peter, First and Second Epistles of.** These two epistles must be considered quite separately: 1 Peter seems to have been written especially to Gentile Christians, but there is no sign of the early dispute about the observance of the law. Though purporting to be the work of St. Peter, its tone is distinctly Pauline, and this, with certain other difficulties, has led to its being regarded as spurious by sev. important modern critics, e.g. Davidson, Julicher, and Harnack. During the early ages, however, it was received without question, and even now it is less difficult to accept the epistle as the genuine work of St. Peter than to accept any of the various theories propounded by its adversaries. With 2 Peter the case is different. No certain trace of this epistle is found in the Christian literature of the second century. During the third century it was received by certain churches, but we find mention of the doubtfulness of its authenticity in such writers as Origen, Eusebius, and Jerome. It is thought to be a work of the second century, a production of the school that also produced the *Apocalypse of Peter*. For both epistles see the articles by F. H. Chase in Hastings' *Dictionary of the Bible*, where also a full bibliography is given.

**Peterhead**, seaport and burgh of E. Aberdeenshire, Scotland, in Buchan dist., on the N. side of P. Bay. Keith Inch, cut off by the harbour from the tn. proper, has fish-curing (chiefly herring) establs. White fishing has developed since 1945. The celebrated 'P. red granite' is quarried. Shipbuilding, granite-polishing, woollen manu., and fish and vegetable canning

are among the chief industries. The national 'harbour of refuge' was begun by convict labour (1886) and the S. breakwater was completed by 1921, but work is still proceeding on the N. breakwater. There is a submarine cable between P. and Egersund in S. Norway. Pop. (estimated) 13,000.

**Peterhof**, tn. and summer resort of Leningrad, on the S. shore of the gulf of Finland. Prior to the revolution it was noted for its fine imperial palace and park (1720). 'Monplaisir', built by Peter the Great in the style of Lénâtre with parterres, groves, alleys, water theatre, and bronze fountains, contained interesting relics of himself, Catherine II., and Elizabeth. The palace was ruined by Ger. guns and bombs in the Second World War, and in 1943 all that remained was a shell of blackened, pitted walls. The Gers. even wrecked the water system supplying the fountains. The fountains themselves, including the celebrated Samson, were sent to Germany as scrap metal.

**Peterhouse**, see PETER'S COLLEGE, ST., CAMBRIDGE.

**Peter I. Island**, in the Antarctic, is 9 m. long, 1 m. wide, with a height of 1000 ft. It was the first land to be discovered S. of the Antarctic Circle, by Captain F. von Bellinghausen of the Imperial Russian Navy. A certain confusion was later caused in cartography by alternative naming of the is. in this area.

**Peterloo Massacre**, name given to the happenings of Aug. 16, 1819, in Manchester. On that date a large body, principally composed of workmen, held a meeting in favour of parl. reform, under the leadership of Henry Hunt. The magistrates ordered the meeting to be broken up by the military, including sev. troops of horse; as a result eleven lives were lost and many persons wounded. The meeting took place in St. Peter's Field (now the site of the Free Trade Hall), hence the name Peterloo (in imitation of Waterloo).

**Peteromys**, see FLYING SQUIRREL.

**Peters**, or **Peter**, **Hugh** (1598-1660), Independent divine, son of Thomas Dyckwoode, otherwise P., and of Martha, daughter of John Trellify of Fowey, Cornwall, educated at Trinity College, Cambridge. He emigrated to Holland and then to New England, estab. a colony at Saybrook, Connecticut, and was a co-founder of Harvard College. He became the minister of the first church at Salem, Massachusetts. P. returned to England in 1641 to represent Massachusetts Bay Colony and served with the forces of Cromwell and Fairfax as an army chaplain. He took part in parliamentary politics and pub. many pamphlets and, in 1660, at the Restoration, was tried as a regicide and executed. His name for long was anathematised, but to the adherents of the lost cause he seems to have always been lenient and his acts of kindness to some of the Royalist clergy are recorded in Walker's *Sufferings of the Clergy*. His writings and the pubs. in print and MSS. relating to his life are described in the *Bibliotheca Cornubiensis*.

**Peters (Peeters), Jan** (1625-77), Flem. marine painter. The 'Port of Oran' is his masterpiece, and his 'Destruction of the English Fleet at Chatham, 1667', is at Amsterdam.

**Petersburg:** 1. City and port of entry of Virginia, U.S.A., on the Appomattox R., 22 m. S. of Richmond. There are cotton, silk, tobacco, flour, and machinery manufs. and fine granite quarries. During the Amer. civil war P. was almost the last stronghold of the Confederate Army, being defended by 9 m. of fortifications. Against P. Gen. Grant entrenched the Federal Army, and the siege lasted nine months from July 1861. The Federal losses before P. amounted to some 10,000. The present pop. of P. is 30,600. 2. Municipality of Dalhousie co., S. Australia, 70 m. from Port Augusta. It is an important railway junction, connected by rail with Adelaide and other tns. Pop. 2,500.

**Petersburg, St.,** see LENINGRAD.

**Peter's College, St., Cambridge,** or **Peterhouse**, was founded in the latter part of the thirteenth century by Hugh de Balsam, bishop of Ely, for a master and fourteen fellows. By the statutes of 1882, the foundation was changed to consist of a master, eleven fellows, and twenty-three scholars. There is a large number of scholarships, of which twenty-three are open. The list of masters dates from 1290.

**Petersfield,** urban dist. and mkt. tn. of Hampshire, England, 10 m. N.N.E. of Portsmouth. It has a medieval church. Bedale's school, a co-educational estab., is near to P. Pop. 6700.

**Peter's Pence,** also called **Romescot, Rom-lech**, tax or tribute imposed by the pope on the Eng. at the beginning of the tenth century, of a penny for every hearth or house, payable at Laumas Day (Aug. 1). From England the practice spread to other countries of Europe. The anti-papal feeling in England which, in the reign of Edward III., caused the passing of the Statute of Provisors, and in Richard II.'s the Statute of Praemunire, did not alter the fact that the pope received an ann. sum of £200 as composition for P. P. during that period, although the tribute was temporarily stopped for a short time in the reign of Edward III. The payment of P. P. and other papal exactions was finally forbidden by an Act passed in 1534. P. P. revived by Pius IX. is now paid as a voluntary offering by Catholics throughout the world.

**Peter's, St.,** church in Rome, see ST. PETER'S.

**Peter the Great Gulf (Bay),** or **Golden Horn Bay**, wide inlet of the sea of Japan, on the coast of Primorskya, Manchuria, stretching from the Tumen R. (Korea frontier) to Cape Povorotny. Vladivostok, a terminus of the Trans-Siberian Railway, is its chief port.

**Peter the Great Mountains,** or **Periokh Tau**, range of Karategin, E. Bokhara, Central Asia, E. of the Vakhsh or Surkhob valley, forming a W. extension of the N. Pamir. The highest peaks are about 18,000 ft., and there are sev. glaciers.

**Pethick-Lawrence, Frederick William**, first Baron (b. 1871), Brit. statesman, educated at Eton and Trinity College, Cambridge, became a barrister. He ed. the *Echo* (1902-5), the *Reformer's Year Book* (1904-8), and the *Labour Record and Review* (1905-7). In 1901 he married Emmeline Pethick, assuming her surname, and was prominently associated with her in the feminist movement, being imprisoned in 1912 for his activities in that connection. Elected Labour M.P. for W. Leicester 1923-31, he was financial secretary to the Treasury. He took part in 1931 in the Indian Round Table Conference in London. As secretary of state for India, 1945-47, he visited India as a member of the Cabinet mission and took part in the independence negotiations. He was created a baron in 1945. His autobiographical *Fate has been Kind*, appeared in 1943, and he has written on economic matters.

**Pethick-Lawrence, Lady (b. 1867),** Eng. leader of the women's suffrage movement. Emmeline Pethick was b. in Bristol, and after sev. years of social work in the E. End of London married F. W. Lawrence (later Lord P.), editor and proprietor of the then London evening paper, the *Echo*. Became, with her husband, a socialist, and in 1906 was made honorary treasurer of the 'militant' women's suffrage organisation, the Women's Social and Political Union, a position she held till 1912. She was sev. times imprisoned for events connected with the suffragette agitation. In 1913 she became joint editor with her husband of the paper founded by them, *Votes for Women*. She wrote *My Part in a Changing World* (1938).

**Pethidine**, synthetic drug with the formula  $C_{15}H_{17}O_2N$ -Hcl, used as an analgesic and as a substitute for morphine, though it is less powerful than the latter. It is useful in childbirth and in asthma, since it causes relaxation of unstriated muscles. The dose is 1 to 1 gr. (10 to 60 mg.) by intramuscular injection.

**Petiole**, leaf stalk of a plant. It is usually cylindrical and narrow, though occasionally it is elaborated into very remarkable forms, such as the pitchers of pitcher plants.

**Pétion**, or **Péthion, de Villeneuve**, Jérôme (1753-94), Fr. revolutionist, b. at Chartres. He was prominent as a member of the Jacobin Club and fellow worker of Robespierre. Chosen mayor of Paris (1791) in preference to La Fayette, he then became Girondist deputy to the Convention (1792-93), but was accused of being an accomplice of Dumouriez and proscribed. The exact manner of his death is unknown. See *Kurzer*, 1793; C. A. Duhan, *Mémoires inédites*, 1866. See life by J. B. Reynaud-Warin, 1796; A. de Lamartine, *Histoire des Girondins*, 1847; and C. Vatel, *Charlotte Corday et les Girondins*, 1872.

**Pétis de la Croix, François** (1653-1713), Fr. orientalist, b. in Paris, son of François (d. 1695). He became prof. of Arabic at the Collège Royal, Paris (1692). He trans. *Histoire de la Sultane de Perse et des Vizirs*, from the Turkish tales of

Cheikh-Zadeh (1707); *Mille et un jours* (1710-12); and *Histoire de Tiamoor* (*Tamerlane*) (1722) from the Persian. See J. M. Quorard, *La France Littéraire*, 1827-64.

**Petit Brabançon**, see GRIFFON BRUXEL-LOIS.

**Petition of Right: 1.** The constitutional incans by which alone, until recently, the subject could obtain legal relief against the Crown was by P. of R., for the legal impenetrability of the king, coupled with the fiction that the courts are his own, operated to make it impossible for the subject to sue him by the ordinary means of an action at law. A P. of R. was presented to the Crown through the Home Office, which latter office transmitted it to the attorney-general. Relief by P. of R. could be claimed only for money due under a contract, whether for liquidated or unliquidated damages, or for restitution to or compensation for property of which the Crown had obtained possession; but never for a tort (*q.v.*) alleged to have been committed by the king. Where a tort had been committed by any servant of the Crown, the appropriate remedy was (and is) by action against the servant personally. The Labour Gov., after the Second World War, introduced the Crown Proceeding Bill, to bring the state within reach of the ordinary citizens under the ordinary processes of the law in the courts. This Bill passed the House of Lords and its second reading in the Commons in 1947.

**Petition of Right** (1628), document embodying parl. demands and presented to Charles I. in 1628 by the Commons. In view of certain unconstitutional practices of Charles the Commons met and resolved themselves into a Committee of Grievances to consider 'the liberty of the subject in person and estate.' The prin. matters discussed were (i.) illegal exactions under the name of loans; (ii.) the arbitrary commitment of those who refused compliance, and especially the recent decision of the king's bench remanding Sir Thomas Darnel and others upon a *habeas corpus*; (iii.) the billeting of soldiers on private persons; and (iv.) the infliction of punishment by martial law. After passing resolutions on the liberty of the subject in these respects the Commons applied to the Lords for a conference, in order to agree on a petition to the king for a declaratory confirmation of these liberties. There followed two months of delay and equivocation by the king. Coke warned the House to proceed by Bill. 'The king's answer is very gracious; but what is the law of the realm?' he asked. 'That is the question. I put no diffidence in his majesty; but the king must speak by record, and in particulars, and not in general. Let us put up a Petition of Right: not that I distrust the king; but that I cannot take his trust, save in a parliamentary way.' The P. of R. was then drawn up by the Commons. The Lords vainly proposed an amendment but eventually passed the petition without any material alteration, and it awaited only the royal assent to acquire the force of law. After further equivocation the king

grudgingly gave the assent in the customary form.

**Petitions.** The right of petitioning the Crown and Parliament, one of the most valuable possessed by the subject, seems to have been exercised from the earliest times. But for many centuries it was practically restricted to P. for redress of private and local grievances, and the remedies sought were such as have since been provided by courts of equity and by private Acts. The practice of petitioning on political subjects came into vogue during the period of the Great Rebellion, many P., signed by large bodies of people, being presented both to Charles I. and the Long Parliament; and it was probably the recollection of the intimidation exercised by numerous bodies of petitioners in the early days of the Long Parliament that led to the passing of the restraining Act of 1661 against 'tumultuous petitioning.' By this Act it was enacted that no petition (unless the contents had been previously approved by three justices of the peace or a grand jury) should be signed by more than twenty, or delivered by more than ten, persons. By the Bill of Rights the right of the subject to petition the king was expressly sanctioned; but the Commons for a long time showed themselves intolerant of a free expression of opinion, and most jealous of any semblance of interference with their functions. The above mentioned Act of Charles II. has long been practically a dead letter and in ordinary circumstances no one thinks of enforcing it or of inquiring, when a petition is presented, whether its conditions have been complied with.

The procedure of the Eng. House of Commons requires the following rules, *inter alia*, to be observed in the introduction by members of public P.: (1) They must be written, not printed or typed; (2) must be signed by the petitioners and addressed to the House of Commons; (3) must contain no interdictions or excommunications; (4) no documents must be annexed; (5) must be temperately worded; (6) must contain no references to debates in Parliament or to notices of motion not set down in the paper; (7) P. for any sums relating to the public service can be presented only by leave of the Crown; and (8) P. in a foreign language must be accompanied by a trans. The introducing member is responsible for the observance of all rules relating to a petition. All P. are referred to the Public P. Committee. No action for libel can be brought with respect to the contents of a public petition, presented to Parliament. See J. H. Morgan, *Remedies against the Crown*, 1926, and W. S. Holdsworth, 'History of Remedies against the Crown' (in *Law Quarterly Review*, vol. xxxviii.)

**Petitio Principii**, in formal logic, that species of false reasoning which consists in tacitly assum. z the proposition to be proved as a premise of the syllogism by which it is to be proved, or, in other words, in taking the conclusion itself as one of the premises. The nature of this fallacious argumentation is popularly expressed in the phrases, 'begging the question,'

or 'reasoning in a complete circle.' This kind of fallacy frequently occurs in long arguments and in verbose metaphysical writings. Again, as Jevons points out, it is an easy pitfall for those who employ a mixture of Saxon, Lat., and Gk. words in formulating definitions, which on investigation turn out to be mere identical propositions; thus, 'Consciousness must be immediate cognition of an object, for I cannot be said really to know a thing unless my mind has been affected by the thing itself.'

**Petitot, Jean** (1608-91), Fr. painter in enamel, *b.* at Geneva. In England he met Van Dyck (c. 1634), who introduced him to Charles I. P. painted portraits of the king and his court, and made miniature copies of many of Van Dyck's pictures. A portrait of the duchess of Southampton (1612) in the duke of Devonshire's collection, is considered his masterpiece. At Paris he enjoyed the patronage of Louis XIV. The Louvre 'Gallery of Apollo' contains many of his works. See Cecilia Brightwell, *Rhynchus of Biography*, and E. Stroehlin, *Petitot et Jourdier*, 1905. **Petits Chevaux**, see ROUTIER.

**Petkov, Nicolai** (1889-1947), Bulgarian politician, *b.* near Sofia, and a lifelong member of the Agrarian party. After the murder of Stambulski (*q.v.*) in 1923 he spent some years in prison and in concentration camps on account of his opposition to the dictatorship of King Boris and his associates. A strong opponent of Nazism, P. was one of the founders of the Fatherland front (see BULGARIA, *Historical*), signing the Moscow armistice which brought Bulgaria into the war on the side of the Allies (Sept. 1944). When the Fatherland front was formed, P. became deputy Premier, but resigned in Aug. 1945 and went into opposition, thus incurring the enmity of the Communists, who had previously been his colleagues. The elections of 1946, despite intimidation of the opposition, brought the Agrarians about one-third of the votes cast and P. publicly declared that Bulgaria should be governed by an Agrarian-Communist coalition. He was arrested in June 1947 and charged with complicity in a military conspiracy, which he strenuously denied. The conduct of the trial led to a strong protest by Britain and the U.S.A., but P. was sentenced to death and, after the Soviet Gov. had rejected the Anglo-Amer. requests for consultations with a view to the revision of the sentence, he was executed and the Agrarian party dissolved.

**Petőfi, Sándor (Alexander)** (1823-49), national poet of Hungary, *b.* at Kis Kőrös, who favoured a simple and romantic type of poetry. After a somewhat stormy youth, he settled to a literary career at Pesth (c. 1845), and in his patriotic songs (1847) showed his sympathies with the Hungarian revolutionists. In recognition of his stirring lyrics and odes he has been called the 'Hungarian Burns.' *Talpra, Magyar!* (1848) roused tremendous enthusiasm. Among his chief collections of lyrics may be mentioned (titles trans.) *Pearls of Love* (1845);

*Starless Nights* (1845); and *Clouds* (1846). His *Collected Poems* appeared in 1846; A. Haas's ed. 1892-96; and Sir J. Bowring's Eng. trans. of selections in 1866. See lives by A. Fischer, 1889, and U. Norsa (Rome), 1923.

**Petra** (Biblical *Sela*), anct. city of Arabia Petraea (N.W. Arabia), once cap. of the Idumeans and later of the Nabataeans. On the site is the modern Wadi Musa, 70 m. from Akabah. It stood in the bed of a rocky gorge between the Dead Sea and the N.E. extremity of the Red Sea. Edward Lear (*q.v.*) made an expedition to P. which he knew as the home of the children of Esau, cap. city of the fabled Arab race, the Nabataeans. The monuments of P. are both classical and pre-classical; here the Assyrian influence meets the Gk. After the crusaders lost the stronghold of P. to Saladin, P. vanished from the maps and lists, and even the memories of men; until in 1812 Burckhardt rediscovered the abandoned city of stone, a solitude of facades, obelisks, stairways, and passages, an inhuman deadness of nature that was once the site of the Nabataean metropolis. Enclosed in mountainous iron cliffs it presents to-day a ghastly waste of monuments of a sumptuous barbaric art. One of the most impressive of these is the temple of El Deir, entirely hewn from the living rock, and the amphitheatre. See G. Dalman, *Petra und seine Felsheiligtümer*, 1909, and *Neue Petra-Forschungen*, 1912; A. B. W. Kennedy, *Petra, its History and Monuments*, 1925; and G. and E. Horsfield, *Sela-Petra*, 1935.

**Petrarch, Francesco Petrarca** (1304-74), It. poet and leader of the revival of learning, was the son of Ser Petrarco Parenzo of Florence, a jurist and official of state. He was *b.* at Arezzo. In 1312 he went with his parents to Avignon, the seat of the papal court. He began to study law at Montpellier, and subsequently at Bologna, but the profession was repugnant to his poetic temperament, and to his passionate admiration for classical literature, in which Cicero and Virgil were his chief models. In 1326 he returned to Avignon and was ordained, but his interests and mode of life continued secular. In 1327 he for the first time saw Laura, who was the ideal love of his life. She died in 1348, and is only known by the sonnets (*Canzoniere*); who she was is wholly uncertain, and the early biographies never refer to her. She was the chief inspiration of P.'s sonnets, which were his greatest contribution to It. literature, and moulded the lyric poetry of the Renaissance. At Avignon he came under the protection of the Colonna family, whose service he entered. After 1333 he travelled widely but he soon sought the retirement he loved best at Vaucluse, near Avignon. Here he conceived the project of his poem, *Africa*, written in Lat., on the subject of Scipio Africanus. He wrote most of it in 1339. In 1340 he received invitations from the univ. of Paris and from the senate of Rome to accept the laurel crown of the poet. The coronation

of P. took place on the Capitol at Rome on April 8, 1311. He was the first to receive the honour of this revived rite on the Capitol. His latter years were spent at Milan, Venice, and finally Arqua, near Padua. He had many benefices of which he enjoyed the income, and was the favoured correspondent of popes, kings (especially of Robert of Naples), and of statesmen, as well as the friend and correspondent of Boccaccio. The house at Arezzo in which he was born was regarded as a sacred place. He was anxious to bring about the return of the papal court from Avignon to Rome, and to restore Rom. independence.

PETRARCH

P.'s chief title to fame was his passion for the recovery of ant. literature, which he believed to have the power of restoring antique virtue, culture, and social order to a degraded age. He urged the rulers of his day to copy Camillus, Scipio, and the heroes of Rom. hist. He knew no Gk., his Lat. was stiff and showed little true scholarship, but he inspired the new feeling towards ant. studies and more than any one man determined the bent of the intelligence of the young towards ant. study, his influence at Padua Univ. being remarkable. He warred against the medieval conception of life, especially against all terrifying superstitions, and against astrology. He died, leaving many illegitimate children, at Arqua, a small tn. in the Euganean hills, where he is buried. His *Letters* (in Lat.) fill 5 vols. He wrote *De remediis utriusque fortune*; *De viris illustribus*; *Carmen Bucolicum*; *De contemptu mundi*; *Libri rerum memorandorum*. His lt. poetry, which greatly influenced Eng. and Fr. love poetry, consists of the sonnets, *Canzoniere*, or *Rime in vita e morte di Madonna Laura*, and the allegorical *Trionfi*, or *Triumphs of Love*,

Death, Chastity, etc. A complete ed. of P.'s works (*Edizione Nazionale*) is in course of pub. at Florence (first vols. pub. 1926). See E. de Sanctis, *Saggio critico sul Petrarca*, 1869; G. Korting, *Petrarcas. Leben und Werke*, 1878; P. de Nolhac, *Petrarque et l'humanisme*, 1892, 1907; M. F. Jerrold, *Francesco Petrarca*, 1909; E. H. R. Tatham, *P. Petrarca*, 1925; and N. Sapegno, *Il Trionfo*, 1934.

**Petrel** (*Procellaria*), genus of oceanic birds, including the albatross, diving 's., flat-billed P., Shearwater P., and fulmar P., all of which have a hooked bill, rudimentary hind toe, and tubular nostrils. The best-known member is the stormy P. or 'Mother Carey's chicken,' which is the smallest webbed-footed bird known. The plumage is smoky brown with a broad band of white above the tail. Marine insects and crustacea constitute the natural food, but the bird has acquired the habit of following ships to collect the fragments that fall. It is able to run lightly over the surface of the water with the aid of its wings, and this habit has given it the name of P. after St. Peter.

**Petri, Olaus** (1497-1552), Swedish reformer, b. in Orebro. From 1525, with his brother Laurentius, he laboured to spread Lutheran doctrines throughout Sweden. They also trans. the Bible into Swedish. From 1531 to 1533 P. was chancellor to Gustavus Vasa and preacher at Stockholm (1539). He was condemned to death (1540) for refusing to reveal a plot about which he had learnt through the confessional, but was pardoned and allowed to continue as pastor at Stockholm (1543). He left writings on religious subjects, a mystery play, and *Seniska Tranika* (see ed. of 1869). Strindberg treated his life dramatically. See also J. Schuck, *Olaus Petri*, 1894.

**Petricicu-Hasdeu, Bogdan**, see HASDEU.

**Petrie, Sir William Matthew Flinders** (1833-1912). Eng. archaeologist, b. at Charlton, Kent, and educated privately. Archaeological research led to his book *Stonehenge* (1880). In 1884-86 he carried out excavations at Naukratis and Daphni, proving Gk. settlement, and discovered middle kingdom papyri in the Fayum, 1888-90; but this was transcended in importance by the discoveries at El-Amarna in 1891 and at Nakadah in 1894. In the former he unearthed the palace of Akhenaten, and valuable frescoes. In connection with the Palestine Exploration Fund, he discovered and excavated at Lachish. In 1903-5 he discovered at Tell-el-Yehudiyeh the cartwork city of the Hyksos (Nile delta). P. shared with Prof. Rosner the honour of being the greatest of Egyptian excavators. No one in England has ever excited so much interest in Egyptology or introduced so many fresh workers into the field, e.g. the papyrologists, -nelli and Hunt. But he discounted the importance of philology, being himself no philologist, and it is this that gives an amateurish quality to his *History of Egypt* and some other works. He set new standards in archaeology by his recognition of the importance

of pottery and by his personal supervision of his native assistants. It was not his good fortune to light upon such sensational discoveries as Carter's tomb of Tut-an-kh-Amen or Reisner's reburial of Queen Hetepheres. Cumulatively, however, his contribution was considerably greater and the variety of the objects found is almost incredible as the outcome of a single lifetime. P. estab. a tradition in the theory and practice of scientific excavation in Egypt, and the effect of the tradition is seen in archaeological work throughout the world. But to a wide public he was known for the new light his researches cast upon the study and interpretation of the Bible, and it is in those parts of the Bible which possess an Egyptian background that his contributions are likely to bear most fruit. P. belonged to the group of scholars who find traces of Egypt throughout the Pentateuch, as opposed to those who deny this. Apart from his attempt to make the Hyksos dominion of Egypt last for nearly 800 instead of 200 years, some of P.'s most interesting work is to be found in parallelisms which he draws between Egyptian and Heb. life. He was prof. of Egyptology at Univ. College, London, from 1892 to 1933, founded the Egyptian Research Account, and was knighted in 1923. His pub. works are *Inductive Metrology* (1875); *Pyramids and Temples of Gizeh* (1883); *Taerial Portraits and a Season in Egypt* (1888); *Historical Scarcels and Havaria* (1889); *Ten Years' Digging* (1893); *Tell el-Amarna* (1894); *Religion and Conscience in Ancient Egypt and Syria and Egypt* (1895); *Royal Tombs of the Earliest Dynasties* (1901); *Abdus*, i (1902), ii (1903); *History of Egypt* (ed. 1903-5); *Researches in Sinai* (1906); *Eastern Exploration* (1919); *Pictorial Egypt* (1920); *Descriptive Sociology of Ancient Egypt* (1926); *Hill Figures of England* (1926); *Geras* (1928); *Bethshet* (1930); *Seventy Years in Archaeology* (1931, an autobiography); *Palestine and Israel* (1931); *Egyptian Architecture* (1938); and *Egyptian Science* (1939).

**Petrifaction** is produced by such minerals as calc-spar, silica, iron pyrites, and phosphate of lime which, dissolved in water, have so acted upon some animal or plant as to penetrate every cavity of the structure. The result is a solid substance in which the most delicate parts are preserved often without signs of decay previous to or during the process. In some fossils the substance of the shell has been dissolved and a more durable mineral substituted, so that a perfect model is constructed.

**Petrified Anemone**, see (HOARITE).

**Petissage**, see under MASSAGE.

**Petrograd**, name proclaimed by the tsar for St. Petersburg, 1914, and replaced by the name Leningrad (q.v.) in 1924.

**Petrographic Province**, term used in geology to denote a portion of the earth's crust within which the igneous rocks belong, to greater or less extent, to a definitely similar suite. There are two such provs., the calc-alkali and the alkali. The calc-alkali types include porphyritic,

gabbro, diorite, and other plutonic rocks, and basalt or other lavas; the alkali prov. yields such rocks as picrite, nepheline-gabbro and soda-granite. It is suggested by some geologists that calc-alkali rocks are characteristic of folded regions, while alkali rocks may be expected to occur in dists. subject to block-faulting. The plutonic igneous rocks of the Lewisian fundamental complex and those of the Old Red Sandstone age in Scotland are examples of calc-alkali provs., while the carboniferous igneous rocks of the Midland Valley of Scotland, Devon, and Cornwall belong to an alkali prov.

**Petrography**, see PETROLOGY.

**Petrol** (Gasoline, Motor Spirit), distillate of petroleum between the limits of about 70° and 100° C. with a flash point of about 60° F. and sp. gr. 0.73; it is very volatile, evaporating at ordinary temps. With air it forms an explosive mixture, and it has come into great use for internal combustion motors; it is also used for lamps and with incandescent mantles. It consists of paraffins chiefly, pentanes and hexanes, but may also contain aromatic hydrocarbons, olefines, sulphur compounds, and other impurities according to the petroleum used in its production. P. is obtained in general from the heavy oils by a process of 'cracking,' i.e. a chemical change involving heating under pressure (sometimes with a catalyst), which results in the decomposition of the crude material into bodies with lower molecular weights. The oil to be cracked may be vaporised first, or it may be treated in the liquid state. Sometimes the resulting P. is treated chemically with such reagents as sulphuric acid, caustic soda and sodium hypochlorite, and sodium plumbite to remove sulphur compounds, after which it is distilled again. Frequently other substances are added to P. Benzene is commonly used in this connection (up to as much as 10 per cent.). If benzene is used, it must be carefully refined, or trouble will arise in blocking up the parts of an engine by decomposition products. Many devices have been tried to prevent 'knocking' when P. is used in engines. It can be avoided by ensuring a lower compression ratio, but this is accompanied by loss of efficiency.

More usually a little tetraethyl lead (see ETHYL) is added to the fuel, as well as ethylene bromide, and a lubricant. The function of the ethylene bromide is to convert the lead into a more or less volatile compound. Another anti-knock reagent is iron carbonyl. In addition to boiling points of P., other important criteria are dewpoint, colour, smell, chemical composition. Aviation spirit contains low boiling-point fractions 40-70° C.

**Petrol Rationing** came into force in the United Kingdom at midnight of Sept. 22, 1939, but modifications were made soon afterwards to provide for the additional needs of doctors and taxi drivers. An order by the Mines Dept. was made about the same time prohibiting the use of kerosene or paraffin in any motor vehicle. In March 1942 the basic petrol ration for goods vehicles was abolished and petrol

issued at the discretion of the Regional Transport Commissioners. The basic ration for private motorists, having been gradually reduced between Feb. and June 1942, was abolished altogether on July 1, 1942, after which allowances were granted only in cases of genuine need. The basic petrol ration was restored in 1945 soon after the war in Europe ended. It was again abolished in 1947 for a few months, but restored soon afterwards on a reduced scale. After the ration was restored white petrol could only be used for private cars and red only for commercial vehicles and, generally, for mechanical plant. The Motor Spirit (Regulation) Act, 1948, provided that a garage proprietor convicted of having commercial petrol in a pump not marked 'commercial' might be disqualified from his business for twelve months, and the owner of a private car convicted of having commercial petrol in his tank disqualified for holding a driving licence for a year. In addition heavy fines or imprisonment might be imposed. The loss of petrol through the 'black market' was estimated (1948) at 100,000 tons a year.

**Petroleum (Rock Oil)** natural oil composed of hydrocarbons existing at various places in the earth's crust. The existence of P. has been known for many centuries but it is only within the last hundred years that its uses have been appreciated to any extent. It is now used with its various distillates as an illuminant, as fuel, and as a source of power in internal combustion, Diesel, and sev. other types of engines. It can be safely said that the aeroplane as it is known to-day and the fast road traffic of present times owe their development practically entirely to P. P. occurs in certain geological formations, but the best supplies are from carboniferous, Silurian, and from Tertiary formations, intermediate strata providing much loss. Various theories as to the genesis of P. have been advanced such as (a) by the action of steam on carbides, (b) by the decomposition of the fatty parts of marine organisms under high temps. and pressures. This latter theory is supported by the fact that most P's are optically active, a fact which indicates their derivation from organic matter which shows optical activity. In some places P. is found at the earth's surface in the form of seepages, in others it is found trapped at greater or lesser depths in rocky formations. In the places where these seepages occurred, the P. was collected in very early days by the local inhab. for domestic use. It has been suggested that the burning fiery furnace into which Shadrach, Meshach, and Abed-nego were cast by Nebuchadnezzar was nothing more than a seepage that had become ignited. In cases where the P. has become trapped below the earth's surface, wells (see OIL WELLS) are sunk. There are indications that there were hand-dug wells in Burma in the thirteenth century. The P. recovered from these wells was not refined and its prin. use was for preserving the wood of houses and boats.

The method employed at the present day for recovery from underground reservoirs is drilling. The first well drilled by other than hand power was drilled by Edwin Drake in Pennsylvania in 1859, using a steam engine. Originally the percussion method of drilling was used almost exclusively, but this system has now been practically entirely superseded by the rotary method. Sometimes when the underground reservoir is tapped, the P. comes up under great pressure and in the early days of oil-well drilling, oil was forced into the air for a considerable height, this type of well being known as a 'gusher.' Nowadays the flow from all wells is practically always controlled. Usually the P. is pumped to the surface and then conducted through pipes (often hundreds of m. long) to the site where distillation and refining is to be carried out. Crude P. is dark brown or yellow, fluorescent and offensively odorous. From the chemical standpoint P's may contain hydrocarbons of four types—namely paraffins, naphthenes (such as cyclopentane), aromatic bodies, and unsaturated hydrocarbons. In addition to any or all of these there may be present pyridine, quinoline, phenols, resins, mercaptans, asphaltic bodies, and so on. According to the predominant hydrocarbons a P. may be paraffinic, naphthenic, aromatic, asphaltic, etc. Amer. P. is mainly paraffinic with only small traces of nitrogen and sulphur compounds. P. from Baku is of the naphthenic type and yields excellent lubricants. Rumanian P. contains a good deal of aromatic material, as does P. from Borneo, whilst Persian P. is characterised by being fluorescent, and is intermediate between paraffinic and naphthenic composition. Important factors in the description of a P. are density, viscosity, surface tension, specific heat, vapour pressure, flash point, colour, refractive index, optical activity, and heat of combustion. The crude oil is subjected to fractional distillation and refining.

Modern distillation and refining (see the article below, PETROLEUM REFINING) processes are extremely complicated, requiring very expensive plant. At various stages the processes are carried out under pressure or in a vacuum. The distillate is sometimes agitated by currents of air blown in with sulphuric acid and caustic soda to purify colour and odour, sulphur, tarry matter, and other impurities. Among the products of distillation are cymogene and chigolene with low flash points used in freezing machines, etc.; gasoline, boiling at 115° F. for vapour lamps and fuel for internal combustion engines; kerosenes, the illuminant. The residuum is further treated for heavy lubricating oils, vaseline, and wax. In the case of Great Britain only those oils with a flash point of 73° F. or upwards may be used as illuminants. As a fuel for motors and engines of the internal combustion type the products of P. have enormously increased and much is being done to render the use of the less refined oils practicable. It is being used

for locomotives and cargo vessels and in the navy. Not only is it of greater calorific value but there is less loss in practice than with coal and it implies less labour in many ways, e.g. the process of 'coaling' ships would be less troublesome. Amer. P. was first discovered in Pennsylvania, many other localities having given rise to it since, e.g. California, Texas, Ohio, Kansas, Illinois, etc., whilst a good deal has been obtained from Mexico. Russian P. has been known for a very long time, the region round Baku being noted in particular for its supply of P. P. is also found in considerable quantity in parts of Rumania, Poland, Africa, Dutch E. Indies, Japan, Iran, and Canada. In the last decade or so new important countries have entered the P.-producing field, notably Bahrain, Iraq, Kuwait, and Saudi Arabia. Small quantities are obtained in Scotland by the distillation of a bituminous shale (see SHALE OIL) which occurs there. The total world output of crude P. in 1948 was approximately 451,171,000 tons made up as follows:

U.S.A.	297,190,000 tons
Venezuela	70,116,000 "
U.S.S.R.	30,500,000 "
Iran	25,268,000 "
Saudi Arabia	19,260,000 "
Mexico	8,376,000 "
Kuwait	6,400,000 "
Rumania	4,500,000 "
Colombia	3,408,000 "
Iraq	3,153,000 "
Argentina	3,000,000 "

From 1938 to 1948 production fell in the following countries as under.

	1938	1948
Netherlands		
E. Indies	7,400,000	4,410,000
India and Burma	1,200,000	200,000
Rumania	6,900,000	4,500,000

In the case of the first two areas where production in 1948 was below that for 1938, this is due to the main producing wells having been put out of action during the Second World War. Production in Netherlands E. Indies increased from 1,000,000 tons in 1947 to 4,410,000 in 1948. See also ASPHALT; 'FLASH POINT'; PETROL. See R. N. Boyd, *Petroleum, its Development and Uses*, 1895; H. Neuburger and H. Notholt, *Technology of Petroleum* (trans.), 1901; B. Redwood, *Petroleum and its Products*, 1906; A. B. Thompson, *Petroleum Mining and Oil Field Development*, 1910; Shell Petroleum Company Ltd., *The Petroleum Handbook*, 1931, 1948 (private circulation); W. H. Enmons, *The Geology of Petroleum*, 1931; L. Gurwitsch and H. Moore, *The Scientific Principles of Petroleum Technology*, 1932; and C. Webber *The Story of Petroleum*, 1934.

**Petroleum Acts.** The Petroleum Acts of 1871 and 1879 relate to the grant of licences to keep petroleum. Petroleum (i.e. any rock oil, kerosene oil, Burma oil, oil made from petroleum, coal, schist, slate, peat, or other bituminous products) which on test gives off an inflammable

vapour at a temp. of less than 73° F. may not be kept without a licence unless kept in separate securely stoppered glass, earthenware, or metal vessels, containing not more than one pint each, to an aggregate quantity not exceeding three gallons. The licensing authorities are the dist. and bor. councils. The regulations of July 1907 exempt from licence petroleum spirit kept for or used on light locomotives; but such spirit must be kept or used in conformity with the regulations. In no case is petroleum kept for sale exempt from licence under the Act. No person other than one acting on behalf of the Crown or one holding a licence may search or bore for petroleum within the United Kingdom. Provisions for regulating boring or searching for oil are made in the Petroleum (Production) Act, 1918. Under the Petroleum Spirit (Conveyance) Regulations, 1926, the secretary of state may make regulations as to the conveyance of petroleum spirit by road and for protecting persons or property from danger in connection with such conveyance (see Statutory Rules and Orders, 1926, No. 1310, and also other regulations, 1929-32.) A number of miscellaneous powers are conferred and duties imposed by the Petroleum (Consolidation) Act, 1928: notice of ships carrying petroleum spirit must be given on entering harbour and the harbour authorities must make by-laws in respect of ships carrying spirit into harbours; the Act also provides for by-laws as to petroleum-filling stations, regulating their appearance, position, design, size, and colour. It provides for regulating classes of spirit likely to be dangerous or injurious to health; empowers gov. inspectors to ensure compliance with the Act and the issue of warrants to search for and seize petroleum spirit. Exemptions from the provisions of the Act are specified in the case of the keeping and use of petroleum spirit for motor vehicles, motor boats, aircraft, and certain classes of engines. There are provisions in the Ministry of Fuel and Power Act, 1945, on the functions of the minister for securing the effective and co-ordinated development of petroleum (as of other minerals).

**Petroleum Refining.** There are very many different types of crude oil and methods of handling them vary considerably. Therefore all that is given is an outline of the usual practice and the principles generally followed. The process of treating crude petroleum is always one of fractional distillation with subsequent chemical treatment, filtering, redistillation, and compounding of each of the fractions. The crude is introduced into stills and then heated. At various temps. vapours from the different components are drawn off and condensed, the more volatile first. The components of petroleum boil at different temps., but when the boiling-point of the first is reached the vapour will contain some of the less volatile components. Therefore a system of continuous rectification is employed whereby evaporation is effected in many successive stages and the residue

of each stage is returned to the preceding one. This results finally in the crude being split into two fractions, one containing all the low-boiling-point components, the other all the high. The heaviest fractions of crude oil would require such high temps. to evaporate that that 'cracking' (decomposition by heat) would occur. In order to avoid this distillation is carried out under vacuum, the boiling-point thus being lowered. For the very lightest fractions condensation of the vapours cannot be obtained at atmospheric pressure, so distillation is carried out under pressure which increases the boiling-point and consequently the temp. at which condensation can be obtained. Steam distillation, i.e. the injecting of steam into the oil in a still, is applied just like vacuum distillation for the higher boiling-point components, and also often in combination with vacuum distillation.

About 1912 the fractional condensation system was adopted. Under this system the oil is heated up to the highest temp. necessary to drive off all the distillate, and is then cooled down gradually so that the successively cooled fractions are lighter and lighter. The heating is carried out in a 'pipe still,' i.e. a series of tubes about 4 in. in diameter, connected together, so that the oil travels back and forth over the fire until it reaches the required temp. The heated oil, on leaving the pipe still, passes to the fractionating columns where the separation into fractions or 'cuts' takes place. These columns are long cylindrical vessels set up on end and fitted with a large number of trays of a special type.

The cracking process plays an important part in modern P. R. Cracking is a high temp. treatment which breaks up heavier or larger hydrocarbon molecules into smaller ones, often at the same time altering their internal structure. This enables a much higher gasoline yield to be obtained from the crude. Among the better known liquid phase cracking methods are the Dubbs process, Holmes-Manley process, tube and tank process, and the Cross process. The unrefined gasoline obtained requires elaborate refining before it can safely be used as motor spirit. The distillate is again distilled to obtain the following fractions: (1) a light gasoline distilling up to about 100° C., (2) a heavy gasoline distilling about 100–200° C., and (3) a gas oil fraction. The last is separated mainly with a view to economising in chemicals. The light gasoline is treated with a concentrated caustic soda solution to draw off the so-called mercaptans (sulphur compounds of relatively simple composition with a very bad odour). The heavy gasoline is treated with sulphuric acid in the same way. The fractions are also treated with other chemicals and eventually the light and heavy fractions are recombined and ready for use.

The refining of kerosene is carried out in practically the same way as that of gasoline, sulphuric acid and caustic soda again being used for the purpose. Lubricating oil is refined chiefly to obtain a

good colour and to keep the colour stable during long periods of storage. Here again sulphuric acid is used, but in order that the lubricating oil may mix thoroughly with the acid and the acid tar settle out readily, it is usual to reduce the viscosity of the oil by warming it.

Many other oils, fuels, and by-products are derived by a variety of methods.

**Petrology, Petrography, or Lithology**, science or study of the rocks is concerned with their chemical and mineralogical composition, their macroscopic and microscopic structure and their systematic classification. In the field the geologist can determine something of the external characters of a rock by means of a knife, a pocket lens and a little acid. In the laboratory, by means of sp. gr. determinations and the use of the blowpipe, the value of metalliciferous rocks can be quickly estimated. By chemical analysis a more exact estimation of the composition of the rock can be made, and from a knowledge of its bulk composition it can be suitably classified. The examination of thin slices of rocks under the microscope is one of the most important of petrographic methods. Rock sections can be made which are less than  $\frac{1}{8}$  of an inch thick. Mounted on thin glass slides (with a medium such as Canada balsam), these rock sections are examined under a microscope fitted with polarising and analysing prisms. The mineralogical constitution of the rock can then be determined, the constituent minerals being distinguished by their appearance under ordinary and polarised light, their refractive index, pleochroism, birefringence and crystalline form, etc. As well as observing the minerals of the rock in their microscopic sections, by the use of liquids of varying densities, the minerals can be separated and obtained pure from the crushed rock. This method is dependent on the characteristic sp. grs. of the various minerals.

The rocks of the earth's crust are classified as sedimentary, igneous and metamorphic. The first type are rocks which have been formed more or less exclusively under water by the accumulation of detritus and fragmental volcanic material by organic agency or by chemical action and the evaporation of saline solutions. This list includes the secondary cementing of fragmental rocks and the deposits of rock salt, gypsum, etc. As a group the sedimentary rocks show a stratified bedded or laminated appearance, and except in some calcareous rocks, a fragmental or 'clastic' structure. It is in these rocks too that fossil remains are to be found. These stratified rocks are treated petrologically under four groups: (1) Coarser detrital deposits ('arenaceous') forming sandstones, quartzites, etc. (2) The finer detrital deposits or 'argillaceous' rocks (clay, slate, marl, etc.). (3) The calcareous rocks consisting of carbonate of lime (limestone). (4) 'Pyroclastic' rocks, consisting of fragmental volcanic material (tuffs and ballustras). Coal peat, and lignite are of organic origin.

Igneous rocks, formed by the consolidation of molten magmas, are generally vitreous or crystalline, and differ from one another in character, according to the composition of the magma and to the conditions of consolidation. The composition of the rock is indicated by the essential minerals, although, under different conditions of solidification, magmas of similar composition may give rise to different mineral aggregates. In any genetic classification, however, the essential minerals necessarily are important. According to their structural features, dependent on the condition of consolidation, the massive igneous rocks are divided into three groups: volcanic, hypabyssal, and plutonic. Further they are classified as acid, intermediate, and basic according to their percentage of silica, acid rocks containing 65 to 80 per cent, intermediate 55 to 65 per cent, and basic 45 to 55 per cent.

Plutonic rocks are essentially coarse grained, and have originated during high pressure and slow cooling of the original magma. Included here are granites, which contain essentially quartz, acid feldspar (e.g. orthoclase), and mica, together with other accessory minerals like sphene, apatite, etc. Syenites contain little or no quartz. Diorites consist of soda-lime feldspar and hornblende, with accessory minerals. Gabbros, norites, and peridotites are more basic in type. Hypabyssal rocks include dyke rocks such as granophyres (acid), porphyries, phryrites, dolerites, and lamprophyres. Volcanic rocks are mainly of the lava type, the essential point being that solidification has taken place by quick cooling under low pressures. They are often glassy. Included here are rhyolites (acid), trachytes, phonolites, andesites, basalts (basic).

Metamorphic rocks are those which are formed from the alteration of existing rocks (which may be sedimentary or igneous) by percolating waters, or by heat and pressure. They are classified under (a) thermal metamorphism, where temp. alterations have caused metamorphism, e.g. schists, gneisses, chloritoid slate, marbles, etc.; (b) dynamic metamorphism, where intense pressures have been at work, e.g. many gneisses and schists, phyllites, amphibolites, etc. They often show a banded or foliated appearance, are generally crystalline, and show typical structures, etc. Thus 'Augen structure,' strained crystals, and cataclastic structure are characteristic. By the alteration of the rocks few minerals are formed (see METAMORPHISM).

Grout, *Petrography and Petrology*, 1932; P. G. H. Boswell, *On the Mineralogy of Sedimentary Rocks*, 1933; F. H. Hatch, and A. K. Wells, *Petrology of the Igneous Rocks*, 1937; F. H. Hatch and R. H. Rastall, *Petrology of the Sedimentary Rocks*, 1938; and W. H. Twenhofel and

S. A. Tyler, *Methods of Study of Sediments*, 1941.

Petromyzon, see LAMPREY.

Petronel, see PISTOL.

Petronius, Gaius, one of the chosen companions of Nero, and regarded as director-in-chief of the imperial pleasures (*Ellegantibus arbiter*). The influence which P. thus acquired excited the jealousy of Tigellinus, and being accused of treason he put an end to his life by opening his veins (Tacitus, *Annals*, xvi. 18, 19). He is said to have dispatched in his last moments a letter to the prince, taunting him with his brutal excesses. It is generally agreed that he is the author of the work, portions of which have come down to us, bearing the title *Petronii Arbitri Satyricon*. It is a sort of comic romance, often licentious, but frequently keen in its satire. The most complete fragment we possess is the celebrated *Cena Trimalchionis*. Best ed. is that by W. D. Lowe (1905), with useful notes and a trans. in Eng. prose. There is also a text and trans. by M. Heseltine, 1913.

Petropavlovsk; 1. Tn. in the N. Kazakhstan Region of the Kazakh S.S.R., on the Trans-Siberian Railway, 170 m. W. of Omsk, has a large trade in cattle and cattle produce with Bokhara. Pop. 47,000. 2. Tn. on the E. coast of Kamchatka.

Petropolis, tn. and summer cap. of Rio de Janeiro, Brazil, in the beautiful Serra da Estrella, 28 m. N. of Rio de Janeiro. It was the cap. of the state from 1894 to 1903. It manufs. silk, cotton goods, and cigars. The new hotel Quitandinha is the most expensive ever built. An Inter-Am. defence conference was held in P. in 1917. Pop. 46,800.

Petrovgrad, formerly Veliki Bečkerek, tn. of the Banat, Yugoslavia, founded in 1724. It lies on the Bega Canal and has vine and silk-worm culture. Pop. 32,800.

Petrovic Niegos, see DANILO I.

Petrovsk, see MAKHACH-KALA.

Petrozavodsk, cap. of the Karelo-Finnish S.S.R., and a port on the W. shore of Lake Onega, 190 m. N.E. of Leningrad. It has paper mills, iron mines, steel and mica works, a gov. cannon foundry and powder factory, tanneries, and brick works, and a trade in timber, corn, and fur. There is a univ. Pop. 69,700.

Petrus Damiani, Saint, see DAMIANI.

Petrus de Vineis, see VIGNA, PIERRE DELLA.

Petrus Lombardus, see LOMBARD, PETER.

Petsamo, or Pechenga; 1. Prov. of Finland, bounded on the N. by the Varanger Fjord, on the E. by Russia. Pop. 2100. 2. Port of the Murmansk Region of the R.S.F.S.R. This tn. and Pikkajärvi, to the S.W., were the scene of fighting in the Finnish-Russian war 1939-40, and both were occupied by Soviet troops. The fleet air arm, co-operating with the Russians, first raided P. in July 1941. The tn., which became part of Finland in 1920, was ceded to Russia in 1945. Pop. 1700.

Petticoat Lane, old name for Middlesex Street, in the E. of London. Running N. from Whitechapel High Street, Bishopsgate, it was the centre of a seventeenth-century colony of Fr. weavers. In later

years it became a Jewish quarter, noted for its Sunday morning open-air market for second-hand clothing. The old name was discontinued in about 1830.

**Pettie, John** (1839-93), Brit. painter, *b.* at E. Linton, Haddingtonshire. He shared a studio with Orchardson for a time, and was elected R.A. in 1873. His colour schemes are effective and his figures well handled. His works include 'The Drumhead Court-martial' (1865); 'The Body Guard,' 'An Arrest for Witchcraft' (1866); 'A Challenge,' 'A Death Warrant' (1879); 'The Vigil' (1884); 'The Chieftain's Candlesticks' (1896); 'Two Strings to her Bow' (1887). *See* life by M. Hardie, 1908.

**Petty, Sir William** (1623-87), Eng. statistician and political economist, *b.* at Romsey, Hampshire. He studied at the Jesuit College, Caen, and then returned to England and entered the R.N. In 1649 he took his medical degree at Oxford, and in 1652 became physician-general to the army in Ireland. After the Restoration he gained the confidence of Charles II., devoted his time to statistical studies, and became one of the founders of the Royal Society. He pub. *Reflections upon some Persons and Things in Ireland* (1660); *A Treatise of Taxes and Contributions* (1662); *An Essay concerning the Multiplication of Mankind* (1682); *Political Arithmetick* (1690); and *The Political Anatomy of Ireland* (1691). A collected ed., *The Economic Writings of Sir William Petty*, ed. by C. H. Hall, was pub. in 1899. *See* life by Lord E. Fitzmaurice, 1895, and M. Pasquier, *Sir William Petty: ses idées économiques*, 1913; also C. H. Hall (ed.), *Economic Writings of Sir W. Petty*, 1899; and Marquess of Lansdowne (ed.), *Correspondence*, 1928.

**Petty, William**, *see* LANSDOWNE, MARQUESS OF.

**Petty Bag Office**, defunct office of the old court of chancery (*see* CHANCERY), the clerk of which had the duties of drafting parl. writs of *scire facias* (*q.v.*), *compes d'elire* for bishops, and, indeed, all original writs passing under the great seal and commissions of sewers, lunacy, and the like. Some of these writs, says Stephen, were originally kept in a *hamper* (whence the name 'hamper office') in contradistinction to those which were kept in a little sack or bag (whence the name P. B. O.); the hamper contained writs and returns relating to the business of the subject, while the bag contained those in which the crown was mediatly or immediately concerned. All the duties formerly belonging to the clerk of the P. B. O. with respect to writs and letters patent are now, by the Great Seal Offices Act, 1874, vested in an official called the clerk of the crown in chancery or his officers; while the other duties appertaining to that office, *e.g.* enrolment, sealing, and issuing of documents and writs, and other matters relating purely to the administration of justice, are now performed by the senior clerk of the crown office dept. of the central office of the high court. *See* Halsbury's *Laws of England*.

**Petty-Fitzmaurice, Henry Charles Keith**, and William, *see* LANSDOWNE, MARQUESS OF.

**Petty Officers** in the R.N. are analogous to the non-commissioned officers in the army, a chief petty officer ranking with a sergeant-major and a petty officer with a sergeant. In the executive and engineering branches they rise through the ranks by merit and examination, and are responsible to their superior officers for the proper care of sev. portions of the ship, of groups of men and machinery. All artisan ratings automatically acquire the rate of petty officer as soon as they are qualified in their particular sphere.

**Petty Sessions**, *see* SESSIONS OF THE PEACE.

**Petunia** (from *petun*, a native S. Amer. name for tobacco, to which plant the P. is allied), genus of ann. or perennial plants (family Solanaceae), with attractive funnel-shaped flowers of a great variety of colours. They are specially valuable in hot, dry beds and borders.

**Petworth** (anct. *Peteorde*), par. of Sussex, England, 9½ m. W.N.W. of Arundel. P. House, associated with the families of Percy, Seymour, and Wyndham, was rebuilt between 1686 and 1696; it has one of the best private collections of pictures in England, including twenty of Van Dyck's portraits, and some excellent carving by Grinling Gibbons. In 1947 it was acquired by the National Trust from the third Lord Leconfield. Pop. (1931) 2,500.

**Petulls**, *see* FULAMS.

**Peutinger Map**, medieval copy of a Rom. road map made in the latter half of the fourth century A.D., which was in the library of Conrad Peutingger, a scholar and antiquary of Augsburg, upon his death in 1547. It is now in the National Library, Vienna. The map, which is more strictly a diagram of road routes, covers the Rom. Empire from Spain and Britain in the W. to India in the E. The Brit. portion is largely incomplete, but it is important as the earliest known map of Rom. Britain. It is thought that the map was brought to Europe from a monastery in Jerusalem, and that it was copied from the original in the thirteenth century.

**Pewenssey**, par. and vil., Sussex, England, on the coast, 6 m. N.N.E. of Eastbourne, has the extensive remains of the Rom. Anderida, a fort of the Saxon shore built in the second half of the third century and garrisoned until the end of the fourth. P. was the landing place of William the Conqueror, 1066, and a Norman castle, still existing, was built in the E. end of the Rom. fort. It enters the hist. of the Cinque Ports as a corporate member of Hastings. Pop. 500.

**Peveril**, or **Peak, Castle**, *see* under CASTLETON.

**Pews**, enclosed seats in churches. Church seats were in use in England some time before the Reformation, as is proved by records as old as 1450 speaking of such seats by the name of *pews*. They were originally plain fixed benches, all facing E., with partitions of wainscoting about 3 ft. high, and sides of the width of the seat, panelled or carved, the sides some-

times rising above the wainscoting and ending in finials or poppies, or else ranging with it and finished with a moulding. After the Reformation, probably under the influence of the Puritans, who, objecting to some parts of the service which they were compelled to attend, sought means to conceal their nonconformity, P. grew into large and high enclosures, containing two or four seats, lined with baize, and fitted with doors, desks, and cushions. By the law of P. in England, all church seats are at the disposal of the bishop. It appears that by common law every parishioner has a right to a seat in the church, and the churchwardens are bound to place each one as best they can. The retention of family P. ended shortly after 1850, and the renting of P. has now become less common.

**Pewsey**, tn. of Wiltshire, England, 6½ m. by road S. of Marlborough; it is an agric. centre. Pop. 2,000.

**Pewter**, alloy of lead and tin formerly used for making drinking vessels, plates, etc. According to law it must not contain any free lead (to avoid lead poisoning), which is easily soluble in acid liquors. The eutectic proportion of tin is therefore the minimum, i.e. 67 per cent. In France vessels containing over 18 per cent of lead may be confiscated. See M. Bell, *Old Pewter*, 1906; C. A. Markham, *Pewter Marks and Old Pewter Ware*, 1909; H. J. L. Masse, *Pewter Plate* (2nd ed.), 1910; H. Jenkins, *The Pewter Collector*, 1921; and H. H. Cotterell, *Old Pewter: its Makers and Marks*, 1929.

**Pezza, Michele**, see DIAVOLO.

**Pfalz**, see PALATINATE.

**Pfalzburg**, see PHALSBURG.

**Pfennig**, Ger. coin, since 1871, representing the one-hundredth part of a mark. Before the First World War one and two-P. copper coins were current; in 1915 iron pieces of 5 and 10 Ps. were issued; in 1916 aluminium pieces of 1 and 50 Ps. were coined, and later even zinc coins of 10 Ps. Thereafter nickel coins were issued.

**Pfleiderer, Otto** (1833-1908), Ger. theologian of the new school and exponent of modern Protestant N.T. criticism in Germany, b. at Stettin, near Cannstadt, P. studied at Tübingen. He occupied the chair of theology at the univ. of Jena in 1870, and at Berlin from 1875. His *Christian Origins*, pub. in London in 1906, contains some of his last philosophical ideas and exegesis. Another well-known work of his is *The Development of Theology in Germany since Kant, and its Progress in Great Britain since 1825* (trans. 1890). See lito by P. Gastrow, 1913.

**Plorzhheim**, tn. of Württemberg-Baden, Germany, on the N. border of the Black Forest, 16 m. S.E. of Karlsruhe. Situated on the R. Enz, its manufs. include clocks, cheap jewellery, chemicals, iron goods, paper, and leather. Pop. 78,700.

**Phæaciæns, or Phæacians** (Gk. Φαίακες, or Φαίηκες), mythical people mentioned in Homer's *Odyssey*, vi.-viii., as dwelling on the is. of Scheria (Corcyra or Corfu). They were visited by Odysseus on his return from Troy to Ithaca. The Cyclopes were supposed to have driven them from

Hyperia, their first home. Alcinous, father of Nausicaa, was their ruler at the time of Odysseus's visit. They lived a life of undisturbed happiness and peace, and possessed wonderful ships that needed no human guidance. See A. C. Merriam, *Phæaciæns of Homer*, 1880.

**Phædon, or Phædo** (Gk. Φαίδων), Gk. philosopher of the fourth century B.C., a disciple of Socrates. Taken to Athens as a prisoner of war (c. 400 B.C.), he became intimate with Socrates, who procured his release. He was present at the death of Socrates, as related in Plato's famous dialogue called by his name. After this he returned to Elys and founded the Elysian school, later merged in the Eretrian.

**Phædra** (Gk. Φαίdra), in Gk. legend, daughter of Minos and Pasiphaë, wife of Theseus. She fell in love with her stepson, Hippolytus, and when repulsed by him accused him to Theseus of attempting to dishonour her. Theseus called on Poseidon to destroy Hippolytus. The god accordingly sent a monster from the sea which terrified the horses of Hippolytus who was dragged along in his chariot and killed by the seashore. The truth became known after his death, and P. slew herself. Euripides' *Hippolytus*, Seneca's *Phædra*, and Racine's *Phædre* are plays dealing with the subject.

**Phædrus** (Gk. Φαίδρος), Rom. fabulist of the first century after Christ, originally a Macedonian slave, perhaps liberated by Augustus. Under Tiberius he suffered from the hostility of Sejanus, but lived to see his overthrow (A.D. 31), and probably d. in Claudius' reign. The *Fabulæ Esopæ* in iambic verse ascribed to him were first pub. by Pithagoras (1596). Later eds. were those of Bentley (1726), Orrelli (1831), Müller (1877, 1890), Schmitz and Ramavino (1884), and J. P. Postgate, 1919. See L. Hervieux, *Les Fabulistes latins*, 1884, 1893-96, and J. Bédier, *Les Fabliaux*, 1893.

**Phædrus** (Gk. Φαίδρος), Athenian of the fourth century B.C. He was a friend of Plato, one of the most famous dialogues being named after him. It is a discourse between Socrates and P., full of poetic beauty and enthusiasm.

**Phæstus** (Gk. Φαίστος), unet. Cretan city 2½ m. S.W. of Candia. From 1900 excavations have revealed a magnificent palace, with a smaller one at Hagia Triada 2 m. distant.

**Phæthôn** (Gk. Φαέθων, the shining), in the Gk. poets, often an epithet of Helios, the sun god. More usually the name of a son of Helios and Clymene. To prove his descent and gratify his ambition he persuaded his father to allow him for one day to drive the chariot of the sun, but failing to control the fiery horses came too near the earth. Zeus killed him with a thunderbolt and hurled him into the Eridanus (Poi). See G. Knaack, *Quæstiones Phæthonæ*, 1885, and Bangert, *De Fabula Phæthonica*, 1885.

**Phæton**, most commonly an open four-wheeled carriage drawn by one or two horses; there are varieties known as pony, mail, and spider P's.

**Phagocytosis** (Gk. φαγειν, to devour; κυτος

cell) is the process of ingestion of undesirable material by certain cells, the phagocytes. In the higher animals the majority of these cells are the white corpuscles, or leucocytes, in the blood. They resemble amoebæ in their mode of movement and in their ability to ingest and digest many kinds of bacteria. On this account Metchnikov introduced the theory of P. to explain immunity to disease. If the germs were rapidly ingested, disease might be prevented, and animals with active phagocytes would thus be naturally immune. If ingestion were slow, the disease would run its course, but might eventually be combated by P. Metchnikov distinguished two kinds of phagocytes, the small ones in the blood, and the larger ones in blood and in certain tissues such as endothelial cells and connective tissue. As a result of the research activated by his theory, phagocytes are now distinguished according to their function. Some ingest parasites; others flock to the surface of exposed wounds and help to form a protective covering; others force their way through the walls of capillaries in injured tissues, remove dead matter and injurious bacteria, and form the pus sometimes accompanying inflammation. Other phagocytes secrete products that kill the bacteria, while yet others may resorb the tissues of tumours, cysts, and of grafts. P. has been recognised in many animals. It was first observed by Metchnikov in the larvae of starfish and in the common water ' flea' (Daphnia). During metamorphosis the cells of tails of tadpoles first undergo differentiation and are then removed by P. In sponges phagocytes ingest obstructing and injurious particles and eject them into the water currents.

**Phalacrocorax**, large, web-footed bird. See CORMORANT.

**Phalanger**, see CUSCUT.

**Phalanx**, name given to the formation of the heavy infantry of the anct. Grecian armies. It consisted of a series of parallel columns of men standing close one behind the other, and capable of penetrating and resisting almost any other formation. The Spartan P. was the original of this formation and consisted of soldiers standing from four to eight men deep. The Macedonian P., the last of this formation, was sixteen men deep. The soldiers were armed with swords and spears, usually long pikes. They were flanked by *pelastæ* and infantry. The Romans defeated the P. by a combination of missile attacks and harassing tactics.

**Phalaris** (Gk. *Φαλάρης*) (c. 570-549 B.C.), tyrant of Agriguntum (Agrigento), Sicily, maintained his position with the aid of mercenaries. The tradition of his roasting people alive in a brazen bull is as old as Pindar. He was deposed by Telemachus, ancestor of Theron. Bentley proved the *Letter* ascribed to P. to be forgeries. See H. Bentley, *Dissertation* 1699 (new ed. 1817); E. A. Freeman, *History of Sicily*, 1891; Suidas, *Phalaris*; and Cicero, *De Officiis*, li. iii.

**Phalarope** (*Phalaropus*), genus of birds which includes two species that some-

times occur in Britain. The red-necked P. (*P. hyperboreus*) breeds mostly in polar regions, and also in the Orkneys, Shetlands, Hebrides, and W. of Ireland. It is about the size of a sandpiper, and its winter plumage is leaden grey and white, ruddy patches appearing on the neck in summer. The grey P. (*P. fulicarius*) is rather larger.

**Phalerum** (Gk. *Φαλέρου*), in anct. geography, a seaport of Attica, Greece, the port of Athens up to c. 475 B.C., when the Piræus (q.v.) to the W. replaced it. It is on a bay 3½ m. S. of Athens, now frequented as a bathing-place.

**Phallus**, representation of the male generative organ, used at certain Dionysiac festivals in anct. Greece, as a symbol of the powers of procreation. It was an object of common worship throughout the nature-religion of the E., and was called manifold names, such as Linga, Joni, Polleus, etc. Originally it had no other meaning than the allegorical one of that mysterious union between the male and female, but at a later and decadent period its worship became an intolerable nuisance, and was put down by the senate on account of the more than usual immorality to which it gave rise. The Phœnicians traced its introduction into their worship to Adonis, the Egyptians to Osiris, the Phrygians to Attys, the Gks. to Dionysus. The common myth concerning it was the story of some god deprived of his powers of generation, an allusion to the sun, which in autumn loses its fructifying influence. The procession in which it was carried about by Phallophoroi was called Phallagogia, or Periphallia, and a certain hymn was sung on that occasion called the *Phallickon Melos*. Aristotle traces the origin of comedy to the ribaldry and the improvised jokes customary at those festivals. Before the temple of Venus at Hierapolis there stood two phalli, 180 ft. high, upon which a priest mounted annually and remained there in prayer for seven days. The P. was an attribute of Pan, Priapus, and to a certain extent also of Hermes.

**Phalsbourg** (Ger. *Phalsburg*), tn. of the dept. of Moselle, France, 25 m. W.N.W. of Strasburg. It was originally a strong fortress. Pop. 2600.

**Phaltan**, tn. and cap. of the state of P., Bombay, India, 50 m. S.E. of Poona. Pop. 11,000. The state has an area of 39 sq. m. Pop. 71,500.

**Phanerogamia**, or Flowering Plants, one of the two great divs. of the vegetable kingdom. They have evident flowers with stamens and pistil and usually a perianth; they reproduce themselves by seeds which contain an embryo. Those that have the seeds enclosed in an ovary are Angiosperms and the others Gymnosperms.

**Pharaoch**, Anct. Heb. form of the ordinary title of an Egyptian king.

**Pharisees** (Heb. *פָּרִישִׁי*, separated; Gk. *Φαρισαῖοι*), religious party among the Jews, first achieving prominence during the latter half of the second century B.C., in the time of John Hyrcanus. They were opposed to the secularising of the

high-priesthood, which had so long been increasing, and were characterised by the stress they laid upon the eternal, permanent, and unchanging nature of the law, and upon the separation between Israel and the Gentile races. They did much service to their people by their uncompromising patriotism and by their opposition to the liberal opinions of the Sadducees; but they rapidly became the slaves of formalism, and their very servitude rendered them overweening in their pride as the only observers of the law. See E. Schurer, *History of the Jewish People in the Time of Jesus Christ*, 1886-1890.

**Pharmaceutical Society**, Brit. society, which was founded in 1841 to protect the interests of chemist- and druggists and to increase their usefulness to the community. In 1843 a Royal Charter of Incorporation was granted which set out the four objects of the society as being the advancement of chem. and pharmacy, the promotion of a uniform system of education, the protection of those carrying on the business of chemists and druggists, and the provision of a fund or funds for benevolent purposes. Up to the end of 1933 the society was a voluntary association with membership restricted to registered pharmaceutical chemists and chemists and druggists. With the passage of the Pharmacy and Poisons Act, 1933, however, the voluntary nature of the society ended and every person who passes the appropriate examination and becomes registered in one or other of the above classes automatically is a member of the society. The present membership is nearly 26,000. Under the Pharmacy Acts of 1852 and 1868 the P. S. conducts examinations, registers successful candidates, and by the Pharmacy and Poisons Act of 1852 to 1933 institutes proceedings when the law is contravened. In 1842 it founded a school of pharmacy, now a school of the univ. of London. The P. S. has a library of nearly 20,000 books, reports, etc., and a museum of *materia medica*, and publishes the *Journal of Pharmacy and Pharmacology* and the *Pharmaceutical Journal*.

**Pharmacognosy**, or *Materia Medica*, knowledge of drugs, particularly as regards their origin and their condition in the unprepared state; *pharmacy* is the compounding, use, and administration of drugs as medicines, whereas *pharmacology* (*q.v.*) is the scientific study of drugs and their mode of action. Formerly most drugs were obtained from natural sources, especially plants, as for instance digitalis from the foxglove, ergot from a fungus which parasitises rye, and cocaine from the leaves of the coca plant. Nowadays many drugs are prepared synthetically, though natural products are still important. See T. I. Williams, *Drugs from Plants*, 1949.

**Pharmacology**, in its widest aspect, is the science concerned with change effected in the function of living material either by the direct action on it of chemical compounds or by their effect on its environment. P. is now generally restricted to the science dealing with the

effect of drugs on man. The first treatise known on P. was that of Dioscorides (c. A.D. 60), and on it all subsequent pharmacopœias have been founded. It was trans. and extended by the Arabs and Persians, who were the authorities on P. in the Middle Ages, and who made some attempts at classification according to the action of the drug. Little advance in P. was made in Great Britain until the seventeenth century, when a series of pamphlets was pub. describing the action of drugs from America and the Far E. Amongst the drugs described were ginseng, salap, and ipecacuanha. In the eighteenth century Anton Stœrck of Swabia investigated and advocated the use of emetics and certain alkaloids; Purkinje experimented on himself to test camphor, belladonna, stramonium, and turpentine; François Magendie (1783-1855) made medical use of compounds of bromide, iodine, and of morphine, strychnine, and other alkaloids. The nineteenth and twentieth centuries have witnessed the discovery of new drugs and the sifting of old ones. Many have been removed from the pharmacopœias as a result of the critical tests made to determine their efficacy. In Germany, U.S.A., and England numerous experiments have been made to discover the effect of various drugs on animals and the maximal and minimal doses. This work has yielded valuable information, but the results must be used with caution, for the effect of a drug on man may be very different from its effect on other animals. The action of drugs on the endocrine organs has been fully investigated.

Since rational treatment of disease must depend on knowledge both of the disease and of the drug and its action, P. is dependent on pathology, chem., and physiology (*q.v.*). Investigation of the action of drugs is made difficult by the fact that drugs acting in very different ways may apparently produce the same effect. The heart, for example, may be accelerated either by drugs paralysing the vagus nerve fibres, or by drugs exciting the sympathetic fibres. Difficulties arise also in connection with the classification of drugs. That at present adopted is based on both chemical and physiological considerations, for attempts to use either separately, or to use a botanical classification, result in grouping together drugs either of different constitution, or of different action, or both. The method of administration of the drug and the size of the dose are also included in the study of P. See MEDICINE; MATERIA MEDICA; PENICILLIN; PALUDRINE; SULPHONAMIDES. See W. E. Dixon, *Manual of Pharmacology*, 1925; J. A. Gunn, *Introduction to Pharmacology and Therapeutics*, 1929; W. Straub, *Lane Lectures on Pharmacology*, 1931; C. Solomon, *Pharmacology, Materia Medica and Therapeutics*, 1934; W. T. Taylor and R. J. Woher, *Laboratory Manual of Pharmacology*, 1948; and F. K. Oldham, F. E. Kelsey, and E. M. Gelling, *Essentials of Pharmacology*, 1948.

**Pharmacopœia**, book containing formu-

lar for the preparation of compound medicines, especially such a book recognised as a standard. Hist. does not definitely record when the first P. was pub. The first ed. of the Chinese *Materia Medica* is said to have been prepared about 3000 B.C. by the emperor Shen Nung. The Ebers papyrus was written some 1500 years later. Books on materia medica were produced by Theophrastus (380-286 B.C.), Scribonius Largus (A.D. 45), Dioscorides (c. A.D. 60), Galen (A.D. 130-200), and others. Some authorities aver that the first real P. was the *Nuovo receptario composito*, which was made official in Florence at the close of the fifteenth century, or the work prepared by Valerius Cordus which was adopted officially by Nuremberg (in 1516), or that prepared by Adolph Oeco in 1564, which was actually called a P. and made official in Augsburg in 1613. But these books were only 'official' in small terms. The Royal College of Physicians was the first body to prepare a P. which became official throughout the whole country. The project was first discussed in 1585 and, after considerable discussion, the first issue of the P. was produced in May 1615. Only two copies of this issue are known to exist. This was the first *London Pharmacopoeia*, and the colleges at Edinburgh and Dublin issued similar works, revised periodically, commencing in 1699 and 1807 respectively. The disadvantages and dangers of three separate authorities with different names and different standards of strength for their preparations led Parliament to provide, by the Medical Act, 1858, for the pub. of the *British Pharmacopoeia*. National Ps. are pub. in many countries, of which the *United States Pharmacopoeia*, revised every ten years, and the *Fr. Codex* are the most widely used.

Pharmacy deals with the sources, preparation, and supply of medicines. Persons desiring to practise P. or to use the title chemist or druggist in conjunction with retail business must be registered under the Pharmacy Acts, having satisfied the examination and other conditions of the Pharmaceutical Society (*q.v.*).

**Pharnabazus**, satrap of the Persian provs. bordering the Hellespont, who played a prominent part in Gk. hist. from 412 B.C. to 393 B.C. He was a loyal friend to Sparta.

**Pharnaces I.** (c. 190-156 B.C.), king of Pontus, the son of Mithridates IV. He waged war upon Eumenes, king of Pergamum, and Ariarathes (181-179), in which the Romans intervened.

**Pharnaces II.** (d. 47 B.C.), king of Pontus, the son of Mithridates the Great, whom he succeeded in 63 B.C. He encountered the Rom. forces under Julius Caesar, near Zela (47), and was slain in the battle.

**Pharos**, peninsula, formerly an is. off the N. coast of Egypt; and one of the seven wonders of the ant. world. On founding Alexandria, Alexander joined it to the mainland by a mole. Ptolemy II. erected a lofty tower on this is., and by the light of torches or fires shown from the

upper windows, ships were guided safely into harbour.

Another P. is that at Dover, one of the most striking monuments of Rom. Britain. With a second at Dover, and another on the cliffs near Boulogne, France, it fitted into a scheme for assisting the navigation of cross-Channel traffic. Possibly it was part of the estab. of the *Classio Italica*, the Channel Fleet.

**Pharos**, see LIGHTHOUSE.

**Pharsalus** (modern **Phersala**), tn. of ant. Thessaly, Greece, 21 m. S.W. of Larissa. In the neighbouring plain of Pharsalia Caesar won his famous victory over Pompey, 48 B.C.

**Pharynx**, cavity situated at the back of the nose, mouth, and larynx, and above

THE PHARYNX

(copied from Laidlaw)

A, Oesophagus; B, posterior part of nostrils; C, Eustachian tube; D, opening to mouth (base of tongue); E, superior opening of larynx; F, inferior opening of larynx; G, epiglottis; H, thyroid cartilage; I, cricoid cartilage; J, posterior part of larynx.

the gullet. It therefore serves as a communication between nose and mouth and as part of the air and food passages. It extends from the base of the skull to the level of the sixth cervical vertebra, where it becomes continuous with the gullet. The interior of the cavity is lined with mucous membrane, which is lined with ciliated columnar epithelium in the naso-P., and stratified squamous epithelium in the oral P. Outside this is a layer of fibrous tissue, the *pharyngeal aponeurosis*, and outside that, again, is the muscular coat. The upper portion of the cavity or naso-P. belongs to the respiratory tract, and is joined to the lower portion, or bucco-P., which belongs to the digestive tract, by the pharyngeal isthmus. The P. communicates with the middle ear by

means of the Eustachian tube, and by this means the middle ear can become infected from the P.

**Phase Diagrams**, see under METALLURGY (PHYSICAL METALLURGY).

**Phase Modulation**, see MODULATION.

**Phases**, changes in the appearance of the moon and of a planet due to the illuminated part being observed from different angles. P. increase from the dichotomous to the gibbous stage till, at opposition, the moon, or planet, is 'full,' when the process is reversed and the moon wanes to 'new.' The two inner planets, Mercury and Venus, exhibit P. similar to those of the moon. The P. of the latter can be seen with quite a small instrument, and it was their discovery by Galileo in 1610 that finally estab. the Copernican system. Of the exterior planets only Mars and a few minor planets show P., and these only gibbous.

**Phasianidae**, see PHASANT.

**Phasis**, River, in anct. Colchis, see RION.

**Phazania**, see FEZZAN.

**Phasian**, or *Phasianus*, genus of game birds which, according to modern ornithologists, contain six species: *P. colchicus*, *P. reevesi*, *P. ellioti*, *P. himis*, *P. mikado*, and *P. summurangi*. The genus is distinguished by the very long wedge-shaped tail and the absence of a crest. *P. colchicus*, the common P., was introduced from S. Russia and Asia Minor into W. Europe by the Romans, but in the greater part of Europe a true, pure-bred common P. is rare or even non-existent, because of the introduction of other species with which it has freely interbred. Of *P. colchicus* at least thirty local races are known, including the large and desirable Mongolian P., with rich red flanks, green gloss on the plumage, and a broad white ring round the neck, the ring-necked P. which, more than any, has hybridised with the common P. in Britain; and the Jap. P., distinguished by its dark green breast. The other Ps. hybridise with the varieties of the common P., but the offspring is always infertile. Reeves's P. (*P. reevesi*), a native of China, is over 6 ft. in length, and has yellow and brown spangled plumage. *P. mikado* was discovered in central Formosa in 1893; the male is ultramarine blue with a white barred tail. A number of members of other genera of the family Phasianidae are called Ps., including the golden P. (*Chrysolophus pictus*), Lady Amherst's P. (*C. amherstiae*), the pucrus Ps. the kaleke Ps., the eared Ps., and the impeyan Ps. The smallest member of the P. family is the *Ophrysia superciliosa*, the P.-quail, a native of Nepal.

**Phasant-shooting in Great Britain**. — The season for this sport begins on Oct. 1 and ends Jan. 31. Until the leaves have fallen in the covert, the birds are shot over pointers or setters on rough ground, or with spaniels in hedgerows and small plantations. From about the middle of Nov. battues are organised; the birds, which prefer to run on the ground rather than take to the air to escape danger, being driven to a point from which they

are flushed, and exposed to the fire of a double line of guns. The shooter, who is provided with his own loader, kills cocks in preference to hens, and kills only those birds in front of him. As a rule coverts can only stand three battues.

See W. B. Tegetmeier, *Phasants*, 1897, and Hon. Walter Rothschild's article in the *Encyclopædia of Sport*, 1897-98; also B. Fitzgerald, *British Game*, 1948.

**Pheidias**, or **Phidias** (c. 500-432 B.C.), sculptor of anct. Greece. He was the son of Charmides and was b. in Athens. He studied under the Argive Ageladas, or, according to another authority, under Hegias of Athens. Works which have been attributed to him are a colossal figure of Athena Promachos in bronze, the Lemnian Athena, a gilt Athena at Plataea, and the Zeus at Olympia. He had the opportunity of proving his genius when Pericles appointed him to superintend the adornment of Athens. P. planned the erection of temples and public buildings and, chief of all, the Propylæa and the Parthenon. Fragments of the frieze, metopes, and pediment of the Parthenon were brought to England by Lord Elgin, and are preserved under the title of the Elgin Marbles in the Brit. Museum. P. executed the statue of Athena in ivory and gold about 435 B.C., and six years later was accused of impiety in having introduced his own and Pericles's likeness on the shield of the goddess and of stealing the gold entrusted to him. He was cast into prison, where he d. P. is acknowledged to be the greatest of all sculptors. In beauty of conception and execution he has never been excelled. See A. S. Murray *Greek Sculpture*, 1880; C. Waldstein, *On the Art of Phidias*, 1835; and A. Hekler, *Die Kunst des Pheidias*, 1924.

**Pheidon**, king of Argos (q.v.), was the first to introduce the use of copper and silver coinage into the Peloponnesus.

**Phelps**, **Samuel** (1804-78), Eng. actor-manager, b. in Devonport. He made his début at the Haymarket in London as Shylock (1837), and was engaged by Macready. From 1844 to 1862 he and Thomas Greenwood produced at Sadler's Wells, Clerkenwell, over thirty Shakespearean as well as other 'legitimate' plays, which had great influence in raising the taste of theatrical audiences. His chief parts were Lear, Macbeth, Othello, and Sir Giles Overreach, but he also excelled in the comic characters of Bottom, Falstaff, and Shallow. See memoirs by J. and K. Coleman, 1886, and life by May Phelps and J. Forbes-Robertson, 1886.

**Phenacetin** ( $C_9H_9ONH.C_6H_5.OC_2H_5$ ), white crystalline substance obtained from para-aminophenol. It is soluble in alcohol and glycerine, but slightly soluble in water. It is used in medicine for neuralgia and headaches.

**Phenacodus**, genus of extinct ungulates in the div. Condylarthra, has been found in the Eocene of America and Europe. It was a digitigrade mammal with fifteen pairs of ribs.

**Phenic and Phenol Acid**, see CARBOLIC ACID.

**Phenobarbitone (phenobarbital, luminal)** is phenyl-ethyl-barbituric acid

i.e.  $\text{C}_{12}\text{H}_{13}\text{O}_3\text{N}_2$ . It is used extensively as a hypnotic and in the treatment of epilepsy, for its depressing action on the cortical activity of the brain. The dose is  $\frac{1}{2}$  to 1 grs. (50 to 100 mg.) by mouth or by subcutaneous injection. It has a more prolonged action than barbituric acid (evipan) which is rapidly destroyed and excreted by the body.

**Phenocryst**, see PORPHYRY.

**Phenol**, see CARBOLIC ACID.

**Phenol-formaldehyde Plastics**, see under PLASTICS.

**Phenolphthalein** ( $\text{C}_{20}\text{H}_{14}\text{O}_4$ ) is prepared by heating phthalic anhydride (3 parts) with phenol (4 parts) and a little strong sulphuric acid to  $115^\circ\text{C}$ . It is a white crystalline substance, slightly soluble in water, but dissolves readily in alcohol. It is used in volumetric analysis as an indicator for weak acids. With alkali it gives a pink coloration, but the presence of acids destroys this coloration. P. is also used in medicine as a mild purgative.

**Phenomenology** is the science of phenomena in philosophy, involving a contention that the existence of 'substance' is an illusion, that matter is no more than an indeterminate and unknown something underlying phenomena. Phenomenalism originated in Idealism (q.v.) and positivism (q.v.), and later developed into an attack upon the traditional doctrine of substance. Locke and Berkeley in a measure are phenomenologists, Berkeley holding that all objects of knowledge must be phases of mind arising from stages of perception, while Hume argued that if the supposed but unknowable substantial substratum of external sense phenomena is illusory, so is the supposed substantial ego which is stated to underlie the internal phenomena of consciousness. Modern phenomenologists adhere to the theory that there is only one normally 'conscious personality.' The subconscious mental activities of an individual are put together and called the 'subliminal' or subconscious ego or self. In abnormal cases of 'double consciousness' the subliminal self struggles for mastery over the conscious self and is, for a time, successful. P. has a close connection with the science of psychology (q.v.), especially in its bearing upon the 'subliminal self.' Indeed the connection is close enough to cause confusion between the two. In principle the two studies are dissimilar. Briefly P. tries to show that absolute knowledge as an expression of spiritual life is based upon experience, and is the final triumph, as it is the final cause, of the complete process of experience. By P. as may be gathered from the foregoing analysis, we generally understand the descriptive study of phenomena as they are immediately presented to experience. But P. may also be described as a philosophic method which makes use

of descriptions which are phenomenological in the usual sense of the word, but which regards them only as a means of seeking something that lies beyond the phenomena. The chief exponent of the phenomenological movement in this later sense of the word was the Ger. philosopher Edmond Husserl (d. 1938), who taught at Freiburg Univ. The P. of Husserl is indeed a description of the immediate data of consciousness; but whereas ordinary academic psychology allows itself to be monopolised by the object, Husserl considers the thinking subject; his psychology is a reflexive psychology. It is the very 'structures' of conscious activity that he tries to discover, e.g. 'perception,' 'distant recollection,' 'exemplification by analogy.' These structures he calls essences. But there is a radical difference between Husserl and Plato: Husserl's essences do not exist in themselves, in a separate world, as ideal types of possible things; they are factual data resulting from the relationship between objects and consciousness. Other phenomenologists who, like Husserl, see consciousness as without content, are Heidegger (q.v.) and Sartre (q.v.). See G. Hegel, *Phenomenology* (trans.), 1910; P. Coffey, *Ontology*, 1914; K. Stavenhagen, *Absolute Stellungnahmen* Erlangen, 1925; J. Hering, *Phénoménologie et philosophie religieuse*, 1925; W. Reger, *Einführung in die Phänomenologie*, 1926; and M. Farber, *The Foundation of Phenomenology*, 1943. See also G. Gurwitsch, *Les Tendances actuelles de la philosophie allemande*, 1930, and P. Foulquière, *Existentialism* (trans.), 1947.

**Phenomenon** (Gk. *φαινόμενον*, from *φαίνω*, I appear), that which appears as distinguished from that which exists. The term was once used to denote the world of sense as opposed to the world of reason, but Kant has given it a more extended connotation. In the *Critique of Pure Reason* he says: 'The undetermined object of an empirical intuition is called phenomenon. The empirical intuition is a mere phenomenon in which nothing that can appertain to a thing in itself can be found. . . . In the whole range of the sensuous world, investigate as we may, we have to do with nothing but phenomena.' See NOTION; also H. Spencer, *First Principles*, 1862.

**Phenylacetic Acid**, see CINNAMIC.

**Phenyl Carbinol**, see BENZYL ALCOHOL.

**Phenyl-methane**, see TOLUENE.

**Phenyl Methyl Ketone**, see ACETO-PHENONE.

**Pherecydes**: 1. Of EROS, an early Gk. philosopher, fl. about 514 B.C. He is said to have been the teacher of Pythagoras, and to have taught the doctrine of Metempsychosis. 2. Of Athens, one of the early Gk. logographers, was a contemporary of Herodotus.

**Phersala**, PHARSALUS.

**Phi Beta Kappa**, oldest Amer. college fraternity, formed in 1776 in imitation, apparently, of the Bavarian order of *Illuminati*, whose first head was Adam Weishaupt, prof. of law at Ingolstadt. The name, formed of three letters of the

Gk. alphabet, is generally supposed to signify the initial letters of the Gk. motto, 'Philosophy is the guide of life.' The society was founded in Virginia, at William and Mary College, Williamsburg, by a number of undergraduates, and branches of it were soon afterwards estab. at Yale and Harvard, and later in practically all the other prin. univs. of the U.S.A. The society, including past and present graduates, is governed by a national council.

**Phidias**, see **PHEIDIAS**.

**Phigalia**, anc. tn. of Arcadia, whose site is now occupied by Pavlitzia, 15 m. N.E. of Kyparissia. From its temple of Apollo were brought to the Brit. Museum the Phigalian Marbles, a frieze representing a contest between Centaurs and Lapithæ. The temple was probably built about 430 B.C. by Ictinus.

**Philadelphia** (the city of brotherly love) is the largest city of Pennsylvania and the third in pop. in the U.S.A. It lies 130 m. N. of Washington, D.C., and is situated on the Delaware R. at the junction with its great trib. the Schuylkill and 96 m. from its mouth. P. was founded by Wm. Penn the Quaker in 1682 as a city in which men of all races might live, each following, unpersecuted, his own religion. It is sometimes called the Quaker city, though the Quaker element no longer prevails. The Daughters of the Revolution, a society of great social importance, has a large contingent here. This tn. is noted, like Boston, for social exclusiveness, and though equally busy, it is a quieter and more sedate city than New York, and inclined to Conservative ideals. It is known sometimes as the 'city of houses,' and is, unlike many Amer. cities, largely composed of small houses. Its 1600 m. or so of streets are laid out, with few exceptions, with chequer-board regularity. One exception is the wide, tree-lined Parkway, completed in 1924, which runs from City Hall Square in the centre of the city to Fairmount Park, which, the best known and largest of the many open spaces, is nearly 2000 ac. in extent. The city hall, formerly the tallest building in P., is 548 ft. to the top of the statue of Wm. Penn which crowns its tower. The city is noted for its private art collections, and it has also a public gallery, housed in the Academy of Fine Arts. The free public library, founded by Benjamin Franklin in 1731, has fifteen branches in the city. Franklin, who was buried in Christchurch cemetery here, founded also, in 1750, the school that grew in 1755 into a college, and in 1779 into the univ. of Pennsylvania, which now covers 60 ac. and has 9000 students. Its medical, dental, and law schools are particularly noted. P. is celebrated for the efficiency of its elementary schools and for its normal and manual training schools, among which may be mentioned the Drexel Institute and Girard College. The Swedish church of Gloria Dei, built in 1700, is the oldest building in the city. Output of manufactured goods is exceeded only by New York and Chicago, and the city is first in the U.S.A. in the leather

trade and second in manuf. of cigars and clothing. There are large printing and publishing houses. The Baldwin Locomotive Works are the largest in America. There is a great domestic trade in grain, live-stock, fruit, lumber, etc., and a big European trade. Exports are exceeded only by New York, though the city is so far from the sea. It has a total water frontage of 37 m. on the two rivers, about 6 m. on the Delaware being occupied with its harbour, which has some 300 wharves. There is a large gov. navy yard at League Is., just above the tn. P. is one of the most historic cities in the U.S.A., and has an historical society of its own. Independence Hall Building was completed in 1735, and here the constitution of the U.S.A. was framed, and independence proclaimed, as its name indicates. In this building, too, is housed the famous Liberty Bell revered by all Amers. It was the ringing of this bell which announced to the citizens that the declaration of independence of Great Britain had been adopted. P. was the cap. of the Federal states from 1787 until 1800, and the cap. of Pennsylvania from 1683 until 1800 (Harrisburg is now the cap.). The U.S. mint was founded here in 1792. In colonial days P. was a great political centre, and here assembled the hist.-making Continental Congress of 1774. On July 4, 1776, the Declaration of Independence was promulgated here, and Articles of Federation were signed on July 9, 1778. The first cap. of the U.S.A. and its first metropolis, P. has often been compared with Boston, and, like Boston, it is a kind of mirror to Amer. hist., with a copious intellectual tradition and social aristocracy. But it is much bigger than Boston and much more heavily industrialised. It is more complex, with marked interminglings of Pennsylvania Dutch, Scots-Irish, Germ., and plain Brit. Like Boston it has a strong puritanical outlook and there is still no alcohol on Sunday, while the cinemas do not open till the afternoon. Finally P. is the only great Amer. city where the political machine is Republican. A great disappointment came to P. in 1916: the city had vainly counted on being the United Nations cap., which might have served to revivify it and renew its ant. distinction. See R. Shackleton, *The Book of Philadelphia*, 1918, and C. Morzen, *The City of Firsts*, 1926.

**Philadelphia**, city in Lydia, Asia Minor, called in honour of Atalua Philadelphus of Pergamum (c. 150-138 B.C.); the modern Ala-Shehr.

**Philadelphians**, sect founded in London in 1672 by Jane Leade and John Pordage, to explain the works of Jacob Boehme (q.v.), the Ger. mystical writer. Their doctrines stressed the necessity of contemplation, and apparently included spiritualism. They disappeared at the beginning of the eighteenth century.

**Philæ**, islet in the Nile, 5 m. S. of Aswan, in Nubia (q.v.). Length about 1200 ft.; breadth about 450 ft. It is famous for anc. temples and ruins, built by the Ptolemies and by the Rom. emperors,

chief of which are the temple of Isis, 'Pharaoh's bed' (an incomplete Rom. hall), the shrine of Harendotes, and the Propylon. See H. G. Lyons, *Report on the Island and Temples of Philæ*, 1896, 1908, and Baedeker's *Egypt*.

**Philanthropy**, see CHARITIES; CHARITY, ORDERS OF; CHARITY ORGANISATION SOCIETY.

**Philaret**, Vasilii Drosdov (1783-1867). Russian preacher, b. at Kolomna. He became bishop of Iteval (1817), archbishop of Tver (1819), and metropolitan of Moscow (1825). He wrote two catechisms (see Blackmore, *The Doctrine of the Russian Church*, 1845) and began a trans. of the N.T. into Russian. See his *Select Sermons* (Eng. trans., 1873).

**Philaethes**, Eugenius, see VAUGHAN, THOMAS.

**Philately**. In general usage P. covers both the study and the collecting of postage stamps (*q.v.*), and thus anybody who is actively interested in stamps, from whatever angle, is known as a philatelist. The word P. is derived from two Grk. words, *philo*, meaning 'fond of,' and *telos*, meaning 'exemption from tax.' It was coined by a Frenchman, M. G. Herpin, in 1866, and has long been universally accepted. Stamp collecting started in a desultory manner not many years after the introduction of the first adhesive postage stamps, the Great Britain 1d. black and 2d. blue of 1810, and though, to begin with, the hobby met with a good deal of derision, being the subject even of some caustic verses in *Punch*, it continued to gain fresh adherents, and by the end of the fifties was fairly well estab. Among the famous pioneer Brit. philatelists may be mentioned the Rev. F. J. Stadhforth, Sir David Cooper, Judge Philbrick, Dr. C. W. Viner, E. L. Penherton, J. Orebury Taylor, and W. A. S. Westoby.

As early as 1552 J. B. Moens started dealing in stamps in Brussels and in 1861 F. G. O. Berger-Levrault issued, for the benefit of his friends, the first stamp list in Strasbourg. Three months later A. Potiquet issued, in Paris, a catalogue of stamps for sale, while in 1862 the first four, devoted entirely to postage stamps, *The Monthly Advertiser*, appeared in Liverpool, to be followed in 1863 by a London pub., *The Stamp Collector's Magazine*. The first Brit. work on stamps, F. Booty's *Aid to Stamp Collectors*, being a List of English and Foreign Stamps in Circulation since 1840, consisting in the main of material previously pub. abroad, came out in 1862. It ran through sev. eds. and was finally reissued with illustrations (the first illustrated work on postage stamps) under the title *The Stamp Collector's Guide*. But the two most important of the early catalogues, both pub. later in 1862, were J. E. Gray's *Hand Catalogue of Postage Stamps for the Use of Collectors and Mount Brown's Catalogue of British, Colonial, and Foreign Stamps*. The first stamp album was produced by a Frenchman, J. Lallier, in the same year and was put on sale simultaneously in Paris and London.

To show how the hobby spread, it may be noted that the first stamp auctions were held in Paris in 1865, in New York in 1870, and in London in 1872; while the first philatelic societies were founded in Paris in 1865, in New York in 1867, and in London in 1869. The two former have long been defunct, but the last, known originally as the Philatelic Society and now as the Royal Philatelic Society (the 'Royal' was added by warrant of King Edward VII. in 1906), is still active and remains unquestionably the leading philatelic society of the world, owning magnificent club rooms and library and publishing its own jour., *The London Philatelist*, since 1892. As stamp collecting grew in popularity the study of stamps became more intense and the desire to read about them more widespread, and if the hobby is recognised as by far the most popular of all hobbies, it may safely be said that the literature concerning stamps is infinitely more extensive than the literature concerning any other hobby. It ranges from elaborate monographs dealing in minutest detail with the stamps of different countries or even individual issues to popular books touching upon the romance, the hist., and the interest of stamp collecting in its every aspect. Many philatelic jour., of which about a dozen are Brit., are pub. throughout the world (before the Second World War there were some two hundred of them), some being highly technical and others consisting mainly of gossip and advertisements. Numerous countries possess official postal museums, but although the Brit. Post Office has an unrivalled collection, in sheets, of Brit. postage stamps, it is not open to the public, though sections of it are exhibited from time to time. In the Tapling collection, left to the nation in 1891 by T. K. Tapling and housed in the King's Library in the Brit. Museum, this country owns the finest of all general collections of postage stamps, while the royal collection of empire stamps, started by King George V. and continued by his successor, is unique in its range and quality. Portions of this collection are occasionally shown.

In the time of Tapling it was possible for one man to form a virtually complete collection of the postage stamps of the world, but that is now impossible, for the market has been flooded for years with unnecessary issues: the number of stamps produced since 1810 has mounted to sev. hundred thousand, and any serious collector to-day is almost forced to devote his attention to one country or epoch or branch of P. Amongst the reasons which have, of later years, so vastly enhanced the popularity of stamp collecting may be cited the introduction of pictorial and commemorative issues and of air mail stamps. The first popular commemorative pictorial issue stamps were issued in the U.S.A. in 1893 to celebrate the discovery of America by Columbus, 400 years previously, and it was probably the success of this set of sixteen stamps which has led to the immense number of

such sets since that date. Great Britain has never issued a pictorial stamp in the real meaning of the word, though of recent years stamps to commemorate the silver jubilee of the reign of King George V., the coronation of King George VI., and other national events have appeared. Nor has Great Britain ever issued an air mail stamp, though some of the most valuable of such stamps, the air mail stamps of Newfoundland issued in the early days of Atlantic flying, emanated from a Brit. dominion.

The value and saleability of rare stamps depend, apart from their scarcity, upon sev. factors. First, they must belong to those countries and issues which are particularly collected and, secondly, they must be perfect in every respect. There are many fashions in P., but the earlier stamps of such countries as Great Britain, the U.S.A., Canada, Newfoundland, W. Indies, Cape of Good Hope, Ceylon, Brit. Guiana, Mauritius, New S. Wales, Hawaiian Is., France, Spain, and the It. and Ger. states are practically immune from the vagaries of taste. The really classic stamps of these and other countries, having an international appeal, have mostly risen greatly in price during the last few decades, and this, added to the fact that they are such an easily portable form of wealth, has caused many people in troublous times to regard them as a desirable investment. As for condition, this is a point which, ignored by most of the early collectors, has become more and more significant. The difference in value between superb and poorish copies of even the rarest stamps is startling, and where imperforate stamps are concerned only one in twenty-five or fifty examples has clear margins on all four sides. Many stamps are rare and valuable because they contain errors. The observed variety of such errors is very large, but some of them can be mentioned. There may be a mistake in the wording or the type; a wrong paper or colour or perforation or watermark (q.v.) may be used; a surcharge or overprint (a surcharge alters the face-value of a stamp, while an overprint does not) may be repeated twice or more or

may be printed upside down or on the back or omitted altogether; a price label may be missing; a perforate stamp may be printed imperforate; the centre of a stamp or the frame round the centre may appear in an inverted position. To appreciate how such errors arise it would be necessary to explain how stamps are constructed and printed, but basically they are all due to the fact that though man employs machines, he is not a machine himself.

The highest price known to have been paid for a single stamp is £7343. This was paid by Arthur Hind in the U.S.A. for the Brit. Guiana 1 cent of 1856, the only discovered example of the error whereby the normal '4 cents' label was accidentally replaced by a '1 cent' label. After Hind's death the stamp was put up for auction in London, and withdrawn, the reserve not having been reached. It was returned to the U.S.A. where, it is rumoured, it was privately sold for more than Hind had originally paid for it. Alfred Lichtenstein, it is said, gave £12,000 for an envelope stamped with two matchless copies of the Mauritius 1d. of 1847, while the absolutely mint copy of the Mauritius 2d. of 1847 which King George V., as Prince of Wales, purchased in 1903 for £1150, would undoubtedly bring more than £10,000 to-day. These were the first two stamps to be issued by any Brit. possession, and through some misunderstanding had 'Post Office' instead of 'Post Paid' printed on them. Other exceedingly rare and valuable stamps, to mention six normal ones and six with errors, include Canada 12d. (1850), Brit. Guiana 2 cents (1851), Hawaiian Is. 2 cents (1851), Ceylon 4d. (1857), Moldavia 81 parales (1858), Brit. Columbia 5 cents (1855), India 4 annas, with inverted head (1854), New S. Wales 4d., with inverted frame (1854), Cape of Good Hope 1d. and 4d., in the colour of each other (1861), U.S.A. 24 cents air mail, centre inverted (1918), Jamaica 1s., centre inverted (1919). The most valuable Brit. stamps are not Victorian but Edwardian: the 8d. and 10s. of 1902 each overprinted 'I. R. Official'. The 10s., so overprinted, was in use for but a brief period, while the 8d. so

#### SOME FAMOUS POSTAGE STAMPS

1. 1847 *Mauritius*. This 1d. together with a 2d. of the same date, were the first stamps issued by a British colony. They are the most famous stamps in the world.
2. 1851 *Canada*. When this stamp was issued the shilling had a varying value throughout Canada while the penny was constant. Hence the curious figure.
3. 1857 *Ceylon*. Only a few copies are known unused.
4. 1854 *India*. With inverted head, this is the most valuable Indian stamp.
5. 1854 *Western Australia*. A very rare stamp with inverted frame.
6. 1851 *British Guiana*. One of the two first stamps of the colony, not known to collectors in Europe until 1877.
7. 1851 *Hawaii*. The earliest Hawaiian stamps were mainly used by American missionaries writing home; indeed they are often called 'missionaries'.
8. 1858 *Moldavia*. A stamp of great rarity. Moldavia is now a republic of the U.S.S.R.
9. 1869 *United States of America*. The centre of this heavily post marked stamp is inverted, being known as the 'Inverted Flag'. It is a rarity of note.
10. 1902 *Great Britain*. This stamp of Edward VII is one of the two most valuable stamps of Great Britain.
11. 1860 *Tuscany*. In fine condition, this stamp is a classic rarity.
12. 1920 *Jamaica*. With inverted centre, this is one of the rarest British Empire stamps issued during the reign of George V.

overprinted, was in use for only one day, May 12, 1901. But some of the early Brit. 'abnormals' (stamps printed from plates which were hardly ever employed) are also very valuable, as are some of the early high face-value stamps, 10s., £1, and £5, particularly if unused. Most stamps, it may be added, are more valuable unused than used, but the rule is by no means universal, especially if it be a bisected stamp, for during sudden shortages of stamps in the early days this practice was occasionally officially sanctioned in some countries and colonies, and it is necessary to make sure that the postmark is genuine.

The forging of stamps began soon after they came into general circulation, and as long ago as 1862 J. B. Moens wrote a pamphlet (the Eng. ed. is a trans. from the Belgian ed. of the same year) entitled *On the Falsification of Postage Stamps*, while in 1863 T. Lewes and E. L. Pemberton wrote *Forged Stamps: How to detect Them*. The early forgers aimed at defrauding the revenue rather than the collector and much of their work was excessively crude, but the later forgers and fakers (and it is the faking of genuine stamps, either by repairing them or by adding some detail to transform a common stamp into a rare variety, which is the prin. danger these days) have often shown remarkable, if misguided, skill. But it is satisfactory to know that even their most finished efforts cannot deceive the real expert.

Books and articles on P. dealing with every country and every branch and phase of study and collecting abound. For Great Britain the works of H. B. Wright and A. B. Creeke, J. B. Seymour, Sir E. D. Bacon, S. A. R. Oliver and F. H. Valency, T. Todd, and P. Hamilton are of importance. *Bibliotheca Lindesiana*, 1911, with Supplement, 1926, compiled by Sir E. D. Bacon, and *The Standard Index to Philatelic Literature*, ed. by A. H. Harris and analysing books and journals from 1879 on, are admirable works of world-wide bibliographical reference, but both are now somewhat out of date. Enormous and informative stamp catalogues are issued annually by such firms as Stanley Gibbons in London, Scott in New York, Yvert and Teller-Champion in Paris, Galvez in Madrid, and others. See also **POSTAGE STAMPS**. See T. Todd, *A History of British Postage Stamps* 1919.

**Philby, Harry St. John Bridger** (b. 1885), Eng. explorer and orientalist, b. in Ceylon. Son of a tea-planter, he was educated at Westminster School and Trinity College, Cambridge. He joined the Indian civil service in 1908, and became political officer in Amara. He led the Brit. political mission to central Arabia, 1917-18. P. crossed the Arabian Peninsula from Uqair to Jidda, and explored the S. provs. of Nejd in 1920. He was Brit. representative in Transjordan, 1921-24. He crossed the Rub al' Khali ('Empty Quarter') Desert in 1932, soon after its crossing by Bertram Thomas. His pubs. include *The Heart of Arabia* (1922); *Arabia of the Wahabis* (1923);

*Arabia* (1930); *The Empty Quarter* (1933); *Pilgrim in Arabia* (1943); and *Arabian Days* (1948).

**Philemon**, Gk. writer of the New Comedy, b. at Soli in Cilicia according to Strabo, or at Syracuse according to Suidas. P. began to exhibit comedies a little earlier than Menander and before 328 B.C., and died in the reign of the second Antigonos, son of Demetrius. He lived nearly 100 years. He is said to have written ninety-seven comedies, of which only fragments exist, which are generally pub. with those of Menander, whose rival he was. The best ed. is by Meinecke (Berlin, 1823). See MENANDER.

**Philemon and Baucis**, in Gk. mythology, a devoted married pair, gave entertainment to Jupiter and Mercury when they had been refused hospitality by every other house in the vicinity. The gods took them to the top of a hill whence they saw their vil. submerged in flood, their own cottage only rising in the form of a temple above the water. When Jupiter asked them to make a request, they begged to serve in his temple and to die together. Accordingly at death Zeus changed Philemon into an oak and Baucis into a linden.

**Philemon**, Epistle to, book of the N.T., being the shortest of the epistles written by Paul during his imprisonment. In twenty-five verses the apostle addresses P., an hospitable Christian of Colosse, asking him to take back his former slave, Onesimus, who, having first robbed his master, had run away, probably to Rome, where he had been converted to Christianity by Paul. No adequate proof has been brought against the authenticity of the epistle, although in the fourth century some critics held that the subject matter was too trifling to have been written by Paul, while in the nineteenth century others regarded it as a mere literary pamphlet on the slave question. See commentaries by C. J. Ellicott, 1865; J. B. Lightfoot, 1884; and J. A. Beet, 1890; and article in Hastings's *Dictionary of the Bible*, vol. ix., 1917.

**Philetas of Cos** (fl. fourth to third century B.C.), Gk. elegiac poet and grammarian of the Alexandrian school. He was tutor to Ptolemy II. and wrote a commentary on Homer. See fragments of his poems in T. Bergk, *Poetae Lyrici graeci*, 1882.

**Philharmonic Societies**. The Eng. Philharmonic Society was founded in 1813 by J. B. Cramer and others, to foster musical ideals by giving concerts on a subscription basis; its career has been most successful. P. S. are estab. also in New York and elsewhere.

**Philidor, André** (c. 1647-1730), Fr. composer, b. probably in the Dauphiné, entered the royal service as a boy, played all sorts of instruments there, competed with Lully in writing fanfares, marches, etc., and was soon commissioned to provide dances and stage diversions. In 1684 he became librarian of the king's musical library and made a huge MS. collection of court and church music. His works include diversissements *Le Carnaval*

de Versailles, *Le Mariage de la Couture avec la grosse Cathon, La Princesse de Crée, La Mascaraude du raiasseau marchand, Le Jeu d'échecs*, etc.

**Philidor, Anne** (1681-1728), Fr. composer, b. in Paris, son of André P., entered court service as obolst in the chamber music and the royal chapel, founded the *Concert spirituel* in Paris, 1725, and later in life superintended the Duchesse de Maine's and the Prince de Conti's private concerts. His works include pastorals, *L'Amour vainqueur, Diane et Endymion, Danaë*, etc.

**Philidor, François Andre** (1726-95), Fr. musician and chess player, b. at Breux. His chief operas are *Blaise le Savetier* (1759); *Le Soldat magicien* (1760); and *Tom Jones* (1761). He was regarded as the finest chess player of his age, and pub. *Analyse du jeu des échecs* (1777). See G. E. Bonnet, *Philidor et l'évolution de la musique française du XVIII<sup>e</sup> siècle*, 1921.

**Philip, St.**, was the first disciple of Jesus Christ and one of the apostles. He was a native of Bethsaida, a tm. near the sea of Tiberias. He has been erroneously confounded with Philip the Deacon. P. suffered martyrdom at Hierapolis, but in what year is not known.

**Philip**, kings of Macedonia, see **PHILIPPOS**.

**Philip I.** (1052-1108), king of France. He succeeded to the Fr. throne in 1060. At first the ally, he afterwards became the opponent of William the Conqueror, and they quarrelled principally over the possession of Maine. He quarrelled with the papacy because of his bigamous marriage with the countess of Anjou. He widened the boundaries of France, however, by the annexation of Valois and the Vexin.

**Philip II.** (1165-1223), king of France, commonly known as Philip Augustus, b. at Gonesse. He was crowned king during the lifetime of his father, Louis VII., and succeeded him in 1180. To him really belongs the credit of attempting to consolidate the whole of the forces of France. With this end in view he supported the sons of Henry II. of England in most of their frequent quarrels with their father. He succeeded also in subduing the count of Flanders and the duke of Burgundy. He was one of the chief conspirators in the league which did much to crush the power of Henry II. in France. He went on crusade with Richard I., but quarrelled with him, and returned from Syria to plot against him. The sudden return of Richard, however, upset the plans of P. and John, and resulted in a war which lasted until 1199. On the accession of John he supported the claim of Arthur of Brittany to the Eng. throne. On the murder of Arthur he summoned, as John's overlord, the Eng. king to answer for the deed in Paris, and when John failed to appear invaded Normandy. The fall of Château-Gaillard resulted in the practical conquest of Normandy, and virtually put an end to the Angevin empire. The hallmark of his success, however, was the battle of Bouvines in 1213, where he succeeded in defeating the combined forces of England and the empire. The rest of his

reign was occupied in building up the social fabric in France and in strengthening Fr. institutions. He had some difficulty with the papacy owing to his divorce of his wife Ingeborg. The papacy was for the time strong enough—it was the days of Innocent III.—to force him to put away Agnes of Meran and take back Ingeborg of Denmark. See A. Luchaire, *La Société française au temps de Philippe-Auguste*, 1909, and life by W. Hutton, 1896.

**Philip III. (Le Hardi)** (1245-85), son of Louis IX. (St. Louis), b. at Poissy. He accompanied his father's unfortunate expedition to Tunis, which was in the original plan to have been a crusade. He was present at his father's death, and succeeded him in 1270. Before his death he fought a long and unsuccessful war with Aragon.

**Philip IV.** (1268-1314), commonly called 'Le Bel,' king of France, b. at Fontainebleau, succeeded Philip III. in 1285. He married the queen of Navarre, Joanna, and by this marriage obtained Champagne, Brux, and Navarre. Early in his reign a revolt broke out in Flanders, and P. suffered a great defeat at Courtrai, the precursor of the overthrow of chivalry by the new infantry tactics. His attempt to levy taxation upon the clergy led to the quarrel with Pope Boniface VIII., one which involved Edward I. and the Eng. nobles, and led to the first practical anti-papal legislation in England. Boniface issued the famous bull, *Unam sanctam*, and P. replied by a wholesale confiscation of clerical property. The pope retaliated by an excommunication and a threat of interdict. P. caused the pope to be arrested and so maltreated that he died shortly afterwards. After the brief pontificate of Boniface's successor, Benedict XI., a Fr. pope, Clement V., was elected and, under the influence of P., moved the papal court to Avignon, where it remained for seventy years. In this reign the order of the Knights Templars was abolished, and the wealth of that order confiscated by the Fr. king. He greatly increased also the taxation of the country. See G. Lizerand, *Clement V. et Philippe*, 1910.

**Philip VI.** (1293-1350), king of France, the first of the Valois kings. He was the son of Charles of Valois, the brother of Philip IV. On the death of Charles IV. in 1328 he succeeded to the Fr. throne, the Salic law being pleaded in order to prevent the accession of Charles the Bad of Navarre and Edward III. of England. Edward pleaded that although the Salic law might hold good in excluding a woman from succeeding in person, still her claim could be transmitted through her son. The succession question, however, was but the pretext for the Hundred Years war; in reality it was caused by the desire to protect the woolen trade with Flanders, the continued secession of the Fr. in Guienne, and the constant quarrels between the Norman sailors and the men of the Cinque Ports. The war may be said to have begun in 1336. The first great battle was off Sluys, where the Fr. fleet was entirely destroyed. In 1346,

after threatening Paris, Edward retreated towards Flanders, but Philip pursued and was defeated at Crécy. The tactics adopted by Edward on this occasion led to the complete overthrow of the Fr. chivalry, and the Eng. followed up their victory by the siege and capture of Calais. The war ended for a time owing to the outbreak of the Black Death.

Philip II. (1527-98), king of Spain, the only son of the emperor Charles V., b. at Valladolid. He married, in 1543, the daughter of the king of Portugal, who bore him before her death, in 1546, a son, Don Carlos. This prince, a vicious idiot, ended his days before his father, being imprisoned by him and dying in prison in 1568. P. spent much of his time in his father's favourite prov., the Netherlands, and before the death of his father he married, in 1554, Mary I. of England. In the

PHILIP II.

following year his father abdicated and P. became the most powerful monarch in Europe, although his father's attempt to obtain for him the imperial throne failed. He left England at the end of fourteen months, dissatisfied also that Mary had failed to bear him a son. He succeeded in breaking up the formidable league raised against him by the papacy and the Fr., and set himself up in Europe as the champion of the counter-reformation. He crushed heresy in Spain by means of an energetic use of the Inquisition, but failed in the Netherlands, where his oppressive measures and his heavy taxation led to revolt, civil war, and finally to the breaking away of the United Provs. (Holland). In 1570 he married Anne of Austria, who became the mother of Philip III. In the following year his half-brother won the great victory at Lepanto over the Turks. He annexed Portugal to Spain in 1580, claiming the throne on the extinction of the male line. After the execution of Mary Queen of Scots, and irritated by the frequent raids of the Eng. privateers, he sent his Armada to England. This, in 1588, was badly defeated. His home policy had led to the practical bankruptcy of Spain, and his long war against

the Moors led to the extinction of much of the trade of the country. In 1592 he failed in his attempt to drive Henry of Navarre from the throne of Franco. P. had great ability, but his ability was overshadowed by his fanaticism. He raised Spain to a dominant position in Europe, but left her with a governmental system which undermined her prosperity. See W. H. Prescott, *History of the Reign of Philip II.*, 1855-58; and lives by M. Philippson, 1882; L. Bertrand, 1929; D. Loth, 1932; L. Pfandl, 1938; and W. T. Walsh, 1938.

Philip III. (1578-1621), king of Spain, b. in Madrid, the son of Philip II. by his third marriage, he succeeded to the throne of Spain in 1598. He left the government of the country practically in the hands of his minister, Lerma. During his reign occurred the attempt to bring about a Sp. marriage with Prince Charles (afterwards Charles I.) and the outbreak of the Thirty Years war, in which Spain was very largely involved. Previously, in 1609, a treaty was made with the United Provs. which practically assured them of their independence, although this was not officially recognised until 1648.

Philip IV. (1605-65), king of Spain, b. at Valladolid. He succeeded his father Philip III. in 1621, and during the early part of his reign the country was unsuccessfully governed by Olivarez. The Dutch captured many of the Sp. colonial possessions; Portugal recovered her independence in 1641, and two years later, by the defeat at Rocroi, the prestige of the Sp. Army was badly shaken. After the Peace of Westphalia was signed in 1648, the Spaniards and Fr. still continued fighting, until by the treaty of the Pyrenees (1659), Spain ceded much territory to France. In 1665 Portugal defeated Spain at Villa Vicosa; in the same year P. died.

Philip V. (1683-1746), king of Spain, the first of the Bourbon kings of Spain, b. at Versailles. He was the second son of the dauphin of France and the grandson of Louis XIV. and Maria Theresa of Spain. He entered Madrid in 1701, and at the end of the War of the Sp. Succession was by the treaty of Utrecht guaranteed the throne of Spain, certain stipulations being made to prevent his obtaining the throne of France as well. He married, as his second wife, Elizabeth Farnese, and as a result of her overweening ambitions in Italy for the sons of her former marriage, was involved in a struggle with the Austrians. P. abdicated for a short time in 1724, but on the death of his son again took his place on the throne. He still aspired to the Fr. throne, but the birth of heirs to Louis XV. ended his hopes and resulted in the family compact in 1733.

Philip I. (1478-1506), king of Castile, surnamed the Handsome, b. at Bruges. He was the son of Maximilian I., emperor of Germany, by Mary of Burgundy, in right of whom he inherited and transmitted to his posterity of the house of Austria the seventeen provs. of the Netherlands. In 1496 he married Joanna, eldest daughter of Ferdinand the Catholic and Isabella,

sovereigns of Aragon and Castile; and in 1504, on the death of Isabella, who bequeathed the kingdom of Castile to her daughter, P., as well as his consort, assumed the regal title. He was crowned at Burgos with her, and, in consequence of her mental weakness, exercised all the functions of government during the short remainder of his life, which closed in the following year at the early age of twenty-eight.

**Philip Neri**, see NERI.

**Philip of Greece and Denmark, Prince**, see under EDINBURGH, DUKEDOM OF.

**Philip of Macedon**, see PHILIPPOS.

**Philip the Bold** (1342-1404), founder of the second and last ducal house of Burgundy, was the third son of Jean, king of France, and was b. at Poitiers. He was present at the battle of Poitiers (1356), and displayed such heroic courage as gained for him the sobriquet of *le Hardi*, or 'the Bold.' On the accession of his brother, Charles V., to the throne, he married Margaret, the heiress of Flanders. In 1372 he commanded the Fr. army opposed to the Eng. In 1380 he exerted himself to suppress the sedition of the Flem. tns. against the Fr. crown, and, raising an army, inflicted upon them the bloody defeat of Rosbeck (Nov. 27, 1382), killing 26,000. Flanders, Burgundy, Artois, Rethel, and Nevers fell to him by the death of the count in 1384. Energy and wisdom characterised his gov., and his ter. was one of the best governed in Europe. During the minority and subsequent imbecility of his nephew Charles VI. of France, he was obliged to take the helm of affairs and on his way to repel the Eng. attack on Flanders he d. See life by O. Cartellieri, 1910.

**Philip the Evangelist**, one of the seven deacons chosen to relieve the twelve apostles of the burden of attending to charitable distribution (Acts vi.). He was driven from Jerusalem by the persecutions and went to Samaria to preach, where he had great success. Thence he was sent to guide the Ethiopian eunuch to the truth (Acts viii.). P. then went on a preaching tour to Caesarea, and later he entertained St. Paul and his company (Acts xxi.). Tradition says that later he settled in Asia Minor, but he has been confused with Philip the apostle. It is probable that he d. in Tralles.

**Philip the Good**, third Duke of Burgundy (1396-1467), grandson of Philip the Bold. On the assassination of his father at the instigation of the dauphin (afterwards Charles VII.), he succeeded to the duchy. Bent on avenging the murder of his father he entered into an alliance with Henry V. of England at Arras in 1419. Some disputes with the Eng. prompted P. to conclude a treaty with the king of France in 1429. However, the Eng., by ceding to P. the prov. of Champagne and paying him a large sum of money, restored him to their side. Smarting under some fresh insults of the Eng. viceroy, he made a final peace (1435) with Charles. Later he declared war against the Eng., and, in conjunction with the king of France, gradually expelled them from their Fr.

possessions. He was the founder of the Order of the Golden Fleece.

**Philiphaugh**, battlefield on Yarrow Water, 3 m. W.S.W. of Selkirk, Scotland, where Sir David Leslie defeated the Royalists under Montrose (1645).

**Philippe Egalité**, see ORLEANS, DUKES OF.  
**Philippeville** (anc. Rusicada), seaport of Algeria, in the dept. of Constantine. It has a fine harbour, and exports cattle, cereals, dates, esparto grass, and minerals. Pop. 66,000.

**Philippi**, anc. city of Macedonia, on the Gangites, was so called after Philip II. of Macedon. It is celebrated for the victory of Antony and Octavian over Brutus and Cassius in 42 B.C. St. Paul founded (A.D. 53) a Christian colony here, to which he addressed his epistle to the Philippians.

**Philippians**, Epistle to the, probably the last of the epistles which St. Paul wrote during his captivity at Rome, during the latter part of this period. Its date would therefore be between 62 and 64 according to the ordinary chronology, between 57 and 59 according to that of Harnack. The church in Philippi had been planted some ten years previously on the second missionary journey (see Acts xvi. etc.), and was composed chiefly of pious Gentiles. In the region in which Philippi stood women occupied a higher social position than elsewhere, and the epistle shows us the importance of the feminine element in the Church. See J. Hastings, *Dictionary of the Bible*, 1898; and commentaries by J. B. Lightfoot, 1891; C. R. Biggs, 1900; H. Lietzmann, 1911; M. Jones, 1918; and H. G. G. Herklotz, 1946. See also H. N. Bates, *Guide to the Epistles of St. Paul*, 1926, and articles on PAUL.

**Philippian**, three orations of Demosthenes, the Grecian orator, against Philip, king of Macedon, in which the orator sought to arouse the Athenians from their indolence; hence any discourse or declamation abounding in acrimonious invective, e.g. the fourteen orations of Cicero against Mark Antony.

**Philippine Islands**, or **The Philippines**, archipelago forming the republic of the Philippines, situated about 550 m. off the S.E. coast of Asia, between 4° 40' and 21° N. They are bounded on the W. by the China Sea, E. by the Pacific Ocean, and S. by the Celebes Sea and the coastal waters of Borneo. The total land area of the P. Is. is 111,400 sq. m., and includes the is. of Luzon, 40,420 sq. m., most northerly; Mindanao Is. 36,337 sq. m., most southerly; Samar, 5050 sq. m.; Negros, 4905 sq. m.; Palawan, 4500 sq. m.; Panay, 4446 sq. m.; Mindoro, 3759 sq. m.; Leyte, 2799 sq. m.; Cebu, 2000 sq. m.; Bohol, 1611 sq. m.; Masbate, 1262 sq. m.; and over 7000 others, mostly very small. Of volcanic origin, the physical features are hilly and mountainous. On the E. coast of Central and N. Luzon is the Sierra Madre range, on the W. coast is the Caraballo Cordillera. N. from the gulf of Lingayen, and the Zambales southward from that gulf to Manila Bay. Mt. Mayon (8280 ft.), an active volcano, lies at the S.E. extremity of Luzon, and Mt.

Apo (10,312 ft.), on the E. border of the S. portion of the basin of the Rio Grande, Mindanao, is an extinct volcano, and the highest elevation in the archipelago. The Cagayan R., 220 m. long, in N. Luzon, is the largest in the archipelago; the Rio Grande de Mindanao (200 m. long) in Mindanao is second in size. The Pampana and the Agno are the prin. rvs. in Central Luzon, and the Rio Bohol, which rises in Lake Bato and flows N.N.W. into San Miguel Bay, is the prin. riv. of S. Luzon. The other is. are drained by many streams, some of which are of considerable size. Laguna de Bay, the largest body of fresh water in the P. I., is situated in the lowland basin of Central Luzon, 6 m. inland from Manila Bay. The other prin. lakes are: Lake Taal (17½ m. long), S.W. of Laguna de Bay; Lake Cagayan in N. Luzon; in Mindanao, Lanao, Liguasan, and Buluan in the W.-central portion, and Mainot, Pinava, Dagun, Dalocum, and Linao in the valley of the Agusan. There are small lakes in some of the other is. The volcanoes in the archipelago are as follows: Babuyan Claro, Camiguin de Babuyan, and Diddas in the Babuyanes Is. off the N. coast of Luzon; Cagua or Cagua in N. Luzon; Canlaon and Magaso in Negros; Camiguin de Mindanao in the is. of Camiguin, off the N. coast of Mindanao; Apo and Calayo in Mindanao; and Taal and Mayon, the only ones about which eruptions are recorded; Taal has been silent since 1751, but twenty-six eruptions of Mayon occurred in the nineteenth century, the most destructive of which was in June 1897, when the tn. of San Fernando and many vls. were destroyed. Earthquakes and typhoons are of frequent occurrence in the is.

The fauna of the is. shows a large degree of specialisation, but the number of species and their respective ranges have not yet been satisfactorily determined. There are about 690 species of birds; crocodiles and fishes, of which there are 500 species, are numerous. Arthropoda are very abundant. The flora, which is essentially Malayan and intermixed with Chinese and Australian elements, is rich and varied. Two thirds of the land surface is covered with forests; gutta-percha, india-rubber, and other trees yielding gums, largely abound, and there are also good timber trees, dye woods, etc. The soil, usually of a reddish colour, is for the most part disintegrated lava mixed with decayed vegetation. The climate, which is more salubrious than most tropical climates, varies little throughout the year, temp. being uniformly high. Agriculture is the prin. industry of the is., and the prin. crops are hemp, sugar, tobacco, coconuts, corn, sweet potatoes, and rice. Many fruits have been introduced, including grapes, blackberries, figs, and strawberries, but bananas, mangoes, and citrus fruits are more generally grown. The production of rubber is increasing, especially in the S., and 1,200,296 kilos of crude rubber were exported in 1940. The P. I. are among the world's foremost producers of coco-nut oil and copra.

During 1947 copra exports totalled 998,140 metric tons. There are also papaya, lanzones, chico, pillaut (*Canarium commune*), oranges, and mandarins. In 1918-49 5212.3 million lb. of rough rice were produced. Manila hemp (abaca), sugar-cane, maize, tobacco, and magnay are also important products. With the exception of the water-buffalo, which is indispensable for agric. purposes, the domestic animals are few in number but are steadily increasing. Amor. horses have been introduced to improve the breed. The neat cattle, which are of Australian and Indian origin, are raised chiefly for beef, hides, and horns. Swine and goats are numerous, but there are few sheep. The is. are potentially rich in economic minerals, and extensive gold-mining operations have been instituted in the provs. of Benguet and Ambos Camarines in Luzon, and on the is. of Masbate. In 1940 the output of gold was valued at \$38,000,000. Mining installations were, however, largely removed by the Jap. during the war; three mines were restarted in 1947. Some silver and platinum has been recovered with the gold. Chromite has been discovered; in 1940 190,000 long tons were produced, but in 1946 only one mine was working, 58,000 long tons being produced. Copper is widely distributed. There are outcrops of lead, with which silver is largely associated, and extensive deposits of iron-ore (production in 1940 was 1,220,000 long tons). Among other minerals are manganese ore, sulphur, mercury, zinc, gypsum, and phosphate; coal has been discovered, asbestos, rock asphalt, and silica deposits have been found, and drilling for oil was resumed in 1947. The first railway, opened in 1892, was built by an Eng. corporation under the guarantee of the Sp. Gov. from Manila to Dagupan (121 m.). The advent of Amer. rule saw a great increase in railways, and in 1948 there were some 490 m. of track on Luzon, and 73 m. on Panay and Cebu. Roads also have been greatly improved and extended (total length of roads is 14,933 m.), and there are regular steamers to Singapore and Hong Kong, and between the prin. ports of the archipelago. The greatest value of pre-war commerce was with the U.S.A., the 1910 figure being 469,000,000 pesos, then Japan (30,000,000 pesos), Great Britain (11,000,000 pesos), China (10,000,000 pesos), Dutch E. Indies (0,000,000 pesos). In 1938 exports to the United Kingdom were valued at £992,523; in 1946 at £722,498; imports from the United Kingdom were £747,003 in 1938 and £349,066 in 1946. Total imports in 1948 were valued at 1,037,577,000 pesos and exports at 619,713,000, 93 per cent of the latter being accounted for by coco-nut and abaca products. Before the Jap. invasion there were forty-six sugar centrals and four refineries, textile mills, desiccated cocoa factories, coco-nut oil mills, ninety-two large cigarette and cigar factories, and 2391 rice mills. In 1947-48 307,913 short tons of sugar were produced (the average pre-war output was 900,000 tons).

Tobacco output was 17,650,000 kilos in 1947-48. In 1946 free trade was established between the U.S.A. and the P. I. for eight years. There are twenty-one fine harbours. Manila, the prin. port of entry, with a channel 30 ft. deep, has the finest harbour in the entire Far E. At Cavite is a navy yard which still belongs to the Amer. forces. After Manila, the cap. (pop. 1,024,500), the chief tns. are Iloilo on Panay (pop. 94,300); Cebu on Cebu (155,100); Zamboanga on Mindanao (137,700); Davao on Mindanao (103,100); and Baguio (27,000) in the Mt. Prov. (the summer cap.) (all pop. figures are those estimated before the Jap. invasion); other tns. are Legaspi, Iloilo, Vigan, and Naga on Luzon. The total pop. of the archipelago according to the 1948 census was 19,234,182.

**Constitution and Government.**—The new independent republic of the P. I. came into being on July 4, 1946, by agreement with the U.S. Gov. embodied in an Act of Congress signed by President Roosevelt on March 24, 1934, accepted by the Philippine Legislature on May 1, 1934, and ratified by the Philippine electorate soon afterwards. This Act, which, a ten-year transitional period designated as that of the 'Philippine Commonwealth,' at the end of which complete independence would become automatically effective. But, owing to the Jap. invasion and occupation, this period had to be prolonged. The republic is governed by a constitution adopted in 1935 and amended in 1940. The president and vice-president are elected for four years and the former may be re-elected for another term. There are eleven departmental secretaries: foreign affairs; interior; justice; national defence; health; education; finance; public works and communications; labour; commerce and industry; agriculture and national resources. The legislature is bicameral: a Senate of twenty-four, and a House of Representatives of ninety-eight members, all elected on April 23, 1946. The franchise is given to both male and female citizens twenty-one years of age or older who can read or write Sp., Eng., or a native dialect and who have certain residential qualifications; but rural illiteracy is high, and at the 1946 elections the voters numbered not more than 2,500,000; the figure reached 3,000,000 in the 1947 general elections. The president's powers are wide, including control of the provs. and municipalities and limited powers of veto. The constitution vests in the republic all ownership of the natural resources which, apart from public agric. land, may not be alienated. Exploitation of natural resources is limited to citizens of the P. I. or of the U.S.A. and to corporations or associations 60 per cent of whose capital is owned by Filipinos or Amers. (see J. M. Aruego, *The Framing of the Philippine Constitution*, 2 vols., Manila, 1937). Despite the proclamation of the new republic, close relations by agreement between the P. I. and the U.S.A. remain. Under Amer. pressure an agreement of 1946, expiring in 1974, opened to Amer. interests or companies the exploitation of

any public utility business or resources open to Filipinos.

The U.S.A. is allowed to develop and maintain strong military, naval, and air bases in the archipelago (the is. fortress of Corregidor in Manila Bay was, however, transferred to the republic of the P. I. on Oct. 11, 1947). Until the republican gov. has trained a foreign service staff, the U.S.A. will continue to represent Filipino interests abroad. Furthermore the Philippine Trade Act, signed by President Truman on April 30, 1946, assures the continuance of complete free trade between the two countries for eight years ending July 3, 1954; to the end of 1954 Filipino exports to the U.S.A. pay a duty equal to 5 per cent of the existing Amer. duties, and the duty thereafter increases by 5 per cent a year annually until the full duty is payable after July 3, 1974. But the Amer. system for import quotas is maintained for Filipino sugar, tobacco, and rice.

**Religion.**—Rom. Catholicism is the chief religion, and has some 12,604,000 adherents or 80 per cent of the pop. An independent Filipino Church was founded in 1902 by Gregorio Aclay, an ex-Catholic priest, who assumed the title of Obispo Maximo. The ritual of this Church resembles that of the Rom. Church, but in doctrine it adheres to modern science and denies the possibility of miracles, and marriage is permissible to its apostles. The following of this Church is about 1,500,000. There are about 350,000 Protestants, 48,000 Buddhists, 678,000 Muslims (chiefly in Mindanao and Sulu); 14,000 Shintoists; 630,000 Pagans; and 67,000 others.

**Education.**—Education in the public schools is free, secular and co-educational. In the urban schools Eng. is taught, but is no longer the official language. In 1945-1946 there were over 2,500,000 pupils in the 11,791 public schools and there were nearly 47,000 Filipino teachers. There is a normal school, six regional normal schools, trade schools, and agric. and farm settlement schools. Higher education is provided by the state-supported univ. of the Philippines, which in 1941 had over 700 profs. and 7600 students; and by about ninety private institutions of higher learning, including the univ. of Santo Tomas. There are also 468 private schools accredited by the gov. for secondary education.

**Justice.**—The judiciary is headed by the supreme court, with a chief justice and ten associate justices all Filipinos, appointed by the president; it cannot declare a law or treaty unconstitutional except by a two-thirds vote. There are sixteen judicial dists., each with sev. judges of first instance, justices of the peace courts, and municipal courts.

**The Filipinos.** The word 'Filipino' may be used with the following meanings: (1) a native of the P. I. of Sp. descent; (2) the Christian pop. of the P. I., numbering about 15,000,000; or (3) the native pop. of the P. I. The Filipinos, in the widest sense of the word, are a mingling of many

racés, speaking perhaps a hundred of differing languages or dialects, professing different religions, and living in various grades of civilisation. There are over eighty ethnic groups. About 30,000 are 'Negritos' (Negroes of the P. I.), who appear to be a small remnant of the original inhab., and they are a dwarfish race, believed to be akin to the Australian 'black' natives. The Sulu Archipelago, W. Mindanao, and W. Palawan are inhabited chiefly by some 100,000 Moros (Sp. for 'Moors'); like most of the natives they are of Malay stock (mainly from Borneo), and chiefly differ from the others in their religion, being Muslims, while the others are mostly Christian. They have a native literature, and use a modified Arabic alphabet. Special mention must be made of the five to six thousand mt. peoples (Buid, Hanunó, and Tagbanwa) of the pagan pop. of Palawan and Mindoro, since, alone in the whole of the archipelago, these have preserved their ancient native scripts, elsewhere replaced by the Rom. alphabet.

The bulk of the native pop., numbering about 16,500,000, speak languages belonging to the great Malayo-Polynesian family (see under LINGUISTIC FAMILIES). In point of number the three most important groups are (1) the Bisayans or Visayans (nearly 7,500,000), the most civilised people in the archipelago, when discovered by the Spaniards, now mainly living in the central part of the P. I. and in N. and E. Mindanao; (2) the Tagalogs or Tagals (c. 4,250,000), now the most advanced people of the P. I.; they live in central Luzon, including Manila, and in the greater part of Mindanao; (3) the Iloks or Ilocanos (c. 2,500,000), mainly in N.W. Luzon. Other important vernaculars are Pampangan (c. 650,000), mainly in the prov. of Pampanga, to the N. of Manila Bay; Pangasinan (c. 600,000), N. Luzon; and especially Bikol or Bicol (c. 1,300,000), also in Luzon. Sp. and Eng. are the official languages, and a kind of 'pidgin' Sp. known as Filipino-Sp. or *español de cocina* ('kitchen Spanish'), is widely used.

*History.*—Magellan (q.v.) arrived at the P. I. in 1521, and in 1565 Spain took final possession of the archipelago; but after nearly four centuries of misgovernment and unrest, and following on the revolt of 1896, in which Ibal (1861–96) and the 'Young Filipino party' played the prominent part, the is. were lost by Spain to the U.S.A. as the result of the war of 1898–1901. Following on the re-establishment of the civil courts and civil municipal govts. at the conclusion of the Sp.-Amer. war, a Philippine Commission of five members was appointed by the Amer. president in 1900 to determine the legislative functions of the central gov. at Manila. In 1907, after the completion of the census, a popular assembly of eighty members was opened at Manila. Later the P. I. were governed by a governor-general, appointed by the U.S. president, assisted by a Cabinet of six, of which five had to be Filipinos. After the cession to the U.S.A. the progress of the Filipinos was rapid, and, in 1934, as indicated

above, the U.S.A. promised to give independence to the is. Then, however, came the Second World War and with it, in 1941, the invasion of the P. I. by the Jap.

When Guam and Wake Is. were lost by the Amers. in Dec. 1911 their chance of reinforcing the P. I. in the face of Jap. naval and aerial superiority became remote. In any event Amer. exports had, before the war, long been doubtful about their ability to defend the is. in view of their remoteness from the main Amer. bases, and moreover the possibility of strengthening their permanent defences before 1937 was prohibited by the treaty of Washington, and the early abandonment of Amer. control was contemplated in the Act of 1934 which provided for full Filipino independence in 1946. The Amer. policy was in fact one of deliberate withdrawal from an advance base, which was generally held to be indefensible. This policy had to some extent been modified after 1933 by Gen. MacArthur (q.v.), who took command of the archipelago in that year and held such pronounced views on the possibilities of defence that two years later he retired from the Amer. Army and began to build up a strong Filipino force against the day when the Amer. garrison should be evacuated. As Jap. penetration pressed southward into Fr. Indo-China and Amer. policy began to stiffen against further aggression, the weight of MacArthur's opinions began to make itself felt and he was recalled to take command of the forces in the Far E., and the garrison of the P. I. was strengthened with considerable reinforcements during 1941. The Jap. attacked the P. I. on Dec. 9, 1941. For details of military and naval operations see PACIFIC CAMPAIGNS IN SECOND WORLD WAR; see also MANILA.

Philippopolis, see PLOVDIV.

Philippos, kings of Macedon. Of these the most famous were: 1. Philip of Macedon (382–336 B.C.). Upon the death of his brother, Philip obtained the gov. of Macedon, first as guardian to his infant nephew Amyntas, but a few months later he assumed the title of king. Once firmly established on the throne, he resolved to obtain possession of the various Gk. cities. Demosthenes endeavoured to rouse the Athenians to their danger, but they did not adopt any rigorous efforts to check the progress of the Macedonian king. He subdued the Phocians and was rewarded

with the place of the latter in the Amphictyonic council (346 B.C.). The Athenians at length became thoroughly alarmed, and they resolved to oppose him. Through the influence of Demosthenes they formed an alliance with the Thebans, but their united army was defeated (Aug. 338) in the decisive battle of Cheronea, which put an end to the independence of Greece. Philip now determined on war with Persia, but in the midst of his preparations he was murdered by a youth named Pausanias. He was succeeded by Alexander the Great. See D. G. Hogarth, *Philip and Alexander of Macedon*, 1897. 2. Son of Demetrius II. (220-178 B.C.). During the first three years of his reign he conducted a war against the Aetolians, and afterwards engaged in two wars with the Romans. The first lasted from 215 B.C. when he concluded an alliance with Hannibal, to 205. The second commenced in 200, and was brought to an end by the defeat of Philip by the consul Flaminius at the battle of Cynoscephale in 197.

**Philippsburg**, tn. of Württemberg-Baden, Germany, 17 m. S.W. of Heidelberg. Pop. 3000.

**Philippus**, Marcus Julius, name of two Rom. emperors, father and son, of whom the former reigned A.D. 244-49. He was an Arabian by birth, and rose to high rank in the Rom. army. He obtained the empire by the assassination of the third M. Antoninus Gordianus. He was slain near Verona, either in battle against Decius (q.v.), or by his own soldiers. His son, whom he had proclaimed Augustus two years before, perished at the same time.

**Phillips**, or **Phillips**, **James Orchard**, see **HALLIWELL-PHILLIPS**.

**Phillips**, Ambrose (c. 1671-1749), Eng. poet, b. in Shropshire. He was educated at St. John's College, Cambridge, and his first printed work is a copy of Eng. verses in the collection pub. by that univ. in 1695. A performance was given at Drury Lane, in Feb. 1712, of his tragedy *The Distast Mother*, which, although little more than a trans. of the *Andromaque* of Racine, was received with great applause, and long continued to be presented. A short time before, P.'s trans. of Sappho's *Hymn to Venus* had been printed in the *Spectator* (No. 223). But Pope and others contrived to bring him into ridicule, and the public were taught to call his poetry 'namby-pamby,' a name probably first bestowed by Henry Carey, the author of *Sally in our Alley* and *Chrononhotonthologos*. He produced two more tragedies, *The Briton* (1722) and *Humphrey, Duke of Gloucester* (1723). He next engaged in a periodical paper called *The Freethinker*, in which one of his associates was Dr. Boulter; he was almost certainly the chief contributor to *The Grumbler* (1715). See S. Johnson, *The Lives of the Poets* (vol. iv.), 1715 (new ed., vol. iii.), 1905.

**Phillips**, John (1676-1709), Eng. poet, b. at Bampton, Oxfordshire. His poem *The Splendid Shilling* (1703) is a happy imitation of Milton's style. The poem *Cyder* (1708) is his chief work, but that on the battle of Blenheim (1705) is of no great merit.

**Philistia**, in anct. geography, the name for a dist. on the lowlands of the Mediterranean coast, stretching from Jaffa to the desert S. of Gaza. It was occupied by the Philistines (q.v.). Gaza, Ashdod, Gath, Ashkelon, and Ekron were five centres of gov., each under its own prince.

**Philistine**, term of contempt or reproach used in England at the beginning of the seventeenth century. Later it became applied to persons whom the more enlightened or cultured considered beneath them in taste and intellect. Carlyle and Matthew Arnold in the eighteenth century used it frequently, having taken it from the Germs., with whom it denoted an impenetrable provincial.

**Philistines**, people inhabiting in biblical times the S. coast of Palestine, which became known as the Plain of Philistia (q.v., and see Joel iii. 4, etc.). They gave the name to the whole country of Palestine (q.v.). They are first mentioned (as Peloset or Palesati or Purasati) in the Egyptian records at Medinet Habu, as the chief tribe of the 'Peoples of the Sea,' who invaded Egypt, but were heavily defeated by the reigning Pharaoh, Rameses III., in 1191 B.C. They were able, however, a little later, to effect a settlement on the S.W. maritime plain of Canaan. They are often mentioned in the Bible (*Pelishtim*), where they are said to be of Hamitic stock (Gen. x. 14), but originated from Caphtor (Amos ix. 7). This is commonly supposed to denote Crete, but it is far from certain. The adjective 'uncircumcised,' so often applied in the Bible with contempt to the P., marks them off from their Semitic neighbours. Their language, too, was not Semitic (Neh. xiii. 24). Their chief god, Dagon, seems to have been taken over with the country they occupied, for he was a corn-deity well known in Syria and Palestine. The idea that he was a 'fish-god' is based on a mistaken etymology. The armour of the Philistine giant Goliath, described in 1 Sam. xvii., was of bronze and iron; the P. managed to maintain a monopoly of the importing and forging of iron until the reign of Saul (1 Sam. xiii. 19-22). Their power was broken by David. We know very little of Philistine culture, partly owing to the fact that their main cities continued to be occupied in subsequent ages, and have not yet been sufficiently excavated.

**Phillimore**, Sir Robert Joseph (1810-83), Eng. jurist and politician, b. in London. A writer on legal subjects, he left his *Commentaries on International Law*, a treatise on the law of domicile, and ed. the 9th ed. of Richard Burn's *Ecclesiastical Law*; he ed. also (1845) *Memoirs and Correspondence of George, Lord Lyttelton*. He was Liberal M.P. for Havistock and a friend of Gladstone. He ultimately became a judge of the probate div. of the high court.

**Phillip**, Arthur (1738-1814), Eng. naval officer and first governor of Australia, his name being perpetuated in Port Phillip Bay, Victoria; b. in London. As Capt. P., in 1787, he took out from England a small fleet carrying about 750 convicts

for Botany Bay, which he reached in Jan. 1788. But he considered the spot ill-suited for a settlement and selected a place to the N. of it which seemed to him to have the necessary qualifications, and, on Jan. 26, 1788, the Eng. flag was hoisted at Port Jackson, thus marking the beginning of the Brit. occupation of Australia. With convicts and their guards P. founded New S. Wales colony, the success of which he never doubted. His penal colony, however, had a difficult period of apprenticeship but, despite threatened famine and not a little vice and corruption among the very mixed settlers, the colony eventually thrived. It owed much to the sanguine temperament of P.; but his dream of establishing there a semi-feudal land system was doomed to disillusionment, for he found such a system could not succeed in Australia any better than in N. America. A national memorial on the wall of St. Mildred's Church, Broad Street, London, unveiled by the duke of Kent in 1932, commemorates the fact that P. laid the foundation of the colony which became the commonwealth of Australia.

Phillips, Edward (1630-c. 1696), Eng. poet, nephew of John Milton, b. in Westminster. His great work is the *Theatrum poetarum* (1675), a complete collection of ant. and contemporary poets, with observations upon them. The work contains criticisms far above the contemporary national taste, corrupted as the nation then was by the false and capricious refinements of the court of Charles II. Other works attributed to P. are *Enchiridion linguae latinae* (1684) and a poem on the coronation of James II.

Phillips, John (1631-1706), Eng. poet and author, brother of Edward P., b. at Bampton in Oxfordshire. His chief works, which are remarkable for licentious and coarse wit, pungent satire, and a generally controversial scurrility, are *A Satyr against Hypocrites* (1655); *Montielion, or the Prophetic Abnanack* (1660); *Maronides, or Virgil Travesty* (1673, which like some of his other works is in the style of *Hudibras*); *The Augustus Britannicus* (1697); and *The Vision of Mons* (1706), in addition to numerous trans. from Gk., Lat., and Fr. An early life of Milton, his uncle, is attributed by some to P. See W. Godwin, *The Lives of Edward and John Phillips*, 1815, and Helen Barber-Lane, *The Early Lives of Milton*, 1902.

Phillips, John (1800-74), one of the most distinguished of early geologists of England, b. at Marden, Wiltshire; his father married the sister of Wm. Smith, the 'father of English geology,' in whose care John, as a child, was placed after the premature loss of both his parents. For five years he attended Holt Spa School in Wiltshire, where he acquired a taste for classical learning. His uncle was by profession a civil and mining engineer, but devoted his time mostly to the preparation of maps of England and Eng. cos., and the nephew shared in the preparation of the maps, thereby acquiring a valuable preliminary training in geology. He was prof. of geology at King's College, London,

from 1834 to 1840, when he resigned to serve on the geological survey of Great Britain under De la Beche. In 1844 he became prof. of geology in Dublin Univ. and later a reader in geology at Oxford. In 1864 he was elected president of the Brit. Association. P. made a special study of liassic crustacea, colitic saurians, and Wenlock shales. He wrote numerous works on geology, including *Illustrations of the Geology of Yorkshire* (1835); *Geology of Oxford and the Thames Valley* (1871); besides *A Geological Map of the British Isles* (1842) and *Memoirs of William Smith, the Father of English Geology* (1844).

Phillips, Stephen (1864-1915), Eng. poet and playwright, b. at Somerton, near Oxford, son of Stephen P., D.D., precentor of Peterborough. He was educated at Stratford-on-Avon Grammar School and at Oundle. After studying for the civil service he played in F. R. Benson's Shakespearian companies for six years, then became an army tutor at Wolfham and Needham's, and finally devoted himself to literature. Of poetry he pub. *Primavera* (1890); *Bremus* (1894); and some other vols., that of 1897 being crowned by the Academy. He then took to writing verse-plays for London theatres: *Paolo and Francesca* (1899); *Ulysses* (1902); *The Sin of David* (1904); *Nero* (1906); *The King* (1912). From 1913 he was editor of the *Poetry Review*. His best play to be performed was *Armageddon* (1915). Pub. *Panama and other Poems* (1915). Completed *Harold*, a verse play, just before his death.

Phillips, Walter Joseph (b. 1884), Canadian artist of Brit. descent, b. at Barton-on-Humber, England, and educated in Birmingham. He first exhibited at the Royal Academy in 1913, and in the same year emigrated to Canada, settling in Winnipeg. Here he began the art of colour-woodcut for which he has become famous, galleries in Europe and America showing examples of these, and pictures, etchings, and water colours. He has an exquisite sense of colour and a fine originality of design and pattern. He has pub. two portfolios of his woodcuts, and also *The Technique of Colour Woodcut* (1927).

Phillips, Wendell (1811-84), Amer. reformer and orator, b. in Boston. He gave up a legal practice to devote his time to the abolition of slavery, and he was regarded as the prime orator of the movement. In 1840 he was sent by Massachusetts to the World's Anti-Slavery Convention. His *Speeches, Lectures, and Letters* were pub. at Boston (1864 and 1892). See lives by G. L. Austin, 1888, and C. Martin, 1890.

Phillipsburg, tn. in Warren co., New Jersey, U.S.A. It manufs. silk and machinery, and has iron foundries. Pop. 15,000.

Phillipsite, greyish translucent mineral, the primary form of which is a right rhombic prism. It consists chiefly of silica and alumina.

Phillpotts, Eden (b. 1862), Eng. novelist, b. at Mount Aboe, India; eldest son of Capt. Henry P. (15th Native Infantry), political

agent for the states of Harrowice, Rajputana. Educated at Plymouth, he became a clerk in the Sun Fire Insurance Office, 1880-90; and then, after studying for a time for the stage, adopted literature as a profession. In his novels P. gives a vivid and often terrible picture of Devonshire life. His pubs. include *Lying Prophets* (1896); *The Human Boy* (1899); *The Good Red Earth* (1901, reissued as *Johnny Fortnight*, 1904); *My Devon Year* (1903); *The American Prisoner* (1901); *The Secret Woman* (1905, dramatised 1912, but banned by censor); *Portreere* (1906); *The Folk Afield* (1907); *The Mother* (1908, dramatised 1913); *Widcombe Fair* (1913); *The Judge's Chair* (1914); *The Farmer's Wife* (play, 1917); *A Shadow Passes* (1918); *The Bronze Venus* (1921); *Redcliff* (1924); *Yellow Sands* (play, with Adelaide P., 1926); *Buy a Broom* (play, 1929); *Tryphena* (1929); *Essays in Little* (1931); *A Shadow Passes* (1933); *Portrait of a Gentleman* (1934); *Woodnymph* (1936); *Portrait of a Scoundrel* (1938); *Golderness* (1940); and *Pilgrims of the Night* (1942). The novels of P. are mostly of Devonian life and character and the mood atmosphere in them is detailed and true. They have a considerable vogue, though in point of success he reached the zenith of his career with the play *The Farmer's Wife*, a somewhat old-fashioned comedy with a simple plot and homely scenes which enjoyed a phenomenal run in London and in the provinces.

**Philo, Judæus, or Philo (Philon) the Jew** (b. c. 25 to 20 B.C.), member of a distinguished sacerdotal family. He was a native of Alexandria, and it is possible that he belonged to the sect of the Pharisees. He was eminent for his learning and eloquence, having been educated not only in the subjects usually studied by a Jew in his condition, but also in the Gk. philosophies, of which he had an extensive knowledge. He was especially conversant with Plato, and it is for his attempt at a reconciliation of the Platonic philosophy with the Mosaic revelation that his name is especially famous. The Logos doctrine owes its origin to P., and the influence of his school is visible in many of the N.T. writings, notably in the fourth gospel and in the epistle to the Hebrews. A more direct product of his school, however, is the apocryphal Book of Wisdom. There are eds. of Philo's works by T. Mangey (1742), C. E. Richter (1828-30), L. Cohn and I. Wendland (1896-1930); also monographs by C. Siegfried, 1875; J. Reville, 1881; J. Drummond, 1888; H. Windisch, 1909; E. Bréhier (2nd ed.), 1925; H. Willms, 1935; and E. R. Goodenough, *An Introduction to Philo Judæus*, 1940.

**Philo, Quintus Publius**, Rom. general. During his consulship (339 B.C.) he defeated the Latins, and was appointed in the same year dictator, when he passed the *Leges Publilianæ* according to which one consul must be a plebeian. During his second consulship (327) he carried on war in S. Italy, and during his third (320) he fought against the Samnites.

**Philoteles**, in Gk. legend, was the

armour-bearer of Hercules, from whom he inherited his bow and arrows. At the beginning of the Trojan war P. was left behind at Lemnos, but Helenus, having prophesied ten years later that Troy could only be taken by Hercules' arrows, Ulysses returned for him. See Sophocles' *Philoctetes*.

**Philodendron**, ornamental dwarf or climbing plant with oblong, heart-, or arrow-shaped leaves. Among the chief species cultivated in Britain are *P. andræum* and *P. gloriosum*, both climbers, and *P. venustum*, a dwarf plant.

**Philology** is the branch of knowledge which is concerned with the origin, growth, and relation of various languages. In this respect it is synonymous with 'linguistics' (q.v.), and has a wide range of meaning. In a strict sense, P. may indicate the study of written documents and literary works, and particularly of their language, its aim being to obtain from all these documents all possible information regarding the development of the language in question, and of its relationship with other languages; this special field is known as comparative P.

Gk. and Lat. P. was developed to a high degree of excellence in the sixteenth to eighteenth centuries. Semitic scholars followed the same methods in dealing with the Semitic languages then known, such as Heb., Arabic, Ethiopic. However, until about 150 years ago P. as an exact science was still in its infancy. During the second half of the eighteenth century Sanskrit (q.v.) began for the first time to attract the attention of European scholars: the Fr. Jesuit Cœurdoux, in 1767, and Sir Wm. Jones, in 1786, pointed out certain resemblances between Sanskrit and some European languages, especially anct. Gk. and Lat. At the time it was no more than a brilliant conjecture, but in 1816 the Ger. prof. Franz Bopp pub. a comparative grammar of the Sanskrit, Gk., Lat., Persian, and Ger. languages; with it comparative P. may be said to have begun.

A century ago, 'when the archeology of the Near and Middle East was still in its swaddling clothes,' there were already good dictionaries and grammars of various Indo-European, Semitic, and other languages. After the discovery and decipherment of the numerous Egyptian, Assyro-Babylonian, Hittite, Phœnician, S. Arabian, and other inscriptions, philologists began to apply scientific methods in the compilation of grammars and dictionaries of the new tongues. To-day many languages long since extinct, belonging to different linguistic families (q.v.), are nearly as well understood by competent scholars as archaic Gk., Lat., or anct. Heb. Others, however, such as Hurrian, are still little known because there are not ancient written documents. See further under: LANGUAGE; LANGUAGE, ORIGIN OF; LANGUAGES, CLASSIFICATION OF; LINGUISTIC FAMILIES; LINGUISTIC SCIENCE; also INDO-EUROPEAN LANGUAGES.

**Philomela**, in Gk. mythology, was the daughter of Pandion, king of Athens.

She was dishonoured by Terens, king of Thrace, the husband of her sister, Procne, and had her tongue cut out so that she could not reveal the fact. But P. wove words into cloth, and Procne, on discovering the truth, slew her son Itys and served him up as a dish before the king. Whereupon Terens pursued the sisters, who were changed, one into a swallow, and the other a nightingale, while the king became a hoopoe. Hence in poetical speech the nightingale is often called P.

Philomena, St., young woman whose cult had much vogue in the nineteenth century, after the discovery in 1802 of relics, in the catacomb of St. Priscilla, with a broken tablet inscribed *Filumena, Paetecum*, leading to the belief that the body was that of an unknown martyr. It would seem, however, that the church of St. Praxedis in Rome already contained the relics of the real St. P.

Philon the Jew, *see* PHILO, JEWERS.

Philopomen (252-182 B.C.). (Gk statesman and patriot, b. at Megalopolis, Arcadia. He defended his native city against the Spartans (222), and, joining the Macedonian king, Antigonus, defeated the enemy at Sellasia (221). In 210 he was appointed general of the Achæan horse, and in 204 was raised to the position of *strategos*. After his victory over the Spartans at Mantinea (208) he was proclaimed liberator of Greece, and in 192 again defeated the Spartan army under Nabis. In 182 he was taken prisoner by the Messenians and given a cup of poison.

Philoscenus (fl. 316 B.C.), Eretian painter who was remarkable for the rapidity with which he worked. His greatest work was a picture of the battle between Alexander and Darius, painted by order of Cassander, king of Macedon.

Philosopher's Stone, *see* under ALCHEMY.

Philosophy, term of which the meaning has in the course of centuries undergone considerable modifications. Pythagoras is reputed to have been the first to use it, replying to Leon's question as to his vocation that he was a 'philosopher,' that is, a lover of wisdom (*philos* and *sophia*). No kind of knowledge was in those early days outside the scope of P., which comprehended the whole range of human interests. This is seen in the Stoic definition of P. as the endeavour after theoretical and practical perfection in the depths of logic, physics, and ethics. Plato, in the *Euthydemus*, declares that P. is concerned with the ideal alone, and is identical with wisdom, whilst Aristotle uses the word sometimes to embrace all science, and sometimes as equivalent to the science of being (ontology). In the days when it was possible for the great minds of the world to be pre-eminently not only in one or two but in most of the dept., of science, the philosopher could formulate his system of P. from his own first-hand knowledge and experience. All knowledge was thus taken by P. to be her prov., and a philosopher, so called, was very often an expert in the various sciences. Such a state of things was only possible while science was in a very rudimentary condition, and with the growth of specialised knowledge P.

could no longer include, though it still retained the claim to transcend in importance, all knowledge. In this sense the scholastics and neo-scholastics define P. as 'the knowledge of things through their highest (i.e. most universal and independent) causes.'

Before the more modern definitions of P. are mentioned, a brief answer may be given to the old query, 'What is the good of P.?' From the time of Aristophanes onwards the philosopher has been represented as unpractical, immersed in useless and chimerical speculations. But Aristotle remarked, in order to prove that P. is vain and illusory we are compelled to philosophise. The sceptic is as much a philosopher as the idealist. There are experts in the special sciences who sometimes decry P., yet tread upon philosophical ground while pursuing their most abstruse inquiries. Mathematics is ultimately concerned with the questions of time and space, physics with causality and substance, art with beauty, religion with virtue, etc. P. is thus seen to be a necessity of human nature; the pursuit of speculative truth has always engaged men's minds, although there have ever been those to say that the end was unattainable. It is not so much the end as the pursuit that is important. An understanding of what is meant by the term P. in present-day usage is a necessity to a thorough study thereof, but unfortunately this is by no means an easy matter. Hardly any two writers are agreed as to the definition and boundaries of P., and the word has different connotations in different countries. Kant defined philosophical knowledge as knowledge through conceptions, as such; Horbart defined P. as the working out of concepts, and divided it into three depts., logic, metaphysics, and aesthetics (including ethics). Comte and Spencer also regarded P. as the unification and classification of the various sciences with a view to merely material ends. In the Eng. language, until very recently, P. meant almost anything, as evidenced by the term 'natural philosophy,' used by physicists. When properly used in the wider sense, P. may be taken to include logic, ethics, aesthetics, metaphysics, ontology, cosmology, and psychology; political economy and the 'philosophies' of law and hist. are often included. All these subjects are closely related to P., although not included in the narrower use of the word.

The most noteworthy advance in modern times has been that of psychology, which is now generally studied separately from P., and which, it is claimed by some, should be treated entirely as a physical science. The bearing on psychological investigations of the theory of knowledge, and the peculiar characteristics of 'mind' as a study, render it desirable for psychology to be retained as a dept. of P., although distinct from and subordinate to the higher branches. Logic, ethics, and aesthetics, whilst also forming part of P., differ from the other depts. in being 'normative' sciences, having reference to

the 'norms,' or standards, respectively of truth, virtue, and beauty. For the purposes of this general outline of the progress of philosophical thought, P. will be taken to include epistemology, or the theory of knowledge, metaphysics, and ontology. The ultimate task of P. is to show the interconnection of the sciences and their ramifications as part of an organic whole, which constitutes the totality of knowledge. Some idea of the steps in the fulfilling of this task may be gained from a knowledge not only of the philosophers themselves, but of their indebtedness to and connection with one another.

The beginnings of P. are as a rule attributed to the Gks., but the Indian ideas of the sixth century B.C. and later form an interesting parallel philosophic development. The Upanishads, whose main thesis is the monistic idea of the one true Absolute (Brahman or Paramathman), preceded the six philosophical systems. These are the *Nyaya*, the *Vaisheshika*, the *Sāṅkhya*, the *Yoga*, the *Mīmāṃsā*, and the *Vedānta*; they all are based upon a Monism, expressed in a more or less poetical language. In contrast to these declining oriental civilisations, the culture of the Gks. was only in process of formation.

Gk. P. may be divided into three sections: a physical or cosmological period, dealing with questions of being (c. 600–450 B.C.); a humanistic or ethical period, dealing with the ethical and social relations of man (450–400 B.C.); and a systematic period, during which all human problems were first connected in thought into a whole (400–300 B.C.). The problem of the early Gk. philosophers was to find the ultimate form of the objects of external perception. Thales thought that water was the source of all things; Anaximenes that it was air; and Anaximander, chaos. The Pythagorean P. had for its general principle number: the organisation of the universe in its various relations is a harmonious system of numbers. The Eleatic school, of which Parmenides was the real head, asserted that there was in reality no change or movement in the universe. The riddles of movement of Zeno (Achilles and the tortoise, etc.) had much influence on the conclusions of the Eleatic school. These conclusions were challenged by Heraclitus, who taught that 'everything is in a state of flux' (*πάντα ῥεῖ*), and that the permanence of things is only apparent. Empedocles attempted to combine the Eleatic principle of 'being' with the 'becoming' of Heraclitus. Democritus, the main author of the atomist theory, was the next noteworthy philosopher of Greece; he may be said to have laid the foundations of modern physics and cognate sciences, and is the earliest philosopher who attempted to give a scientific explanation of the world. Anaxagoras was the last philosopher of the early period; and his doctrine of *νοῦς*, mind, as the omnipotent, omniscient, and harmonising power is the first teleological explanation of the universe. The Sophists were the first philosophers

of the second Grecian period, although they were in reality a professional class who came forward to meet the growing demand in Greece for knowledge. The founder of the school is usually considered to be Protagoras, whose fundamental thesis consisted, in modern language, of the denial of all objectivity, and the restriction of knowledge to the impressions of the individual. His famous dictum was 'Man is the measure of all things,' and he may be called the first of the Individualists. Other prominent names among the Sophists are Gorgias, of Leontini, Prodicus, Hippias, Polus, Thrasy-machus, etc. The Sophists were generally teachers of rhetoric and eloquence, and during this period P. underwent a change in character. Problems of an ethical nature were discussed more, and, as a result of the prevalent doubts of the existence of any universally valid truth, scepticism (g.r.) was the prevailing note. Hence the title *Sophist* is still used in a disparaging sense, but there is no doubt that they did some good in fostering culture and promoting intellectual activity. The philosopher who was instrumental in refuting the arguments of the Sophists and rehabilitating P. was Socrates. Of his P. we possess no record written by himself, as he never left any; his life and P., as revealed in the *Dialogues* of Plato, are inseparable. He based conduct on knowledge; to know oneself is the sum of all P. and the only pursuit worthy of man. He founded no special school of P., though he gave the starting-point to several lines of thought. The minor or imperfect Socratic schools, as they are termed, are three: the Megarian, the Cyrenaic, and the Cynic. The originator of the first was Euclid of Megara, and his system combined Socratic ethics with the 'One-being' doctrine of Parmenides. The Cyrenaic school, founded by Aristippus, was the forerunner of the Epicureans, and held that pleasure was the only good, though not such pleasure as would be followed by pain. The sect of the Cynics was founded by Antisthenes, who declared virtue to be the only thing worth living for; virtue was, however, defined as abstinence and asceticism. Diogenes of Sinope is the famous example of a Cynic philosopher. The last epoch in Gk. P. is a landmark in the list of human thought. In the two great names of this period, Plato and Aristotle, the thought of all preceding ages reached its culmination. In their union and contrast they form the two poles of thought around which the human search for truth still revolves. Plato is occupied mainly with an inquiry as to the necessary and universal element in experience; he represents the synthesis of pre-Socratism and of Socratism. We are indebted to Plato for two great truths: that, in order direct human knowledge aright, reason must be the starting-point and that all human thinking is accomplished by means of universal concepts. The doctrine of universal ideas has had a great influence on the list. of P., and is now an important factor in every philosophical system. Aristotle may be called

the founder of empiricism in the auct. world. Plato placed P. in an idealistic antithesis to actuality, and a more realistic conception of things was supplied by Aristotle. There are two essential elements to be considered in a rational examination of the world, the *idea*, or matter, and the form which may be given to it by human intelligence. Aristotle was called the philosopher by medieval schoolmen, and his work certainly far surpasses, both in character and amount, that of his predecessors. His logical treatises, his ethics, and his psychology served for ages as standard treatises on the various depts. of P.

During the Rom. rule there were, from a philosophical point of view, two main periods, a moral and a religious. The three main systems of the first period are Stoicism, Epicureanism, and a scepticism. The first teaches that happiness is to be found not in outward things, but in power over 'all thoughts, all passions, all desires.' Epicureanism declares the supreme good to be personal pleasure, consisting not in self-indulgence, but in tranquillity and peace of mind. Total submission is advocated by Scepticism (q.v.), which declares definite knowledge unattainable. The chief names in Stoicism are Zeno, the founder, Panætus, Posidonius, Seneca, Epictetus, and Marcus Aurelius; in Epicureanism, Epicurus, Metrodorus, Hermarchus, Polystratus, and Apollodorus may be mentioned; Pyrrho of Elis founded the Sceptical school, of which Arcesilaus and Carneades were the prin. adherents. The religious P. of the Rom. period is known as neo-Platonism. The germ of this teaching is found in the writings of Philo, but the title of founder of neo-Platonism properly belongs to Plotinus, a pupil of Ammonius Saccas. Neo-Platonism is a religious P. with strongly marked mystical tendencies and has more in common with religion than with P. proper. The Gnostics and the Christian Fathers were representatives of faiths which formed the transition from auct. to medieval P. The chief of the Gnostics were Basilides, Carpocrates, Valentinus (Alexandrian Gnostic), and Mnander, Saturninus, Tatian, and Bardesanes (Syrian Gnostics); among the Fathers may be mentioned Justin Martyr, Athenagoras, Theophilus, Clement of Alexandria, Origen, Athanasius, and St. Augustine. The latter based their P. on Platonic Illuminism as the most 'spiritual' of the Gk. P's., but they had some trouble with those elements of Plato's system which seemed to conflict with Christian dogma, e.g. the eternal existence of matter. It was St. Augustine who really 'christened' Platonism.

The first representative of medieval or scholastic P. was John Scotus Erigena. The great problem over which the battles of the Schoolmen were waged was Nominalism *versus* Realism. The Nominalists, who followed Aristotle, maintained that universal notions were mere empty abstractions of the mind, having no objective reality. The Realists, following Plato's teaching, contended that universal notions

had a real existence prior to the concrete things which embodied them. An intermediate theory, which sought to unite the two systems, was called Conceptualism, which was finally superseded by the moderate realism of the Thomists. The chief figures among the earlier scholastics are Roscelin, the nominalist; Abelard, the dialectician who foreshadows the moderate realism mentioned above; Anselm, his adversary, a pioneer in medieval psychology; and William of Champeaux, the extreme realist. Albertus Magnus, 'the Universal Doctor,' introduces the urge to thorough-going synthesis, which found its perfection in the writings of St. Thomas Aquinas and was continued by the Thomists. In contradistinction to these a Franciscan school, headed by Alexander of Hales and St. Bonaventure, continued the 'mystic' (neo-Platonic) tendencies of the Victorine school of the twelfth century. A veneer of Aristotelian logic was given to their doctrines by Duns Scotus, after whom the Scotists are named. Thereafter came the slow decline of Scholasticism, which, by the Reformation, had ceased to represent any vital force in the world of P. During the period of the Renaissance, the intellectual movement which marked the transition from the Middle Ages to the modern world, nearly every system of auct. P. was revived, and the resulting intellectual activity found expression in the writings of the philosophers of the 'transition period.' Chief among these was Giordano Bruno, the It., whose system is a pantheism which had much influence on Spinoza. Jakob Boehme and Montaigne represent respectively mystical theosophy and scepticism, whilst Bacon and Hobbes showed the defects of the existing methods of research and inquiry, the latter emphasising the importance in science of deduction, to which Bacon did not ascribe any importance.

Modern P. is generally regarded as commencing with Descartes. The first phase of modern thought is scientific Rationalism, which appealed to the reason, by which such mighty results were being obtained in natural science. From Descartes to Leibniz there is a period of metaphysical systems which have a close connection with science. This Rationalism, however, assumed a harsh, narrow aspect. Reason was deified, and represented as the all in all, and Deism took the place of religion. The gradual undermining of Rationalism was due to the efforts of the Empiricist school, which argued that experience is the source of all knowledge. Scepticism succeeded Empiricism, but was itself discredited by the new movement, started by Rousseau, Lessing, and Herder, which grew into what is known as Ger. Idealism. This in its turn has been supplemented by the theories of Schopenhauer, Spencer, and others. The chief men who have been instrumental in bringing about this progress are as follows: Descartes's system was idealistic and dualistic; the world falls into two completely separated realms, the one of body and the other of mind.

Behind this dualism, however, is the conception of deity, the one perfect substance in which both realms meet. The manner in which this union is brought about was not satisfactorily explained by the parallelism of Descartes. Geulinx attempted to overcome the difficulty by his theory of Occasionalism, which attributes all movements, both mental and physical, directly to God; Malebranche is closely connected with this position. Hobbes held that the end of P. was social, and that theology and transcendentalism did not come within its sphere. Spinoza declared the unity of all things in God, mind and matter being equal, both being attributes of the infinite, eternal, and all-comprehending substance which he calls God. Leibniz was the chief representative of Pluralism in metaphysics, regarding individuation as an irrefragable truth. His system was in all respects the logical antithesis of Spinoza's, and made an immediate and widely extended impression on the culture of Europe, which it dominated until the time of Kant. Wolff was the first follower of Leibniz who erected an independent system on his principles; he attempted to combine the teaching of Leibniz with the older Aristotelian doctrines of the schools. Among the pupils of Wolff who influenced Kant were Baumgarten and Crusius. Locke may be called one of the founders of modern psychology; his P. is a study of ideas. The influence of his writings has been very great on the subsequent course of philosophic thought, and his principles were developed in the hands of Berkeley, Hume, Reid, and the so-called Scotch psychological school, and afterwards in those of the Fr. sensationalist and materialist school, including such names as Condillac, Helvétius, Diderot, and D'Holbach.

Kant was the pioneer of a line of thought leading again to those wider issues as to the meaning and constitution of reality treated of by Plato and Aristotle. He has given the most thorough analysis of the human mind that has ever been offered. He created a new dualism between the phenomenon and the noumenon. The development of Idealism was carried on by Fichte and Schelling. The line of thought pursued by Kant, Fichte, and Schelling culminates in Hegel. The diverse elements of thought, subject and object, individualism and pantheism, which previous P. only partially reconciled, are now taken up and fused into one system. The two elements of knowledge which Kant had left unreconciled, and which Fichte and Schelling harmonised only by suppressing one of the sides, were brought into a synthesis. The ultimate principle of all knowledge is the unity of consciousness. Hegel's system must be regarded as the culmination of Ger. Idealism. 'Mountains of dust and rubble and millions of graves testify to-day to the fatal character of such one-sided historical thinking as that of Hegel' (Douglas Jerrold). Of the philosophers since Hegel, Schopenhauer was a pessimist who regarded life as

essentially evil; his chief tenet is that the inner essence of man's nature is will. The Positivism of Auguste Comte is in reality a denial of the utility of P., save as a classification of the different sciences. In its later form Humanism as a whole was worshipped as the mediator between the outer world and man. The Utilitarianism of the Benthamites and J. S. Mill, though based on an individualistic and hedonistic theory, was at bottom social in its nature. The theory known as psycho-physical parallelism was taught by Fechner and Paulsen. The doctrine of evolution inspired by the P. of Spencer may be described as the creed of the Unknowable. Among other modern systems of P. that of Lotze is teleological in nature, combining the monadology of Leibniz with the pantheism of Spinoza, and has had much influence on Amor, thinkers.

It may be said that modern P. is divided into two main sections, of which the one maintains and the other denies that matter and spirit can be reconciled in a manner comprehensible to the human reason. On the latter side are the Positivist, the Kantian, the theological Agnostic, and all the allied schools, whilst on the former side are the Theist, the Idealist, the Spiritualist, and their followers and allies.

One of the chief tendencies of present-day P. is to seek to establish a closer relationship between P. and the sciences. But in order to complete this movement, it is necessary to define more clearly just where the physical conception of the universe stops and the philosophical perception of the universe as a whole begins. Students to-day already recognise that the physical conception of the universe does not allow for the degree that time relations as well as space relations affect it. Indeed physical science is not to be regarded as an attempted interpretation of reality, but only as a means of conducting tests and investigations to support theories of reality. Conscious behaviour and life include the physical scientist, as was the case with Newton, and a perception of the universe is dependent on life and consciousness. For that very reason different scientific interpretations reveal inconsistencies, and it is just these variations that philosophy must endeavour to interpret and bring to agreement. Thus P. confines itself to actual experience, including not only present, but past and future, in any aspect which may reveal some new postulation in its endeavours to interpret reality, and this in part explains the growing return to realism as opposed to a materialistic theory founded on physical interpretations. A valuable contribution to the philosophical literature of the present time has been made by Prof. S. Alexander. It may perhaps be described as the first system of P. yet propounded by a Brit. philosopher. Alexander declares 'that space and time are real, and that the physical world arises from space and time. He denies that idealism can provide the base upon which reality rests, holding that ideas are merely abstractions from reality, and that

with a certain complex element in physical structure life is evolved, or, as he puts it, is 'emergent.' He makes no attempt to explain life away as an elaborate system of mechanism. Similarly a further complex development in the physical structure produces mind. Beside the work of Alexander, the work of J. S. Haldane deserves mention. Haldane thinks that the universe as it is assumed to be in physical science is only an idealised world, while the real universe is the spiritual universe, in which spiritual values count for everything. The group of workers who are in agreement with Haldane include Bradley and Bosanquet of Great Britain, Royce of America, Croce and Gentile of Italy, and Volkelt of Germany. Opposed to their teaching is a school which includes W. James, Dewey, and Schiller, who, from a pragmatic standpoint, propound that experience in conduct gives us 'right,' while experience in thought is 'truth.' They demand that the practical consequences of an idea should be its true measure of value, involving a criticism of a monistic universe, and their demand imports a belief in pluralism (*q.v.*). In America there is a tendency to refute the idealism of Kant as developed by Hegel, and Bertrand Russell and G. E. Moore have written from that standpoint. In France the P. of Bergson (*q.v.*) has had a wide following. He is opposed to absolutism, and offers in support of his criticism his doctrine of change as the answer to the riddles of the philosophical world. Croce and James in many respects subscribe to this theory. Bergson's attitude towards evolution is expressed as the universe being a mind functioning both theoretically and practically; the practical operations produce the materialistic world, while the theoretical manifestations result in the spiritual world. Prominent among Ger. philosophers is Wundt, who died in 1921. His theory is that the body is part of an experience of which the soul is subjective. He proclaims the 'will to believe,' and up to this point is supported by W. James. Impulsive will is imputed to all organisms, and activity is will, and the highest will he calls God. Fr. P. reveals a decided sociological trend, and is conducted rather by way of attempts to solve separate problems than the formulation of any complete system. It may be that the earlier mathematical studies of some of the leading philosophers like Cournot and Renouvier and the scientific investigations of Bergson and Le Roy produced a more precise method of inquiry, and modern Fr. thought appears to withdraw from the consideration of individualistic systems, declaring that reality is too rich and complex to support that contention. P., it is said, is a manifestation of life itself which blossoms to self-consciousness through grades of increasing harmony.

In France, after 1944, existentialism (*q.v.*) gained much attention, its chief exponent being Jean Paul Sartre. Based on his view that 'all human activities are equivalent, all are destined by principles to

defeat,' it conceives of the absolute inanity of existence and negation of all creation, and offers no dogmatic solutions to questions of ultimate origins and destinies. It is not entirely a novel P., and its distinctive features are borrowed from Kierkegaard (*q.v.*), amongst them that God and exceptional individuals are above moral categories, and that subjectivity is truth, i.e. 'consciousness creates out of itself what is true.' Karl Jaspers (*q.v.*) upholds the existentialist contrast between mere existence and significant existing, but stresses the experience of another person as a separate other person. Whereas Martin Heidegger (*q.v.*), whom Sartre follows (but who denies any connection with existentialism), holds that there is no other, that existence is somehow born from nothing, and also that the possibility of a God and of man's dignity reside in being as such.

The relationship between P. and sociology has a particular interest in these days when the study of social questions appeals to a rapidly growing number of students. Bosanquet suggests that the philosopher reads in society the wider expression of what individual man really is. He investigates the social whole in order to discover in its progress what the mind of society really is and what are its powers of self-assertion or self-offacement in human and natural environment. The state is merely an expression of certain needs and ambitions of man. Bosanquet's theory is based upon Plato's assertion that politics was a science, and that political forms correspond to types of mind, and, further, that the central inspiration of all science is good, and, finally, in a glorious climax, that no one who has not comprehended the connection that links the order of the universe and its influence upon society was competent to be a ruler of men.

An Aristotelian reaction has shown itself in the neo-Scholastic movement among Rom. Catholic philosophers, fostered by the work of Cardinal Merleau at Louvain, and the study of the works of Aquinas imposed by recent popes upon seminary students. The chief leaders of the movement are Dr. Grabmann of Munich, J. Maritain in France, and F. Aveling, M. C. d'Arcy, P. Coffey, and others in Great Britain. The current interest in psychology (*q.v.*) and its ever-widening appeal to a class of student with little or no previous acquaintance with P. as a science call for a word of warning. There is a tendency to include all questions associated with the study of the mind under the heading psychology. In most cases the classification is wholly unjustified, and it is only too easy for the student to examine some question which is purely philosophical under the delusion that he is studying psychology. Psychology knows only causes and effects of mental life; it has nothing to do with ideals, values, purposes, and ends except as mere facts. P. is an attempt to get at the deeper reality of things; the significance of human life, the nature of the soul, human destiny, immortality, and

God are purely philosophical problems. Psychology examines phenomena, P. seeks to explain.

The large number of philosophical works that followed the break-up of the Hegelian school were alike in that they consist, not in any enthusiasm in speculation for its own sake, but rather in the desire to see how others have speculated, or, in other words, in the hist. of P. Thus many writers of a philosophical bent have acquired a reputation exclusively for their criticisms rather than for any system of P. Among independent philosophers who are better known for their chapters on the hist. of P. are Zeller, Prantl, Sigwart, and also Kuno Fischer, the last-named being no mean constructive philosopher. Even such philosophers as Ernst Reinhold and Chalybäus are known as historians of P. more widely than as expositors of systems of P.; while Trendelenburg's *History of the Doctrine of Categories* is read in Germany far more than his *Logical Investigations*. Indeed it is remarked by Erdmann that this preponderance of the historical element is seen even in the speculations themselves, especially in the form of critical discussions contained in historical introductions. The only exceptions would appear to be Lotze and Weissé; for such well-known works as Hillebrandt's *Organon of the Philosophical Idea* and Wirth's *Idea of the Godhead* are really sketches of the hist. of P. In this connection it is pointed out by Erdmann that Christ has received many compliments for his criticism of the Hegelian P. but that as regards his theory of distinguishing activity he seems to stand alone; yet he does not think that this marked preference is any indication of philosophical decrepitude and sees an almost conclusive parallel in the effect on the study of the law of the brilliant historical writings of Savigny. There is clearly much gain in having the hist. of P. presented in a philosophical manner; for, just as the study of legal hist. paved the way ultimately for increased study of the law for its own sake, so the study of the hist. of P. may give an impetus to a wider study of P. See also COSMOGONY; ETHICS; LAW; LOGIC; MIND; POLITICAL ECONOMY; POLITICS; PSYCHOLOGY; SOCIAL PHILOSOPHY, etc.

Philosophy, Social, see SOCIAL PHILOSOPHY.

Philostatus (c. A.D. 170-250), Gk. sophist and rhetorician of Lemnos. He settled in Rome at the time of Severus and wrote *Lives of the Sophists*, *Life of Apollonius of Tyana*, *Heracles*, and *Epistles*. The standard ed. of his works is by Kayser (1849). There is an Eng. trans. by E. Berwick (1809). P. the younger, a grandson of the preceding, wrote a work entitled *Imagines* (on paintings).

Philotas (d. 330 B.C.), Macedonian soldier, son of Parmenion, one of the generals of Alexander the Great. While P. was serving in Media he was accused of treason, and his action having implicated Parmenion, father and son were executed.

Philozenus (135-350 B.C.), Gk. dithyrambic poet, b. at Cythera. He spent part of his life at Syracuse, where he lived at the court of Denis the Anarchist. Only a few fragments of his poems have come down to us.

Phips, or Phipps, Sir William (1651-1695), first royal governor of Massachusetts, b. at Pennington in Maine. In 1687 he rescued treasure to the value of £300,000 from a Sp. wreck, and was rewarded for his services with a knighthood and appointed a sheriff of N.W. England. He captured Port Royal in 1690, but failed in his attack on Quebec (1691). He was appointed governor of Massachusetts in 1692. See life by Bowen in Sparks's *American Biography*, 1834-37.

Phiz, see BROWNIE, HUSBOT KNIGHT.

Phlebitis, inflammation of a vein. It is generally caused by the extension of inflammatory processes from neighbouring tissues, and results in the formation of a thrombus or clot in the course of the vein. This clotting is attended with particular danger, as if it becomes detached from any cause, septic emboli or masses of infected fibrin are carried away in the bloodstream and may lodge in an important organ. Hence they may cause dangerous inflammation through an infectious process, or by obstructing the circulation may increase the blood pressure

locally to a disastrous extent. Thus an embolus may reach the brain and cause sufficient vascular disturbance in the cerebral region to produce paralysis and death, or it may lodge in the lung and cause a pulmonary embolism. The symptoms of P. are pain, swelling, and oedema of the affected part and a cordy appearance of the vein itself. The treatment should involve rest and fomentations of the part, and, if practicable, the thrombus should be removed by a surgical operation. P. is often associated with varicose veins of the leg.

**Phlebotomy**, see BLEEDING and VENESECTION.

**Phlegethon** (flaming), in Gk. mythology, a riv. of fire which encircled the infernal regions and emptied itself into Lake Acheron.

**Phlegm**, mucous secretion, with impurities such as dust and bacteria, expelled by coughing from the lower air passages.

**Phlogiston Theory**, in chem., a theory of combustion elaborated by J. J. Berch (1635-82) and G. E. Stahl (1660-1734). According to this theory, all combustible bodies contained a 'principle of combustion', *phlogiston*, which they gave up to the air or to other bodies when burnt. Though the P. T. was enthusiastically supported by Eng., Ger., and Fr. chemists in the eighteenth century, it was overthrown by the work of Lavoisier (q.v.) who showed that on combustion a burning body combined with atmospheric oxygen and that the products weighed more than the original substance. See E. J. Holmyard, *Makers of Chemistry*, 1931.

**Phlorizin** (Gk. *φλοῖς*, bark; *ίζω*, root), glucoside found in the bark of the roots of sev. allied plants, such as the apple, pear, and cherry.

**Phloroglucinol**, or symmetrical trihydroxybenzene,  $C_6H_3(OH)_3$ , colourless crystalline solid (melting point  $218^\circ$ ), formed by fusing resorcinol (q.v.) with caustic potash in the presence of air. It gives a dark violet colour when treated with ferric chloride solution. It is used as an analytical reagent.

**Phlox**, well-known genus of plants in the family Polemoniaceae. There are fifty species, which grow wild in N. America and Siberia, and sev. are cultivated in Britain.

**Phnom-Penh**, see PNOM-PENH.

**Phocæa** (modern Fokha or Fokia), anc. Ionian city on the W. coast of Asia Minor. Its inhab. were noted for their maritime pursuits, and founded the colonies of Massilia (Marseilles) and Alalia in Corsica. During the sixth century B.C. it submitted to the Persian yoke, but in 500 joined in the Ionian revolt against Persia. The modern town was founded by the Genoese in 1421.

**Phocæe**, see under BYZANTINE EMPIRE.

**Phocids**, see SEAL.

**Phocion** (c. 402-317 B.C.), Athenian general. He distinguished himself at Naxos (376), with Evagoras conquered Cyprus (351), restored the power of Athens in Eubœa (349), and drove Philip out of Chersonesus (340). He showed his wisdom in advising cessation of hos-

tility with the Macedonian king and in trying to check the Athenian policy of war. He was involved in the intrigues of Cassander, and, in particular, was suspected of having advised Alexander, son of Polysperchon, to seize the Piræus in 318; Alexander, to whom he fled, betrayed him to the Athenians and he was compelled to drink the hemlock. There are lives by Plutarch and Cornelius Nepos.

**Phocis**, prov. of anc. Greece, N. of the gulf of Corinth and W. of Boeotia, and traversed by the mt. range of Parnassus (8068 ft.). The Delphic shrine, though within its borders, was held by Dorians who in the 'sacred war' of 590 B.C. strove to free themselves from Phocian supervision. A similar Phocian war lasted from 356 to 346, ending in the fall of P. at the hands of Philip of Macedon, who razed all the Phocian towns to the ground excepting Abæ.

**Phocæa**, see PORPOISE.

**Phœbus** and **Phœbe** (bright), names of Apollo, the sun god, and Artemis, the goddess of the moon, respectively.

**Phœnicia**. Out of two Gk. forms, *φαινή*, *-κος*, and *φαιάδα*, the Romans formed the Lat. names for Carthaginians, *Pœnici* and *Pœni*; the change from *ph* to *p* was due to Etruscan influence; the etymology of *φαινή* is uncertain, but traditionally explained as 'palm-tree'; it is more probable that it meant 'red' (due to the sunrise from the Gk. point of view), 'Orient', 'Levant.' The indigenous name was *Kana'an*, Heb. *Ken'an*, Accadian *Ki-na-hhi*, *Ki-na-hna*; Egyptian *K'-n'-n'*. This anc. country extended along the E. coast of the Mediterranean, perhaps from the Amanus Mts. on the N. to Mt. Carmel on the S., and was bounded on the E. by the mts. of Libanus and Anti-Libanus (i.e. Lebanon). Its N. and S. as well as its inland frontiers differed at different periods, according to the gradual progress and decline of its people, and, indeed, so uncertain would their boundaries appear to have become after the loss by the Phœnicians of their independence, that no two Gk. or Rom. writers can be found to assign the same limits to their ter. The chief towns, which were for the most part built on the coast or upon is., were, from S. to N., Arco (subsequently Ptolemais and then St. Jean d'Acre); Tyre and Sidon, for some period the chief of all the Phœnician cities; Sarepta (Sarpad), between Tyre and Sidon, and mentioned in the list. of Elijah as Sarpadath (1 Kings xvii. 9); Berytus (modern Beirut), a few m. N. of Sidon (later the Rom. colony Felix Julia); Byblos (Heb. Gebel, Phœnician Gubli, modern Jubel or Djebail), 24 m. N. of Berytus, the seat of the governor of P. in the Tel el-Amarna period and of the worship of the goddess Baaltis; Tripolis (now Tarabulus), so named because it originally consisted of three cities, each a furlong distant from each other, and each with its own ramparts; and Arvad or Aradus (modern Ruad) on an is. N. of P., and whose fleet is mentioned in the Tel el-Amarna tablets. Ugarit (modern Ras Shamrah), situated opposite the most easterly cape of Cyprus (some 6

m. N. of Latakia), was a flourishing city in the second half of the second millennium B.C. The soil produces at the present day pine, fir, cypress, cedar, terebinth, palm, sycamore, acacias, olives, figs, wheat, barley, rye, apricots, peaches, almonds, pomegranates, citrons, grapes, bananas, cotton, indigo, and tobacco; the mineral ores are confined to iron and stone. It is difficult to say for which of the two occupations, mining or navigation, this industrious and energetic people was more renowned. The rough, rocky soil did not tempt the Phœnicians to become farmers, but the great blue waters before them, and the splendid cedar forests which covered their mts., made

the coast-line, however, the names of Phœnician trading posts are found in various parts of the Mediterranean, even in Greece and Egypt. The strongest settlements of the Phœnicians were always on the is. Cyprus was especially favoured by them.

The goods which the Phœnicians brought to Greece were imitated by the inhab. of the land so far as they were able. The jewellery of gold and silver, the bronze utensils and armour, the painted vases and terra-cotta figures which the primitive Gk. procured from the Sidonian merchant were his earliest models. P. had copied her art from Egypt or Mesopotamia or inland Syria, and as a rule they handed

PHOCIS: THE SITE OF DELPHI

them, as far as we now know, the first sailors who ever sailed out of sight of land. To obtain metals for their craftsmen they sailed into every part of the Mediterranean and apparently even out into the Atlantic Ocean to Gaul and Britain. They brought gold and silver from Spain (perhaps also gold from Ireland), copper from Cyprus, and probably iron and tin from Britain. They brought pearls from the E., perfumes and spices from Arabia, fine linen from Egypt, lions' and panthers' skins from Africa. They made useful articles of this material, and sold them in all parts of the ant. world. The most famous adventurous voyage is the *pleriphus* around Africa achieved by the Carthaginian Hanno (perhaps fifth-fourth century B.C.), as told by Pliny. *Hist. Nat.* II., 169. The Phœnicians did not usually penetrate far from the coast, but the legends of the foundation of Thebes seem to show at least one case in which the Phœnician trader pushed boldly inland, and built his settlement 12 or 15 m. from the sea. On

those elements on, usually somewhat altered, to other regions. Thus Greece in her turn took her early art at second hand, the foreign, indirect influence being plainly traceable. Centuries, however, were to pass ere the borrowers succeeded in abandoning the stiff conventional style which they had originally adopted from their instructors. It was not only in arts and handicrafts that the Phœnicians left their mark on Greece; the religion of Greece shows traces of Phœnician influence. Aphrodite, for instance, is but a modification of the Phœnician Asherah, Hercules of Melkart. By far the most important Phœnician contribution to Gk. culture was the transmission of the alphabet (*q.v.*). An idle story runs that glass making was discovered by shipwrecked sailors who found that the sandy shore with the many shells ground up by the waves became coated with glass beneath their camp fires. The Tyrian purple, obtained at great cost from shellfish, a sort of Phœnician whelk, known as a *murex*

(each yielding but a drop of dye), was famous all over the world. The Rom. emperor wore a purple toga; the term 'royal purple' is still current.

The Phoenicians belonged to the N.W. branch of the Semites (*q.v.*). It is difficult to conjecture the precise date of the settlement of the Phoenicians on the Syrian coast. It is clear that the Phoenicians must have settled on the coast of the Mediterranean at a very early period. The Phoenicians were part of the second wave of Semitic migration, and probably settled on the Mediterranean coast during the fourth millennium B.C., but they do not appear in hist. before the eighteenth century B.C.

*History.*— Apart from the evidence from cuneiform and Phœnician inscriptions, the sources of Phœnician hist. are confined to the Bible and to Gk. historians such as Herodotus, Menander of Ephesus, Josephus's fragments of the Phœnician Deus's hist. of Tyre, Justin, and a few others. The extraordinary discoveries (1933-38) of the Fr. scholar André Parrot at Tell Hariri (anc. Mari) on the Middle Euphrates of the royal archives (containing over 20,000 tablets written in cuneiform script) show that the Amorite kingdom of Mari of the eighteenth century B.C. had diplomatic and commercial relations both with Mesopotamia and the cities situated on the Mediterranean coast. Amongst the numerous states and ins. mentioned in the Mari tablets we find the important Phœnician city-state of Byblos. Excavations in P. show that in the eighteenth century B.C. (and probably even earlier) this country was under Egyptian control. Even in the far N., at Ras Shamrah (anc. Ugarit), and in the far E., at Qatna (N.E. of Hama), there have been found monuments attesting to the direct connections between P. and the Egyptian kings. The archaeological find at Byblos give a vivid idea of the extent to which the art and craftsmanship of P. were influenced by Egypt in the nineteenth and eighteenth centuries B.C. After the Hyksos invasion of Egypt, which brought the downfall of the twelfth dynasty (middle of the eighteenth century B.C.), P. became independent, and her cities were free to develop economic and military strength without outside interference. With the eighteenth dynasty (c. 1570 onwards), however, and particularly with Thothmes III. (first half of the fifteenth century), P. became an Egyptian prov. The glory of P. only truly began with the recovery of its independence on the decay of the Egyptian Empire in the fourteenth century B.C. At that period Byblos was the first city of P., and as it was the chief centre of trade in papyrus, the Gks. have taken the word *βύβλος* for 'papyrus' and 'book' (hence, many centuries later, the name *τὰ βιβλία*, 'the Bible'). Later Sidon and Tyre achieved the hegemony of P. From the eleventh or tenth century onwards P. estab. colonies throughout the Mediterranean coasts. At the end of the second millennium B.C., with the definite or temporary political decay of the great nations of the Bronze Age, the Egyptians,

the Babylonians, the Assyrians, the Hittites, the Cretans, in the E. Mediterranean, we enter a new historical world. P. (as well as two other Semitic nations, Israel and Aram) played an increasingly important part. To the W. of P. seeds were sown amongst the eager-minded peoples which later constituted the nation of Hellas, the Gks. A vast Phœnician colonial empire was built up in the E., S., and W. Mediterranean, in Cyprus, N. Africa, Malta, Sicily, Sardinia, Marseilles, and Spain. Trading colonies were estab. in Greece, Egypt, and other countries. In the tenth century B.C. Tyre, under Hiram I., son of Abibal, and contemporary of David and Solomon, became the leading Phœnician state. Solomon requested the aid of Sidonian artificers and a supply of cedar wood from Lebanon for the construction of the temple and royal buildings; and if, as tradition says, Phœnician workmen built the whole temple, its brazen pillars and remarkable Holy Place were sufficient testimony to their skill in applied art. The golden age of P. waned when Hiram's third successor, Ithobaal, having murdered the last of the sons of Hiram, seized the throne and assumed the style of 'king of the Sidonians.' In 876 B.C. Awad, Byblos, Tyre, and Sidon were under Assyrian domination, and paid tribute to the Assyrian king, Assurnazipal. Under Hiram II. Tyre was trib. to Tiglath-pileser III. of Assyria, but the next Tyrian and Sidonian king, Luli or Elulenis, revolted and successfully withstood a siege by Shalmaneser V. During Sennacherib's campaign against Hezekiah (701 B.C.) Luli fled to Cyprus, though Tyre still held out. Arvad and Gubal (or Byblos), however, surrendered to the Assyrians. At this time Sidon was under the rule of an Assyrian nominee, Ithobaal; under his successor, 'Abdimilkut, it rebelled against Assarhaddon in 678 B.C., was destroyed, and then rebuilt. Tyre, after the destruction of Sidon, assumed the hegemony of so much of P. as was left independent, but was besieged at various times, and finally in 588 B.C. by Nebuchadnezzar. Its king surrendered, and a puppet king (Baal II.) was appointed, who reigned from 574 to 561 B.C. Afterwards the monarchy of P. gave way for a time to a system of gov. by *suffetes*, or judges. With the fall of Babylonia (539 B.C.) P. passed under Persian rule, and (together with Cyprus and Syria) she became the fifth Persian satrapy, but the Phœnician cities continued to have their kings and local autonomy. Phœnician fleets were frequently employed by the Persians in naval warfare, as in the attack on Miletus during the Ionian revolt, 498 B.C., and again, in 480 B.C., the most reliable portion of the Persians' naval forces was composed of the ships of the Phœnician cities. But at the battle of Eurymedon, when Persian naval power was completely broken, Cimon of Athens intercepted eighty Phœnician galleys and destroyed most of them off the coast of Cyprus (480 B.C.). A Phœnician navy was also engaged in the closing stages of the Peloponnesian war.

After the restoration of the Phœnician monarchy Tyre in 332 B.C. was burnt by Alexander the Great (Awad, Byblos, and Sidon, on the other hand, with joy had accepted Alexander the Great). Soon the last vestige of independence in P. was gone, and in 64 B.C. it sank to the position of a Syrian colony of the Romans.

The chief, if not the only, reliable sources of our information concerning the religion, manners, and laws of the Phœnicians, are the Phœnician inscriptions (see below) and coins. The latter may be divided into three groups: (1) The earliest period, i.e. from the beginning of the Phœnician coinage (end of the fifth century B.C.) until Alexander the Great: coins from Arvad, Byblos, Tyre, Sidon, and others; (2) the period of Alexander, the Ptolemies, and the Seleucids: coins of Arvad and Sidon, with the representation of the *tyche* (Fortune), of Tripoli, with the Dioscuri, of Tyre, with the head of Melqart, etc.; (3) the period of the Rom. Empire: mainly coins representing the temples of Berytus, Tripoli, Tyre, Sidon, and so on.

**Language.**—The Phœnician language, now extinct, belongs (together with Heb., Moabite, Ammonite, Edomite, all strictly related to each other, and perhaps also the language of the numerous Ugurite or Khas Shanirah inscriptions) to the Canaanite main branch of the N.W. subdiv. of the Semitic linguistic family. The other main branch of the N.W. subdiv. is Aramaic. The E. or N.E. subdiv. consists of Accadian (or Akkadian), including Babylonian and Assyrian, while Arabic and S.-Arabic (including Ethiopic, Amharic, and all the dialects) form the S. subdiv. of the Semitic languages. Phœnician was the speech current in pre-Christian times in the commercial cities of the Phœnician coast, Tyre, Sidon, Byblos, and the neighbouring ins., where it was spoken for over 1500 years. It also was the language of the numerous Phœnician colonies along the Mediterranean shores, and particularly at Carthage and its colonies—the Carthaginian dialect is known as Punic. Phœnician inscriptions have also been found in the is. of Cyprus, in Greece, in Malta, Sicily, Sardinia, Marselles, Avignon, and Spain. Two extremely important Phœn. inscriptions (including a Phœnician-Ittite bilingual) were recently discovered at Karatepe in E. Cilicia. In the W. Mediterranean, especially in the ter. of Carthage, the Punic dialect outlived the fall of this metropolis as well as the Phœnician language of the mother country; in the fifth and sixth centuries A.D. it was still the language of the peasants, and probably continued to be so until the Arabic conquest. It may thus be said that Phœnician was spoken for about 2000 to 2250 years, or even longer.

Z. S. Harris, the author of two outstanding books on Phœnician (*A Grammar of the Phœnician Language*, 1936, and *Development of the Canaanite Dialects, an Investigation in Linguistic History*, 1939), subdivides the Phœnician language as follows: (1) Early Phœnician, down to the

end of the ninth century B.C.; (2) Middle Phœnician, eighth to sixth centuries B.C., inclusive; (3) Late Phœnician (in P. itself), fifth century B.C. to the beginning of the Christian era; (4) Punic, c. fifth century B.C. to 146 B.C. (i.e. to the destruction of Carthage); and (5) Neo-Punic, 146 B.C. to the sixth century A.D. or to the Arabic conquest. The Phœnician inscriptions (including the Punic and Neo-Punic inscriptions) are our main source for the study of the Phœnician language. Comparatively few inscriptions were found in P. itself, but the earliest of them, including the Ahiram egyptaph, belonging to the last centuries of the second millennium B.C. or the first century of the first millennium B.C., are the earliest extant readable inscriptions, written in the N.-Semitic alphabet, the prototype of all existing or discontinued alphabets (see under ALPHABET). The next few centuries have been rather poor in their yield; the bulk of material from P. proper is late and consists largely of royal *stelæ*, belonging to the fourth-second centuries B.C. By far the largest number of Phœnician inscriptions are the Punic inscriptions, of which thousands have been unearthed in Carthage; nearly all of them, however, are of pure votive or funerary character. The main differences between the Phœnician and the 'Punic' inscriptions are the following: (1) The latter became more and more cursive; these differences, with a few exceptions, were purely external: the number and the phonetic value of the letters remained always the same; the direction of the lines, always horizontal, was constantly from right to left. (2) The Punic inscriptions linguistically betray the mixed pop. of the empire of Carthage, which may be termed 'Berber-Phœnician' or 'Libyo-Phœnician'.

Another source for the study of the Phœnician language is contained in the transcriptions of Phœnician words into the scripts of other languages, such as Egyptian, Assyrian, Heb. (in the Bible), and particularly in the classical literature or Grk. and Lat. inscriptions. These transcriptions are very important because they give, if only in a limited way, a picture of the vocalisation of Phœnician, whilst the Phœnician and Punic inscriptions are purely consonantal. The only example of connected Phœnician discourse in transcription appears in Plautus' *Pœnulus* (v. 1. and II.), which contains a monologue of ten lines in Punic—with Lat. paraphrase—of a Carthaginian of Plautus' times (late third century B.C.).

**Religion.**—Like all ant. Semitic religions, except that of the Hebs., the Phœnician religion was a pantheistic and personified worship of the forces of nature. Until recently one of the main sources for the study of Phœnician mythology was the work of P. of Byblos, a Phœnicio-Grk. historian, who apparently was born c. A.D. 12, and still lived in 117. His work was supposed to be based on the works written by Sanchuniathon, a Phœnician priest born in Berytus c. eleventh century B.C. Unfortunately Philo's work has only

been preserved in fragments quoted by late Gk. historians. Our historical sources of the Phoenician religion are thus very meagre and indirect: the best version of Sanchuniathon's account of Phoenician religion given by Philo is excerpted from Porphyry in Book I., chapter ix., of Eusebius' *Præparatio Evangelica*. Our knowledge has been greatly supplemented by recent discoveries at Ras Shamrah (see above). At that site, in 1929 and the following years, hundreds of clay-tablets, dating from the fifteenth and early fourteenth century B.C., were found (written in a hitherto unknown cuneiform alphabet of thirty-two letters: see under ALPHABET), which proved to be documents of inestimable value in many fields of research, but particularly in hist. of religion. Many of these documents were found in a library housed in a building situated between the city's two great temples, one dedicated to Baal and the other to the god Dagon. The majority of the documents are in the nature of mythological poems concerning early Phoenician gods and heroes. These early Phoenician religious beliefs are of the greatest interest, and their possible relationship with many of the religious beliefs and practices reflected in the O.T. has already been discussed by many scholars. The supreme god is known as El (= 'God' in the Heb. Bible). The wife of El is Asherah-of-the-Sea, the counsellor of the gods, and their son is Ba'al, who is the god of the rain and storm. Amongst the adventures related of Ba'al is a conflict with Lotan (= probably the Heb. Leviathan). Aliyan Ba'al represents the growth of plants, and fights against Moth (= 'Death'), the god of the dried-up summer soil, but is slain by him. The goddess Anath, the sister and lover of Aliyan, goes in search of him, recovers his body, brings him back to life, slays his enemy, Moth, and places Aliyan on Moth's throne, to assure the revival of vegetation in another season. Another myth tells of the time when El entrusted Kerith with the command of 'the army of the Negeb.'

The later Phoenician religion is known, but very imperfectly indeed, from the various inscriptions (see above). Every city and high place had its local Baal, and there were, as well, Baalim of the mts. and rivers. By the side of Baal stood his female counterpart, Baalath. But the female element in nature was usually adored under the name of Ashtoreth or Ashtart. Among the other main gods must be included Melkarth (king of the city), the supreme 'Baal of Tyre.' There can be no doubt that Phoenician idolatry, human sacrifices, and 'prostitution practised in the name of Ashtoreth' recall the worst features of pagan worship. Later, at Carthage and Marseilles, a ram was substituted for the human sacrifice and a meat-offering prescribed.

See H. R. Hall, *Ancient History of the Near East*, 1913; E. Kiehl Chatterton, *The Romance of the Sea Rovers*, 1924; G. Contreau, *La Civilisation phénicienne*, 1926; and Z. N. Harris, *A Grammar of the Phœnician Language*, 1936.

Phoenicopteridae, see FLAMINGO.

Phoenix, in anct. Gk. legend, was the son of Amyntor and Ilippodamia. Having quarrelled with his father by gaining the affections of his father's mistress, Cleobule, he was banished and fled to Peleus. Peleus made him tutor to his son, Achilles, whom he accompanied to Troy (*Iliad*, ix.)

Phoenix, cap. of Arizona, U.S.A., co. seat of Maricopa co., on the Salt R., 100 m. N.E. of Tucson. The chief industry is agriculture, the processing of dairy products, and the export of citrus fruit; Indians deal in precious stones. Pop. 65,100.

Phoenix, fabulous sacred bird of Egypt, according to the people of Heliot polis, visited them once every 500 years on the death of its father. The story, as told by Herodotus, who did not believe it, was that the P. came from the Arabian desert, bearing its father embalmed in a ball of myrrh, and buried him in the temple of the sun. It was said to resemble an eagle in size and shape, but had red and gold plumage. According to another story the bird placed itself on the burning altar at Heliopolis, and from the ashes there flew a young P., freshly feathered. Pliny's version is that it built for itself a nest in which to die, and that a new bird sprang from the corpse. There was never more than one P. at a time.

Phoenix Group, eight small is. in the W. Pacific Ocean, between 2° 30' and 4° 30' S. lat., and 171° and 174° 30' W. long., annexed by Great Britain in 1889-92. They form part of the Gilbert and Ellice Is. administration. The U.S.A. has aviation and communication facilities on Enderbury and Canton Is. Area 16 sq. m. Pop. 850.

Phoenixville, bor. of Chester co., Pennsylvania, U.S.A., 23 m. N.W. of Philadelphia. Pop. 14,000.

Pholis, see CENTROLOTTUS.

Phonetics, branch of science which deals with the speech sounds of the human voice and investigates their production, combination, interaction, and list. A close study reveals differences in sounds which at first appear identical and directs attention to the particular part of the vocal organs where the difference arises. The study of the vocal organs is a prime necessity in P. Speech is produced by the passage of air from the lungs through the larynx, modified by the various resonance chambers set up in the mouth and nose. In its passage through the larynx the air may cause the vocal chords to vibrate, in which case a 'voiced' sound is produced. If the chords are not set in vibration a voiceless sound is made. For most voiced sounds there is a corresponding voiceless one. The difference between them may be ascertained by repeating the sounds, v, f; z, s. In uttering the first sounds of these pairs, if the ears be stopped by the fingers, or a finger placed on the throat, the vibration of the vocal chords can be noticed, while it will be found to be absent when the second sound of each pair is uttered.

Sounds are again subdivided according to the action of the mouth and nasal passages: (1) If the air is allowed to escape

almost unimpeded the resultant sound is a vowel. Vowels were formerly defined as those sounds which could be produced independently of other sounds, in contradistinction to consonants which needed the help of a vowel for their expression.

(2) If, however, the passage of the mouth be narrowed but not closed a rubbing sound, termed 'fricative,' is produced varying according to the precise position of the narrowing. Such sounds are s, z, th, sh, zh, which can be pronounced without vowels and continued for any length. Hence they are also termed 'continuants.'

(3) The passage of the mouth may again be completely blocked during the issue of the air. This action gives rise to the sounds known as 'plosives' or 'stops,' e.g. b, p, t, d, k, g, etc. Such stopping of the sound consists of the 'applosion' at the instant of stopping, and the 'explosion' when the breath forces its way through the obstacle. In initial plosives the explosion is most evident, while in final ones the applosion is the chief sound. (4) If, by lowering the velum or soft palate, the breath be allowed to issue through the nose, the sound produced is a nasal (voiced or voiceless). Sounds are classified according as the following or closure takes place between the back of the tongue and the soft palate (velar or back continuants, stops, nasals), between the front of the tongue and the hard palate (palatal or front continuants, stops, nasals), between the blade of the tongue and the ridge above the upper teeth (dental continuants, etc.), between the upper teeth and lower lip (labio-dental), and between the upper and lower lips (labial).

A systematic representation of P. can only be made where each sound is denoted by its own particular symbol. The variety of sounds in each language is, however, so great, and the differences between the several languages so pronounced, that the ordinary alphabet is far from being adequate for this purpose. The system of representation now generally in vogue is that of the Association Phonétique Internationale, and it is used in this article.

**Vowels.**—The character of the vowel sounds is determined by the place of articulation and the height to which the tongue is raised. Articulation may take place between the front of the tongue and the hard palate, or between the back of the tongue and the soft palate, or intermediate between these two points, when the middle of the tongue is but slightly raised. The position of the lips also modifies the sound. They may be either rounded so as to form a ring, or neutral. Usually back vowels are accompanied by rounding the lips and front ones by relaxing them. A long vowel is phonetically indicated by the sign : . The back vowels are (u), (U), (o), (ɔ). In (u) the back of the tongue is raised quite close to the soft palate, while the lips are well rounded. The sound is heard in Fr. *rouge* and Ger. *du*. In Eng. the sound is rarely pure when long, generally merging into the consonant (w), so that 'too' is represented phonetically by (tiw). It occurs when short, however,

as in 'pull' (pul). When the tongue is not raised quite so high as for (u) a more open sound (U) results. This sound does not occur usually in Eng. and Fr., but is common in Ger., as in *Lust*, *und*. With the tongue still further lowered and the lips less rounded are produced the close (o) sound and the more open (ɔ). The former may be heard in Fr. *rose*, *collé*, and in Ger. *sonit*. In Eng. it does not occur pure, but is rendered as a diphthong, the second part of which is an unstressed (u). Thus 'no' is phonetically (nou). The open (ɔ) sound occurs in Eng. long in 'law' (lɔ) and short in 'not,' a difference in quantity being noticed owing to the short (ɔ) being lax. (ɔ) is also heard in Fr. *robe*, *or*, and Ger. *Sonne*.

There are two intermediate vowels, pronounced rather to the back of the middle of the tongue, which is lower than in the case of other vowels, while the mouth is held more open. These are represented by (a) and (ɑ), the former of which is pronounced more to the rear of the tongue than the latter, and is heard in 'father,' Fr. *père*, *père*, Ger. *Vater*. The (a) sound occurs in Fr. *rage*, *patte*, and is also the first part of the diphthongs in 'hail' (hai), 'how' (hau). If the back of the tongue be raised slightly the (a) sound changes to the sound of 'u' in 'but' represented by (ʊ). Somewhat more forward on the tongue is pronounced the vowel sound of 'put' represented by (ʊ), and still further forward with the tongue more raised are attenuated (ɛ) and (e), the former, more open, being heard in 'there' (ðɛ), Fr. *là* (lɑ), Ger. *da* (da), the latter, more closed, in 'dead' (ded), Fr. *ble* (ble), Ger. *fehl* (fɛhl).

The foremost vowels in which arching of the tongue is most pronounced, are (open) (i) and (closed) (ɪ). The difference between these two sounds is not often made. The former is heard in Eng. in 'it,' Ger. *ist*, the latter in Eng. before 'r' as in 'tear' (tɪ), Fr. *sire*, Ger. *mir*. Elsewhere in Eng. it is diphthongal, ending in a consonantal (i) sound as in 'meet' (mi:t). When the forward vowels are pronounced with the lip-rounding of the rear vowels modified sounds are produced. Corresponding with (ɛ) is the sound (œ) heard in Fr. *neuf* (nœf) Ger. *neun* (nœn), and with (e) the sound (ø) as in Fr. *feu* (fø), Ger. *schon* (fø:n). The sound (u) pronounced with lip rounding is modified to (ʊ) heard in Fr. *ruse* (ryz), Ger. *Sunde* (zundɔ). An indefinite vowel is pronounced when the tongue is raised in the middle represented by (ə) (turned e), which occurs in unaccented syllables, as in 'stirrup,' 'better' (stɪrɒp, betə), Fr. *le*, Ger. *little*. In Fr. the sounds (ɔ, ɛ, œ, and a) are sometimes pronounced with the soft palate lowered, allowing issue of air through the nose and giving well-characterised *nasal* sounds. The phonetic transcript of these sounds is (ʒ, ɛ̃, œ̃, ɑ̃), as heard in *bon*, *vin*, *humble*, *grand* (bɔ̃, vɛ̃, œ̃mblɔ̃, grɑ̃). In Eng. the vowels are lax or wide, in Fr. they are 'tense' or 'narrow,' while in Ger. they are also 'tense,' though not quite to the same degree.

**Consonants.**—*Continuants* are formed by the narrowing of the oral passages. They include the labio-dental sounds (v) and (f) as in Eng. 'very' and 'find,' the bilabials (p) as in Sp. *saber*, voiced (w) as in 'wet,' unvoiced (u) as in N. Eng. 'which,' the sibilants s, z, ʃ as in 'rash' (ræʃ), ʒ as in 'vision' (vɪʒən), the hisping sounds (θ) 'th' in 'thin' and (ð) in 'this' (ðɪs), palatal continuants as (ç) in Ger. *ich*, (j) in Fr. *jeur*, Eng. 'yes,' velar or back continuants as (g) and (x), the former in Sp. *luego*, the latter in Scottish 'loch,' Ger. 'ach.' It is generally produced in Fr. and Ger. by vibration of the uvula, and is designated by (R). The trilled (r), caused by vibrating the tongue-point, is, however, most used in country dists., and is alone held to be correct for singing and the stage. The Eng. 'r' at the end of a word is merely the sound (ɹ) (see under vowels), as 'there' (ðe:ə), while at the beginning it is caused by a tap of the tongue against the base of the teeth. L is a voiced 'lateral' caused by a narrowing between the side rims of the tongue and the side gums. In Fr. and Ger. it is sharper and less prolonged than in Eng. The 'll' of the Welsh language is really an unvoiced 'l' sound. It is also a continuant caused by forcing the breath under pressure through the mouth. It may be held to be a glottal spirant, but is very vocalic in character.

**Plusives or Stops.**—These consist of the palatal sounds g and k, the dental d and t, and the labial b and p. Slight aspiration occurs with the voiceless stops before accented vowels in Eng. and Ger. (ph, th, kh). In Fr. g and d in *luison* are pronounced k and t. A characteristic Ger. sound is the glottal stop (ʔ) caused by the opening of the glottis and resembling a faint cough. It precedes a vowel at the beginning of a word or sound part of a compound as *ein* (ʔain), *Verrein* (ferʔain).

**Nasals.**—In these sounds the stoppage is practically the same as that of the plusives, the breath being, however, allowed to escape freely through the nose. They are usually voiced, the dental nasal 'n' corresponding to 't,' 'd,' the labial 'm' to 'b,' 'p.' The velar nasal (ŋ) as in 'long' (lɒŋ), Ger. *denken* (dɛŋkən) to 'g,' 'k.' In Fr. there is a palatal nasal (j) as in *régner* (rɛʝnɛ).

See W. Viëtor and W. Ripman, *Elements of Phonetics, English, French, and German*, which is a very useful little book for beginners. Other good books are Laura Soames, *Introduction to English, French, and German Phonetics*, revised by Viëtor, 1899; P. Passy, *Sons du Français, Chrestomathie Française*, 1901; W. Viëtor, *Die Aussprache des Schriftdeutschen*, 1909; 1914, 1919; M. D. De Witt, *English English and World Standard English*, 1924; J. C. Ward, *English Phonetics*, 1923; and W. Ripman, *English Phonetics*, 1931.

**Phonograph**, see **GRAMOPHONE**.

**Phonography**, see **SHORTHAND**.

**Phormion**, commander of the Athenian fleet during the fifth century B.C. He gained, among other victories, two at

Naupactus over the Peloponnesian fleet in 429 B.C.

**Phormium**, genus of hardy herbaceous plants, see **FLAX**; **NEW ZEALAND**.

**Phoronis**, solo genus of the class Phoronida, consisting of a few species of marine worm-like animals, which may live on rocks or in shells of Molluscs. They are widely distributed at depths varying from low water to about thirty fathoms. Each animal is encased in a tough flexible tube into which it may completely withdraw. At the anterior end is a horse-shoe-shaped group of tentacles. The fertilised eggs affix themselves to the tentacles and there develop into larvae of the actinotrocha form. P. has affinities with the Polyzoa and Sipunculoides.

**Phosgene**, or **Carbonyl Chloride**, chloride of carbonic acid. When a mixture of equal volumes of carbon monoxide and chlorine is exposed to bright sunlight or passed over heated animal charcoal, direct combination occurs with the formation of P. or C. C., COCl<sub>2</sub> (Gk. *phos*, light, and *genao*, I produce). This compound, discovered by John Davy in 1811, is a colourless heavy gas, nearly 3.5 times as heavy as air, with a penetrating and suffocating odour which impairs the sense of taste, and is very poisonous, far more so than carbon monoxide. It is readily liquefied by cooling, forming a colourless, mobile liquid, boiling point 8.2°. The gas does not fume in moist air, but is readily hydrolysed by water. Hot water decomposes it quickly to carbon dioxide and hydrochloric acid, COCl<sub>2</sub> + H<sub>2</sub>O → CO<sub>2</sub> + 2HCl. When the gas is passed into a solution of ammonia in toluene, urea is formed. P. has been used in chemical warfare (*q.v.*). A practical application of the gas in industry is made in the preparation of certain dyes, *e.g.* crystal violet. See J. R. Partington, *A Text-Book of Inorganic Chemistry* (11th ed.), 1933.

**Phosphates**, salts of phosphoric acid, H<sub>3</sub>PO<sub>4</sub>. By the action of sodium hydroxide on this acid in calculated quantities, the following P. can be obtained. NaH<sub>2</sub>PO<sub>4</sub>: Sodium dihydrogen phosphate. Acid to litmus. Na<sub>2</sub>HPO<sub>4</sub>: Disodium hydrogen phosphate, or ordinary sodium phosphate. Slightly alkaline; used as a reagent, and in the preparation of artificial drinking waters Na<sub>3</sub>PO<sub>4</sub>: Normal sodium phosphate—alkaline; used as a water softener. Microcosmic salt is HNa<sub>2</sub>H<sub>2</sub>PO<sub>4</sub>·4H<sub>2</sub>O. All the above are soluble P. Silver phosphate, Ag<sub>3</sub>PO<sub>4</sub>, is insoluble.

There are also pyrophosphates and metaphosphates, salts of pyrophosphoric acid and metaphosphoric acid respectively. They are of less importance than the ordinary (or ortho-) P.

**Tests.**—Soluble P. give precipitates with ferric chloride (yellow-white); with silver nitrate (yellow); with warm ammonium molybdate (yellow). See **MINERAL PHOSPHATES**.

**Phosphor Bronze**, copper-tin alloy to which phosphorus has been added and capable of being made tough and unalloyable. In one type 0.02–0.1 per cent of phosphorus has been added for the pur-

pose of deoxidation, and in which, on analysis, practically none will be found; in the second type 0.2-0.4 per cent of phosphorus is added, thereby increasing the toughness of the alloy. It is used chiefly for springs and for bearings: for springs the alloys contain 4.8 per cent of tin, and for springs 9-11 per cent.

**Phosphor Copper** is formed by plunging a stick of yellow phosphorus, contained in a copper sheath, under the surface of molten copper. The phosphorus boils, passes through the molten copper, and is absorbed, forming a compound  $\text{Cu}_3\text{P}$ . There are two P. Cs. used commercially, containing 10 per cent and 15 per cent respectively of phosphorus. It is used for making phosphor bronze (see preceding article).

**Phosphorescence**, term first applied to describe the state of luminescence which certain substances show in the dark after exposure to light. Such bodies were called 'phosphori,' and the term was afterwards applied to animals similarly endowed. Almost all bodies are phosphorescent in some degree. When the P. is continuous (as in fluor spar, quinine, etc.) it is called fluorescence (q.v.). In minerals P. may be shown by (1) heating to a temp. below red heat (fluor spar); (2) friction (phosphorus and fused calcium chloride); (3) Cleavage (mica, the two split portions exhibiting positive and negative electricity); (4) Crystallisation (boracic acid after fusion).

In the organic world we find numerous cases of P. The luminosity of decaying matter was at one time adduced as the cause of the P. of the sea. Now it is regarded as due to the presence of luminous bacilli. In the vegetable kingdom the cases of P. are limited to algae and fungi, the chief of the latter being hymenomyces. A species of *tropeolum* (majus) was discovered to be luminous by the daughter of Linnæus (1762). All the groups in the animal world up to and including fishes afford examples of the phenomenon. Among the protozoa the luminous noctiluca, which is found around the coasts, emits light from the general protoplasm of the body. On the high seas it is replaced by a species of pyrocystes. The larvae of remora are recorded as luminous porifera. Numerous instances of P. occur among the coelenterata. The jellyfish (Medusæ) are luminous, the scapena (Pneumatulide), and the alcyonarians and siphonophores. The ovoid jelly 'beroe' emits its light only after remaining for some time in the dark. Echinoderms show a few species of ophiuroids. Worms show a large number of luminous types. The luminosity of the worm photodrilus ceases after sexual congress. Among mollusca the bivalve pholias is recorded by Pliny as being phosphorescent, emitting light from the mantle cavity. Of the crustacea the schizopoda are self-luminous, while in others, such as the genera talitrus or orchestia, luminosity is probably due to the presence of luminous bacilli. The angler fish may be cited as an instance of luminous fish. Among insects are the luminous hemiptera (bugs) and coleoptera (beetles).

To the former belong the lantern flies, while the luminous beetles belong to the families of the Lampyridæ or Elateridæ. In some species both sexes are luminous, in others only one. The colour of the light varies, but in all cases the light is monochromatic. The uses of the light are to enable sexes to find one another (earthworms); to serve as a warning signal (stinging coelenterata); to attract prey (angler fish); to illuminate the surroundings (deep-sea fish). See also BACTERIA; LUMI; LUTUUS.

**Phosphoric Acid**, see under PHOSPHORUS.

**Phosphorus**, see LUTUUS.

**Phosphorus**. Symbol P; atomic number 15; atomic weight 31.02. Discovered by Brand, 1669. An element which exists in two allotropic forms, viz. (1) ordinary or yellow P., and (2) red P. It does not occur in nature in the free state, but usually in the form of phosphates, the most important of these phosphates being the two salts of calcium, phosphorite,  $\text{Ca}_3(\text{PO}_4)_2$ , and apatite,  $\text{Ca}_5\text{F}(\text{PO}_4)_3$ , both of which occur very largely in Canada. Calcium phosphate is present in all fertile soils and is a source of phosphate for plants; it also forms the mineral part of bones (60 per cent.), and various compounds of P. are found in the animal body, such as the brain and nerves. The free element was formerly prepared from calcium phosphate, either the natural mineral or bone ash prepared by calcining bones being employed. This, treated with sulphuric acid, is converted into calcium sulphate and phosphoric acid— $\text{Ca}_3(\text{PO}_4)_2 + 3\text{H}_2\text{SO}_4 = 3\text{CaSO}_4 + 2\text{H}_3\text{PO}_4$ . The insoluble sulphate is filtered off and the phosphoric acid is evaporated down, mixed with charcoal, the mixture dried in cast-iron pots, and finally distilled in clay retorts. The crude P. which distils over is condensed under water, remelted and purified by oxidising impurities with sodium dichromate and sulphuric acid, or by pressing through canvas leather, and is then cast into sticks. At the present time P. is obtained by heating crushed rock-phosphate (calcium phosphate, large deposits of which occur in Florida, Tennessee, and N. Africa) with sand and powdered coke or anthracite in an electric furnace at 1400-1500° C. P. vapour distils off:  $\text{Ca}_3(\text{PO}_4)_2 + 5\text{C} + 3\text{CaSiO}_3$ . The calcium silicate,  $\text{CaSiO}_3$ , forms a fusible slag which is run off, and the P. vapour is condensed under water. The crude P. is purified as above. The P. obtained in this way is the substance known as yellow P., and is a waxy, transparent substance, which becomes yellow or reddish from the action of light. It has a sp. gr. of 1.82, melts at 44° C., boils at 287° C. On account of its ready inflammability P. is always kept under water, in which it is practically insoluble. It is, however, soluble in carbon disulphide, forming a solution which on evaporation leaves so fine a residue of P. that it at once takes fire in the air. On exposure to moist air, P. glows and gives off garlic fumes and finally ignites. P. burns in air, with a brilliant white light

forming the oxide  $P_2O_{10}$ ; burned with a limited supply of air the oxide  $P_4O_6$  is mainly formed. Plunged into chlorine  $P$  takes fire, the pentachloride and trichloride being formed according as the chlorine is or is not in excess. Heated with caustic soda, phosphine,  $PH_3$ , is produced. Red  $P$  will not do this. Yellow  $P$  is very poisonous and in large doses causes death in a few hours. Inhalation of the vapours of  $P$  sets up crises of the teeth and jaw, causing what is known among those employed in the manuf. of matches as 'phossy jaw.' Red  $P$  is formed when ordinary  $P$  is heated for some time to  $250^\circ C$  in an atmosphere, free from oxygen. It is purified by boiling with caustic soda, and is obtained as a red powder made up of small crystals, though for a long time thought amorphous. It has a sp. gr. of 2.05-2.34, does not take fire on exposure to air or chlorine, is insoluble in carbon disulphide and in caustic soda, and is not poisonous. The oxides of  $P$  are  $P$  oxide,  $P_2O_3$ ;  $P$  tetroxide,  $P_2O_4$ ; and the pentoxide,  $P_2O_{10}$ . The first and last are the best known and give rise to  $P$  acid and phosphoric acid respectively.  $P$  acid is formed when  $P$  oxide is dissolved in water, but is prepared by the action of water on the trichloride,  $PCl_3 + 3H_2O = 3HCl + H_3PO_3$ . The acid can be concentrated and obtained crystalline, forming crystals which melt at  $70.1^\circ C$ . It is a dibasic acid and is a powerful reducing agent, and on heating is converted into ortho-phosphoric acid with evolution of phosphine. When  $P$  pentoxide is allowed to deliquesce in air it takes up one molecule of water to form metaphosphoric acid,  $HPO_3$ . Dissolved in hot water it reacts with three molecules of water forming orthophosphoric acid,  $H_3PO_4$ . Orthophosphoric acid, or phosphoric acid, as it is called, is commercially obtained by treating bone ash with sulphuric acid. When pure it forms crystals which melt at  $38.6^\circ C$ . It is a tribasic acid forming three series of salts. On heating above  $160^\circ C$  it loses water, forming pyrophosphoric acid as a first product, and finally is converted at red heat into metaphosphoric acid. Pyrophosphoric acid,  $H_4P_2O_7$ , is a glassy mass and passes into the ortho-acid when its solution is boiled. Ordinary  $P$  is used for making matches. Safety matches contain no  $P$ , but are rubbed on a prepared surface of 'red'  $P$ .  $P$  is also used for making phosphor-bronze. The compounds are used in sev. ways. The pentoxide is used as a desiccating agent and the phosphide of calcium is used on 'Holmes' signal, which is placed on the water, when spontaneously inflammable phosphine is produced.  $P$  compounds, especially hexamethyl tetraphosphate, have proved highly effective in rendering plants, by which they are absorbed, toxic to biting and sucking insect pests.

Photius (c. 820-91), patriarch of Constantinople, famous for the fact that in his time occurred that rift between E. and W. Christianity which has never been healed for more than a short time. Having previously held high office in the Byzantine

court he was in 858 elected patriarch in place of Ignatius, who had been deposed for correcting the vices of the emperor Michael. Pope Nicholas I., however, accepted the appeal of Ignatius and refused to recognise  $P$ , who in return deleted his name from the canon of the mass, an action equivalent to a rupture of communion. A dispute over Lat. missionaries in Bulgaria supervened and made things worse. In 867  $P$  convened a council at Constantinople to which the papal legates were not admitted, and denounced the errors of the Latins, including the 'Filioque clause' in the creed, i.e. the doctrine that the Holy Spirit proceeds from the Father and the Son (*Filio*). By a turn of fortune at the imperial court  $P$  fell that same year, and Ignatius was restored, but on the death of Ignatius in 879 he again became patriarch, being recognised this time by the pope, John VIII. But the Ignatian party was not extinct, and in 886 the emperor Leo VI. permanently exiled  $P$ . He has been treated as a saint by the Gk. Church, and as an arch-enemy and worker of div. by the W. Church. Actually it can now be seen that the schism in his time was not more than the result of a long drifting apart of  $P$  and W., and of alien traditions fruitful in misunderstanding. As a result of the work of Prof. Dvornik,  $P$  emerges as a great churchman, a learned and cultivated scholar, and a genuine Christian, if one subject to the weaknesses of his age; he shared but did not inspire the anti-W. prejudices of his time. His outburst against Rome of 869 acquired a historical significance out of all proportion to its significance in his own life. The causes of the schism undoubtedly lay deeper, in the age-long inability of E. and W. to believe each in the good faith of the other. See works of  $P$  in Migne, *Patrologia Graeca*, vols. cl.-cliv., 1860. See also J. Ruinart, *Le Schisme de Photius*, 1911; M. Jugie, *Photius et la primauté de St. Pierre et du pape*, 1921; E. Orth, *Photiana*, 1928; F. Dvornik (Orthodox), *The Photian Schism, History and Legend*, 1948 (an important restatement accepted in its main conclusions by the Rom. Catholic historian); and P. Hughes, *History of the Church*, vol. n., pp. 161-81 (2nd ed.), 1918.

Photo-Chemistry is that branch of chem. which deals with chemical changes that are brought about by the agency of light. The action of the green colouring matter of plants may be taken as typical, as in the presence of sunlight it decomposes the carbon dioxide in the air, the plant assimilating the carbon and setting free the oxygen. The action of chlorine on hydrogen is effected very rapidly in the presence of intense light. The gases combine very gradually in diffused daylight, but have no action on one another in darkness. The rate of chemical action is often proportional to the intensity of the light, but this is not universally true. This action is not confined to any particular wave-length, but the most active in this respect are the violet and ultraviolet or actinic rays. The action of light on photographic plates produces an effect

which is not immediately visible (and is possibly concerned with the formation of sub-salts of silver), but requires another chemical action in order to render it visible; this is called *developing*. Silver salts are very susceptible to the action of light. Thus silver chloride (which is a white substance) when exposed to light assumes a violet and then a dark-brown coloration and finally loses the chlorine. This exemplifies one action of light, namely, decomposition (contrast combination above). Silver bromide is acted upon in the same way. The combination of hydrogen and chlorine referred to is assumed to be preceded by the formation of 'activated' units of hydrogen and chlorine by the action of the light, followed by combination to form molecules of hydrochloric acid. Light may act as a catalyst or as an anti-catalyst; it may start a reaction or completely change the natural course of a reaction.

**Photo-Engraving, see PROCESS WORK.**

**Photo-Electricity.** The commercial applications of the photo-electric effect since 1920 have become so extensive and so varied in character that it is doubtful whether any previous scientific discovery has been so rapidly commercialised. The photo-electric effect is the emission of electrons (*q.v.*) from a metallic surface when light falls on it. The first hint of this effect was discovered in 1887 by Hertz (better known for his researches on wireless waves), who found that when ultra-violet light (*q.v.*) was directed on a spark gap the electric discharge occurred at a lower voltage. In 1888 Hallwachs found that a body charged with negative electricity could be discharged by directing a beam of ultra-violet light on it. The nature of this curious effect was explained by Lenard and J. J. Thomson following the discovery of the electron by the latter. The facts that the emission of electrons begins immediately the light falls on the metallic surface, and that the maximum speed of the ejected electrons depends only on the wave-length of the light falling on the surface, were explained when Einstein applied the quantum theory to the problem. A simple type of photo-electric cell is shown in the diagram. It is a small glass cell coated on the inside with a deposit of potassium or other alkali metal, distilled into the cell while the latter is highly evacuated. The surface near E is left quite clear of the metal. A trace of the inert gas argon is then introduced and the cell is sealed off. R is a thin metal ring connected to the pin D, and the metallic deposit is connected by a wire to the pin A. B and C are 'dummy' pins fixed in the base of the mount so that the cell may be held in an ordinary valve holder. An alkali metal is used because, other things being equal, the photo-electric effect is greatest with these metals in ordinary light. The ring R is kept at about + 150 volts relative to the film, so that the electrons flow from it to the ring. The electric current so caused is very minute, but it can be amplified by means of an ordinary wireless valve and the amplified current can be made to operate

a relay that acts as a switch in an electrical circuit. The photo-electric cell when coupled up in this way behaves like an automatic eye. Photo-electric cells are now used, for example, to switch on the lamps in large buildings and station goods yards whenever the intensity of the daylight falls below a given level. They are used as burglar alarms, operating the bells when a beam of light falling on the cell is interrupted. Similarly, they are used extensively in counting machine units, recording each unit on an illuminated board as it passes in front of the cell. As these cells are sensitive to changes in the colour of the light falling on them they are used

PHOTO-ELECTRIC CELL

for such purposes as detecting atmospheric pollution; rejecting discoloured peas en route for bottling; rejecting proprietary articles that have accidentally shed their labelled wrappers; for the automatic opening of doors when a person approaches and for closing them afterwards. But the most important application of the photo-electric effect so far is the invention of talking films (see CINEMATOGRAPH). Such journals as the *Electrical Review* give details from time to time of the newest applications of P.-E.

**Photogrammetry**, science of measuring and surveying by aid of photography with a rigid camera and stand and a lens free from distortion and a fixed vertical position of the plate with regard to the lens. The size and arrangement of objects in the negative will bear a constant ratio to those of the original subject. The camera for photogrammetric purposes is generally provided with levelling screws and a graduated circular scale at the base, while four fixed points are arranged at the back to register on each plate exposed the position of the horizontal line and of the lens axis. A magnetic compass and a theodolite are usually attached to the camera.

**Photography** the recording of light-images by means of light sensitive substances.

**History and Methods.**—In 1826 Thomas

Wedgwood, son of Josiah Wedgwood the potter, pub. an account of experiments carried out by Sir H. Davy and himself in a method of copying paintings on glass and of recording profiles by the action of light upon silver nitrate. But these images could not be fixed as the unaffected portion of the emulsion was not removed. In 1811 Niepce obtained images on a bituminous film. Later he experimented with Daguerre (q.v.), and six years after Niepce's death (1839) the latter pub. particulars of his Daguerreotype process in which a metal plate coated with silver iodide was exposed in the camera and subjected to vapourised mercury in a dark room. A positive image was produced direct darks and lights in the subject so recorded. The Daguerreotype was the first practical process, and produced excellent results, but it bears little historic relation to present day processes, which have more directly evolved from the work of Fox Talbot an Eng. contemporary of Daguerre. Fox Talbot pub. (1839) particulars of his first process a method of photogenic drawing with the image produced on paper coated with chloride of silver and fixed by solution of silver chloride and potassium bromide. Later hyposulphite of soda became generally used to dissolve out the unwanted silver and so to 'fix' the image. In 1841 Fox Talbot patented his Talbotype or Calotype process. Fox Talbot's processes resulted in a negative image (darks and lights in the subject reversed) on paper. A positive print was obtained by printing through this negative on to another sheet of sensitised paper. The development since Fox Talbot's time has been rapid. J. B. Keade proposed a *developper* (1842) to increase the effect produced by light. In 1845 Niepce de St. Victor suggested glass with a coating of albumen to replace paper for negatives. In 1851 Le Gray and Scott Archer separately proposed the use of collodion as a vehicle for the sensitive salts, the latter publishing an account of his collodion wet plate process. The collodion process was an excellent one. It is used largely to day with little alteration by process engravers. But the plate had to be exposed while the emulsion was still wet. In 1871 Dr. R. F. Maddox used a gelatine emulsion to hold the silver bromide salts and this could be dried after coating and before exposure doing away with the need for a portable dark room. The dry plate was improved in sensitivity and other qualities. In 1899 George Eastman placed on the market the first roll-films, celluloid taking the place of glass, and in 1891 he introduced a daylight loading film. From this P. as a popular hobby may be said to date. Recent improvements in sensitive materials have largely been in increased sensitivity and in the improved rendering of coloured objects in monochrome. The early emulsions were sensitive only to light of short-wave lengths, blue, violet, and the invisible ultra-violet. Such colour-blind emulsions are still made, and plates coated with them are known as ordinary.

By the addition of certain sensitising dye-products emulsions can be made sensitive also to yellow and green (orthochromatic) and, in addition, to red (panchromatic). Most emulsions are still unduly sensitive to blue light, and filters are used to correct this imperfect sensitivity or to emphasise or minimise the relative brightness of coloured objects when reproduced in monochrome. A yellow filter on the lens will darken a blue sky and thus show up the whiteness of clouds. Considerable penetration of haze can be effected by the use of suitable filters and under certain conditions the use of filters can reveal in a photograph details invisible to the human eye.

The camera, essentially a light-tight box with lens at one end and a place for the sensitive plate or film at the other, was developed from the camera-obscura (q.v.). Modern developments have been largely in the direction of compactness and in the lenses fitted. Simple lenses, those composed of a single glass, have a number of defects when used for P. Chromatic aberration, the bringing into focus of light of different colours at different distances from the lens instead of on one plane, is corrected by cementing together two lenses made of different glasses—this is the Meniscus Achromatic. As only the central area of a single lens gives a sufficiently clear cut image, a 'stop' is used to cut out the edges. This causes distortion the form depending on whether the stop is behind or in front of the lens. By placing a lens on each side of the stop, the two distortions balance and an undistorted image is produced. Such a double lens is known as a rectilinear. Three aberrations remain: spherical aberration, the production of an image slightly unsharp all over unless only a small central area of the lens is used; curvature of field, the tendency in simple lenses to bring objects into sharp focus in a curved field, not on a flat one, such as is provided by plate or film, and astigmatism, a complex fault making it impossible to focus sharply at the same time vertical and horizontal lines. A high degree of correction of these aberrations is found in the anastigmat lens, often a combination of up to eight different elements, the practical advantage of which is the sharpness of the images produced even when practically the whole area of the lens is used. With such a lens far more light is passed to the film during a given period than when a small stop has to be used to cut out the uncorrected rays from the edges of a simple lens.

In the early days it was the usual practice to take a negative of the scene in which the finished print was required. To-day, owing to production of precision cameras and the more critical definition of the modern anastigmat lens and the finer grain of negative-making materials, small negatives are commonly taken and enlarged prints made by projecting an enlarged image of the negative on to sensitive paper. This has led to a vogue called miniature P. with a 'press' of its own. The sensitive paper used for

enlarging has an emulsion similar to that on films or plates, but not so speedy; this is bromide paper. Prints of various colours can be produced by using chlorobromide papers, the emulsion of which is a mixture of chloride and bromide of silver, the ratio of the two halides determining the colour and speed. Multi-grade is a modern bromide paper with unique characteristics. Two emulsions, one soft in gradation, the other contrasting and sensitised to blue-green light, are coated on to a single base. The use of suitable filters in printing or enlarging can be made to alter the contrast of the result. Gaslight paper is less sensitive, and can be worked in dim artificial light, and no dark room is necessary. The Bromoil process favoured by many pictorial photographers is based on a print on bromide paper. The image is bleached in a solution which transforms

produced in the U.S.A. It is the Land one-minute camera and is made to take two spools, one of negative and one of positive paper. After exposure the ends of the two spools of paper are pulled out together to a predetermined stop and as they pass between two rollers in the camera a narrow bag of paper extending across the positive paper is burst. The bag contains the processing solution which is squeezed into close contact with the exposed negative paper. The unused silver compounds diffuse or migrate to the positive paper, there to be reduced by the solution to form a positive image. The finished quarter-plate print can be removed from the camera a minute after the operation has commenced.

*Colour Photography.*—As early as 1785 Senclauer pointed out that when a spectrum was thrown on to silver chloride violet and blue were reproduced. In

THE PRINCIPLE OF THE CAMERA

OO' is the object. The convex lens of the camera is pulled out so that it forms a real, inverted image  $II'$  on the sensitive plate PP. Thus by varying the distance of the plate from the lens it is possible to form images on the photo for various positions of the object.

it from one of various degrees of light and dark to one of various degrees of stickiness. The print is then dabbed over with pigment, which adheres in various degrees, according to the stickiness of the various parts, and the tones of the picture are thus reproduced in pigment; considerable latitude is possible in the building up of the pigment image. Bromide and gaslight are development papers, the process being to expose, develop, fix (to remove the undeveloped sensitive salts) and wash, as in making negatives. Other printing papers are known as print-out-papers, because the image is printed out to its full depth, the print being finished by toning to the desired colour and fixing; with self-toning printing-out papers toning and fixing are combined. In platinotype paper the image is formed of metallic platinum; the paper is expensive, but the results are of exceptional quality and permanence. Carbon printing depends upon the hardening of dichromated gelatine on exposure to light; the image is of carbon pigment in gelatine, these portions of the impregnated gelatine which have not been hardened by light action are washed away by the application of warm water. An image similar to that of a carbon print, but not necessarily pigmented, can be used as a resist in etching designs, etc., on to metal or glass.

A camera with unique features has been

1812 in his book *Zur Farbenlehre*, Goethe printed an account of the researches of Seebeck, the great Ger. physicist, into the action of coloured illumination upon silver chloride. During the next eighty years investigations were conducted along these lines by many famous men, including John Herschel, Hunt, Niepce de Saint Victor, Poitevin, Becquerel, Zanker, and Wiener.

In 1891 Lippmann gave an explanation of the theory of interference and exhibited actual photographs of colours produced by his method. Lippmann used a transparent gelatine emulsion of silver bromide exposed in contact with a mercury reflector. The light passing from the subject through the emulsion was reflected back along its path by the reflector. Where two trains of light-waves interfered the emulsion was unaffected, but where they reinforced each other a series of planes of metallic silver was produced on development, and the distance apart of these planes depended on the wavelength of the light. The result, when viewed at the angle of maximum reflection, was a photograph in colours corresponding to the actual subject. The systems in use to-day are indirect and based on the Young-Helmholtz theory that all colours may be matched for the human eye by mixing in various proportions light of the three colours, blue, green, and red. There

are two main systems, the additive and the subtractive.

In the additive processes three negatives are exposed through red, blue, and green colour filters respectively. Positive transparencies are made from these and each projected through a filter of a colour similar to that used in exposing the corresponding negative, all three images being combined or added to each other in register on a screen as demonstrated by Clerk-Maxwell in 1861, or viewed in a device which combines all three images in an eyepiece (Cross, 1879; Ives's Krönsköps, 1902). The most widely used of the additive processes were the screen plates or films, 1896; Autochrome, 1907; Warner-Powrie, 1907; Omnicolor, 1907; Thames, 1908; Paget, 1913; Agfacolor, 1924; Finlay, 1929; Dufaycolor Roll Film, 1935. This method used a mosaic of blue, green, and red filters on a glass plate or film support. A panchromatic emulsion was coated on to the mosaic; the plate was exposed so that the light passed through the mosaic to the emulsion; the plate was then processed by reversal to a positive and could then be viewed by transmitted light or projected on to a screen. In the Autochrome the mosaic was made of dyed starch grains. The Paget process employed a separate taking screen, and from the resulting negative a positive was made and bound up in register with a viewing screen.

In 1869 Louis du Flauron proposed the subtractive method in which the positive images from separation negatives made through red, blue, and green filters were converted into a dyed or otherwise coloured image, complementary in colour to that of its taking filter, the amount of colour being proportional to the amount of silver developed in the positive. The colours used are known as subtractive or complementary: thus the positive from the negative taken through red filter is coloured blue-green, the positive from the green separation negative is coloured magenta, and the positive from the blue separation negative is coloured yellow. When these coloured positives are superimposed a colour print or transparency is produced which may be viewed either by reflected or transmitted light.

Sanger-Shepherd (1900) used gelatine-coated film sensitised in potassium dichromate to hold his dyed image. Pinotype (1905) was a similar process. In the two-colour Kodachrome film (1914) two colour-separation negatives, exposed through red and blue-green filters respectively, were developed and treated in a ferric chloride bath which bleached the image and simultaneously softened the gelatine adjacent to each particle of silver. These softened areas were stained in blue-green and orange dyes and the images bound in register. The method was adapted to cinematography by making the prints in register on each side of a double-coated film. Kodachrome film (1936) uses three-emulsion layers on a film support. The top layer is sensitive only to blue light, the middle layer records the green, and

the bottom layer the red. After development to a negative the residual silver bromide in each layer is exposed and independently developed in coupler developers. Coupler developers deposit dye of predetermined colours wherever they develop silver bromide to silver. Different coupler developers are therefore used for each layer, and when the positive silver image is dissolved away a subtractive colour photograph built up from a yellow, magenta, and blue image results. The Agfacolor process (1936) seems similar, but the three coupling components are included in the three layers during manufacture. Technicolor (1934 and 1938) (*q.v.*), much used in cinematography, is a three-colour imbibition process employing three-colour separation negatives made simultaneously in a special 'beam-splitting' camera. Ilford Colour Film 'D' (1918) is an integral tripack process which does not carry colour-formers and must therefore be laboratory processed. Gevacolor (1948) is a multilayer colour transparency material of the reversal and colour development type. Kodak Ektachrome film is a reversal processed sheet film in which the coupler components of the dyes are incorporated in the emulsion layers during manufacture and a single-colour developer serves to produce all three positive dye images. Ferranicolor (1919), a process developed in Italy, seems to have some affinity with Kodacolor (1942).

Of the subtractive colour processes producing prints on paper the most successful have been Three-colour Carbro (1902) in which carbon tissues, yellow, magenta, and blue, are sensitised in dichromate, dried, and exposed through the three appropriate separation negatives. After development in warm water the three dye images are superimposed in register on a final support. Three-colour Carbro uses three bromide prints made from the three separation negatives. These are squeezed into contact with yellow, magenta, and blue carbon tissue which has been sensitised in dichromate and ferricyanide. The silver image is reduced and reacts with the dichromate producing local hardening. Washing away the soluble gelatine leaves dye images which are superimposed on to a final support. Vivex (1932), a modified form of Carbro, was a largely used commercial process. Kodak Wash-off Relief (1931) used bromide prints on a safety-base support. After exposure behind the three separation negatives through the safety-base support the images were developed and the image bleached with simultaneous hardening of the surrounding gelatine. Soluble gelatine was removed with warm water leaving hardened reliefs. These were soaked in dyes of complementary colours to the taking filter used in making the negative. The dye images were transferred under pressure from the reliefs to a mordanted gelatine-coated paper, the three superimposed images producing a colour print. The improved dye-transfer process (1946) used a tanning developer for the reliefs. Dufaycolor (1938) was a modified carbon

process. Dufay tissue (1945) was a Carbo process using printing material with a cellulose acetate base. In the wet carbon process (1944) carbon tissues are exposed whilst still wet behind separation negatives. Minicolor (1941) and Kotavachrome were designed for the mass production of colour prints from Kodachrome transparencies. Both processes use three emulsions coated on an opaque white safety base. Kodacolor Roll Film 2 (1942) was an integral tripack on roll-film support in which the coupling compounds used to produce the dye image were included in the emulsion. A single developer was used, and when the negative silver images were reversed a negative dye image in colours complementary to those of the subject was left. The negative was printed on to paper carrying a similar set of emulsions, and after similar processing a positive colour photograph was obtained. Very beautiful 'metal-chrome' colour prints were exhibited during 1949.

**Photogravure** is an intaglio process: the ink which forms the printed image is retained in hollows in a metal plate or cylinders before being transferred to paper by means of pressure in a press. There are two kinds of P.: (1) that which is printed from a plate; (2) that which is printed from a cylinder. Plate printing can be further subdivided into (a) the kind where the continuous tone of the original picture is split up into a multitude of dots by means of a screen very similar to the one used for making half-tone blocks (see *PROCESS WORK*) and (b) where the tone is split up by means of a grain not unlike that of aquatint (*q.v.*).

Plates can be printed in two ways. The first by means of a platen similar to that of a letterpress machine. In the second method a thinner plate is employed which is bent round a cylinder and printed in the same way as a solid cylinder. More typical of P. is the method of using a cylinder which is particularly economical for long runs. The cylinder has an iron or steel core on which a shell of copper is deposited by revolving the cylinder in a tank of copper sulphate through which an electric current is passed.

The course of one particular method employed for the production of a popular

magazine may here be followed. While the reading matter is being set in type, paper negatives are made of the pictures, and the type, when correctly set, is printed with almost white ink on a shiny black paper, and dusted with white powder which sticks to the printing and intensifies the image. This is in effect a negative. The negatives of the pictures and the negatives of the type are pasted together in correct relation to one another, forming one negative of the whole page. The complete negative is then photographed on a film resembling that used in a normal snapshot camera, but a little thicker. The result is a positive, which is an exact image of the page as it will appear when printed.

#### PHOTOGRAVURE SCREEN AND CELLS

*Above.* Portion of a screen magnified 23 times. The white lines assist in forming the walls of the cell which retain the ink on a cylinder.

*Below.* Diagrammatic cross-section of cell formation on a cylinder, magnified 23 times. The cells in the darkest shadows of an illustration (as A) are seven-eighths of one thousandth of an inch deep and those in the highest lights only about one-tenth of a thousandth of an inch.

The positives of the individual pages are then carefully 'planned' over a lay-out on a sheet of glass, so that the paper, when folded and trimmed, will fall in their correct sequence. It should be remembered that the negatives just referred to are of opaque paper, while the positives are made of transparent film.

The sheet of positives is now ready for transferring to the copper cylinder and is done by means of carbon tissue. Carbon tissue is paper coated with gelatine and made sensitive to light. It is 'squeezed' on glass and when dry stripped off. This tissue is exposed to light behind a screen. The screen used is different from that used for making a normal letterpress half-tone block, being composed of a lattice work of white lines that leave tiny squares of black between as in the diagram. Immediately after printing the screen, the sheet of positives is printed on the same tissue, which therefore has a combined image composed of the picture and a superimposed network of white lines. The object of the screen is to split up the image into an immense number of square cells which will later be etched. The tissue is squeezed on the copper cylinder and then soaked in hot water which enables the paper backing to be peeled off. This gelatine image will vary in thickness

according to the amount of light which penetrated through the positive when it was printed. After carefully protecting the margins and any parts of the cylinder not required to print, it is etched. The result on the copper will be a multitude of square pits of depths varying according to the tone of the original. The process is carried out by slowly revolving the cylinder in a trough while the etcher pours the solution over it from jugs, using different strengths to suit the differing needs of the various pictures and type. A very large number of prints could be taken direct from the copper, but nowadays it is more general in rotary P. to face the cylinder with chromium before printing.

The printing is effected by the cylinder revolving in a trough of ink (or in contact with a roller which revolves in the ink), and as the ink is drawn above the surface of the trough a thin steel blade (the 'doctor'), which is in contact with the cylinder along its whole length, wipes all superfluous ink from the surface. Continuing its revolution the cylinder is brought into contact with the paper by means of a rubber-covered cylinder. The pressure is sufficient to withdraw the ink from the pits in the cylinder and transfer it to the paper.

P. is a process particularly useful for printing photographic originals in very large numbers at very high speeds. It produces a particularly rich effect from rather dark subjects. This is largely due to the fact that the dark tones in gravure carry more ink than in the light tones.

*Colour Photogravure* is employed in many periodicals and magazines. The method of reproducing from a coloured original by P. is on conventional lines and is similar to that which is used for three- and four-colour letterpress half-tone. The coloured original is photographed three times through a different coloured filter, i.e. a violet filter for the yellow plate; an orange filter for the blue plate; and a green filter for the red plate. The negatives which are produced correspond to the colour values of the original, but a certain amount of retouching is necessary to correct the balance of colour. A positive is made from each of the negatives, which when made up into sheet form is ready for transferring to the copper cylinders. The process follows as for monotone reproduction but four cylinders are required for a four-colour reproduction. After etching, the cylinders are ready to go on the printing press and the paper reel is fed through the machine. After each colour is printed, the web progresses through the machine over steam-heated drums, which makes the colour perfectly dry before a subsequent printing takes place. The periodical is produced at approximately 25,000 copies per hour, the machine actually making 12,500 revolutions per hour, producing two copies at each revolution.

*Flat Plate Hand Gravure* is a process not much used now. It does not fail to produce first-class results, but it is slow and therefore costly. The plate is prepared as for an aquatint, by covering it with a dust

of bitumen or resin which is made to adhere to the plate by slight heating. A carbon tissue of the desired picture is prepared as described earlier and laid on the plate and etched. No screen, of course, is used, as the dust-grain breaks up the image into an infinite number of cells. If inked and wiped and printed by hand, exquisite results can be obtained. This process is appropriate for limited eds. of plates for use in books, and for producing high-quality reproductions of works of art. If the paper is damped, even hand-made paper is practicable, which improves the quality enormously for some kinds of work. See H. Bischoff, *Photogravure Machine Printing*.

*Photo-lithography*, see under LITHOGRAPHY.

*Photometry*, experimental comparison of the illuminating power of different sources of light. It attords a method of measuring this illuminating power by comparison with that of a conventional standard. The standard adopted was originally the illuminating power of a sperm candle, six to the pound, burning at the rate of 120 grains per hour, the illuminating power of any source being then expressed as equivalent to so many standard candles. This standard is too inaccurate for modern work, owing to the varying illuminating power of these candles. Sev. standards have been suggested, among them being the portion of a certain size flame of an Argand burner, the flame of amylacetate contained in a special lamp, and the pentane lamp. The latter is by far the most accurate. It consists of a flame of pentane vapour, mixed with a definite proportion of air, and burning in a special type of lamp, the ring burner of which is made of stentite. This lamp is equivalent to ten standard candles. The instruments used for carrying out these comparisons are called photometers. The simplest photometers are those of Foucault, Rumford, and Bunsen. The Foucault photometer consists of a semi-transparent screen fixed at right angles to an opaque partition, which can be moved in its plane perpendicular to the screen. The two sources of light to be compared are placed one on each side of the screen, their distances from the screen being adjusted until each half of the screen is equally illuminated by its corresponding source; the illuminating power may be then compared according to the inverse square law (see LIGHT). The Rumford photometer effects the comparison by adjusting the intensities of two shadows of a vertical rod thrown on a screen by the two sources. The distance of the sources from the screen are adjusted until the shadows have the same intensity. The positions of the sources are also adjusted so that the shadows are cast side by side on the screen to facilitate the comparison. By applying the inverse square law the illuminating powers may be deduced. Bunsen's grease-spot photometer consists of a screen of opaque paper with a grease spot at its centre. If a source of light be placed in front of this screen, and viewed from the remote side, the grease

spot will appear brighter than the rest of the screen, while it appears darker on the other side. When two sources are to be compared they are placed one on each side of the screen and their distances adjusted until the spot appears the same on both sides; these distances are then measured, and the inverse law applied. In their simple forms the above types of photometer are not used to day, but the Lummer Brodhum photometer is an adaptation of the Bunsen. It consists essentially of an opaque disk, part of which is illuminated by one source while the remainder is illuminated by the other. The instrument is so arranged that both sides may be seen at the same time and their respective brightness compared. Thicker photometers have a white surface which is alternately illuminated by two sources. If the sources are so placed that they illuminate the screen unequally a flickering effect is produced. The distances of the sources from the screen are then adjusted until this flickering vanishes when the ordinary inverse square law is applied. In all this work external lights should be excluded and all the light from the sources should be transmitted in the same direction. Further all the lights should be of the same colour otherwise the equality of illumination will be difficult to determine owing to this difference in colour. It is generally found that different sources emit different coloured rays in different proportions so that to obtain a really accurate result the light from each source should be split up into a spectrum and each corresponding part of these spectra should be compared in turn. The direct use of the flicker photometer gives results which differ very little from the results obtained by spectra comparison. A further difficulty arises in practice because lamps in ordinary use emit unequal amounts of light in different directions so that the measurement of the light emitted in one direction may afford a misleading estimate of the total. While it is possible to make measurements in so many directions relative to the lamp that a satisfactory average is obtained the process is tedious, and the diffusing sphere is usually employed. This is a large sphere coated internally with a white powder with a portion shielded from the direct rays of the lamp placed inside the sphere; the brightness of the shielded part depends upon the total amount of light emitted from the lamp and provides a measure of it.

**Photomicrography**, production by photographic means of enlarged pictures of microscopic objects, as contrasted with microphotography which produces minute prints requiring microscopic examination from objects of normal size. The former practice is of the utmost utility in many branches of science and is capable of yielding results of great artistic virtue, the latter was once fashionable as a scientific curiosity and has achieved utility as a means of recording printed matter in small compass for transit or storage. The general optical considerations are treated under MICROSCOPY AND

**MICROSCOPY**. main peculiarities of P from the practical point of view are that a higher degree of resolution can be attained than by visual microscopy as the blue and ultra violet rays can be used but that the observer of the photomicrograph is deprived of the information to be gained from alterations of focus the picture represents an optical section of a finite thickness that cannot be extended by ocular accommodation or mechanical adjustment, and the picture is thus less informative than the direct image although it can be studied at leisure and discussed or duplicated.

Photographic recording was used as soon as it became available the daguerreotype process being employed and before 1880 the use of wet collodion plates for P was well known although the lack of convenient light sources restricted technique. The introduction of suitable dry plates is recorded in 1882 and these by their convenience and instant availability quickly ousted the wet plate. Nevertheless until recently the wet plate was unsurpassed for resolution owing to its freedom from grain. The technique in common use has changed little since the early days the greatest advances having been made in the light sources available and in the sensitivity of the photographic plates. The apparatus consists essentially of a suitable microscope arranged to project a magnified image on a sensitive photographic plate but there is a modern tendency for complete instruments to be designed making the means by which the ultimate refinements of critical adjustment can be made these are excellent for routine use but are incapable of yielding the results possible with less highly integrated apparatus.

Advances in P have been made possible by the introduction of plates for use in the infra red region to exploit local transparency of normally opaque substances or to secure differentiation by selective absorption. Ultra-violet P has been used since 1904 to gain additional resolving power although the development of a practical process dates from 1921 when Barnard and his colleagues developed suitable apparatus, monochromatic radiation segregated from electric spark discharges is utilized for illumination. P in the near ultra violet to excite fluorescence and to provide sensitive absorption pictures has become a commonplace in every laboratory owing to the development of mercury discharge lamps.

The most distinctive photographic branch of P is that one now termed 'cinemicrography' which produces films for projection. Apart from directly recording microscopical events it can be used to obtain slow motion pictures of movements too fast to follow by eye and also to convert imperceptible changes into a visible sequence. The extreme high speed photography possible on a large scale is limited in microscopical practice by the light intensity available or tolerable to the specimen, its main application promises to be in physiology. At the other end of the scale 'time lapse' photography, in which the successive exposures

of the film are made at intervals of seconds or hours, has proved very useful in research; nuclear division, tissue growth, cell feeding, and similar slow processes can be photographed, and projected at increased speed, with the result that the processes acquire an easily appreciated significance; the same action may, moreover, be observed repeatedly by many observers. It is notable additionally that, even in the absence of 'phase-contrast' (see MICROSCOPES AND MICROSCOPY) certain regions in the cells, which would not be identified in normal observation, can be differentiated owing to the movements of the almost imperceptible shadows. A further application of the cinematic technique is the reconstruction of a specimen

its possibility was announced (1878) by Graham Bell, of telephone fame. The instrument depends on the peculiar properties of selenium, though hard indiarubber, antimony, and other substances will act. Crystallised selenium is very sensitive to light and its resistance to an electric current varies with the intensity of light. The transmitter is a plane thin silvered mirror so fixed to a tube as to vibrate with sound such as speech. A beam of light is concentrated on this by means of a lens, so that the rays are reflected parallel. The receiver is a parabolic mirror unconnected with the transmitter, with a selenium 'cell' at the focus; this is placed in series with a battery and telephone receiver. The

W. G. Harvey

by projecting a film made by photographing serial sections of it in sequence, so that the observer can see the relationships of the various parts as he is conducted through the specimen; this might be considered as providing P. with the third dimension which it lacks in comparison with visual microscopy. The modern technical practice is to use sub-standard (16-mm.) film for cinematography, as the definition can be maintained, whilst the problems of illumination, and of moving and exposing the film without vibration, are greatly eased.

The practical details of P. can be learned only by experience; books on the subject are J. E. Barnard and F. V. Welch, *Practical Photomicrography*, 1936; R. M. Allen, *Photomicrography*, 1941; and C. P. Shillaber, *Photomicrography*, 1945.

**Photon.** Although light and other electromagnetic radiations travel through space as a wave motion, they interact with matter as though they were discrete particles or quanta of finite energy (see LIGHT; X-RAYS, Compton Effect; QUANTUM THEORY; PHOTOELECTRICITY). To emphasise the particle aspect of quanta, they are sometimes referred to as *Pa.* or particles of light; cf. electrons (particles of electricity), protons, neutrons, etc. (particles of matter of various kinds).

**Photophone.** Instrument for transmitting sounds by means of a beam of light;

selenium cell is composed of alternate disks of brass and selenium. The rays of light falling on the transmitting mirror are scattered by its vibrations, so that they vary in intensity on the focus of the parabolic mirror, which causes the resistance of the cell to vary; the varying current actuates the telephone receiver.

**Photo-sensitive Glass,** see under GLASS, Coloured Glass.

**Photosphere,** white-hot radiating surface of the sun. The surface presents a mottled appearance. Langley and Janssen compared these appearances to 'rice grains,' computing their diameters at nearly 400 m. Langley regarded them, although what they are is still doubtful, as the tops of long columns in which the heated matter from the sun's interior rises to the surface. Hansky and Chevalier showed that these granules moved with a velocity of 5 m. to 20 m. per second. The temp. of the visible surface of the sun has been computed by sev. observers, the results varying from 6000° to 10,000° C.

**Photosynthesis** (Gk. *photo*, light; *synthesis*, a building up), or **Carbon Assimilation**, the production of carbohydrates (sugar and starch) in the green leaves and other green parts of plants under the influence of light. The raw materials for the synthesis are carbon dioxide, which diffuses through the stomata of the leaves from the atmosphere (or through

the epidermis from the surrounding water in aquatic plants), and water absorbed from the soil through the roots. Energy is necessary for the reaction, and is supplied in nature by sunlight, though a powerful artificial light is also effective, as is illustrated for instance by the capacity of green plants to flourish under electric light in the caves at Cheddar, Somerset. The first recognizable product of P. is a hexose sugar,  $C_6H_{12}O_6$ , such as glucose, and the reaction may then be represented by the following equation:

The production of oxygen as a by-product of P. will be noted, and is referred to below. The hexose sugar may be secondarily converted into cane-sugar and into starch. The latter being insoluble is an economical form for the temporary storage of carbohydrate in the leaves, but in some plants such as the onion the carbohydrate remains entirely as sugar. The reaction is certainly more complicated than is indicated by the above equation, and it is widely held (though still unproved) that formaldehyde is an intermediate product which then polymerises into sugar:

The polymerisation can readily be demonstrated *in vitro* if formaldehyde solution is subjected to the action of alkalis. It can easily be shown by experiment that P. takes place in green organs only, *i.e.* those which contain the pigment chlorophyll, and will not occur for instance in the white parts of variegated leaves. It seems that chlorophyll functions as a catalyst by combining temporarily with carbon dioxide and water, and promoting their conversion into formaldehyde. The importance of P. in the living world is that it provides a source of carbohydrate and other organic material by green plants, and also indirectly by non-green plants such as fungi as well as by animals, for building up their bodies and as a source of energy when it is oxidised during respiration. The equation for respiration is the reverse of that for P., and serves to indicate that the energy of all living organisms is ultimately derived from the sun:

In addition P. prevents the depletion of atmospheric oxygen resulting not only from respiration but also from such processes as combustion, decay, and fermentation. Without P. the life of all ordinary plants and animals is inconceivable; a few bacteria are able to perform chemosynthesis and to build up

their bodies using chemical energy instead of sunlight.

**Phototropism** (Gk. *φως*, light; *τροπή*, a bending or turning), or **Heliotropism** (whence the name of the plant *heliotrope*), the bending of a plant organ (*e.g.* a stem) in response to the stimulus of light so that the organ becomes orientated in a definite direction with respect to the direction of the incident light. Stems, coleoptiles (stem sheaths of grasses), and flower stalks bend towards the incident light, as is noticeable when plants are grown in window boxes, and are therefore said to be positively phototropic; some roots are negatively phototropic, bending away from the light (though most roots are insensitive), whilst leaf blades usually turn at right angles to the light. P. should be distinguished from phototaxis, which is a movement of a whole organism (such as a motile alga or an animal) towards or away from light; also from photonastic responses, such as the 'sleep' movements of flowers and leaves, which bear no relation to the direction of the light. The positive P. of a stem or other organ is evidently caused by the side towards the light growing at a slower rate than the side away from the light, so that a positive curvature results. Decapitated coleoptiles do not respond, and it has been shown that the tips of the coleoptiles contain a growth-stimulating substance (hormone) whose distribution to the illuminated side is retarded, causing it to grow more slowly than the other. P. is of obvious value in enabling the organs of plants to carry out their functions efficiently.

**Phototype, see COLLOTYPE.**

**Phraates**, name of four kings of Parthia:  
*Phraates I.* subdued the Mardi.

**Phraates II.**, son of Mithridates I., defeated and slew Antiochus VII. (Sidetes), 128 B.C., but was himself overcome in battle soon afterwards by the Scythians and his army destroyed.

*Phrautes III.* lived at the time of the war between the Romans and Mithridates of Pontus. He took no part in the war, although he formed an alliance with the Romans, but at a later period he invaded Armenia, and incurred the displeasure of Pompey. He was murdered by his two sons.

**Phraortes IV.** was renowned for his cruelty, which eventually produced a rebellion against him. He was driven out of the country, but restored by the Scythians. He was poisoned in A.D. 2.

Phragmites, see REED.

**Phrase**, in music, a succession of sounds either in melody or harmony, forming a definite melodic or thematic feature, and terminating in a pause (*repos*), that is, a comparatively long note or a rest, thus forming a cadence more or less perfect.

Phrenology, pseudo-science based on the assumption that 'faculties are localised in the brain, and' that these areas are in evidence on the skull. Phrenologists profess to discover an individual's talents by locating these 'bumps' or areas. The bones of the cranium have thicknesses and air spaces producing exterior unevenness having no relation to the cortex

within; localisation exists (see BRAIN), but has no connection with external variations in the shape of the head. The subject was opened by Dr. F. J. Gall in 1796 in Germany, with a 'map' of thirty faculties. Spurzheim, G. and A. Combe, and Dr. Elliotson were the exponents in Britain. Phrenological societies sprang up in Britain about 1832, but strenuous opposers were found in Sir C. Bell, Sir W. Hamilton, Jeffrey, Brown, Brougham, etc. The subject has since then been in ill repute among doctors and scientists, though in 1901 Dr. Bernard Hollander pub. *The Mental Function of the Brain, or the Revival of Phrenology*, in which he collects a large number of instances where similarly placed lesions of the brain produced similar effects in character. He considers the case for localisation scientifically established, but is wary in extending his support to external 'bumps.' See G. Combe, *Essays on Phrenology*, 1819; J. Fowler, *Practical Phrenology*, 1846; A. Bain, *On the Study of Character, including an Estimate of Phrenology*, 1861; J. P. Blackford, *Phrenology for Students*, 1916; J. Coates, *Phrenology*, 1920; and the *Phrenological Journal*, 1824, *et seq.*, and works cited under GALL, FRANZ JOSEPH.

**Phrygia**, country of Asia Minor, which was of different extent at different periods. Under the Rom. Empire P. was bounded on the W. by Mysia, Lydia, and Caria, on the S. by Lycia and Pisidia, on the E. by Lycania (which is often reckoned as a part of P.) and Galatia (which formerly belonged to P.), and on the N. by Bithynia. The Phrygians are mentioned by Homer as settled on the banks of the Sangarius, where later writers tell of the powerful Phrygian kingdom of Gordius and Midas. It would seem that they were a branch of the great Thracian family originally settled in the N.W. of Asia Minor as far as the shores of the Hellespont and Propontis, and that the successive migrations of other Thracian peoples, as the Thyni, Bithyni, Mysians, and Teucrians, drove them further inland. P. was conquered by Croesus, and formed part of the Persian, Macedonian, and Syro-Grecian empires; but, under the last, the N.E. part was conquered by the Gauls, and formed the W. part of Galatia, and under the Romans was included in the prov. of Asia. The earliest Gk. music, especially that of the flute, was borrowed in part through the Asiatic colonies, from P. With this country also were closely associated the orgies of Dionysus and of Cybele, the Mother of the Gods, the *P. Mater* of the Rom. poets. After the Persian conquest, however, the Phrygians became proverbial among the Gks. and Romans for submissiveness and stupidity. The Rom. poets constantly use the epithet Phrygian as equivalent to Trojan. The Thracio-Phrygian group of languages were Indo-European, but too little is known of them to fix their place in linguistic affiliations. Some scholars consider anet. Phrygian as part of a large group, termed Thracio-Ilyrian, of which Armenian and Albanian are held to be remnants. See W. M. Ramsay, *The Cities and Bishoprics of Phrygia*

(vol. 1.), 1895-97, and W. H. Buckler and W. M. Calder, *Monuments and Documents from Phrygia and Caria*, 1939.

**Phrygian Mode**, third ecclies, mode, represented on the pianoforte by the scale beginning with the note E, played on the white notes. See also HARMONY; MODE.

**Phryne** (c. 340 B.C.), celebrated courtesan of anet. Athens, was the daughter of Epicles, and was born at Thebes in Boeotia. Hyperides the orator, Apelles the painter, and Praxiteles the sculptor were among her lovers. She served as model for the 'Venus Anadyomene' of Apelles, and the 'Cnidian Venus' of Praxiteles.

**Phrynichus** (Φρυνιχος): 1. Attic tragic poet, was probably a disciple of Theopis. He produced his first tragedy in 511 B.C., or twelve years before Aeschylus (490), and is considered to be the real inventor of tragedy, for he put on the stage serious subjects illustrative of heroic deeds, and aimed at moving the passions of his audience, whereas Theopis made use of light, bacchanalian stories. Further he improved the poetical character of the drama and introduced dithyrambic choruses. He also was the first to use *mask* representing female persons in the drama. Herodotus (book vi.) relates that when his *Capture of Miletus* was exhibited on the Athenian stage the audience burst into tears, so moved were they by the vivid representation of the sufferings of a kindred people. He further relates that P. was fined 1000 drachmæ for producing the play, and that a law was passed forbidding it ever to be shown again. His last work was produced in 476. 2. (fl. 429 B.C.) One of the most distinguished poets of the old comedy, was probably the son of Eunomides. His writings are characterised by their elegance and vigour, and there is probably no ground for Aristophanes' attack on him in the *Frogs* for the use of low buffoonery. He is said to have invented the 'Tonic a Minore Catalectic' verse which was named after him. 3. Gk. sophist and grammarian, was probably a native of Bithynia. He lived in the reigns of Marcus Aurelius and Commodus, and is chiefly remembered for his *Σοφιστικὴ παρασκευή*. He also wrote *Γλῶσση ῥημάτων καὶ ὁμοίων Ἀττικῶν*, a lexicon of Attic words. See W. G. Luthersford, *Phrynichus*, 1881.

**Phthalocyanines**, pigments (mostly blue and green) remarkable for their fastness to light. The first of the series to be discovered was obtained by chance during a process in a chemical works, but its intense colour led to systematic investigation, and other similar compounds were soon prepared and their structure ascertained. Ps. are composed of four molecules of phthalonitrile,  $C_8H_4(N)_2$ , attached to a central nucleus which may be two atoms of hydrogen or an atom of copper or other metal. The first to be marketed was Monastral Blue B (1935).

**Phthiotis**, dept. of Greece, S.E. of Thessaly (q.v.), and home of Achilles (q.v.). Pop (with Phocis), 219,400.

**Phthisis**, or Consumption, or Pulmonary Tuberculosis, progressive wasting disease

especially pulmonary consumption. It is widespread among the civilised nations, and has been introduced by them among the less civilised with dire results. Its widespread and infective nature has long aroused medical science, public opinion, and gov. action in providing sanatoria. The isolation of the tubercle bacillus by Koch in 1882 was one of the great triumphs of pathology. The bacillus is a minute, often curved, thread-like rod; when stained with fuchsin it retains its colour on treatment with mineral acid, while that of surrounding tissue is decolorised; its vitality is like that of other bacteria, great, resisting heat and cold, and is retained for some time in the dust of the dried sputum expectorated by phthisical patients; it is therefore of importance that it should be prevented from drying. That the human body is highly resistant to attack is shown by the number of cases of arrested disease, but a hereditary predisposition appears to be established. In some persons, and any condition lowering the vitality predisposes to attack, e.g. alcoholism, syphilis, frequent child-bearing, prolonged lactation, and previous disease of the lungs. Deficient ventilation, overcrowding, insufficient or improper food, insanitary conditions, absence of sunlight, all favour attack, as do also the irritant injuries to the lungs produced by particles of dust in connection with various occupations such as mining, stone work, and grinding.

**Symptoms.**—Hæmoptysis, or spitting of blood, may occur at any stage, but denotes a serious stage. The temp. tends to rise towards evening and fall in the morning, and night sweats are common. Pain is not usually present except during an attack of coughing due to the softened parts of affected areas entering a bronchus; general pallor and emaciation appear with the characteristic hectic flush, and there is a steady decrease of weight. Pleuritic adhesions, dry pleurisy, are the rule, and frictional sounds may be detected; cavities and areas of consolidation round the tubercles alter the percussion note and breath sounds. The changes in the lung, including early stages, are best detected by an X-ray examination: miniature radiography on a large scale in factories, etc., is becoming increasingly common. The Mantoux test (similar to the tuberculin test in cattle) is positive.

**Progress.**—The first stage usually occurs at the apex of one lung, but is variable, in older people often occurring at the base. In the majority of cases it remains at one focus, fibrous tissue grows round, the patch dries up and often acquires a deposit of calcareous salts. The focus may be arrested but becomes active again. The alveolar tissue becomes inflamed, and catarrh is present, and the products cause a consolidated area of lung. The centre of the nodules may become caseous, while the inflammation spreads in the surrounding portions. As these coalesce a general softening takes place, and the matter collects in the bronchi, from which it is coughed up, leaving a cavity. Suppura-

tion may take place, the cavities unite and fill with blood and pus. The blood vessels may be injured and small aneurisms formed, and infection of the blood or lymphatics may carry the disease to other parts, thus hastening a fatal termination. In the acute form, or galloping consumption, rapid progress may be made in a few weeks, very little tendency to form fibrous tissue being present, and other micro-organisms probably hasten the softening. Chronic P. is characterised by steeper resistance due to the formation of fibrous tissue, and by periods of rest and recovery alternated with fresh irritation; progress may be slow until the cavities become too large, when decline of resistance sets in. The disease is liable to spread to the alimentary canal and the intestines, when it causes ulceration; diarrhoea is then common; or it may spread to the larynx, where the infection may cause great pain; or it may attack the pleura, a usual complication.

**Treatment.**—Application of mustard or antiphlogistine poultices, radiant heat, and immobilisation of the chest by strapping, are useful with pleural pains. Niemeyer's pill and nerpenthe are useful in case of night sweats, and the latter for the cough, which is also relieved by hydrocyanic acid or opium preparation. Ice may be applied to the chest or given to suck when hæmoptysis is troublesome; in this case complete rest in bed is essential. Purgatives should be avoided, and if diarrhoea is constant, opium should be resorted to. A generous diet with tonics, maltine, glycerine, and cod-liver oil should be the rule. Removal from unhygienic surroundings is imperative. Overwork should be avoided, and fresh air and sunshine appear to be of the greatest effect. Living and sleeping in the open air, judicious exercise and bright surroundings, or removal to drier climates, have proved of enormous benefit. There is much difference of opinion as to the most suitable climate; dryness and sunshine appear to be most efficacious, but warmth is not necessary. Dampness is not necessarily harmful, but much evidently depends on the climate of one's residence and the stage of the disease. Pure air and equable temp. are essential, and sea voyages are of great benefit. It is generally considered that early stages can be arrested; the disease is not incurable in such cases, but recovery is slow, and premature return to ordinary habits and work is dangerous. Good results are obtained by collapse of the lung. The three methods used are (1) injection of air into the pleural cavity (*pneumothorax*) or into the abdomen (*pneumoperitoneum*); (2) immobilisation of the diaphragm by crushing the phrenic nerve in the neck (*phrenic avulsion*); (3) removal of parts of the ribs (*thoracoplasty*). Injection of colloidal gold (sannoerysin) are of doubtful value, owing to the risk of gold poisoning. *See also* TUBERCULOSIS. *See* J. Maxwell, *Introduction to Diseases of the Chest* (3rd ed.), 1918, and *The Care of Tuberculosis in the Home* (2nd ed.), 1918.

**Phylacteries**, called by the Jews *tephillin*, or *tephillin* (*Talmud*), small cubical leather cases, two in number, one of which is worn on the forehead, the other on the inside of the left arm above the elbow. Each contains a strip of parchment or vellum inscribed with certain texts, viz. Exod. xiii. 1-10 and 11-16; Deut. vi. 4-9 and xi. 13-21. The practice of wearing

PHYLACTERY

P., based on Exod. xiii. 9 and 16, and Deut. vi. 8-9 and xi. 18, began in ant. times (see Song of Sol. viii. 6, and Prov. iii. 3 and vi. 21), and is still continued by strict Jews at the weekday prayers.

**Phyllite**, fissile clay slate in which the lustre of the finely disseminated mica is very prominent.

**Phylloxera**, genus of Aphides or plant-lice. *P. vastatrix* is a native of N. America, and the most dreaded insect pest of the grape vines. It appeared in Europe, along with imported vines, between 1858 and 1863. The life cycle of the insect is complex, and it is in the parthenogenetic stage of reproduction that it is excessively prolific. The female, after pairing with a male, lays only one egg, and this may hatch in autumn or survive till the following spring, and then hatch into a wingless larval form, which after a moult lays great numbers of eggs. These in hatching give rise to galls either on the leaves or in the roots, which seriously interfere with the functions of the plants. In the autumn, after sev. generations of wingless females, winged forms appear and these after finding new plants or a healthy vineyard lay large and small eggs, the larger becoming females and the smaller males. Control measures include the use of resistant varieties of vine, and quarantine regulations in dists. where outbreaks occur; infected vineyards are sometimes flooded when circumstances admit.

**Physical Society of Edinburgh**, Royal, see ROYAL.

**Physical Society**, of London, incorporated body, founded in 1874, and amalgamated in 1932 with the Optical Society. The object of the society is to promote the advancement and diffusion of a knowledge of physics. Membership is open to all who are interested in physics, whether as students (under twenty-six years of age) or as fellows. There are also four specialist groups within the society, optical, colour, low-temp., and acoustics, membership of which is open to all interested in the subjects with which they deal, irrespective of membership of the society. Evening science meetings, at which papers on physics are read and discussed, are held about once a month in London, and full day meetings outside London about three times a year; these may take the form of a conference or visit to an industrial concern. The specialist groups also arrange similar meetings and conferences. The society's annual exhibition of scientific instruments and apparatus in London is a function of interest to all concerned with development and research in the various branches of physics.

The *Handbook of the Physical Society's Annual Exhibition of Scientific Instruments and Apparatus* is pub. each year. The *Reports on Progress in Physics*, also pub. each year, contain articles on various branches of physics prepared by specialists. These articles are surveys of the present state of knowledge in the subject presented in such a way as to be of interest to the non-specialist; comprehensive bibliographies supply information for the further pursuit of the subject. The society also publishes a monthly jour., the *Proceedings of the Physical Society*, containing original papers in all branches of physics. It is divided into two parts. Section A contains papers on micro-physics, the physics of elementary particles, etc.; Section B contains papers concerned with macroscopic physics, e.g. acoustics, radio, geometrical optics, mechanical properties of matter, etc. Reviews of newly pub. books are also included.

The offices of the society are at 1 Lawther Gardens, Prince Consort Road, London, S.W.7.

**Physical Training**, method of acquiring and maintaining bodily fitness. The belief that mental power and efficiency in action were related to physical well-being was prevalent among the ant. Gks., but their example was not followed in the succeeding centuries except in so far as physical fitness was developed as part of military prowess. It was not until after the pub. of Rousseau's *Emile* in 1762 that the value of P. T. as part of normal education began to be recognised. This conception was developed by the Ger. pioneers, Johann Guts-Muths (1759-1839) and Friedrich Ludwig Jahn (1778-

1852), while Friedrich Froebel (*q.v.*) influenced physical education by his insistence on the importance of play in the growth of the child. Jahn founded an organisation devoted to gymnastics, physical contests, and team games, called the Turnvereine. It was linked to the political resurgence of Prussia in the same way as the Sokol movement, which began in 1862, was linked to the patriotic aspirations of the Czech people. In Denmark P. T. became part of the normal school curriculum as early as 1814, and in the same year the Royal Central Institute of Gymnastics was opened in Stockholm by Per Henrik Ling (1776-1839). Ling introduced a system of gymnastics, known as Swedish drill, which with the Ger. systems has been the basis of most P. T. since his day (*see GYMNASTICS; SWEDISH MOVEMENTS*). Various modifications have been introduced, particularly in the direction of relating P. T. more to the natural and rhythmical movements of the human body. From Germany and Scandinavia the cult of P. T. spread to most European countries and to the U.S.A. It was at first linked mainly to military training or to remedial treatment for physical defects. Gradually, however, it came to be included in the normal school curriculum. The Amer. Physical Education Association was founded in 1885, and physical education became more and more popular in the U.S.A. from that date. In England, as a result of the preference for outdoor games, P. T. was not introduced into elementary schools until 1909. The value of P. T. is now undisputed, and it is recognised that the various systems are not mutually exclusive. Any course of P. T. must be directed according to the end in view. For instance, the system advocated by Eugene Sandow is primarily for muscular development, while the system of J. P. Müller is directed towards ensuring normal health and well-being. The value of P. T. lies in this possibility of obtaining controlled results, and combined with considerations of diet (*q.v.*) it forms an essential part of any specialised training whether for military purposes or for sport (*see TRAINING*).

**Physical Units.** All measurements in scientific work are referred to the *fundamental* unit of length, mass, and time. The *metre* is the unit of length on the metric system, and is the distance between two lines at 0° C. on a platinum-iridium bar called the International Prototype Metre, kept at the International Bureau of Weights and Measures. The Brit. unit of length is the *foot*, one-third of the standard yard; the distance at 62° F. between the centres of two gold plugs in a standard bronze bar, kept in the Standards Office of the Board of Trade. Other usual or practical units are derived from the metre (*e.g.* the cm., mm., etc.) and the foot (*e.g.* inch, etc.) (*see WEIGHTS and MEASURES*). The *gram* is the metric unit of mass, and is defined as one thousandth part of the mass of the International Prototype Kilogram of platinum-iridium, kept in Sévres at the International Bureau

of Weights and Measures. The Brit. unit of mass is the *pound avoirdupois*, and is the amount of matter contained in a standard piece of platinum kept in London. Again there are the usual practical units (*q.v.*). The *mean solar second* is the unit of time and it is defined as the eighty-six-thousand-four-hundredth part of the mean solar day. Units are either on the C.G.S. (centimetre, gram, second) or the F.P.S. (foot, pound, second) systems. In addition to the above there are *derived* units. (For actual definitions, *see under* appropriate word.) *Area*: sq. cm., etc. *Volume*: cubic cm., etc. *Density*: mass per unit volume, *e.g.* gms./c.c., or lb./cubic foot. *Force*: dyne (C.G.S.), poundal (F.P.S.). *Acceleration*: cms./sec./sec. or ft./sec./sec. *Energy*: foot-pounds (F.P.S.) or ergs (C.G.S.). 1 joule = 10<sup>7</sup> ergs. *Power*: Watt (at the rate of 1 joule/sec.). 1 Horse Power = 33,000 ft.-lb./minute. *Heat*: the calorie (C.G.S.) or the Brit. Thermal Unit (B.Th.U.), i.e. the quantity required to warm 1 lb. of water through 1° F. 1 Therm. = 100,000 B.Th.U. of heat. 1 B.Th.U. of heat = 772 foot-pounds of work. There are two systems in electrical work: (a) *The Electromagnetic System*, based on the definition: unit magnetic pole is such that when placed in air 1 cm. from an equal pole repels it with a force of 1 dyne. (b) *The Electrostatic System*, based on unit electrical charge which when placed 1 cm. from an equal charge in air repels it with a force of 1 dyne. For practical purposes these units are often inconvenient, and there are therefore *Practical Units*, *e.g.*: *Current*, ampere; *quantity*, coulomb; *potential difference*, volt; *resistance*, ohm; *energy*, kilowatt-hour or Board of Trade Unit; *capacity*, Faraday; *inductance*, Henry. *Dimensions* of any physical quantity can be given in terms of the fundamental units. Length (*L*), Mass (*M*), and Time (*T*). The dimensions of velocity are  $\frac{\text{distance}}{\text{time}} = \frac{L}{T}$  or  $LT^{-1}$ , and of Force = acceleration  $\times$  mass =  $M \times \frac{LT^{-1}}{T} = MLT^{-2}$ .

**Physician** (Gk. *φυσικός*, natural philosopher), one who having passed certain examinations is qualified to practise medicine as a profession. Only those who are qualified in medicine, surgery and midwifery are allowed to practise as medical practitioners and are registered as such under the Act of 1858. In England a practising doctor who is also engaged in trade, or who uses a remedy the ingredients of which he keeps secret, or in any other way does not comply with the rules of the society, is not recognised by the Royal College of Physicians. In the U.S.A. each state has its own laws with regard to the practice of medicine; in general a P. m. obtains a licence after having passed the examination of the state in which he wishes to practise.

**Physicians, Royal College of, see ROYAL COLLEGE OF PHYSICIANS.**

**Physio Nut, or *Saprophyta Curcas***, species of Euphorbiaceae found in sub-tropical

parts of the world, but most common in the E. Indies. The seeds contain an acid oil which has emetic and purgative properties, and when expressed is known as jatropa-oil.

Physics may be defined broadly as the investigation of the properties of matter and energy. The definition is generally restricted to exclude those laws of matter and energy which are influenced by the presence of life (biology), and also those laws which take into consideration the molecular changes in matter (chem.). The two branches, P. and chem., overlap a great deal, it being very difficult to draw the line of demarcation between them. The subject matter of P. is subdivided into HEAT (q.v.), LIGHT (q.v.), SOUND (q.v.), ELECTRICITY (q.v.), MAGNETISM (q.v.), and to these may be added RADIATION (q.v.) and ATOMIC THEORY (q.v., and see also ATOMIC HEAT). On light, see also OPTICS, DIFFRACTION, INTERFEROMETER, LENS, MICROSCOPE AND MICROSCOPY, MIRROR, PERISCOPE, PHOTO-METRY, and VELOCITY. Physical Optics is also dealt with under POLARIZATION, ABSORPTION, DISPERSION, REFLECTION, REFRACTION, ERRORS OF. On energy and gravitation see also DENSITY, GRAVITATION, ENERGY, KINEMATICS, PERPETUAL MOTION; also on special aspects of this subject see HYDROMETER, DYNAMOMETER. Reference may also be made to the numerous sub-heads in the article ELECTRICITY AND MAGNETISM and the numerous articles on related topics. See also PHYSICAL UNITS.

While some branches of the subject were successfully studied in remote times and during the Middle Ages, the astonishing progress of modern times can be said to have begun about the time of Galileo (1564-1642) and Newton (1642-1727). In part, at least, this was due to a better appreciation of experimental method; the method, that is, whereby existing theory is allowed to suggest certain questions whose answer, when found by suitable experiments, is made the basis of further theory and further experimentation. Galileo's work on mechanics was carried forward by Newton, whose genius enabled him to state certain generalisations which, until recently, appeared to epitomise the fundamentals of the whole subject, leaving to later generations little to be done except the working out of their consequences in particular cases. Newton also made important contributions to optics. He was, however, unable to accept the wave theory of light put forward by his contemporary Huygens (1629-95), as he could not reconcile it with the rectilinear propagation of light, and the weight of Newton's opinion doubtless retarded the further development of the theory. Nevertheless evidence that light could be diffracted and could undergo interference continued to accumulate until by the end of the nineteenth century the wave theory appeared unassailable.

Knowledge regarding electricity and magnetism (which appeared to be isolated branches of physics) developed steadily

during the same period, and a great advance was possible when near the end of the eighteenth century the invention of voltaic cells made it possible to generate steady currents instead of the minute charges which were all that could previously be obtained by friction. The work of Faraday (1791-1867) and others showed that magnetism and electricity were related, that currents were surrounded by magnetic fields, and that changing magnetic fields could generate currents. This led to modern methods of generating and using electricity. Moreover Faraday's view that the energy of an electric charge is associated with a state of strain in the surrounding medium (the ether) was developed by Maxwell (1831-1879) into the electromagnetic theory of light, a theory that not only linked the branches of light, electricity, and magnetism, but also pointed the way for the generation and use of wireless waves.

During the nineteenth century a mechanical theory of the nature of heat was accepted. It was established, largely as a result of the researches of Joule (1818-1889), that heat in a material was merely the kinetic energy of the particles (atoms and molecules) of which it was composed, and Joule was able to show that whenever heat was produced an equivalent amount of energy of another kind disappeared. Gradually there emerged the idea of the conservation of energy, i.e. that there is, in any system isolated from all other bodies, an amount of energy that, although it may change from one form to another, yet always remains constant in amount. The law of the conservation of energy soon became a fundamental part of physics, and the kinetic theory, when applied to gases, led to simple results and explained the nature of their changes when pressure and temp. are altered.

By the end of the nineteenth century P. appeared as a unified whole, and, on a superficial view at least, physical theories seemed capable of explaining most natural phenomena. It appeared almost as though the main outlines of the subject had been filled in, and that only details remained to be added. Such a view, however, proved entirely illusory, and in the upshot neither the concepts of atoms and the all-pervading ether as then understood nor the laws of mechanics proved satisfactory. According to classical theories the earth moved through a stationary ether, and it was possible by refined experiments to measure its speed relative to the ether. The Michelson-Morley experiment (q.v.), although sufficiently sensitive, revealed no trace of such movement, and led in 1905 to Einstein's theory of relativity. Among other consequences of this theory Newton's laws of motion, although highly satisfactory approximations in most circumstances, are shown not to be fundamental, but to be merely instances of more general laws. Moreover the theory shows that the law of conservation of energy requires modification in that mass must also be regarded as energy; if mass disappears energy must be released in other forms and in enormous

amounts. The second big change of view results from the discovery by J. J. Thomson (1850-1940) of the electron, whose mass was shown to be only a small fraction of that of the lightest atom; this discovery not only demonstrated that the atoms are not the ultimate particles of which matter is composed, but led also to the electrical theory of the atoms themselves. Further it opened the way for the practical use of the electrons in such applications as radio and television, in photo-electricity and X-rays. A third and no less fundamental change was due to the quantum theory (*q.v.*). Pioneered first by Planck (1858-1947), in an attempt to explain certain laws of radiation, this theory has proved to be the key to the understanding of all atomic phenomena. It has revealed not only that light and radiation partake of the properties of both particles and wave motion, but that matter itself has a similar dual nature.

See G. Joos, *Theoretical Physics*, 1931; K. W. Darrow, *Renaissance of Physics*, 1937; P. W. Bridgman, *Logic of Modern Physics*, 1938; C. Caldwell, *Crisis in Physics*, 1939; L. de Broglie, *Matter and Light: the New Physics*, 1939; W. Wilson, *Theoretical Physics* 3 vols., 1940; O. Lühr, *Physica Teils II*, 1949. See also Sir R. T. Glazebrook, *Dictionary of Applied Physics*, 1922-23.

**Physics, Institute of.** The objects of the Institute are the elevation of the profession of physicist and the advancement and diffusion of a knowledge of physics and its applications in industry. It awards the diplomas F.Inst.P., A.Inst.P., and Grad.Inst.P., has eight branches at home and overseas, and the following specialist subject groups: electronics group; electron microscopy group; industrial radiology group; industrial spectroscopy group; stress analysis group; X-ray analysis group; and an education group.

Meetings and conferences on applied physics are held frequently. The Institute awards certificates in laboratory arts and, jointly with the Ministry of Education, national certificates in applied physics. It publishes two scientific journals, each monthly, viz. the *Journal of Scientific Instruments* and the *British Journal of Applied Physics*, and also the *Physics in Industry* series of monographs describing recent advances in certain branches of applied physics. It maintains an appointments register, a panel of consulting physicists, and a benevolent fund.

**Physiocratic School,** name given to a group of Fr. economists and philosophers of the eighteenth century. Their name was at first 'économistes,' but the name 'physiocrates' (Gk. *physis*, nature, and *kratos*, to rule) was given to them by P. S. Dupont de Nemours, one of their number. Their main doctrine was the superiority of nature to all man's work and the excellence of her eternal and immutable laws; thus they held that all commerce was sterile, and the only fruitful labour was agriculture. The money necessary to carry on the affairs of the community they proposed to raise by a single land

tax, whilst their ideal of gov. was a despotism in which the ruler himself obeyed the laws and principles of nature. Their head was François Quesnay, and their chief practical exponent was Turgot, whilst De Gournay and Morellet were also amongst their number. The physiocrats, whose principles were largely drawn from R. Condillon, never had a large following, as their tenets did not attract the multitude. They were, however, sincere, and Turgot used his power in attempting to liberate the industry of France and better the condition of labour. See H. Higge, *The Physiocrats*, 1897.

**Physiognomy,** external appearance of the body and particularly the face, its features and expression, from which we are accustomed to draw conclusions as to character. Many attempts have been made to place it on a scientific basis and to render it useful as an art, and with some very slight success in anthropology and criminology. Della Porta (*Humana physiognomonica*, 1586), Campanella, Cardan, and Lavater (*Fragmente*, 1775-73) gave great attention to the subject. Darwin's *Expressions of the Emotions in Man and Animals* (1873), and Muntegarza's *Physiognomy and Expression* (1890) were the first works of any scientific value. Piderit, in *Mimik und Physiognomik*, 1886, pays special attention to muscular expression. Physiognomic indications of pathological conditions are of course valuable. Phrenology (*q.v.*) attempts to deduce character from 'bumps' on the skull.

**Physiography, or Physical Geography,** description of nature, as originated by Huxley and defined by H. R. Mill, describes the substance, form, arrangement, and changes of all the real things of nature in their relations to each other, giving prominence to comprehensive principles rather than to isolated facts. It aims at a general appreciation of the earth and universe in every aspect as shown in everyday phenomena, with the aid of the sciences of astronomy, geology, biology, physics, chem., geography, and meteorology. It cannot strictly be termed a science, being rather a collection from other sciences of those facts which relate to the earth, especially as it exists at the present day. See T. H. Huxley, *Physiography. An Introduction to the Study of Nature*, 1878.

**Physiology, see LESTARI.**

**Physiology.** For a sketch of the history, development, and scope of this branch of the science of biology, which is concerned with the functioning of the parts and the behaviour of living beings, see BIOLOGY. For special branches see LONGEVITY, REPRODUCTION, ANIMALS, DEATH, DIGESTION, BLOOD, BILE, CIRCULATION OF THE BLOOD, RESPIRATION, etc.; and for Vegetable Physiology see PLANTS. See Sir M. Foster, *History of Physiology*, 1901; A. Hill, *Pioneer in Physiology*, 1908; W. D. Halliburton, *Physiology*, 1923; S. Wright, *Applied Physiology*, 1940.

**Physiotherapy, healing by means of physical agents.** The methods employed in P. include not only massage (*q.v.*) but

also arotherapies, balneology, electrotherapy, heliotherapy, and treatment by ultra-violet and infra-red light, which are dealt with separately under these headings. A very important section of P. consists of the rehabilitation of organs whose functioning has been impaired by accident (e.g. war injuries), or by disease (e.g. poliomyelitis, 'infantile paralysis') (see OCCUPATIONAL THERAPY). The training of a physiotherapist commences with the study of anatomy, physiology, and pathology, and is followed by clinical instruction in special schools attached to hospitals. The Chartered Society of Physiotherapy is at Tavistock House (North), Tavistock Square, London, W.C.1.

**Physostigma**, or **Physostigma**, see CALABAR BEAN.

**Physostomy**. see BONY FISHES.

**Pi**, Gk. letter  $\pi$ , used as a symbol to denote the ratio of the circumference of a circle to its diameter: 3.14159.

**Placenza**, city of N. Italy, in the prov. of the same name, on the r. b. of the Po, 2 m. below the confluence of the Trebbia with that riv., and 36 m. W.N.W. of the city of Pavia. It contains numerous palaces, and is a bishop's see. The cathedral, in the anct. Lombard style, founded in the eleventh century, is famous for the richly curious and grotesque character of its internal decorations. The church of Sant' Antonio, the original cathedral of P., was founded in A.D. 324, but has been sev. times rebuilt. Among the other prin. buildings are the Palazzo Farnese, founded in 1558; also the Palazzo del Comune and the Collegio del Mercanti, both fine monuments of art. Manus. of silks, flour, brass, and iron goods are carried on.

P., called by the Romans, *Placentia*, on account of its pleasing situation, is first mentioned in 219 B.C., when a Rom. colony was settled there. Twenty years later it was sacked and burned by the Gauls. Here in 1746 the combined forces of France and Spain were defeated by the Austrians. In 1796, and again in 1800, it fell into the hands of the Fr., who evacuated it in 1814. In the Second World War the church of S. Agostino was hit, the fresco by Lomazzi being badly damaged. Other churches, too, were seriously damaged, including Carmine Vecchio and the church of the Cappuccini. The Palazzo Malvicini-Fontana was hit in the *cortile*. The cathedral was unharmed. Pop. 73,300.

**Pia Mater**, see BRAIN.

**Piankhi** (d. 714 B.C.), Ethiopian king of Nubia. The expedition which led to his conquest of Egypt is described on a granite stele, now in Cairo. P. is also the name of sev. other kings of the same race and ter.

**Pianoforte**, keyboard instrument commonly said to have been invented by Cristofori in the early eighteenth century, which differed from its predecessors in that its strings were hit by hammers, making possible pronounced gradations of tone, hence the derivation of its name from an early description, *col piano e forte*.

Though plucked string tone can be traced back to the lyre of the anct. Gks. and to still more remote R. sources, only those instruments with a keyboard need be taken into account as direct forerunners of the modern P. Ignoring the now obsolete hurdy-gurdy, the most familiar are the clavichord, virginal, spinet, and harpsichord, all of them possessing certain common, as well as some distinguishing, features. On the sensitive clavichord, dating from the early fifteenth century, the stretched strings were touched by tiny tangents which remained in contact with them as long as the fingers remained on the keys. A slight oscillation of the finger could produce a suggestion of vibrato, and very small tonal gradations were also possible. In shape it resembled a miniature grand piano, without legs, and it was Bach's favourite keyboard instrument. The virginal and spinet both appeared in the early sixteenth century, and the gentle but slightly more metallic tone of each was produced by plectra, which on the depression of the keys, plucked the stretched strings. Because of the plectra, the spinet's name may have been derived from the It. *spina* (thorn), though possibly it was called after the Venetian instrument-maker, Spinetti. The virginal, belonging to England, may have been so named because it was the favourite instrument of Elizabeth, the virgin queen, or because it was popular amongst young ladies, or because it was often used to accompany the hymn *Angelus ad Virginem*. Both were small portable instruments, though of the two the spinet more often had its own legs. More robust in tone was the larger harpsichord, frequently shaped like a small grand piano with legs, which also appeared in the sixteenth century. Again the strings were plucked with small plectra or quills, but the harpsichord had two keyboards, one controlling hard and the other soft quills to produce two grades of tone, which could not be varied by pressure from the player's fingers. In time certain stops were added, bringing other quills into action for tonal effects.

However, Bartolommeo di Francesco Cristofori (1655-1731), a famous It. harpsichord-maker in the service of Prince Ferdinand and his father, the grand duke of Tuscany, Cosimo III., after refining many instruments of the older type, eventually created one with a single keyboard capable of a wide range of tone produced not by mechanical means such as stops, but by the player's fingers; the more swiftly the key was depressed, the louder the tone, and vice versa. This he achieved by substituting hammers for plectra (hence the Ger. name *Hammerklavier*), possibly suggested to him by the old dulcimer, on which the player held a hammer in each hand, and though the harpsichord with its plucked tone survived alongside the P. throughout the eighteenth century, the infinitely greater and more natural eloquence in tone of the new instrument came to be recognised by all the romantic composers from Beethoven onwards. By 1711 Cristofori had

completed a P. with a hammer, hopper, and damper, and an improved model of 1726 also included a check to prevent the hammer rebounding. Within a few years of Cristofori's new invention, a Frenchman named Marius and a Ger., Christoph Gottlieb Schroeter, were at work on similar productions, but as Marius produced his at least five years after Cristofori and Schroeter not until after 1717, the It.'s reputation is not seriously endangered by claims on their behalf.

plano (with double keyboard), invented by Emanuel Moor for the facilitation of certain technical difficulties, such as smooth octave playing, has not won universal favour.

A consideration of the normal action to-day shows that the key is simply a lever for raising the hammer, which is lifted to the string by a jointed piece of wood called the hopper, which has supported the stiff wire formerly used and which made soft playing impossible. As

CRISTOFORI'S PIANO, 1726

SILBERMANN'S PORT. PIANO, 1746

After his death, however, the great improvements that followed in details of the action, tone quality, and quantity, and extension of the compass, came more from Germany, England, and later France and America, than from Italy. In Germany Silbermann's later pianos elicited J. S. Bach's approval when he visited the court of Frederick the Great in 1717, and Zumppe's smaller square pianos enjoyed enormous popularity, not least in England. This latter model is thought to have been invented by the organ-builder C. E. Frederici of Gera, some time in the early eighteenth century; it must not be confused with the upright 'cottage' piano (with strings ranged vertically instead of horizontally as formerly in the upright clavichord, known as a clavichtherium) which appeared a century later. In England John Dibdin was the first to perform publicly on the P. in 1767, and thanks to the devotion of such manufacturers as Stodart and the Broadwood family, this company temporarily took the lead. In 1783 John Broadwood patented loud and soft pedals, and in 1808 James Broadwood introduced metal bracing to reinforce the older wooden frames as the thickness of the strings and their tension was increased. Stodart's firm, however, produced the first complete metal frame in 1820. Other firms notably concerned in the instrument's evolution include those of Sebastian Erard (1752-1831) and Ignaz Pleyel (1757-1831) of Paris, and Steinway of New York, whose fine, overstrung metal frame instruments, complete with third (middle) pedal for sustaining bass notes while the upper harmonics are pedalled normally with the right pedal, enjoy pride of place on the concert platform to-day. The twentieth-century Duplex Coupler

the hammer touches the string the hopper is released from the notch which holds it, by contact with a fixed button, and the hammer is allowed to fall, not to its original position, but to a half position, which it maintains so long as the key is pressed down. When the latter is released the hammer falls back ready for the next stroke. To prevent it rebound from the bed into which it falls, the check is fixed on the edge of the key to retain the hammer until the pressure on the key is removed. The finger action in moving the keys not only raises the hammer but also lifts the damper, a small, felt covered piece of wood which ordinarily rests on the string. The depression of the right pedal has the effect of raising all the dampers so that other strings can vibrate in sympathy with those actually sounded. On the modern upright piano the left pedal causes the hammers to move nearer the strings, weakening the force of the impact, and on the modern grand a slight horizontal movement prevents them from hitting all the strings in each case, three strings for top notes, two for low notes, and one only for very low (hence the indication *u.c.* (*una corda*) for the depression of the left pedal and *t.c.* (*tre corda*) for its release). The hammer is covered preferably with felt of a soft, fine texture, which serves to preserve the continuity of the tone. The system of tuning now used is that of equal temperament, in which each octave is divided into twelve equal semitones.

The coming of the P. caused a marked difference in the style of keyboard writing. Its infinitely greater sustaining power brought an end to the Alberti bass (in which chords were split into short reiterated figures) and to the excessive trills and embellishments required to give

manuf. There is trade in wine and oil. It has a fine cathedral (1517) and a Norman church. Pop. 38,500.

**Pibroch** (Gaelic *piobaireachd*, pipe-tune), form of bagpipe music, of martial character, consisting of intricate variations on a single theme or *urlar*. See A. Mackay, *Collection of Ancient Piobaireachd, or Highland Pipe Music*, 1839.

**Pica**, printing type equivalent in the point system to 12 point. See TYPE AND TYPESETTING.

**Pica**, craving for unnatural food, such as chalk, especially in pregnancy. It is thought to be due to changes in the body's metabolism, or deficiencies such as anemia.

**Piocard, Jean** (1620-82), Fr. astronomer, b. at La Flèche (Sarthe). He succeeded Gassendi as prof. of astronomy in the Collège Royal de France (1655), and was one of those selected by Colbert to originate the Academy of Sciences (1666). In 1667 P. made his first application of the telescope to the measurement of angles, and soon after discovered a new system of astronomical observation with the pendulum. He measured the arc of the meridian of Paris between Amiens and Malvoisine (1669), which he described in *Mémoire de la terre* (1671), and recorded his observations from 1656 to 1682 in *Histoire céleste* (pub. 1741).

**Picardy**, former prov. of France, having for its cap. Amiens. This region is occupied now by the depts. of Somme and parts of Pas-de-Calais, Oise, and Aisne.

**Picardy, Battle of** (1918), see FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGNS IN (1918), *Battle of Picardy*.

**Picaresque Novel**, or *novela picaresca*, name of popular origin given to a type of novel which describes the adventures of a *pícaro*. This Sp. word, meaning 'rogue,' has been naturalised into Eng. as 'picareson,' and first appears in the writings of Capt. John Smith (1579-1631). The vogue for novels descriptive of low life and centring on a rascally hero began in Spain with the pub. in 1551 of Hurtado's *Vida de Lazarillo de Tormes*. The subject of this book is the autobiography of a rascal who becomes successively the servant of a blind beggar, of a priest, of a miserly *hidalgo*, etc. It was enormously successful, and Hurtado's example was followed by Mateo Alemán, who wrote *Atalaya de la vida humana*, a title which was changed to *El pícaro Guzmán de Alfarache* by the public with whom it was so popular. A sequel was pub. at Brussels in 1604, while in 1618 appeared another masterpiece of this genre, *Relaciones de la vida y aventuras del Escudero Marcos de Obregon*, by Vincente Espinel. In Sp. these romances of roguery were called *Gusto Picaresco*, meaning the Picaresque School. The vogue of the P. N. lasted for over fifty years, but declined towards the middle of the seventeenth century. The Sp. P. N. had a direct influence on the Fr. writer Le Sage, who in his *Le Diable boiteux* (1707) imitated *Guemara's El Diablo cojuelo* (1641); and in his still more celebrated *Gil Blas* (1715) borrowed largely from Espinel's *Marcos de Obregon*,

from which indeed he took his prologue, numerous incidents and features, and even the character of Sangrado (Sagredo in Espinel).

In England there existed a sixteenth-century trans. of Hurtado's *Lazarillo de Tormes*, which went through sev. eds., and in 1591 Nash's *Unfortunate Traveller* introduced the P. N. as a native of Eng. literature. In the eighteenth century low life and the manners of rogues were the very stuff of the Eng. novel in the hands of Defoe (*Moll Flanders*, *Colonel Jack*), Fielding (*Jonathan Wild*), and especially Smollett. J. B. Priestley's *The Good Companions* (1929) is a twentieth-century example of the Picaresque style. The old P. N., apart from its literary interest, has a sociological value as a picture of the life and customs of all classes of society. See R. Salillas, *El Inconveniente español*, 1896, and *Humana* (*Antropología picaresca*), 1898; Fonger de Hann, *An Outline of the History of the Novela Picaresca in Spain*, 1903; and J. F. Kelly, *A New History of Spanish Literature*, 1926.

**Picariæ**, picarian birds, an order of Carinate, comprising sev. sub-orders, most of which are inhab. of the tropics. They are the guacharos (*steatornithes*), the Madagascar rollers (*leptomastix*), the humming-birds (*trochilii*), the frog-mouths (*podaryi*), the colies (*colii*), the hornbills (*bucerotes*), and the mottos-mottos (*mototi*). All these sub-orders have the same characteristics, and contain, as a rule, but few species, which represent the various sub-orders in the tropics of both the Old and New World. All the picarians differ from the passerine birds in the arrangement of the tendons of the foot, the *flexor perforans digitorum* being connected with the hallux. Nearly all picarian birds possess one common osteological character, a double notch in the hinder margin of the sternum. As a rule they lay white or at least uniform pale-coloured eggs, which are always hidden from sight in the hole of a tree, or under the shelter of a building or rock.

**Picathartes**, genus of Picathartines which is a sub-family of the Struthionidae (starlings) and embraces two closely allied species. *P. gymnocephalus* or Guinea bare-headed rock-fowl, and *P. oreus*, or Cameroon bare-headed rock-fowl. It was not until 1938 that the true relationship of the two birds was recognised, for previously the genus *P.* had been placed by systematists in the Corvidæ and the birds were erroneously referred in literature as bald-headed crows, as has been shown by Dr. P. R. Lowe. The two species are remarkable in appearance, both having the entire head and nape bare of feathers. In *P. gymnocephalus* the crown and skin on the fore part of the face are bright yellow, with the hinder part black; in *P. oreus* the pattern is reversed, the fore-crown lichen blue, the hind-crown carmine red. The skin of the hind-neck is bright yellow in the first, carmine in the second and very untidy feathered in each case. The general colour of the plumage in both is grey above and white below. The bill is long and fairly straight and powerful, and decidedly crow-like, and the

wings are short and rounded. The legs are strikingly developed and the feet are furnished with strong decurved claws suitable for scratching in the ground and for the bird's characteristic long, springing hops. P. is about the size of a crow. It feeds on insects, snails, crabs, frogs, and beetles, and builds remarkable mud-nests which it plasters on rocks. Its very restricted W. African distribution and its habitat among the rocks in forested country at high elevations explain why so few Europeans have ever seen it. Mr. Cecil Webb, curator-collector to the Zoological Society of London, in Sept. 1948, brought back from the Cameroons a specimen of *P. oreas*, the first instance of P. to be seen alive in captivity. See D. A. Bannerman, *The Birds of Tropical West Africa*, vol. vi., 1948.

Kipfer) of 51,775 ft. and in 1932, from Zürich, 55,577 ft. In 1947 he designed a 10-ton diving bell or 'bathyscaphe' for deep-sea exploration on similar principles, but gave up his attempt in the gulf of Guinea in 1948. He pub. *Between Earth and Sky* (trans. by C. Apehr, 1949).

Piccolo (It., abbreviation for *flauto piccolo*, meaning little flute). The small octave flute, more usually called *ottavino* in It., similar in shape and technique to the ordinary flute, but smaller in size and standing an octave higher in pitch. It transposes up an octave, its music being written an octave below the actual sound.

Piccolomini, Eneas (Enea) Sylvius, see PIUS (popes), *Pius II.*

Piccolomini, Francesco Tedeschini, see PRUS (popes), *Pius III.*

Pic du Midi, see MIDI, PIC DU.

PICCOLO

Picasso, Pablo Ruiz (b. 1881), Sp. painter, b. at Malaga. His father was a drawing-master surnamed Ruiz, whose wife's maiden name, P., was assumed by their son. He began to paint very early (at La Ceruna) and fraternised with the artists of Barcelona Academy. He first arrived in Paris in 1900, and took up permanent residence there in 1903. Until about 1905 his work was influenced by the traditions of Degas and Toulouse-Lautrec; he became known as a painter of portrait studies in delicate neutral tints. This was followed by the 'rose period' in which he fell under the influence of Van Gogh and Cézanne. Some time in 1908-9 P. and a fellow artist Georges Braque invented Cubism. This formula has had great influence on the development of painting, and P. himself adhered to it rigidly until 1914. After the First World War he reverted to more classical painting, and designed the *décor* of a number of ballets, but shortly before and after the Second World War his painting became extremely violent and unconventional, causing considerable criticism. The most notable example of this phase is P.'s 'Guernica,' painted during the Sp. civil war. In 1945 he turned to naturalism, using neutral colours and simple designs, and a year later he began designing pottery. His paintings are in leading European galleries and at the Museum of Modern Art, New York; he is also represented in many private collections. See A. H. Barr, *Picasso: Fifty Years of his Art*, 1947; D. Sutton, *Picasso: Blue and Pink Periods*, 1949; J. Sabartes, *Picasso: an Intimate Portrait*, 1949.

Piccard, Auguste (b. 1884), Swiss physicist, b. at Lutry. Prof. of physics at the Confederate Technical High School in 1910, and in 1922 at Brussels. He gained fame through his stratosphere flights with a free balloon and air-tight gondola. In 1931, from Augsburg, he reached a height (with his assistant

Picenum, former div. of Italy, lying along the Adriatic coast, and bounded on the W. by the Sabine lands and Umbria. The people of the country became more or less subject to the Romans, and remained so until 90 B.C. In the eighth century A.D. Pepin handed it to the pope.

Pichileago, see CHILAMYDOPORTS.

Pichincha: 1. Volcano of the W. Andes in Ecuador, 8 m. N.W. of Quito. It has sev. peaks, the highest being 15,918 ft., while its crater is extremely deep. It has not been in eruption since 1660. Its slopes were the scene of a battle in 1822 when Bolívar triumphed over the Spaniards. 2. Prov. in S.W. Ecuador, subject to earthquakes, though possessing much fertile land. Quito is the cap. Pop. 303,500.

Pickering, mrkt. tn. in the N. Riding of Yorkshire, England, 25 m. N.E. of York. It is an old tn., having a church dating from the fourteenth century and a castle in which Richard II. was imprisoned. There is trade in agric. produce, and agric. instruments are made. Pop. 4300. See G. Home, *The Evolution of an English Town* (1905).

Picket, military term, meaning (1) detachment of regimental details or military police who patrol a tn. to enforce the keeping of bounds, or who remain in barracks for the purpose of guarding against fire or who constitute an unarmed guard on stables, wagon lines, etc. (2) Outmost troops of an outpost line who are not expected to offer serious resistance to the enemy so much as to give warning of his approach. In the eighteenth century when two opposing forces in the field were in loose contact P.s. were used to mark the limit of ground occupied by each side and would be posted in the open in full view of the enemy P. line without either side attempting to molest the other. The word has been borrowed for the vocabulary of industrial dispute (see PICKETING).

**Picketing**, briefly the prevention of 'blacklegging' in strikes, by stationary persons outside the entrances to the factories or workshops concerned. Under the old Conspiracy and Protection of Property Act, 1875, P. was illegal in so far as compulsion was used by the pickets; but in 1906 an amending Act excluded 'peaceful' P. from the operation of the old Act. Again, the Trades Disputes Act, 1927, passed after the general strike of 1926, provided that P. was illegal if committed in respect of a strike which had been declared unlawful, as was the general strike, by virtue of a decision given in the chancery div. The Trades Union Congress pressed frequently for the repeal of the Act of 1927, and on coming to power in 1945 the Labour Gov. repealed it in full.

**Pickford**, Mary (stage name of Gladys Mary Smith) (b. 1893), film actress, b. at Toronto. She first appeared on the stage in 1898 as the child Cissy Denver in *The Silver King*. In 1912 she made her first appearance as a cinema actress—for the Biograph Company, under David W. Griffith, in *The Violin-maker of Cremona*. Others of her films were *Stella Maris*, *Rebecca of Sunnybrook Farm*, *Madame Butterfly*, *Daddy Long-legs*, *Dorothy Vernon of Haddon Hall*, and *Little Lord Fauntleroy*; but her appearances in sound films were less successful. She organised the United Artists Corporation with Charles Chaplin, Douglas Fairbanks, and D. W. Griffiths in 1919, and later became head of her own film company. She married three times, Douglas Fairbanks being her second husband, whom she divorced in 1935. She pub. *Why not try God?* (1934) and *My Rendezvous with Life* (1935).

**Pickling** (metallurgy), the term 'acid-pickling' denotes the removal of scale, oxide, or rust from metals so as to restore their chemically clean surfaces. These various processes may be applied to stock, to work at intermediate stages of fabrication, or to finished components. Stock is available as sheet, rod, bar, tubing, etc., the surfaces of which become oxidised during manuf., either by hot rolling or drawing operations. Scale must be removed before drawing or rolling operations to prevent it from being forced into the metal, with consequent defects. The P. action in some cases is purely chemical dissolution of an oxide or carbonate in the acid of the pickle; in others it may be a mechanical removal of the scale by virtue of action between base metal and acid. Prior to acid P., work must be freed from grease by an alkali or some other solvent; otherwise the oil or grease reduces the effectiveness of the acid P. solution and also causes irregular removal of the scale. After acid P. thorough water washing is necessary to remove traces of acid, otherwise corrosion will occur.

**Pickling of Fruit**, see PRESERVING.

**Pico**, one of the Azores is. lava-covered, and having a volcano 7600 ft. high. Wine is the chief product. The chief tns. are Lages and San Rocco. Area 250 sq. m. **Pico della Mirandola**, Giovanni, Count (1463-94), It. philosopher and writer, b. at Mirandola, the youngest son of Francesco

P., prince of Mirandola. After spending seven years in various univ. cities of Europe, he proposed (1486) a disputation at Rome on 900 subtleties of philosophy. The pope forbade the debate, whereupon P. defended his orthodoxy in an *Apologia*, and in 1493 Alexander VI. absolved him of the charge of heresy. P. also wrote *Heptaplus* (1481), a mystical exposition of the creation. His works also include *Ente et Uno*, an attempt to combine the teachings of Plato and Aristotle, and a treatise against astrology. He led a wandering life, was a generous almsgiver, and a friend of Politian, Ficinus, and Lorenzo de' Medici. See lives by Thomas Moro (Tudor Library ed., 1890), 1510; H. Walter, 1933; and L. Cantier Vignal, 1937; also A. Schull, *Giovanni Pico della Mirandola und die Entdeckung Amerikas*, 1929, and P. Kibre, *The Library of Pico della Mirandola*, 1936.

**Picotee**, variety of carnation (q.v.) in which the plain coloured petals are edged with a second colour.

**Picquet**, see PIQUET.

**Picric Acid**, trinitro-phenol ( $C_6H_2(NO_2)_3O$ ), is formed when nitric acid is heated with wool, silk, leather, etc. It is prepared by acting on phenol with nitric and sulphuric acids, and is obtained as a yellow crystalline solid (melting point 122.5°) which is soluble in hot water. P. A. has been, and still is, widely used as a high explosive. Its solution is used as a dye, as are also the potassium and sodium derivatives. These latter compounds, as well as the ammonium derivative, explode violently on percussion. P. A. is of interest as one of the comparatively few organic acids that do not contain the carboxyl group, —COOH. The name is derived from the Gk. πικρός, pikros, bitter, owing to the intensely bitter taste of the acid. See LYTHOITE.

**Picrite**, olivine rock, usually serpentinised with augite, magnetite, hornblende, etc. Ps. are a subdivision of the ultrabasic igneous rocks, viz. the peridotites.

**Pictavium**, see PICTURES.

**Pictography**, or **Picture-writing**, the most primitive stage of true writing (q.v.). A picture or sketch, termed 'pictograph', represents the thing shown. A sketch of a man would indicate 'man'; the pictograph of animal would represent an animal, a circle might represent the sun. Straight narrative can be thus recorded in a sequence of pictographs, but such pictures could not say enough. Therefore the pictographs also became ideographs (thus P. became 'Ideography'): the pictures not only represent the things they show, but also the underlying idea associated with those things; a circle, for instance, might represent the 'day'. P. is found everywhere, among auct. peoples of Egypt, Mesopotamia, Crte, Central America, China, etc., as well as among modern tribes of N. America, Africa, or Asia.

**Picton**, Sir Thomas (1758-1815), Brit. soldier, b. at Poynton, Pembrokeshire. He entered the army in 1771, became major in 1795, and took an active part in the capture of St. Lucia in the following

year. When Trinidad was taken from the Sp. in 1797 P. was put in charge of the administration as a military dictator, his five years' tenure of office being characterised by arbitrary conduct but undoubted ability in maintaining order. He was criticised for applying harsh Sp. laws in the punishment of natives and he got into trouble with the Privy Council for permitting a kind of Sp. inquisitorial tribunal to be set up for the suppression of *obi* or sorcery. Yet he was a most popular governor, feared yet loved, and he administered Trinidad so successfully that the inhab. presented him with a golden sword when they petitioned against the retrocession of the is. to Spain. He was present at the siege of Flushing (1809), and appointed governor of the tn. He served in the Peninsular war under Wellington, and greatly distinguished himself on many occasions, notably at Badajoz and Vittoria. P. commanded a div. at Quatre Bras, and was shot while leading a charge at Waterloo. See H. W. Robinson, *Memoirs of Sir Thomas Picton*, 1836, and a description of his stormy career in Trinidad in E. L. Joseph's *History of Trinidad*, 1837.

**Pictou:** 1. Tn. of New S. Wales, Australia, 45 m. S.W. of Sydney. Pop. 1500. 2. Cap. of Prince Edward co., Ontario, Canada, 40 m. S.W. of Kingston. It is important for its foundries, shipyards, and agric. products, especially fruit. Pop. 3400.

**Pictor, Fabius**, see **FABII GENS**.

**Pictor**, one of Lacaille's S. constellations, situated S. of Columba. This constellation was plotted in 1752, and the chief star of the blue or Sirius variety has a magnitude of 3.3. The constellation is notable for containing a star of 8.5 magnitude which has the largest proper motion of any in the heavens except Barnard's star, found in 1916. This is 870" a century, and its parallax of 0.31" indicates a velocity of 82 m. a second.

**Pictou**, port of entry and cap. of P. co., Nova Scotia, Canada, 84 m. N.E. of Halifax, in a fertile dist., with extensive coal-mines, steel mills, and building-stone quarries. The P. Academy was opened in 1818. Coal, lumber, dried fish, and canned lobster are exported. P. is Nova Scotia's best N. port for the gulf of Lawrence and overseas trade. Pop. 4500.

**Picts**, people inhabiting Scotland, part of the N. of Ireland, and perhaps portions of France, notably Poitou, in prehistoric and early historic times. They are described by early Rom. authors as a definite nation. Arrian says that they were *neq. falso nomine Pictos* (not falsely named P.), a statement which has led to the assumption that they received their national appellation because they were either painted or tattooed. Claudian, a court poet, writing c. A.D. 400, alludes to the 'iron-marks' on the body of the dying Pict, but whether the people took its name from the fact that it was painted or not is conjectural. According to some scholars, however, the name is a Lat. trans. of the Celtic-Welsh *pryd*, 'shape', external appearance. The Lat.-speaking Britons

used the term P. to describe the barbarians beyond the N. frontier. By the end of the third century it was the accepted name of the inhab. of central and N. Scotland, and adopted nationally by the Caledonians. Time and again during the Rom. occupation the P. harried Romano-Brit. terr., and to secure the safety of the prov. the Rom. erected at different periods the great frontiers of the Antonine Wall and Hadrian's Wall, across the narrower portions of Scotland. These structures were in some degree instrumental in repressing Pictish invasions so long as they were adequately and consistently manned, but on the departure of Rom. forces from the is. the P. once more invaded Brit. terr., penetrating on this occasion as far as London, and making tremendous havoc. Gildas and Nennius, authors of c. A.D. 570 and c. A.D. 800, and Bede (c. 673-735) are the later authorities on the hist. of the P. The hist. of the P. subsequent to the Rom. withdrawal relates chiefly to constant domestic broils caused mainly by the peculiar circumstances which attended the Pictish law of succession, or, as it has been called, the law of tanistry, in which succession was vested in the eldest and most worthy of the same blood and, therefore, not necessarily according to the principle of primogeniture. Soon after the landing of the Scots in Pictish terr. they became involved in war with the P., and incessant hostilities, covering a period of at least three centuries, concluded only with the union of the two peoples under the sway of Kenneth Macalpine, a Pict on his mother's side. A long list of kings, mythical for the most part, is afforded by the *Pictish Chronicle*, which also notices current events in a very perfunctory manner. After the union of the two peoples there is little doubt that they fused insensibly into one stock, and that the P. form part of the ethnic make-up of the present Scottish people. As late as the twelfth century persons alluded to as P. are to be found in the cartulary of Glasgow cathedral, and at the battle of the Standard in 1138 the vanguard of the Scottish army was composed of P. from Galloway. Indeed Pictish seems to have been spoken in Galloway as late as the beginning of the seventeenth century. Very little is known about the ethnic and linguistic affinities of the P. They are considered by some scholars as early Celts, by others (such as Sir John Rhys, Prof. R. A. S. Macalister, Prof. E. MacNeill) as the pre-Celtic aborigines of Scotland. The Caledonians, who gave the Rom. name to the country, were one of the main Pictish tribes. Sev. Oghamic inscriptions, mainly found in N.E. Scotland and in the N. Isles, are written in a variety of Oghams (*g.n.*) known as Pictish Oghams. They have not yet been satisfactorily trans. One famous word given by Bede, *Pean-sahel* or *Bernal*, is said to signify the 'head of the wulf,' alluding, of course, to one of the ramparts which retarded the S. progress of the P. The P. are mentioned in the panegyric of the orator Eumenius on Constantius Augustus in A.D. 297.

Pidgeon, or Pigeon, English (Chinese corruption of the Eng. word 'business'), mixed jargon much in use in the Chinese ports as a means of communication between the natives and European traders. It consists of Eng., with Chinese, Malay, Hindustani, and Portuguese words constructed according to Chinese idioms.

Piece of Eight, *see* EIGHT, PIECE OF.

Piecework, system of payment of wages by results as opposed to payment by time-earnings. For many trades the latter is, generally speaking, the only form that can be applied, since they are not adapted to measurement of output, nor would they be easily able to carry a general or overhead bonus based on efficiency. The simplest and oldest form of payment by results is individual P.; group P. is an extension of this; gang P. prevails in jobs which need the close co-operation of sev. individuals; overhead P., based frequently on the normal output of the work as a whole, provides that, in whatever proportion it may be exceeded, in the same proportion the aggregate wages of the workers will be increased. To encourage 'P. speed' on work which does not lend itself to measurement by the 'piece' there are various local systems, which include 'guarantee rates' or 'lieu rates,' mostly additions to ordinary time-rates, sometimes the survival of a local custom, or induced by the pressure of exceptional conditions of work. Much more complex in many respects are the bonus schemes which have direct reference to output; for both value of output and sales are liable to fluctuations in the sphere of distribution not under the control of wage-earning producers. Objections to P. systems have been made on the grounds that they foster jealousy and rivalry among workers; that piece-rates undermine standard time-rates, that earnings on P. are variable and precarious, upset family budgets, create inequality of wages between individual and individual, and group and group, and serve to emphasise to the employer differences in capacity or industry; and also that they conduce to undue speeding up, exhaustion of the worker, and to a shorter working life owing to premature decline of physical and mental energy on account of the increased strain. It is sometimes contended that systems of remuneration based on results involve a departure from the principle of collective bargaining. Employers and trade unions, however, deny these objections generally and maintain that in so far as they may be valid the remedy lies not in the abandonment but in the perfecting of the system. *See further under* WAGES. *See* W. Graham, *The Wages of Labour*, 1921.

Piedmont, region of N. Italy, bounded on the N. by Switzerland, E. by Lombardy, S. by Liguria, and W. by France,

and comprising the provs. of Alessandria, Cuneo, Novara, and Turin. It has an area of 9813 sq. m., is watered by the Po, and is shut in by the Pennine, Graian, Cottian, Maritime, and Ligurian Alps. Its soil is fertile, producing olives, vine, wheat, maize, rice, chestnuts, fruit, etc., and coal, lead, copper, silver, and salt are mined. The chief manufs. are silk, cotton, and wine. In anct. times P. formed a part of the Rom. prov. of Gallia Transpadana. In the eleventh century it was incorporated with Savoy. Pop. 3,580,000.

Piedras Negras, tn. of Mexico, on the Rio Grande, opposite Eagle Pass (Texas). It is a port of entry to N.E. Mexico and is 850 m. from Mexico city. In the vicinity are coal, silver, copper, and zinc mines. It is also a cattle-raising centre and cattle and horse markets are held. Pop. 18,900.

Piel (originally Fowdray), is. and harbour of the Furness Peninsula, Lancashire, England. Here Lambert Simnel landed in 1487. The is. is notable for the ruins of P. Castle. Pop. 3.

Pien-liang, *see* KAI-FENG-FU.

Pie-poudre, Court of (*curia pedis pulverizati*), in England, was formerly held at fairs or markets to administer ready justice to buyers and sellers, and has now fallen into disuse. It was so called from O.F. *pied poudre*, 'dusty foot.' It is mentioned in the O.E. law books as the court *pepoudrous*, meaning that justice was administered 'while the dust fell from the feet.' Courts *pepoudrous* were 'incident to every fair and market because that for contracts and injuries done concerning the fair or market there shall be speedy justice done for advancement of trade and traffic.' The necessity for this speediness for certain classes of people was recognised as far back as Bracton in the thirteenth century. The records of these courts are necessarily few, and, as a consequence, 'there is no part of the history of English law more obscure than that connected with the maxim that the Law Merchant (q.v.) is part of the law of the land' (Blackburn). But the Selden Society discovered the abbot's roll of the fair of St. Ives, 1275-91, containing a series of cases which show how the merchants administered the law merchant in the courts of the fair, and why such cases did not come into the king's court. In most seaport tns. there was a similar court dealing with cases arising out of ships. Thus any ship coming into the port of Ipswich with a dispute about its Bill of Lading might get summary justice at once from the 'pypoudrous' court at Ipswich between tide and tide (Black Book of Admiralty, Rolls Series, II. 23).

Pier, in architecture, support or pillar for an arch, bridge, or beam; also a rectangular narrow projection on a wall to give additional support to a beam or other load. A P. template is a stone cover on a brick P. L. distribute the load over the whole section. A P. is essentially a structural member as distinct from a 'pilaster' (q.v.), which is often merely of decorative value. Also a breakwater or

jetty built out into the sea, serving to form a harbour, a landing-place, or a marine promenade. See also BREAKWATER.

**Pierce, or Peirce, Benjamin** (1809-80), Amer. mathematician and astronomer. He was educated at Harvard Univ. and studied under Bowditch, author of *The Practical Navigator*. On the death of Bowditch in 1838 P. became the leading Amer. mathematician. The first work that made his name more widely known was his computation of the general perturbations of Uranus and Neptune, and another important astronomical work was his research into the equilibrium of Saturn's ring, in which he showed that a fluid ring was unstable as well as a solid one. His chief mathematical works were *System of Analytical Mechanics*, and *Linear Associative Algebra*.

**Pierce, Franklin** (1804-69), fourteenth president of the United States, b. at Hillsborough, New Hampshire. He served in the House of Representatives (1829-33) and in the Senate (1837-42). He fought in the Mexican war (1846-47), and was elected President from 1852 to 1857. His objection to the abolition of slavery was the chief cause of his subsequent withdrawal from political life. See lives by N. Hawthorne, 1852, and J. R. Irelan, 1888; also Anna E. Carol, *Review of Pierce's Administration*, 1856, and W. R. Leech, *Calendar of the Papers of Franklin Pierce*, 1917.

**Pierites**, see under IGNOTUS ROCKS.

**Pierlot, Hubert** (b. 1883), Belgian statesman, b. at Cugnon. A member of the Catholic party, he was minister of the interior (1934-35), minister of agriculture (1936-38), Prime Minister (1939). In 1940 he assumed also the office of foreign minister, and after the capitulation of King Leopold became head of the Belgian Gov. in exile in London. After Belgium was liberated P. headed a gov. from Sept. 1944 to Feb. 1945.

**Piero della Francesca** (c. 1416-92), It. painter, b. at Borgo San Sepolcro, Tuscany; also called **Pietro Borghese**. He preferred to be known by the name **Francesca**, in recognition of his widowed mother's devotion. P. is chiefly remembered as a painter in fresco. He visited Rome, where he painted frescoes in the Vatican for Nicholas V. These were immense works, and were reproduced in the Vatican library. They were, however, in poor condition as early as the sixteenth century, when Raphael was commissioned to replace them with his masterpieces. There is therefore somewhat slender evidence of the merit of his work. Vasari states that P. did work in an Augustinian chapel, but this no longer exists, and his most famous fresco works are those in S. Francesco of Arezzo, slightly damaged during the Second World War, at Borgo San Sepolcro, and the 'Flagellation of Christ' in Urbino Cathedral. Fuller estimates of his powers are founded on the 'Resurrection of Christ,' an oil painting found in an old Augustinian convent at Arezzo. It is in the style of Perugino, although inferior to the work of that painter. Tiraboschi, commenting

on another painting attributed to P., 'Dream of Constantine,' praised it for its effects of light and shade, special knowledge of the play of muscles, and magnificence of drapery. But critics aver that most of those qualities are not to be found in the 'Resurrection of Christ,' although it is commonly agreed that the effects of silhouette and the sumptuous treatment of robes do render the work remarkable, and are of themselves sufficient merit to warrant his work receiving much higher appreciation. The education of Bramante as a painter is generally ascribed to P., whose work, like that of the latter, is regarded as having some affinity to the school of Padua. P. is, moreover, also celebrated for revealing an advanced knowledge of perspective. He lost his sight at the age of sixty, but lived till eighty-six. See lives by C. Ricci, 1910; H. Graber, 1920; A. Venturi, 1922; and R. Longhi, 1927; also A. Stokes, *Art and Science*, 1919.

**Piero di Cosimo**, see COSIMO.

**Pierre de la Ramée**, see ITAMUS, PETER.

**Pierre, Jacques Henri Bernardin de Saint**, see BERNARDIN DE SAINT-PIERRE.

**Pierre**, cap. of S. Dakota, U.S.A., and also of Hughes co., on the Missouri R., and on the Chicago and Northwestern Railroad, 110 m. W. of Huron. Natural gas is found, and the tn. has a large cattle market. There is a gov. Indian industrial school. Pop. 4300.

**Pierson** (originally **Pearson**), **Henry Hugh**, or **Heinrich Hugo** (1815-73), Eng. composer, b. at Oxford. He was educated at Harrow and Cambridge, studied music with Attwood and Corle, and interrupted a medical course to continue musical studies at Leipzig, where he met Mendelssohn, Schumann, and others. He became Reid prof. of music at Edinburgh in 1844 in succession to Bishop, but soon resigned and returned to Germany, where he remained, married Caroline Leonhardt, and changed the spelling of his name. He produced a musical setting for Goethe's *Faust* (1854), the operas *Leila* (1848) and *Contarini* (1872), the oratorios *Jerusalem* (1852) and *Hezekiah* (unfinished), and *The Mariners of England*.

**Piers Plowman**, see LANGLAND, WILLIAM.

**Pieter de Hondt** (later **Saint Peter Canisius**) (1521-97), Ger. Jesuit theologian, b. at Nijmegen, Holland. He became a Jesuit in 1543 and founded the first house of the Society in Germany, at Cologne. He became the first provincial of the Society in Germany (1556). The re-establishment of Rom. Catholicism in Germany was due largely to his zeal. His catechism, *Summa Doctrinarum*, was authorised in 1566. He was canonised in 1925.

**Pietermaritzburg**, seat of gov. and cap. of Natal, S. Africa, 56 m. N.W. of Durban; founded by the Boers in 1839, and called after two of their leaders, Piet Retief and Gert Maritz. Retief and Maritz were leaders of the trekkers who crossed the Drakensberg in 1838 into Natal and were murdered, together with their followers, by Dingaan, the Zulu king. Later Andries Pretorius made a vow that if

God gave his men victory they would build a church and set apart one day every year to commemorate it. The sequel was the decisive victory of the battle of Blood R., whence the Church of the Vow, built in old Cape Dutch style and opened for worship in 1840. It was subsequently acquired for the nation and is now a museum for voortrekker relics. A Brit. regiment garrisoned the tn. In 1856, when Natal was made a separate colony by royal charter. The first legislative council of Natal met in P. the next day and thus the tn. became the cap. of Natal. Few buildings of the P. of a century ago are to be seen to-day, and the old Itaalzaal or House of Parliament, built closely on the lines of the Church of the Vow, was demolished and the present city hall built on the site. The city hall was rebuilt and reopened in 1901, the original hall having been destroyed by fire in 1898. The city has broad streets and is built on a sloping plain (altitude 2218 ft.) and is noted for its healthy climate. Pietermaritz and Relief Streets perpetuate the names of the two pioneers; other pioneers are commemorated in the street names of Burger, Boshoff, and Greyling. P. is the seat of an Anglican bishop, and is the home of the univ. of Natal; it has also many schools and colleges. There is an art gallery, library, hospital, and the Natal Museum, the latter being notable for its collection of big game animals and economic insects. P. has a large tanning extract factory capable of processing 40,000 tons of wattle bark annually with an ann. extract production of 12,000 tons. Here also is one of the largest shoe factories in the S. hemisphere. Other industries include bricks and roofing tiles, chocolates, cream, dairy utensils, machines for crushing maize, and bi-cuits. The botanic gardens were estab. in 1874. Flowers and shrubs from all over the world are gathered in these gardens, which stretch over 100 ac. There are also parks and a natural bird sanctuary. P. is set in a countryside of lakes and streams and waterfalls. In the vicinity are Howick on the Umgeni R., with golf course and tennis courts; the Karkloof Falls and the Umhass Falls, all popular camping places. Pop. 55,400 (including 26,100 Europeans). See L. Trichardt, *Trek across the Drakensberg* (ed. C. Fuller), 1837-38; M. Nathan, *The Voortrekkers*, 1937; H. G. McKearney, *Urcle Days of Natal*, 1930; and A. F. Hattersley, *Pietermaritzburg Panorama*, 1938.

Pietersburg, chief tn. and administrative unit of the N. Transvaal, S. Africa, near the source of the R. Sand. Copper, tin, antimony, and corundum are worked in the vicinity, and P. is the centre for large goldfields. Pop. 11,000.

Pietists, name given to the adherents of a movement in the Lutheran Church during the seventeenth century in reaction against what they considered cold dogma devoid of religious feeling and practical piety. Without separating from the Lutheran Church, the P. instituted meetings called 'Collegia Pietatis,' whence their name. Philipp Jakob Spener was

the chief promoter of these meetings, which began about 1670. The movement produced some interesting literature. Pietism was not an isolated movement, but can be connected with similar tendencies in other countries.

Pietra Dura, name applied to the finest kinds of Florentine mosaic work, formed of inlaid materials of the hardest kind, viz. agate, jasper, cornelian, chalcedony, etc., set in marble. The true P. D. work is practically confined to Florence, and dates back as far as the sixteenth century, but inferior kinds are manufactured in Italy, where coloured sea-shells are used as a substitute for the stones.

Pieve Santo Stefano, tn. of Italy, in the prov. of Arezzo, situated on the Tevere R. It has some interesting monumental buildings, including the Collegiate Church, which, after the fighting of 1644, stood untouched and almost alone among the ruins. The tn. was systematically destroyed by the Gers. The church of S. Francesco was badly wrecked but the della Robbia reliefs survived. Pop. 5900.

Piezoelectric Effect, see under QUARTZ CRYSTAL.

Piezometer, instrument for measuring the compressibility of liquids. The simplest form consists of a strong glass cylinder, the top of which is fixed to a metal cap. This cylinder is filled with water. Inside the vessel a long glass bulb terminating in a capillary tube is filled with the liquid to be experimented upon, the end of the capillary tube dipping beneath the surface of some mercury. The volumes of the bulb and the capillary tube are known. Pressure is applied to the surface of the water; this forces the mercury into the capillary tube, thus subjecting the liquid to a pressure which is measured by means of a manometer. By observing the compression, the compressibility per unit of pressure can be calculated. The contraction in this case is not totally due to that of the liquid, but the volume of the glass vessel also contracts, and thus a correction has to be made, which Reynault eliminated by a new form of P.

Pig. The wild boar survived in Britain until the eighteenth century. It is from crosses between its tamed representatives and the Neapolitan and Chinese P's. that the valuable Brit. breeds of domesticated P's. originated. The domestication of the P. began at a very remote period in China, but it is only in recent years that special attention has been devoted in all parts of the world to the breeding of animals that satisfy the demand for very prolific sows and perfect pork- and bacon-making 'machines.' All the best European and Amer. breeds owe their present quality to the introduction of blood from Brit. stock. Modern Brit. breeds have attained their present conformation and qualities as the result of careful breeding and selection during the past seventy years. The founding of the National Pig Breeders' Association in 1884 and individual breed societies at subsequent dates have done much to determine the value of the pedigree P. trade as a national asset.

With breeding and selection the long snout, narrow head, and agile, hump-backed muscular body of the wild races have given way to a broader, shorter snout, fuller head and neck, long, level, and broad back, full belly and shorter legs.

**Breeds**—The number of Brit. breeds is few and tending to become fewer. The *Large White*, also referred to as the *Large White Yorkshire*, has a great reputation at home and abroad as a bacon P. The excellence of Dan. bacon owes much to the blood of this breed. The head is moderately long, face slightly dished, snout broad and not turned up much, and wide between the ears; the ears are long, thin, slightly inclined forward, and fringed with fine hair; neck is long, chest wide and deep, back long, level, and wide, belly full with straight underline, hams broad and full to hooks, legs straight and well set, skin fine, white, and smooth, and coat long and silky. The sows are docile and prolific, and on the whole good mothers. Although the number of Ps per litter is usually higher than that of any other Brit. breed, the losses between birth and weaning also tend to be higher. Nevertheless this breed and its crosses provide the best bacon Ps. The *Middle White* was also evolved in Yorkshire, from a cross between the *Large White* and the *Small White*, the latter being now extinct. The *Middle White* is an excellent pork P. attaining killing weight early, with a high percentage of meat to bone, though modern types are good for pork or bacon. For bacon, however, a *Large White* *Middle White* cross is probably better than the pure *Middle White*. The *Large Black* is a breed supposed to have originated in the E. and long popular in Devonshire, Cornwall, Suffolk, and Essex. Although the Breed Society only came into being in 1899, the breed was recognised as pure for many years before. Their dark skin makes them less susceptible to the sun and they are excellent for hot climates. The *Tamworth* originated in Staffordshire and is characterised by its abundant, golden-red hair. It is supreme as a forager, producing a very high proportion of lean meat, and is esteemed for bacon crosses. The sows are less prolific than those of other breeds but rear more of their offspring to weaning. The *Berkshire* was the first Brit. breed to be improved, records going back to 1850. The breed provides a very fine pork P. and is considered valuable for crossing with larger and slower maturing breeds for bacon production. The *Wessex Saddleback*, originating in Dorset, is now esteemed all over the country as a very hardy breed, providing excellent graying Ps which can be killed from early age onward. Outstanding characteristic is the colouring, black head and neck, black body, hind quarters, and hind legs, with a white saddle over shoulders and forelegs and continuous belt of white hair. The *Essex*, or *Essex Saddleback*, resembles the *Wessex Saddleback* with its belt of white encircling the shoulder and forelegs on a black body, neck, and head. The breed is held to be descended from the

old Eng. P. and is esteemed for its hardiness, adaptability to outdoor conditions, and production of good pork Ps and bacon Ps., especially when it is crossed with the *Large White*. The *Gloucestershire Old Spot* is an old breed originating at about the same time and from similar parentage to the *Berkshire*, although the herd book only goes back to 1913. It became noted in the Second World War for its ability to do well on swill alone, and is a hardy, adaptable, and reasonably prolific pig. It is characterised by its white ground colour with a few large black spots. The *Welsh*, although an old breed, has only become widely known since 1918. Its characteristics are said to resemble those of the *Dan. Landrace*. It is a good bacon P. though slow in growing. The *Large White Ulster* is a N. Ireland breed that is now practically extinct, and the *Lincolnshire Curly Coat* has not found much favour beyond its own co. Floppy ears are now considered objectionable and lop-eared strains of breeds are now less frequent. Ps are usually kept with four objects: (a) as a herd to provide gilts (females which have not littered) and sows for breeding, (b) as a herd to provide piglets for others to feed and rear for pork or bacon, (c) as a herd of bought Ps. for fattening as pork or bacon, (d) as a breeding stock to provide piglets for feeding for pork or bacon on the farm where born. The choice of breed or cross-breed will be influenced primarily by the ultimate object, but also by the methods of feeding and housing.

**Feeding**—Ps can either be fed on waste products such as swill, or on concentrated foods, or on a mixture of both. The ideal is to promote unchecked growth and a steady gain in weight from 1 to 1½ lb as a daily average from birth. As food comprises about 75 per cent of the total cost of production, careful thought should be given to the choice and balance of the rations. Ps may be fed twice but preferably thrice, daily. The policy is to feed well-balanced meals which are eaten up within 20 min., rather than to provide all that the P. will eat at a time. In practice, a balanced meal provides a proper proportion of protein for tissue-building to carbohydrates (starches, fats, and oils) for body heat, energy, and weight gains in body fat. This proportion, known as the nutritive ratio, is 1.4 to 1.5 for young growing Ps. and breeding sows, and 1.6 to 1.8 for fattening Ps. There must also be a proper content of food minerals for bone formation, milk production, etc., vitamins for health protection, and water. Where Ps. are reared out of doors and receive green foods and fish meal, mineral or vitamin deficiencies are unlikely. Where the protein is all vegetable, a supplement of lime and salt is needed. Vitamin deficiency of A and D is possible in Ps. housed indoors and getting little or no green food. Cod liver oil at ½–1 oz daily is the corrective. Given enough minerals and vitamins, the key to balanced rations lies in the protein-carbohydrate or nutritive ratio. The heavier the P., the more

## BREEDS OF PIGS

- 1, Middle White Gilt; 2, Large White; 3, Large Black; 4, Tamworth boar; 5, Berkshire Gilt; 6, Wessex Saddleback; 7, Basex Saddleback (*Farmer and Stockbreeder*); 8, Danish Landrace (*Royal Danish Embassy*)

protein needed. At 50 lb. a P. needs 9.3 lb. protein daily, at 75 lb. 0.4 lb., at 100 lb. 0.5 lb., and at 150 lb. or more, 0.6 lb. The chief protein-rich foods are fish meal, meat meal, bean and pea meal, dried blood, dried yeast, soya-bean meal, decorticated ground-nut meal, and separated milk. The chief carbohydrate-rich foods are barley meal, flaked maize, maize meal, maize germ meal, weatings, wholewheat meal, tapioca meal, potatoes, bran, middlings, ground oats, brewers'-grains, and sugar-beet pulp. The last five are considered somewhat inferior, owing to high fibre content, and should not bulk too largely in the rations.

The actual composition of a 'feed' will depend first upon the age and purpose of the Ps., and then upon the foods available and their price according to season and supplies. A popular tested ration for a sow is 10 per cent fish meal, 45 per cent barley meal, and 45 per cent weatings. In varying this or any other ration, other foods of similar feeding values should be chosen to replace part or all of one of the prescribed ingredients. Roots and green foods may supplement a reduced meal ration, though their chief contribution is to the health of the Ps. Swill consisting of kitchen waste is a major P. food during wartime and under shortages. Untreated or raw swill must, by law, be steamed or boiled for at least 1 hr.; 3½ lb. swill replaces 1 lb. of P. meal in a ration. It is most suitable for Ps. of 50 lb. or more, and should have cereal meal added to a suitable consistency. Prepared concentrated swill (Tottenham pudding) is offered by certain local authorities. Ps. may be fed (1) dry meal, with water provided separately; (2) dry meal with water poured on to it; (3) meal soaked and fed wet from buckets. Care is needed in (1) and (2) if meal is not to be wasted. The simplest feeding is with balanced rations in cubed form, the higher cost being offset by the labour saved.

**Housing.**—Ps. are naturally clean animals. Given good housing they will not soil their bedding but usually void in a corner of their shelter or run. Dry, weatherproof quarters, free from damp and draughts, are essential for thrifty growth and good health. Outdoor housing is suitable for all types and ages of Ps., but fattening Ps. are usually housed indoors, where warmth and restricted exercise encourage fattening more quickly. P.-houses should face S., unless flanking a central feeding alley when the pens should run N. and S. Out of doors access to grazing means some economy in feeding, but damage to pastures. Buildings should be movable, and designed to give a dry bed and protection from draughts and sun. A floor area of 9 ft. by 6 ft. is desirable. Sectional wooden huts on runners or wheels or triangular P. arks are suitable for tethered sows with litters and weaner Ps. Feeding troughs are separate. Such buildings can be made into fold units by fencing runs, but need moving frequently. True fold units consisting of house with run and built-in feeder and water trough are made of wood and con-

structed to be moved at intervals of not more than three days. They are suitable for boars, expectant sows, sows and litters, and weaned Ps. up to 100 lb. live weight. Outdoor shelters may be improvised from straw bales, thatched hurdles, and straw-stuffed wire but are temporary expedients at best. **Indoor housing** may consist of one or more sties with runs attached, adapted farm buildings with or without an open or covered yard, or blocks of individual sties with central feeding alleys of the Dan. or Scandinavian type. Sties may be built of wood, pressure-cresoted, brick, or hollow concrete blocks. For sows and litters a sleeping compartment and a run, each 8 ft. square, are the minimum; for fattening Ps. the dimensions should be 12 ft. by 6 ft. Floors must be warm and dry. Wooden floors are warmest but not durable. Concrete floors are suitable if insulated from the cold and damp of the earth. Provision of a farrowing rail is helpful for sows. A built-in feeding trough with a swinging shutter is an advantage. On the farm open or covered yards can be adapted by dividing with straw bales or straw-stuffed wire-netting walls. Loose boxes and disused stables can also be converted. The central feeding or Scandinavian type of P.-house consists of two or more ranges of pens under one roof with central feeding passage and dung passages. Careful design is needed to avoid draughts and faulty ventilation. Floors must be insulated from the earth and outer walls constructed of 'warm' materials. Air-conditioning has been found advantageous. Important measurements are: pens 8 ft. 6 in. by 12 ft., dung passages 3 ft. 6 in., and feeding passage 6 ft.; each pen to hold ten Ps. Detailed plans are contained in Bulletin No. 32 on *Pig-keeping* (Ministry of Agriculture and Fisheries).

**Diseases.**—Swine fever is contagious and most serious. It must be notified by law to the authorities. Sick Ps., usually young, lose appetite, vomit, shiver, suffer great thirst, and tend to eat filth and bedding instead of food. A purple rash may appear on ears and belly; death occurs most often at fifteen days. It is a virus disease. Non-infected Ps. can be protected by the injection of serum. Best preventives are home-breeding of stock, good control of rats, isolation of sick Ps., and isolation of any bought stock for a month. Foot and mouth disease, another virus infection, may affect Ps. and is notifiable by law. Infected Ps. go off food, have high temps., become lame, slaver at the mouth, and blister inside the mouth and sometimes on the skin. Swine erysipelas is not notifiable. It causes a high temp., loss of appetite, and a dark red or violet rash may appear on chest, back, neck, and thighs in patches. Acute infection causes death in a few days. Mild cases may recover or become chronic. Serum injections usually cure most cases. Ann. vaccination may also be used as a preventive. Mange, a scabby condition of the skin, may be treated by scrubbing with warm, soapy water, and then dressing with a mixture of 5 parts milk of sulphur

and 20 parts cod liver oil twice weekly. Ps. are subject to sev. parasites. The round intestinal worm is common, also the lung worm. A hair-like spiral worm, *Trichina spiralis*, encysts in Ps. and is communicable to man in insufficiently cooked pork, ham, or bacon. Remedies are based on santonin and oil of chenopodium, and worming is usually done at 8-10 weeks. Cleanliness in the sties and frequent change of run, if out of doors, are important preventives. Lice may be eradicated by dressing with linseed or mineral or motor oil.

**Economics of Pig-keeping.**—Expenditure must be recovered largely from sale of Ps. Straw, foods, etc., come from outside sources. An economical unit comprises thirty sows and their progeny and two boars, manageable by one man and an apprentice or boy. A herd of half in-P. gilts and half younger gilts, with some pedigree animals for future breeding, gives a sound starting stock; the 1949 cost was £750-£800. The minimum housing would be sixteen or seventeen farrowing sties, a feeding house for weaned Ps., and houses for the boars and growing gilts. Initial capital costs are high. A working capital of roughly one-third that of the initial outlay will also be required to carry through the first year. Food comprises 75-78 per cent of production costs, labour 12-15 per cent, leaving 10 per cent to cover sundries. Depreciation of buildings may be charged at 10 per cent per year, while breeding stock depreciates by about 20 per cent in the case of sows and 30 per cent in the case of boars annually.

**Home Pig-keeping.**—The usual practice is to buy a P. at six weeks after weaning for fattening for bacon or pork. To produce a pork P. of 120 lb. live weight requires 3 cwt. of meal and takes about three months; a bacon pig of 200 lb. live weight requires 6 cwt. of meal and takes about six months. Economies in feeding can be made by using kitchen waste. Apart from the wide range of food products yielded by a P., there is the fertilising value of its manure for the garden.

See Ministry of Agriculture, *Pig-keeping* (Bulletin No. 32); *Home Curing of Bacon and Hams* (Leaflet No. 127), and *Farm Buildings* (Post-war Studies No. 17); R. Morrison, *The Individuality of the Pig*, 1926; G. W. Layley and W. J. Malden, *The Evolution of the British Pig*, 1935; V. C. Fishwick, *Pigs, Their Breeding, Feeding, and Management*, 1939; J. W. Reid, *Pig-keeping*, 1940; J. D. Anthony, *Diseases of the Pig and its Husbandry*, 1940; W. Brett, *Garden and Allotment Pig-keeping*, 1941; H. L. Tinley, *Good Pig-keeping*, 1947; H. R. Davidson, *The Production and Marketing of Pigs*, 1948.

**Pigeon, or Dove**, any member of the *Columba*, one of the main orders of birds, including the extinct dodo and solitaire and the tooth-billed P. (*Didunculus strigirostris*) of the Samoan Is., the beautiful crested crowned Ps. of New Guinea, and the *Columba* or true Ps. The four Brit. species are the large wood P. or

ring-dove (*Columba palumbus*), which often does serious damage to crops; the stock-dove (*C. senas*); the turtle-dove (*Turtur communis*); and the rock-dove (*Columba livia*), from which many of the domesticated breeds of P. are derived. See PARSENGER PIGEON.

**Domestic pigeons** exist in great variety, all parts of the body having been developed to give the marked characteristics of the different breeds, from the dainty fantail to the pouters and croppers which can enlarge or distend the crop or pout; from the tiny tumblers to the huge runts. Wide differences occur also in the plumage; in the archangel it has a beautiful lustre; in the jacobin the feathers of the neck and head form a large hood and mane, and between the numerous breeds is a wide range of colouring. The scandaroon has a long curved beak, the owl a very short and stout one; in the carrier, which is not used like the homer for carrying messages, the beak and eye wattles are enormously developed. The P. fancy is now very large, and a great number of shows are held annually. Particularly choice and successful specimens have been sold for over £100, and £20 to £50 is often paid for single birds. The best Ps. for the table are of Fr. origin, such as the Mondain, Montauban, and Carneau.

**Pigeon-flying.** After 1871, following on the use of pigeons during the Paris siege, the sport became immensely popular, and there were few tns. which had not a P. club, many being enrolled under the National Homing Union, formed in 1896. In some of the races very high speeds have been made. In 1896 a bird flew from Thurso to London, 511 m., at the rate of 1454 yds. per minute. Birds have actually returned from a distance of 1000 m. Since the time of the Romans, homing pigeons have been used to convey messages in military operations. Pigeons were used extensively as messengers by both sides in the First World War; in the Second World War they were frequently used by the secret service and partisans, particularly in Yugoslavia. Aircraft of Coastal Command all carried at least one pigeon to establish contact with their base, should the plane be forced down and the transmitter wrecked.

**Pigeon Pea, or Cajanus indicus**, species of Leguminosae forming a genus in itself, and is known by other popular terms, such as dhal and Congo pea. It flourishes in India, where it is eaten like an ordinary pea.

**Pigeon-shooting.** The shooting of wood pigeons is a difficult sport on account of the natural shyness of the bird and its rapidity of flight. Shooting is generally done in the evening as the birds return to their roosting places in flocks. Another method is for the sportsman to conceal himself in the early morning in a wood where beech mast or acorns are plentiful, trusting to the presence of a few decoy birds to attract the pigeons within easy range. Trap shooting, the birds being suddenly liberated from a collapsible box, was prohibited in 1921.

Clay P. is shooting at a clay saucer

thrown into the air from a trap as a mark. The governing body in this country is the Clay Pigeon Shooting Association (Edgware, Middlesex) which organises a number of championships and an international tournament.

**Pigeon, Wood**, see CUSHAT.

**Pig-footed Bandicoot**, see *CHEROPUS CASTANOTIS*.

**Pig Iron**, see under IRON AND STEEL.

**Pigments**, substances which are mixed with oil, water, and other vehicles to form paints. They differ from dyes in being insoluble; they should not react chemically to each other, or to their vehicles, or be affected by the air, water, heat, sunlight, gases, etc., with which they come in contact, or on which they are painted.

**Inorganic Pigments**.—Among the elementary substances used are all the blacks, i.e. carbon, ivory, lamp and charcoal black, Indian ink, graphite (plumbago or black-lead); also gold, aluminium, platinum, and silver, the last tarnishing with sulphur, rubber, sulphurous gases, etc. Zinc white, chromium green, burnt umber (iron and manganese), Venetian, light and Indian red, burnt sienna, red ochre (iron), cobalt blue (cobalt and aluminium), cobalt green (cobalt and zinc), cobalt black, ceruleum (cobalt and tin), and red lead, which is unstable and dries hard, are simple oxides. Yellow ochre, cappagh brown, raw sienna, raw umber (iron and manganese) are hydroxides, usually with clay or barium sulphate when pale; they are dried by warm air current or calcined. Zinc white has not much covering power and is thin. Viridian is an emerald-green chromium oxide. Prussian blue is prepared by oxidising Prussian blue. Sev. sulphides are in common use: vermilion (mercury), realgar and king's yellow (arsenic), cadmium yellow, antimony red. Those of arsenic and antimony are poisonous. All are liable to contain free sulphur and may react; emerald-green and lead chromes blacken cadmium yellow; vermilion is liable to blackening. An oxysulphide of zinc (Griffith's) is often mixed with zinc white. Chalk whitening (calcium) is a carbonate, white lead a hydrate and carbonate. The former is mainly an adulterant, the latter is useful in oils, but Freeman's white (the sulphate) or Griffith's, with zinc white, is substituted for permanence. Barium, zinc, lead, and strontium are also used in the chromate compound; the first is lemon chrome and permanent. They are rich in oxygen, and tend to become green by the formation of chromium green. Lead chromates are affected by sulphur compounds. Terre verte (iron, potassium, magnesium), a good natural green ochre, consists of silicates, as does smalt (cobalt and potassium). Barium sulphate is permanent; lead sulphate is contained in Freeman's white. Among other chemical compounds: Naples yellow (lead antimonate), not permanent; cobalt yellow (aureolin, cobalt, and potassium nitrites); Schweinfurt green (basic copper arsenite); tungsten green (chromium); Nuremberg violet

(manganese metaphosphate); cobalt blue (oxide and alumina); emerald green (aceto-arsenite of copper); Thénard's blue, cobalt violet (phosphates and arsenates of cobalt); ultramarine blue, Brunswick green (oxychloride of copper); Scheele's green (copper arsenite); Antwerp blue (iron and alumina); Prussian blue (iron ferro-cyanide). In recent years many entirely new types of Ps. have been prepared by the industrial chemist and adapted for specific uses. There is no sharp distinction between Ps. and dyes (q.v.). See also MONASTRAL BLUE and PHTHALOCYANINS.

**Animal and Vegetable Pigments**.—Indian lake, a resinous product produced by insect attack; crimson lake, purple lake, and carmine from the cochineal insect; yellow lakes from the bark of *Q. tinctoria*, and from Avignon and Persian berries; madder lakes and rose madder from the root of madder plant; gamboge, a resinous gum; indigo blue; sap green, from berries of buckthorn; sepia, from the cuttle fish. All these are liable to change due to oxidation in presence of moisture, light, and air, and also when mixed with chromates; this applies particularly to indigo, and the yellow and cochineal lakes. The yellow lakes are, many of them, vegetable acid dyes on stannic and aluminic bases. The various lakes produced by coal-tar derivatives are not valuable.

**Preparation**.—Picking over or separating grades by washing over is resorted to for obtaining purity of colour—as a rule grinding in turps, water or alcohol, linseed or poppy oil. In the case of water-colours, gum-water with or without glycerine is used. Roasting and calcining are resorted to drive off some impurities, or to alter the tone.

**Adulterations**.—These are not easy to detect; vinyl black is sometimes found to be ivory black with indigo; yellow ochre contains lead chromate; and terre verte, green ultramarine; red lead, red sulphide of antimony; lead sulphate, baryta white toned with eosin may be found in vermilion. These must be detected by chemical means after recovering the pigment and drying, the oil being removed by a solvent such as ether. White lead is soluble in dilute nitric acid, while barium sulphate, china clay, lead sulphate, its adulterants, are insoluble; whitening is also an adulteration of white lead.

**Uses**.—Although usually considered from the point of view of reliability in oil painting, and the knowledge thus obtained is as perfect as can be hoped, P. are in use for the art of temporary decoration or protective painting, such as the coating of iron and wood work, wall papers, distempers. Thus white and red lead, zinc white, are strong protectives, though lacking artistic permanence. Damp-proof, metallic, luminous, fire-proof, and anti-fouling paints are in common use.

See A. H. Church, *Chemistry of Paints*, 1901; E. J. Parry and J. H. Coste, *Chemistry of Pigments*, 1902; A. P. Laurie, *The Painter's Methods and Materials*, 1926; A. W. E. Harrison, *The Manufacture of Lakes and Precipitated Pigments*,

1930; C. A. Curtis, *Artificial Organic Pigments and their Applications*, 1930; and J. S. Remington, *Paint Laboratory Notebook*, 1935.

**Pigments of Animals**, see COLOURS OF ANIMALS.

**Pigmies**, see PYGMIES.

**Pignatelli, Antonio**, see INNOCENT (popes), Innocent XII.

**Pignerol**, see PINEROLO.

**Pigott, Richard** (1828-89), Irish journalist, b. in co. Meath. He supplied *The Times* with forged documents, which were in all good faith used by that newspaper as the basis of the articles 'Parnellism and Crime' in 1887. The Parnell Committee was appointed to investigate the matter, and the forgeries were exposed; whereupon P. fled to Madrid, and shot himself to escape arrest. See his *Personal Recollections of an Irish Journalist* (1882).

**Pigou, Arthur Cecil** (b. 1877), Brit. economist, educated at Harrow and King's College, Cambridge. He was successively Jevons memorial lecturer, Univ. College, London (1903-4); Girdler's univ. lecturer in economics, Cambridge (1904-7); prof. of political economy, Cambridge Univ. (1908-43). Among his many works *The "theory of Unemployment"* (1933) is outstanding. The subject of the book is the disequilibrium that takes effect in unemployment, whether due to a change in the demand function for labour or to wage policy. It was described by Lord Keynes as 'the only detailed account of the classical theory of employment which exists.' In his work P. approaches the subject from the none-monetary or, as he calls it, the 'real' standpoint. He argues that it is possible 'to study the problem of unemployment either from the money end or from the real end. The two studies, if made complete and carried through correctly, must necessarily come to the same thing, their analyses meeting in the middle.' P. builds the monetary section of his theory of unemployment on a 'standard monetary system,' which he defines as one 'so constructed that, for all sorts of movements in the real demand function for labour or in real rates of wages, whether they last for a long time or a short, the aggregate money income is increased or diminished by precisely the difference made to the number of work-people (or other factors of production) at work multiplied by the original rate of money wages.' Other works include *The Economics of Welfare* (1920); *Industrial Fluctuations* (1926); *A Study in Public Finance* (1928); *Economics in Practice* (1935); *Socialism versus Capitalism* (1937); *Employment and Equilibrium* (1940); *Lapses from Full Employment* (1945); and *Income, an Introduction to Economics* (1946).

**Pig-sticking**, sport which developed in India, as bears, which had previously been hunted with spears, became locally extinct, and is now regarded as the premier sport of India. It is also practised in Central Europe and other parts of the world. There are sev. varieties of the Indian wild boar (*Sus indicus*), and

the best boars, though of great weight, are capable of immense speed, and in the chase take advantage of every form of cover and obstacle possible, leading the mounted pursuers over the most difficult ground. When overtaken and at bay, the boar fights with great fierceness and pluck.

**Pika**, tailless or piping hare (*Lagomys*), genus of rodents no larger than a guinea-pig, resembling the hares (*Leporidae*), though distinguished from them by the absence of a visible tail, short ears, and limbs nearly equal in length. They frequent the mountainous parts of Asia, but one occurs in E. Europe.

**Pike**, term applied to the members of the genus *Esox*, which is typical of the family Esocidae; they are fresh-water fishes and occur in the temperate parts of Europe, Asia, and America. In diet they are carnivorous, and prey on almost any animal they can obtain, from frogs and fishes to ducks, geese, rats, and foxes; their voracity is notorious. In colour the common P., *E. lucius*, is olive-grey above, silvery below, and has pale spots; in length it attains from 2 to 4 ft., and it is said to live for 250 years. Other names of this species are jack, bake, luce, and pickerel. *E. nobilior*, the maskinongy of N. America, may grow to a length of 8 ft. See G. W. Maunsell, *The Fisherman's rade mecum in most matters relating to Fishing for Trout, Sea Trout, Salmon, and Pike*, 1938, and J. Bickerdyke, *Angling for Pike*, 1949.

**Pike**, military weapon, consisting of a long shaft or handle with an iron head. Some such weapon had been in use from very anc. times, but the word itself dates from the fifteenth century. From that time it was in regular use as the arm of a large part of the infantry, who were called 'pikemen,' and was sometimes as long as 20 ft. It was gradually reduced in length, until in the seventeenth century it was superseded by the bayonet. The P. often had a spike at the end to enable it to be stuck in the ground. It was retained in the Brit. Army, for sergeants, until the end of the eighteenth century.

**Pike's Peak**, height in the Rocky Mts., in El Paso co., near Colorado Springs. It is about 14,100 ft. high, is partially covered with forests, and can be ascended by a rack railway.

**Pila** (Ger. *Schneidemühl*), tn. of Posen, Poland, 54 m. W. of Rydzysz. It is noted for glass, iron-castings, roofing material, and brick manufs. Pop. 21,000.

**Pillar**, port of Paraguay, on the Paraguay R. Cotton, timber, and hides are produced in the vicinity. There are also cotton ginneries, distilleries, and saw-mills. Pop. 10,000.

**Pilaster**, engaged pier with a flat face furnished with base and capital. In Rom. buildings the P. is used only as a respond of a column, usually bearing one side of an arch. In revived classical work Ps. were used more frequently, and formed an important form of ornamentation. A P. is sly projects more than one-third of its surface breadth.

**Pilate**, Pontius, see PONTIUS PILATE.

**Pilate's Staircase**, see SANTA SCALA.

**Pilatus**, Mount, height of the Alps, on

the S. shore of Lake Lucerne, and between the cantons of Lucerne and Unterwalden. The Tomlishorn, its highest point, is 6998 ft., and its ascent can be made by means of a railway. Its name is from 'pileatus,' capped, and not from its being traditionally the scene of the death of Pontius Pilate.

*Pilchard*, or *Clupea pilchardus*, malleocopterygian fish in the large family Clupeidae, and is closely related to the herring and sprat. In size it grows from 10 to 14 in.; in colour it is bluish-green above, whitish underneath and on its sides. It is entirely marine in habit, and its eggs float on the surface of the sea, unlike those of the herring, which are attached to objects at the bottom. The young P., before it has attained maturity, is known as the sardine, and as such forms a valuable fishery; the full-grown P. is used as an article of diet as well as for bait. The method of capture is usually by drift-net. *C. pilchardus* is most abundant off the coasts of Portugal, and in the Eng. Channel and the Mediterranean.

Pileomayo, riv. of S. America. Its source is in Bolivia, about 60 m. N.W. of Potosi, on the E. slopes of the E. Cordilleras. Leaving the S. extremity of the Aullagas plateau it flows E. and S. through the Sierra region to the Bolivian Chaco and joins the Paraguay at Asunción. It has a length of 1300 m.

*Pilea*, genus of Urticaceae, also known as stinging nettle, dwarf foliage plants with small green leaves. *P. muscosa* is a creeper from the warmer parts of America and is sometimes known as *P. microphylla*.

*Pile Dwellings*, prehistoric habitations built on a platform supported on piles driven into the margins of lakes, rivers, or the sea. In Europe they are found in the Alps and in the Jura. The objects recovered from P. D. are often in a remarkable state of preservation, the mud or peat in which they are contained acting as a continuous water-bath. In this way the wooden handles of tools, and of weapons, wooden bowls, wickerwork, woven fabrics, fruit and even identifiable pollen grains have been recovered. Much is known of P. D. in the W. Alps which belong to the Neolithic period, and a type station is recognised at Rohenhausen on Lake Pfäfers, near Zürich. Fishing and hunting of deer and wild ox went side by side with the domestication of animals, the eating of fruit, and the growing of wheat and of flax for textiles. Tools and weapons were of stone, wood, and bone, and table-vessels were of wood and pottery. There was no naturalistic art, but representations of religious symbols are found. In Britain, the famous lake-vil. of Glastonbury represents the La Tène culture of the Early Iron Age. Strictly speaking it is not a vil. of P. D. but the terms are often used synonymously.

*Piles*, or *Hæmorrhoids*, swollen condition of the veins and tissues about the anus. P. are known as internal or external, according as to whether they are situated within or without the sphincter ani, the muscular ring which closes the

anal orifice. In the former case they are covered with mucous membrane, and may be so protruded as to escape through the anal orifice; in the latter case they are covered with skin, and may either form hard tumours or discharge as bleeding P. P. are a symptom of any condition by which the veins of the lower bowel become congested. Habitual constipation, the condition of pregnancy, growths in the rectum, general weakness, and local inflammation are liable to be accompanied by the formation of P. They may make their appearance after a strong effort at defecation, or after sitting on cold or wet ground. They may cause little trouble when quite hard, but if strangulated by the sphincter ani or inflamed by any cause they are apt to occasion extreme discomfort and lead to loss of blood to an exhausting degree. In most cases they submit to treatment in which scrupulous cleanliness, good bowel action, plain food, and soothing ointments have their part. Astringent injections may be tried if the hæmorrhage is excessive. As a last resort they may be removed by surgical operation, which usually consists of strangulating the bases of the P. by strong ligatures, in consequence of which the tumours slough off. Cancer (carcinoma) of the rectum is often mistaken for P., so that in all cases of doubt, and particularly in individuals over forty years of age, a complete rectal examination is indicated.

*Pileus*, name given in botany to the umbrella-shaped head of the mushroom and other fungi. The upper surface is usually rounded and convex, the under surface bears lamellæ or gills; the whole is borne on a thick stalk or stipe.

*Pilgrim*, name given to a person who travels for the purpose of visiting the shrines or tombs of holy men. *Pilgrimages* to Jerusalem, Bethlehem, and the other places which were the scenes of our Lord's life and death began at an early period, probably about the time of Constantine. Eusebius tells us that Helena, Constantine's mother, made a pilgrimage to Palestine and built the church of the Holy Sepulchre. But the Church writers of the time speak of pilgrimages with a grave note of warning on account of the many abuses to which the practice was liable. It increased tremendously in the Middle Ages, notably to the shrine of St. James at Compostella. Englishmen were particularly enthusiastic Ps. before the Reformation: numerous Eng. shrines, especially that of St. Thomas at Canterbury, were visited by Englishmen and foreigners. *Pilgrimages* are still common in the Rom. Catholic Church, the most popular shrine for this purpose at present being that of Our Lady at Lourdes. In the twentieth century pilgrimages to Our Lady of Walsingham, Norfolk, were revived by Rom. Catholics and Anglicans. See Bede Jarrett, *Catholic Encyclopædia*, 1907-12, and S. Heath, *In the Steps of the Pilgrims*, 1949.

*Pilgrimage of Grace*, rising which took place in 1536, in protest against the dissolution of the monasteries, but also against agrarian injustice resulting from

the enclosure movement. Its leader was Robert Aske, and it affected all the N. co., but especially Yorkshire and Lincolnshire. The insurgents took possession of York and then moved on to Doncaster some 30,000 strong. The rising was terminated in the next year by the execution of the leaders.

**Pilgrim Fathers**, name given to a party of 102 Puritans, of whom 74 were men and 28 women, members of John Robinson's church at Leyden, who, on Sept. 6, 1620, sailed from Plymouth in the *Mayflower* to seek freedom of worship for their own faith in New England. They landed on Plymouth Rock on Dec. 16, 1620, and their settlement later formed part of Massachusetts. See J. Brown, *The Pilgrim Fathers of New England*, 1920, and G. F. Wilson, *Saints and Strangers*, 1917.

**Pilgrims**, Anglo-Amer. dining club, existing to promote friendship between the two nations. The London branch was founded in 1902, the New York branch a year later. Traditionally each new Amer. ambas. to Britain makes his first public speech as ambas. to the P. The P. sponsored the erection of a statue in Grosvenor Square, London, to Franklin D. Roosevelt, 1948.

**Pilgrims' Way** prehistoric trackway linking E. Kent with the Winchester district. For the greater part of its course it runs along the escarpment of the N. Downs, above the spring-line at the junction of the Chalk rock and Gault clay, and its general line is marked by Canterbury, Chilham, Charing, Hollingbourne, Chevening, Guildford, and Winchester. It reaches the rampart of the Early Iron Age camp at Bigbury, near Canterbury, and is thus contemporary with or earlier than that earthwork. Coins of the Early Iron Age are associated with its route, and in Roman times, although its course was never straightened, it was used, as discoveries along its course show, for communication and trade. The alleged use of the road by medieval pilgrims to the shrine of St. Thomas at Canterbury is an antiquarian fancy and quite unproven after strict investigation. There is a large bibliography. See J. Cartwright (Mrs. H. Ady), *The Pilgrims' Way from Winchester to Canterbury* (1895 ed.), and H. Belloc, *The Old Road* (1911, 1935) for the popular tradition; and E. C. E. Erwood, *The Pilgrims' Road* (1923), and in *Archæologia Cantiana*, vol. 37, p. 1 for the now generally accepted view.

**Pilgrim Trust**, fund founded in 1930 by Edward Stephen Harkness, an Amer. citizen, who set aside a fund of £2,000,000, the interest on which was to be devoted to charitable causes in Great Britain, by way of recognition of the manner in which the country had fulfilled its obligations since the First World War. At the end of 1945 the market value of the trust's investments stood at £2,751,655. During the years 1940-45 £431,000 was disbursed in grants, £126,933 being for the welfare of H.M. Forces, the sick and wounded, prisoners of war, or civilians directly affected by the war. Among the trust's beneficiaries are Sir John Soane's Museum,

Abingdon Abbey, Ely Cathedral, St. Augustine's Abbey, Canterbury, Westminster Abbey monuments (including the proposed pub. of the Westminster 'Domesday').

**Pilibhit**, dist. of the United Provs., India. It borders Nepal, in the Rohilkhand div., and has an area of 1353 sq. m. Pop. 490,700. There is a tn. of the same name. Pop. 35,000.

**Piling**. Piles are used to support the foundations of buildings and other structures where the ground is of unsound material, e.g. peat, alluvium, etc., or where structures such as wharves, jetties, etc., are most easily constructed on a piled foundation. For timber piles greenheart, elm, beech, jarrah, and pitch-pine are used. The heads are protected by a band of iron and the pointed ends by iron shoes. Reinforced concrete piles are now largely used in place of timber. Proprietary methods of P. include the driving of a steel shell or a mandrel, making possible the casting of concrete piles *in situ*. *Sheet piles* are flat piles of timber, reinforced concrete, or special steel section driven close together to form a retaining wall or a barrier that can be rendered watertight as a protection for other works under construction. The common apparatus for driving consists of a heavy ram working between slides in a timber framework. The ram is hauled up some 8 ft. by a rope and pulley and a small mechanism at the top releases it, so that it falls on to the head of the pile. For heavy rams a winch and chain is used, but steam-P. machinery is in general use now for important or difficult work. The *Lacour*, most commonly used, uses the cylinder itself as a ram, the piston rod resting on the pile head. Steam is fed into the cylinder at the top by means of flexible tubing from the boiler. At the top of the stroke steam is shut off, the exhaust opens, and the cylinder falls. Tubular or screw piles of cast iron or steel are sometimes used. Provided with a screw blade at the bottom, they are sunk by means of a capstan on the head or by a water jet. See R. V. Allin, *Resistance of Piles to Penetration*, 1935; R. D. Chellis, *Pile Driving Handbook*, 1944; D. H. Lee, *Sheet Piling, Cofferdams, and Caissons*, 1945; Amer. Society of Civil Engineers, *Pile Foundations and Pile Structures* (Manuals of Engineering Practice, No. 27), 1946; and *Kempe's Engineer's Year Book*, 1949.

**Pill**, small round mass containing one or more medicinal ingredients intended to act upon the stomach or intestines. It is a form especially applicable to those drugs which are taken in small doses, and recommends itself to most people on account of the ease in swallowing and the comparative absence of disagreeable taste. If the substance is not of a consistency adaptable to the P. form, it is mixed with a material termed an excipient, such as bread-crumbs, mucilage, troscle, soap, and conserve of roses. Where it is required to disguise the taste of any drug, Ps. are coated with sugar or other material. When they are required to act in the lower

intestinal region, Ps. are coated with keratin to delay solution.

**Pillar**, in architecture, a term of wider application than the term 'column.' It signifies any detached vertical mass, whether monolithic or built up in courses, constructed of any solid material. It may be used as a support for some superstructure or as a memorial column, whereas a column is, strictly speaking, a P. of fixed shape and proportions. Ps. in general may be of any shape in section and of various proportions. They are usually slenderer than columns, and are frequently octagonal in shape. Since the medieval Ps. were not regulated by the strict rules of proportion that governed the construction of the classical column, the two terms are used generally here to distinguish the work of the one period from that of the other.

**Pillar Saints**, see **STYLITES**, **ST. SIMEON**.  
**Pillars of Hercules**, see **HERCULES**.  
**PILLARS OF**.

**Pillau**, seaport and former tn. of E. Prussia, 25 m. W. of Königsberg, on the Frisches Haff. It is engaged in fishing, and since 1946 has belonged to Poland, being called Baltisk. Pop. 7300.

**Pillnitz**, vil. in Saxony, on the Elbe, 4 m. S.E. of Dresden. In 1700 it became the residence of the Electors of Saxony, their palace being built a century later.

**Pillory**, instrument for the public punishment of malefactors, now obsolete. It consisted of a wooden frame (with circular holes for the head and arms), in which the prisoner stood. He sat in the stocks, exposed to the public view. It was found to be quite inadequate as a form of punishment, and abolished in England in 1837.

**Pilocarpine**, colourless oily alkaloid of the formula  $C_{11}H_{15}O_2N$ . It occurs in jaborandi leaves, is extremely poisonous, and is used in hair-restorers and medicine.

**Pilot Fish**, small subtropical fish of the horse-mackerel family (*Naucrates ductor*), about 12 in. long, spindle-shaped, steel blue in colour, and marked with five to seven dark vertical bars. It owes its scientific and popular Eng. name to its habit of accompanying ships and large fish, generally sharks, doubtless for the sake of food, for apparently the P. F. obtains much of its food from the parasitic crustaceans with which large fish are infested and also from the small pieces of food unregarded by the shark when it rends its prey. The old notion that the P. F. acted as a pilot and indicated to sailors the proximity of land is fabulous. It is the *pompilus* of the ancients and Ovid calls it *comes ratium* (*Italianica*, 101). The Ca'ing (q.v.) whale receives its alternative name, pilot-whale, from the fact that if the leader happens to run ashore the whole school usually follows.

**Pilot Officer**, see **RANK**, *Royal Air Force*.

**Pilots (Sea)**, strictly speaking, persons not belonging to any particular ship who are authorised to conduct ships through certain rvs., roadsteads, or channels, or into certain ports, and who are usually

taken on board at a particular place for that purpose only (*MacLachlan's Law of Merchant Shipping*). P. may be either licensed or unlicensed. A licensed

pilot is one who holds a licence, issued by the pilotage authority for the dist., to act in the limits named in his licence. A licensed pilot is always empowered to supersede an unlicensed pilot, and a master who knowingly employs an unlicensed pilot after a licensed pilot has offered to take charge of the ship, or signalled for that purpose, is liable to a fine, as is also the unlicensed pilot, for knowingly continuing to act in such circumstances. A ship, whilst navigating in a dist. in which pilotage is compulsory, for the purpose of entering, leaving, or making use of any port in that dist., is required to be either under the pilotage of a licensed pilot of the dist., or under the pilotage of a master or mate possessing a pilotage certificate for the dist., who is bona fide acting as master or mate of the ship. A ship carrying passengers (other than an excepted ship) is, however, compelled to be under pilotage irrespective of whether the dist. in which it is navigating is a compulsory one or not. The Corporation of Trinity House is the prin. pilotage authority of the United Kingdom and has the control of all matters relating to pilotage in the port of London and forty other dists., including Southampton; other dists. are controlled by their own local pilotage authorities. The law relating to P. and pilotage is now consolidated in the Pilotage Act, 1913. By Section 11 of this Act the following ships are excepted from compulsory pilotage: (1) ships belonging to his majesty, (2) pleasure yachts, (3) fishing vessels, (4) ferry boats, (5) ships of less than 50 tons gross tonnage, (6) ships exempted by by-law, (7) tugs, dredgers, sludge vessels, barges, and other similar craft belonging to or hired by a dock, harbour, or riv. authority, (8) ships calling at a port in a pilotage dist. for the sole purpose of taking on board or landing a pilot belonging to some other pilotage dist. The Pilotage Authority makes the necessary by-laws for the regulation of pilotage and P. in its dist., but these do not take effect until they are confirmed by the minister of transport. The Ministry of Transport has the power, on the representation of parties interested, to revoke or vary any by-laws in a pilotage dist., or require the pilotage authority to make by-laws. A pilotage authority may grant a pilotage certificate to any person who is bona fide the master or mate of any ship if after examination they are satisfied that having regard to his skill, experience, and local knowledge he is capable of piloting the ship of which he is master or mate within their pilotage dist. Under the Aliens Restriction (Amendment) Act, 1919, pilotage certificates cannot be granted to aliens, except to masters or mates of Br. nationality trading to the ports of Newhaven or Grimsby. See also **MERCHANT SHIPPING ACTS**.

**Pilpay**, legendary Indian philosopher, see **BIDPAI**.

**Pilsen**, see **PLZEŇ**.

**Pilsudski, Joseph Clemens (1863-1935)**, Polish statesman and soldier, b. at Vilna, and educated at Vilna and Zharkov, where he developed Socialist sympathies, being deported to Siberia in 1887. In 1892 he settled at Lodz, where he joined the newly formed Polish Socialist party, which aimed primarily at liberating Poland from Russian rule. He was re-arrested, but escaped and settled at Cracow, where he worked to form a Polish legion for his country's deliverance. At the beginning of the First World War, P. invaded Russia at the head of his legion, but in 1916 Ger. military methods caused him to resign his command and he was subsequently arrested and interned at Magdeburg. Freed by the armistice in 1918, P. became president of the new Polish republic in the following year, receiving the rank of marshal. He co-operated with Gen. Judenitch in an advance against the Bolsheviks on Lenin-grad, but the campaign failed. In 1920 P. carried out a rapid advance against the Bolsheviks across the Pripiet marshes on Kiev. His advance was, however, checked at Kiov, and his armies eventually driven back on Warsaw. With the advice and operation of the Fr. general, Weygand, and the Brit. general, Sir P. de B. Radcliffe, he was able to ward off the Bolshevik attempt to capture Warsaw as a pawn in the peace negotiations. After the conclusion of peace with the Bolshevik Gov., P. lost favour and temporarily retired. In 1926 he overthrew the gov. by a military *coup d'état*, and became prime minister from 1926 to 1928 and again for a brief period in 1930. From 1926 until his death he was minister of war, and during this period the Polish constitution was altered until it became, in effect, a dictatorship. He concluded a non-aggression pact with Nazi Germany in 1931. Throughout his military career he regarded the Bolsheviks as merely Russian imperialists under another name, and was ready, both before and during the First World War, to serve the Austrian emperor if by so doing he could obtain arms and equipment for his Polish legionaries, who later became, through his efforts, the governing factor in Polish politics. Intensely but narrowly nationalist, P. could only conceive a nation as a people's army, and his pupils and successors, Beck and Smigly-Ridz, learned to despise politicians and the forms of W. European democracy. Among his books are *Rok* (1920) and *Historical Corrections* (1931). See lives by R. Landau, 1931; E. J. Patterson, 1935; and E. Riddaway, 1939.

**Pitdown Man**, or *Eoanthropus Dawsoni*, named from the accidental discovery in 1912 at Pitdown, Sussex, England, of fragments of a primitive human skull. Bones of primeval animals, rough flint tools, and a pointed tool of elephant bone were also found. The remains represent one type of human alive at the beginning of Pleistocene times, but he does not find a place in our own direct family tree. See ANTHROPOLOGY.

**Pima**, Amer. Indian tribe in Mexico

and N. America, estimated to number about 12,000. They inhabit the W. coast and Sierra Madre areas of Mexico and Arizona, from the R. Gila to Jallisco in the S. They are agric. and noted for their pottery and basket-work; but in the eighteenth century they were one of the most warlike tribes, frequently revolting against Sp. rule.

**Pima Languages**, see under NORTH AMERICAN NATIVE LANGUAGES, *Pacific Areas*.

**Pimelea**, genus of Thymelacae, occurs in the Australasian regions. There are in all eighty species, most of which are trees bearing flowers in heads.

**Pimentel**, port and summer resort of Peru, 8 m. from Chiclayo. Pop. 2000.

**Pimento**, genus of Myrtaceae, occurring only in tropical America. There are in all five species, and the most important of these, *P. officinalis*, is cultivated for its fruits, which, when still unripe, are dried and form all-pice.

**Pimlico**, residential dist. of London, lying between Westminster and Chelsea, 2½ m. W.S.W. of St. Paul's. In P. are situated Buckingham Palace and Gardens. The name is believed to have originated in an inn resembling one of the same name at Hoxton, called after the lt. proprietor.

**Pimpernel** (*Anagallis*), genus of annual, biennial, and perennial plants of trailing habit (order Primulaceae), bearing small, often numerous, red flowers. The common P. or poor man's weatherglass (*A. arvensis*) occurs in most cornfields; varieties of it are grown on rockeries. The bog P. (*A. tenella*) is a tiny but beautiful bog plant with rose-pink, funnel-shaped flowers. The yellow P. is *Lysimachia nemorum*, a pretty woodland plant with bright yellow, star-like, solitary flowers.

**Pimpinella**, or Burnet Saxifrage, genus of annual and perennial plants (family Umbelliferae). *P. saxifraga* and *P. major* are Brit. plants. The fruit of *P. anisum* is the aniseed of commerce.

**Pinakothek**, gallery in the Propylaea, in anc. Athens, where consecrated treasures were kept. Imitations of it were built in Munich by Louis I. of Bavaria in 1836 and 1853 to house art collections.

**Pinar del Rio**: 1. Extreme W. prov. of Cuba. The chief products are tobacco, which is of the finest quality, sugar, coffee, rice, wood, and corn. There are rich mineral deposits. Area 5211 sq. m. Pop. 398,800. 2. Cap. of the above prov. 95 m. W.S.W. of Havana, having an important tobacco trade. It makes the best cigars and Vuelta Abajo leaf tobacco. Pop. 61,900.

**Pinchbeck**, reddish-yellow alloy of copper and zinc, the average proportion in which the metal enter into it being 90 per cent copper and 10 per cent zinc, but the composition is very variable. It was much used formerly in the manuf. of cheap jewellery and watch-cases and is said to have been invented by Christopher P., an eighteenth-century London watch-maker.

**Pinckney**, Charles Cotesworth (1746-1825), Amer. statesman and soldier,

b. in Charleston, S. Carolina. The son of a wealthy planter, he was educated at Oxford Univ. and at a military college in Caen, France. Returning home he practised at the Bar in his native city, became a member of the S. Carolina prov. legislature, an officer in the S. Carolina militia, and president of the S. Carolina Senate. Serving with the army of the Amer. colonists in their war with England, he was captured in 1780 and held prisoner for nearly two years. A leading figure in the Amer. constitutional convention, he opposed anything that would make for the abolition of slavery. In 1796 he was sent as Amer. minister to France at one of the most troubled periods of the young republic, but the Fr. Gov. refused to receive P., and he had to take refuge in Holland. Later President John Adams sent him back to France, accompanied by John Marshall and Elbridge Gerry. The mission was not acceptable to Talleyrand unless certain conditions were fulfilled; and when the facts became known in America (1798) there was a popular demand for an immediate declaration of war on France. The Fr., immensely surprised at the spirit of the young country, withdrew their demands. P. was the nominee of the Federalist party for vice-president in 1800 and for president in 1804 and 1808, but was defeated each time.

Pindar (Πίνδαρος) (518-443), greatest of Gk. lyricists, was descended from the nobility of Thebes. He learnt from his uncle Scopelinos, then from lyric poets at Athens, and also from his countrywoman Corinna, who is said to have warned him to sow his mythological detail 'by the handful, not the sackful.' His earliest extant poem (*Pythian* x) dates from 498; in the next forty years he became a famous figure throughout the Gk. world, from Sicily to Rhodes, from Macedonia to Cyrene. His works were collected in seventeen books and included hymns, paeans, dithyrambs, processional songs, maiden-songs, hyporchemata, encomia, dirges, and epinicians (odes for victors in the Games). These last, in four books, have survived complete; of his other poetry we have only fragments, latterly augmented by papyri. P.'s power lies not in his ideas, which are often naive and muddled, but rather in an amazing splendour of language, rhythm, and imagery, which has made his poetry impossible to translate, and fatal to imitate. This praiser of athletes was indeed one of the most purely æsthetic writers there have ever been. The only value of his moralising for the modern reader lies in a grace and magnificence of phrase and symbol such as few poets in the world have attained. See eds. by A. Puech, 1922-23; L. R. Farnell, 1930-32; J. J. Sandys, 1937; and C. M. Bowra, 1947; also B. L. Gildersleeve, *Olympians and Pythians*, 1885; J. B. Bury, *Nemeans*, 1890, and *Isthmians*, 1892; C. A. M. Fennell, *Isthmians and Nemeans*, 1896; and trans. by E. Myers, 1874; C. J. Billson, 1928-30; L. R. Farnell, 1930-32; J. E. Sandys, 1937; and R. Lattimore, 1947. See U.

von Willamowitz-Moellendorf, *Pindaros*, 1922, and G. Norwood, *Pindar*, 1945.

Pindar, Peter, see Wolcott, John.

Pind Dadau Khan, fn. of W. Punjab, Pakistan, 1 m. from Jhelum. There is considerable local trade in salt. P. D. K. was founded by Dadau Khan in the seventeenth century.

Pindemonte, Ippolito (1753-1828), It. poet, b. at Verona, of a rich and cultured family. Early in life he displayed poetical taste and ability, and travelled in Switzerland, England, Germany, and France (1788-90). In 1789 he pub. *La Francia*, on the Fr. Revolution. His prin. works are the *Poesie Campestri* (1788), filled with charming descriptions of Brit. scenery; *Arminio*, a tragedy (1804); *Epistole and Satire* (1805), dealing with contemporary events; *Dodici Sermoni poetici* (1808); *Elogi di letterati* (1859) composed in fine prose, etc. They are all more or less tinged with melancholy, and graceful and classic in manner. See monographs by L. Allierino, 1874; S. Gini, 1899; S. Peri, 1904; M. Scherillo, 1919; and O. Bassi, 1934.

Pindus, range of mts. in Greece, forming the boundary between Thessaly and Epirus. Greatest height, 7665 ft. In the Second World War the Brit. forces fought Ger. and It. forces in the P. gorges in Nov. 1940.

Pine (*Pinus*), large and important genus of coniferous trees. The only Brit. native is the Scottish P. (*P. sylvestris*), a beautiful tree which grows well upon deep, loose, sandy soil. Other Ps. grown for profit in Britain are the Corsican (*P. Laricio*), Austrian (*P. austriaca*), and Weymouth (*P. Strobus*). Except in the coldest parts of Britain the Corsican P. outgrows the Scottish P. both in height and girth, and can bear a greater degree of shade, while of all conifers it is least attacked by rabbits. The Austrian P. is sometimes planted on poor limy soil. The pitch P., a native of S. N. America, and perhaps the most valuable of all Ps., is too tender for the Brit. climate; besides its valuable well-known timber, it yields turpentine, pitch, tar, and resin. The Bankian P. thrives on the poorest soil, and has been largely planted in Germany. The stone or parasol P. is cultivated in Italy for its large edible seeds. Another Mediterranean species, the cluster or maritime P. (*P. pinaster*), is extensively planted on sand dunes, which it binds together with its roots, acting also as a valuable wind break.

Pineal Gland, or Pineal Body, small reddish gland situated behind the third ventricle and connected with the optic thalamus by two nervous structures called peduncles. The function of the pineal body is not known, but it is homologous with a rudimentary third or median eye found in certain lizards. Some physiologists regard it as a ductless gland, though there is no adequate evidence.

Pineapple (*Ananas sativa*), fruit of a tropical Amer. plant which is easily grown in the stovehouse. The flowers, surmounted by a crown of spiny leaves, are borne on spikes which rise from the centre

of the plant. There are numerous varieties of the fruit, and those of the finest flavour are home grown, but the fruit now hardly pays for culture in Britain.

PINEAPPLE

**Pine Bluff**, city in Jefferson co., Arkansas, U.S.A., on the Arkansas R., 40 m. S.E. of Little Rock; it has cotton and lumber mills and iron works. The Merrill Institute is here. Pop. 21,300.

**Pinel**, Philippe (1745-1826), Fr. physician, b. at Saint-André, and after receiving a good classical education at the college of Lavaur, removed to Toulouse, where he studied medicine. Having applied himself with success to the study of mental alienation, he was charged, in 1791, to make a report on the insane inmates of the Bicêtre, became chief physician of this institution in 1793, and in 1795 was chosen to the same office at the Salpêtrière (asylum for females). P. gained fame by his reformation of the old barbarous methods of treating the insane.

**Pine Marten**, *Mustela martes*, member of the genus *Mustela*, allied to the weasel and badger, constituting a special sub-family of the *Mustelidae*, distributed over the Old World, but now rare in Britain. The body is long and lithe, about 18 in., with a tail of about 12 in. The legs are short; the paws have five digits armed with claws. The fur is dark brown, lighter on cheeks and on the sharp snout; the throat and under side of neck are yellow. It is arboreal, and frequents coniferous woods, whence its popular name.

**Pinene**, chief constituent of turpentine, is a hydrocarbon of the formula  $C_{10}H_{16}$ . It is a colourless mobile liquid (boiling point  $156^{\circ}C.$ , sp. gr. 0.86). It occurs in pine-trees and also in many essential oils (e.g. those of laurel, lemon, and sage). Like ethylene it forms a crystalline dibromide, and also forms other additive compounds, such as P. hydrochloride and P. nitroso-chloride. It readily oxidises, yielding various products, including terephthalic acid, terpenylic acid, etc. It is a useful solvent for resins.

**Pinero**, Sir Arthur Wing (1855-1934), Eng. playwright, b. at Islington, and

educated at private schools. He went on the stage in 1874 and acted with Sir Henry Irving and others until 1881, when he retired and devoted himself exclusively to play-writing. His earlier plays were farces and comedies, in which the author often satirised the follies and fads of the day. Among these plays, which almost without exception were successful, were *The Magistrate* (1885); *The Schoolmistress* (1886); *The Hobby Horse* (1886); *Sweet Lavender* (which had a very long run with Edward Terry as Dick Phenyl, 1888); *The Profligate* (1889); *The Weaker Sex* (1889); *The Cabinet Minister* (1890); and *The Times* (1891). In *The Second Mrs. Tanqueray* (1893) P. took a more serious subject, his treatment of which was no doubt influenced by the growing vogue of Ibsen. Encouraged by the success of this 'problem play,' P. frequently took subjects of considerable importance for his themes, and produced *The Notorious Mrs. Ebbensmith* (1895); *Iris* (1901); and *Lottery* (1903). A play of P.'s that pleased people not often pleased by him was *Trelawny of the Wells* (1898). In it Irene Vanbrugh made her reputation, and repeated her success in P.'s *The Gay Lord Quex* (1899). *A Wife Without a Smile* (1904) was not popular. *Mid-Channel* (1909) was hailed as a masterpiece by Wm. Archer, to the astonishment of many. P. always excelled in construction; indeed the neatness of his finish betrays the Ibsen influence. He acted in a number of other plays until 1930. P. was knighted in 1909. See H. Fyfe, *Sir Arthur Pinero's Plays and Players*, 1930, and W. D. Dunkel, *Life and Letters*, 1943.

**Pinerolo**, or **Pignerol**, tn. in Piedmont, Italy, 22 m. S.W. of Turin, and the seat of a bishopric. It was prominent in the seventeenth century as a Fr. fortress and a place of confinement for political offenders, the Man in the Iron Mask being imprisoned here. Cloth, silk, and leather goods are manufactured. Pop. 15,400.

**Pines**, Isle of, dependency of New Caledonia, a Fr. Pacific colony. It is 30 m. S.E. of New Caledonia, has an area of 53 sq. m., and a pop. of about 500.

**Pine Tree Flag**, flag having a white field with a device in green of a pine-tree, first used by the Massachusetts colony in the early eighteenth century, carried by the first vessels of the colonies in the Amer. Revolution.

'**Pine Tree State**,' see MAINE.

**Ping Pong**, see TABLE TENNIS.

**Pinguicula**, genus of Lentibulariaceae, contains about thirty species, of which three grow in Britain and are known as butterwort. *P. lusitanica* is a native of Portugal and W. Britain, *P. vulgaris* is the common species. *P. grandiflora* grows in Irish bogs and has large, deep purple flowers.

**Ping-yang** (Korean **Phyong-yang**), walled city of Korea, cap. of the prov. of Phyong-yang, on the Ta-tong R., 36 m. from its mouth. It is said to date from 1122 B.C., and was the scene of great battles between the Chinese and Jap. in 1592 and 1894. Pop. 75,000.

**Pink**, see CARNATION; DIANTHUS.

**Pinkerton, Alan** (1819-84), Amer. detective of Scottish origin, b. at Glasgow. He emigrated to Chicago, where he estab. the agency which bears his name. He was appointed to the U.S. secret service in 1861, and was prominent in many celebrated cases, assisting in breaking up the 'Molly Maguires.' Later he was employed as special detective on the great Amer. railways. He pub. sev. detective stories in which his exploits were narrated. See R. W. Rowan, *The Pinkertons*, 1931.

**Pinkerton, John** (1758-1826), Scottish historian, b. in Edinburgh, and trained for the law. After publishing some ballads he turned to historical studies and pub. many books on the subject. Among his works are *An Essay on Medals* (1784); *A Dissertation on the Origin and Progress of the Scythians or Goths* (1787); *The History of Scotland from the Accession of the House of Stuart to that of Mary* (1797); and *Modern Geography* (1803, 1817). His *Literary Correspondence* was pub. in 1830.

**Pink Eye**, **Cedematous**, or **Exudative Cellulitis**, form of influenza in horses, characterised by swollen legs and eyelids, the lining membrane of which, as of the nose and mouth, becomes pink. The animal is very languid and the temp. rises. The name is also given to a very infectious form of catarrhal conjunctivitis which is found at intervals in schools and other institutions. It must be regarded and treated as other epidemics of infectious diseases. The outbreak usually dies down in about two weeks.

**Pinkie**, locality near Musselburgh, Midlothian, Scotland, the scene of the defeat of 23,000 Scots, under the Regent Arran, by half the number of Eng., under the Protector Somerset, Sept. 10, 1547. P. House was built in the fifteenth century. Its reconstruction by Alexander Seton in 1613 exemplifies the Anglicising of Scottish architecture resulting from the union of the Crowns. In the reconstruction the growing influence of the Renaissance is evident. The painted gallery is noteworthy, being decorated in the early seventeenth century.

**Pinking**, detonation, explosion of petrol-air mixtures in the cylinder of internal combustion engines, caused by too high a compression ratio. It may be overcome, at least in part, by the addition to the petrol of 'anti-knocks' such as aromatic hydrocarbons, alcohol, or lead tetraethyl (q.v.).

**Pink-root**, or **Indian Pink** (*Spigelia marilandica*), species of Loganiaceae which grows in America. The roots have anthelmintic properties. It is also known as *Wormgrass*.

**'Pink Un.'** see 'SPORTING TIMES.'

**Pinna**, genus of pseudomollusc-brachiopate molluscs related to the pearl-oysters in the family Atrypidae, and the species are popularly termed wing-shells. Some species attain a length of about 2 ft., and the long, delicate byssus is sometimes woven into cloth.

**Pinnace**, formerly a small two-masted vessel, fully rigged, and employed as tender to large ships. In the Brit. Navy

the term is applied to an eight-oared boat larger than a cutter and provided with sails. All Brit. men-of-war now carry motor Ps.

**Pinos, Isla de, is.** in the W. Indies, 37 m. S. of Cuba, of which it is a dependency; it has marble quarries, and produces fruit, cattle, tobacco, sulphur, turpentine, and tortoiseshell. It was discovered by Columbus in 1494, and was long notorious as a pirate stronghold. It was regarded as a part of Cuba by the U.S.A., who relinquished their claim to it in a treaty signed in 1925. Santa Fé is the cap., and has mineral springs. Vegetables and grapefruit are cultivated. Area 1180 sq. m. Pop. 4300.

**Pins.** The earliest P. were doubtless thorns. Bone P. and bronze P. have been found dating from prehistoric times. Some of these old P. have ornamental heads, others are shaped like hairpins, and some of the 'safety' type have been found. In 1483 the importation of P. into England was forbidden, but until 1628, when John Tilley started the manuf. of P. at Stroud, most of the P. used in England were obtained from France. The London Pinmakers' Corporation dates from 1636. The chief centre of the trade is Birmingham. The machine patented by Wright in 1824, apparently on the lines of Seth Hunt's patent in 1817, revolutionised the pin industry when improved by Shuttleworth and Tyler. The old form of pin had the head made separately from the shank, attached thereto by wire. In the manuf. of the present solid-headed P. wire of a suitable gauge runs off a reel, and is nipped between lateral jaws at the required point. It is headed by a die, and pointed by a revolving cutter, at the rate of 360 per min. Brass P. are 'boiled white' with a solution of oxalic acid, argol, water, and alternate layers of grain tin after being scoured in barrels with the solution from the boiling white of the previous load, with the addition of fuller's earth. Iron P. are scoured in a weak solution of cyanide, potash, and water, then electro-plated with copper. Brass and iron P. are washed, dried, and polished in sawdust. Mourning P. are dipped in black japan, then baked. Safety P. are also made by machinery.

**Pinsk:** 1. Region of the Byelorussian S.S.R. 2. Tn. of the Byelorussian S.S.R., at the junction of the Pripiet and Pina Rts. The marshes near by are unhealthy. Before the Ger. invasion in 1941 there were potteries, breweries, tanneries, and brick-works there, and trade was carried on in corn, tallow, tobacco, linseed, and salt. P. was heavily damaged in the First and Second World Wars. Pop. 42,000.

**Pint** (from Lat. *pincta*, *picta*, a painted or marked vessel; Fr. *pinte*), measure of capacity, especially for liquids, also sometimes for dry goods, equal to  $\frac{1}{4}$  quart or  $\frac{1}{2}$  gallon (34.659 cubic in., 57 litre). The Scottish P. contained over three imperial Ps. The U.S. standard P. contains only .47 litre. In medicine a P. is equivalent to twenty fluid ounces.

**Pintail Duck**, or **Sea-pheasant** (*Querquedula acuta*), handsome Brit. wild duck with a long tail, the two middle feathers of which

in the male taper to a sharp point, projecting some five inches beyond the others. The head is brown, the upper parts dark grey, with narrow black stripes, and the under parts white. It breeds in Scotland and Ireland, and visits the E. coast of England in the winter, where, when domesticated, it readily pairs with other ducks. Its migratory range is very extensive.

**Pinto, Fernão Mendez** (1509-83), Portuguese adventurer, *b.* at Montemor-o-Velho. In 1537 he set out to try his fortunes in the E., and travelled for twenty-one years in S.E. Asia, fighting and trading in China, Tartary, and the neighbouring countries, and going on a special mission to Japan in 1542-43. He was the friend and travelling companion of St. Francis Xavier. In 1558 he gave up his wanderings and returned to Portugal, where he married and wrote his famous book, *Il Peregrinação*, pub. in Madrid in 1614. There is an abridged and illustrated trans. by Arminius Vanberv, 1891, and *Portuguese Voyages*, 1498-1663, ed. by C. D. Ley (Everyman's Library) contains a long extract from P.'s famous travel book. See life by M. Collis, 1949.

**Pinto, Serpa**, see SERPA PINTO.

**Pinturicchio, Perino**, or Bernardino di Betti (1454-1513), It. painter, *b.* at Perugia. He assisted Perugino with his frescoes in the Sistine Chapel, and was engaged by various members of the Rom. nobility to decorate their palaces. He also decorated a whole series of chapels in the church of S. Maria del Popolo in Rome. The most striking of his frescoes are those in the cathedral library at Siena, representing the hist. of Pope Pius II. Other frescoes in Rome, still existing in a genuine state, are those in the Cappella Bufalini, probably executed from 1497 to 1500. See G. B. Vernigiglioli, *Memorie di Pinturicchio*, 1837; Schmarzow, *Pinturicchio in Rome*, 1882; and life by W. Bombe, 1912.

**Pinwell, George John** (1842-75), Eng. water-colour painter and black-and-white artist, *b.* at Wycombe. He was one of the most successful book illustrators of his day. His chief productions were illustrations of Goldsmith, Jean Ingelow's poems, the *Arabian Nights*, etc. His prin. water-colour paintings are two scenes from 'The Pied Piper of Hamelin', 'The Elixir of Life', 'A Seat in St. James's Park', etc. See life by G. C. Williamson, 1900.

**Pinzon, Martin Alonso** (c. 1440-93), Sp. navigator, companion of Columbus, in whose first expedition (1492) he commanded the *Pinta*. After their landing at San Salvador (Watling Is.) he separated from Columbus for a time, and discovered Haiti, returning to Palo in Andalusia on the same day as Columbus, of whose success he was said to be envious (see F. Asensio, *Estudio histórico*, 1892). He was the first Sp. navigator to cross the equator (1499-1500), discovering Brazil and the mouth of the Amazon. With Solís (1506) he explored the gulf of Honduras and S.E. Yucatan and the E. of S. America (1508). See C. F. Duro, *Colon e Pinzon*, 1885.

**Plombino** : 1. Tn. in the prov. of Leghorn, Italy, opposite Elba. P. was once the seat of a principality. Ruins of the anct. Populonia are near by (N.). There are iron-rolling mills. The *fortezza* was damaged by bombs in the Second World War. Pop. 10,000. 2. Former principality of N.W. Italy, now part of Leghorn prov. which from 1399 to 1603 belonged to the Applani family. It was ceded to France (1801). Elisa Baciocchi received it from her brother, Napoleon I. (1805), and it was joined to Tuscany (1815).

**Piombo**, see SEBASTIANO DEL PIOMBO.

**Pioneer** (military) (Fr. *pionnier*, foot-soldier), in Brit. infantry organisation, a military artisan employed in peace-time, in such work as painting and repairing barrack-rooms. Formerly, in war, the P. was one of a body of foot-soldiers, generally in the ratio of ten to every battalion, who marched in advance with pickaxes, spades, and other tools to prepare the road or remove obstructions for the main body of the troops or to do other minor engineering or constructive work. In the former Brit. Army in India there were whole battalions called Ps., who were in effect lightly-equipped engineers, but who also fought as infantry. In 1922 on the reorganisation of the old Indian Army the P. units were converted into regiments. There is in existence in the Brit. Army organisation a Royal P. Corps (*q.v.*), and there are P. platoons in infantry battalions.

**Pioneer Health Centre**, unique 'laboratory for the study of human biology,' originally opened in a small house in Queen's Road, Peckham (London, S.E. 15), in 1926. A 'Family Club' was formed, and all married couples (with or without children) were invited to join, at a family subscription of 1s. weekly. More than a hundred families joined in the three years that this first experimental Health Centre was open, and the question had been answered that, given suitable circumstances, there were families who would welcome a health service distinct from any sickness service. The periodic health overhauls, which were and are the main condition of membership, showed that, while sickness might be detected in an individual far earlier than expected, overhaul and treatment are ineffective to regain full health without 'instruments of health' providing conditions in and through which the biological potentiality of the family can find expression. It was decided to close the small centre and to plan a larger enterprise, which would not only extend the previous service but also provide a new social structure with available circumstances and material to vivify the health of the member-families. In May 1935 this new centre was opened in Peckham. The building itself is mainly of concrete and glass, consisting of three large platform: 160 ft. by 120 ft., cantilevered one above the other over parallel rows of supporting pillars. A large swimming bath forms the middle of the ground floor, and may be seen from most parts of the building. In addition to the bath, the

ground floor has a gymnasium, theatre, nurseries, learners' bath, cloakrooms, etc. The only part cut off from general circulation is the consultation block on the top floor, containing private consulting rooms, reception rooms, changing rooms, and a bio-chemical laboratory. The rest of this floor is made up of large light open spaces for games or recreations of any kind. A large social hall shares the first floor with the cafeteria, where, as everywhere in the centre, self-service is the rule: there are no waitresses or attendants, only the 'curators' and doctors to give advice and to study their 'guinea-pigs' in a living society. The whole building is characterized by a design which invites social contact of all kinds; the chance meeting, the organised festive or formal occasion, or the quiet family grouping. Facilities are available for all kinds of recreation: swimming, badminton, table tennis, billiards, roller-skating, reading, chess, jig-saw puzzles, and so on. For children of member families, all these are free, though for adults certain small fees are charged. Before the centre closed, in 1939, the revenue from these fees and the family subscriptions was about £7000 a year. During the Second World War the building was used as a factory and much of the equipment was lost; the doubling of expenses necessitated the increase of the subscription to 2s. The number of member-families was 900 before, and 700 after, the War. The centre could take 2000 were it in a financial position to acquire the necessary equipment for that number of families. The P. H. C. is an experiment, and as such has been built, equipped, and to a large degree maintained by the voluntary subscriptions of those who use it and believe in it. Moreover it is the first of its kind anywhere in the world, and as such has had the difficulties attendant on new and unusual ventures. See G. Scott Williamson and Innes H. Pearce, *The Case for Action*, 1931, and *Biologists in Search of Material* 1938; Innes H. Pearce and Lucy H. Crocker, *The Peckham Experiment*, 1943; and G. Scott Williamson, *Physician Heal Thyself*, 1935.

Piotrkow, tn. in the prov. of Lodz, Poland, situated 25 m. from Lodz, on Strawa R., with ruins of an auct. royal castle. Before the Second World War there were foundries, tanneries, and textile factories. Pop. 31,300.

Plozzi, Hester Lynch (earlier Thrale) (1741-1821), b. at Bodvel, Cornwallshire, daughter of John Salusbury, of Flintshire. She married in 1763 Henry Thrale, the brewer, and soon after became an intimate friend of Dr. Johnson, who frequently stayed at the Thrales' house at Streatham, and travelled with them. Thrale d. in 1781, and three years later the widow married Gabriel P., a musician. She wrote in 1788 *Anecdotes of the late Samuel Johnson, LL.D.*, and two years later pub. her correspondence with the great man. She also wrote *The Three Warnings* (1766), a poem which is said to have been partly Dr. Johnson's work. See *The Intimate Letters of Hester Plozzi*

to *Penelope Pennington, 1782-1831* (O. G. Knapp, ed.), 1913, and O. E. Vulhamy, *Mrs. Thrale of Streatham*, 1936.

Pipa Americana, or Surinam Toad, large, tongueless toad, the only representative of its genus and family, and peculiar to Dutch Guiana. Its most remarkable feature is the hatching of the eggs each in a small pouch on the back of the female, where they are placed by the male, and adhere by a glutinous secretion, gradually becoming imbedded in the epidermis. The eggs are hatched and the metamorphosis of the young is completed before they escape. The toad's head is broad and pointed and the body is brownish-olive.

Pipal, or Peepul, see BO-TREE.

Pipe, measure of quantity used in Great Britain, France, Spain, Portugal, and U.S.A. for liquids, especially wine and oil. Formerly it was a large cask or vat for wine or other liquids, and even for provisions (fish, eggs, meat, etc.). It contains 2 hogsheads, 4 barrels, or 1 tun, and is sometimes used as equivalent to a 'butt' of ale or beer. The common Eng. P. contains 105 imperial or 126 wine gallons. The capacity of a P. varies according to the wine contained, a P. of Madeira containing about 110 wine gallons, of sherry 130 gallons, of port 138 gallons.

Pipe (music), cylindrical instrument with holes through which air passes, making musical sounds. In this, its simplest form, it is probably the oldest of all musical instruments. Such is the P. of Gk. art and song and from it later varieties have been evolved, one being the bagpipes. In England the morris dance was accompanied by P. and tabor. The P. had three holes, two in front for the first two fingers and one at the back for the thumb; the player held the P. in the left hand and, with his right, beat the tabor suspended from his left wrist. All wind instruments, including the organ, are 'pipes.' They may be classified into reed (q.v.) Ps., such as the clarinet, oboe; whistle Ps., such as panpipes (see under ORGAN and also PANDRAN PIPES); and Ps. with cup mouth-pieces, such as the trumpet. Organ Ps. may be stopped, open, reed, or flute (see ORGAN).

Pipe (Tobacco). The tobacco P. was invented in America before the time of Columbus, specimens having been found in auct. Indian mounds. It was introduced into England by Sir Walter Raleigh in 1586, and was first regularly manufactured in London in 1619. Ps. are made of various materials, including pipe-clay (q.v.), meerschaum (q.v.), and briar-root. Briar-root Ps. now very common, have the bowl and stem made of one piece of wood, and although the stem is short, they partially absorb the oil produced in smoking. That Ps. for smoking herbs for medicinal and other purposes were in use in England and elsewhere long before the introduction of tobacco is tolerably certain. Coltsfoot, yarrow, mouse-ear, lettuce, and other plants were smoked in Ps. A primitive kind of P. consisted of a stick of elder, from which the pith had been removed,

with a bowl formed out of common clay and dried by the kitchen fire. Ps. have been found in situations near the Rom. wall in Northumberland and other Rom. stations in Britain. The names Danes' P., Celts' P., Elfin P., Fairy P., Old Man P., etc., are popularly given to some museum specimens, but afford no evidence as to their real antiquity. Many of them are remarkable for their very small size, whence, perhaps, some of the names, but this is easily accounted for by the consideration of the very high price of tobacco when first introduced into Europe. Stone Ps., or P.-bowls, have also been found in Britain, cut in rude forms, and which apparently were used by the insertion of a tube, perhaps a straw. Such P.-bowls, but elaborately carved, are amongst the most remarkable Amer. antiquities. They continue, however, to be made by the Amer. Indians, often of stone, and are adorned with figures of men and animals. Aubrey, writing in 1680, says that tobacco-smokers at first used silver Ps., 'but the ordinary sort made use of a walnut-shell and a straw.' In the reign of William III. Ps. were occasionally made of brass and of iron. The P. was, in the earlier days of smoking, passed round the 'ah! ... man taking a whiff or two and then handing it to his neighbour as in the smoking of the P. of peace by the N. Amer. Indians. The barrel-shaped bowl was most usual during the Commonwealth and the reign of Charles II., although it was made in many various shapes, which are well known from representations of them in prints of the time and on traders' tokens. In the reign of William III. a more elongated form of bowl began to be prevalent, probably introduced from Holland. In the middle of the eighteenth century the wide-mouthed bowl, now so universal, became the prevalent form, and the spur which had hitherto been flat, to rest the P. upon when in use, was elongated, after a fashion supposed also to have originated in Holland. The Scottish *cutty* P. and Irish *dudeen* are short clay Ps. The most celebrated seat of clay P. manufact. in Britain is Broseley, in Shropshire, where it appears to have been estab. in the middle of the sixteenth century. Ps. are, however, made in many places, the clay being obtained chiefly in Cornwall. The P.-makers of London, as early as 1601, had privileges which gave them a monopoly. In 1619 the craft of P.-makers was incorporated in England. Holland has long been famous for P.-making. See W. Bragge, *A Catalogue of Pipes*, 1880, and A. Dunhill, *Pipe Book*, 1924.

**Pipe-clay**, white, friable clay used for making clay pipes. It is similar in many respects to the clay used in the manufact. of china, and consists mainly of kaolin, particles of quartz, and partly decomposed felspar, and is usually free from alkalis. The clay is found chiefly in Cornwall and Dorset, and is made into pipes at Amesbury in Wiltshire and at Broseley in Shropshire.

**Pipefish**, name for sev. elongated fish of the order Syngnathidae, with small gill

opening and no anterior dorsal or pelvic fin. The snout is prolonged into a tube, and the mouth is toothless. They are small marine fish, poor swimmers, and live near the coast in temperate and tropical regions. The eggs of some species are carried by the male in a brood pouch on the abdomen or the tail; in others they are embedded in the soft skin of the abdomen.

**Pipe-line**, line or conduit of pipe sometimes many hundreds of miles long, by which oil is conveyed from an oil region to a market or to reservoirs for refining; also a line for carrying compressed air, or water (for domestic, industrial, or fire-fighting purposes), or tn. gas, or natural gas, or sewage, etc., or a line for conveying power from a hydro-electric installation. Ps. for the transportation of oil over long distances are known as 'trunk' Ps. The possibilities of these have been realised for a long time, one of the earliest being that constructed in 1897 between Baku and Batum on the Black Sea, for the bulk transportation of kerosene. Many thousands of such lines have been laid, chiefly in the U.S.A., the great majority of which have been constructed for the transport of crude oil from the main field to the refineries. During the Second World War sev. were constructed to free tankers, for strategic reasons, to relieve the load on railways, etc. Two famous war-time lines were known as Big Inch and Little Inch, the former being 24 in. in diameter and over 1300 m. long, the latter 20 in. in diameter and over 1500 m. long. Big Inch and Little Inch have twenty-six and twenty-seven pumping stations respectively in their lengths, each requiring 4500 h.p. at full load for the former and 3750 h.p. for the latter. Nearly 485,000 tons of crude oil are required to fill the Big Inch line. In the case of Little Inch the line is used for sev. different grades of gasoline, kerosene, and light gas oil. No attempt is made to separate the products, which are just pumped consecutively into the line, in quantities to suit the point of deliver., and provided the linear speed of products passing through the line is kept above a certain pre-determined minimum, the degree of contamination is very small. Another interesting line was the 'Phuto' (Pipe Lines under the Ocean) system of cross-channel lines which were laid to maintain supplies of gasoline to the Allies during the invasion of Europe. For laying, the lines were wound on huge floating drums, shaped something like a cotton reel, being 40 ft. in diameter and 60 ft. long. Each was then towed by a tug, the drum resting on the water and paying out the line as it went. One of the most effective systems of Ps. is the Victaulic system of flexible Ps., and it would appear that even an unskilled man can build up, from standard Victaulic joints and fittings, and a few specialities, complicated pipe systems which otherwise might require 'specials' or tinplate pipes. In this connection an air line, over 1½ m. long, was laid by unskilled labour in the Toyo mines, near Tokyo, in

1931. The flexibility of this system allows a P. to be laid over a large curve upon the ground or over undulations, without the use of bends, and also permits the P. to lengthen considerably as it sags, thereby avoiding the heavy stresses which otherwise arise. A mile of line can lengthen by 36 in. (or more, according to diameter); assuming this mile to consist

New York Times Photos

#### OIL PIPE-LINE IN PENNSYLVANIA

of 20-ft. lengths the P. can sag 74 ft. in the middle before any undue stress comes on the joints or pipes. The Victaulic joint consists of two portions, the flexible inner ring and the metallic outer ring, or housing. The inner ring is an adaption to pipe-joints of the principle of the U washer which made modern hydraulic machinery possible. The internal pressure of the main acts on the interior flexible ring, forcing its edges against the tube with a pressure which automatically increases as the working pressure rises, thus preventing any leakage. The

housing positions the inner ring accurately in the tube ends, supporting it closely so as to relieve it of all bursting stress, and also couples the tube ends positively, while yet allowing a certain limited but valuable movement between them. Joints are now made to allow an angular movement at each joint, which varies from 5° on small to 1° on large pipes or a longitudinal movement of at least 1 in. The longitudinal movement is the more valuable, providing as it does for expansion and contraction in mains laid above ground and for subsidence in buried mains. A change of shape in a P. invariably necessitates a change of length if severe local stresses are to be avoided, and a well-designed joint should provide for both movements under working conditions. Drop forged steel housings, made from good quality mild steel, have an ultimate tensile strength of 28 to 32 tons per square inch, but where exceptional stresses are to be withstood material of a higher tensile strength is used. The flexible rings are made from a special composition which does not oxidise or harden over long periods even in tropical climates. There are two qualities of rings—one for water or compressed air, the other for oil or gas. The material for both is essentially a rubber composition into which no oils or scrap or reclaimed rubber is used. The protection of Ps. against corrosion, especially buried lines, is of the utmost importance, and in the prices a coating of bitumen, a wrapping of asbestos felt, and a final application of bitumen. Nowadays an inhibitor is normally introduced into the P. to retard the formation of rust.

Piper, John (b. 1903), Brit. painter and writer, b. at Epsom, and educated at Epsom College and the Royal College of Art. His water-colours and striking aquatints of architectural subjects made him famous. During the Second World War he painted the ruins of the House of Commons, and in 1941-42 did a series of water-colours of Windsor Castle, at the request of H.M. the Queen. P. has also designed *décor*s and illustrated books. Pubs. include *Brighton Aquatints* (1939) and *British Romantic Painters* (1942).

Piperaceae, Peppercorns, natural order of shrubs or herbs with small flowers in spikes which are followed by somewhat fleshy fruits. Pepper and betel leaf are important products of *Piper*, a typical genus.

Piperidine, basic liquid (boiling point 106° C.) of the formula  $C_4H_9N$ . It is prepared by reducing pyridine (q.v.) with sodium and alcohol.

Piperine, alkaloid of the formula  $C_{17}H_{19}O_2N$ . It occurs in pepper, and was synthesised chemically in 1882. P. forms white crystals; melting point 128-5° C.

Pipe Roll, Great Roll of the Exchequer, now kept in the Record Office, London. The accounts of the revenue collected by the sheriffs are contained in it, and these were known as pipes. The first extant P. R. dates from the early twelfth century. P. Rs. contain valuable information on subjects connected with

national finance and revenue. See also PUBLIC RECORD OFFICE.

Pipettes, glass tubes drawn to a point at one end and usually provided with a bulb.

PIPETTE

They are graduated to deliver specified volumes of liquids. In order to fill a pipette the liquid is sucked up until it reaches above the graduation mark on the stem, and the finger is then placed on the upper end. By gradually releasing the pressure the level of the liquid is allowed to fall until coincident with the graduation mark. On emptying the pipette the last drops are either blown out or drained off against the side of the containing vessel.

Piping Crow, or Australian Magpie (*Gymnorhina*), genus, by some authorities classified as a sub-order of the family Corvidæ, comprising three species which occur only in the Australian region. Their plumage is black and white. They are

skillful mimics and can be taught to whistle tunes, hence the Australian name 'Flute Player.' Their diet is entirely of insects. *G. tibica* is common in New S. Wales, and is frequently kept as a pet.

Pipit (*Anthus*), genus of passerine birds characterised by a slender soberly coloured body and a notched and fairly long beak. The meadow P. or titlark (*A. pratensis*) is the commonest Brit. species. It is the chief victim of the cuckoo's habit of finding a foster-mother for its eggs. Other Brit. species are the tree P. (*A. trivialis*) and the rock P. (*A. obscurus*). The genus was formerly comprised in the genus *Alauda*, which includes the woodlark and skylark, but is now placed with the wagtails in a separate family, Motacillidæ.

Pippi de' Giannuzzi, see GIULIO ROMANO.

Pippin, see PEPIN.

Pipridæ, see MANAKINS.

Piqua, city of Miami Co., Ohio, U.S.A., 26 m. N.W. of Dayton. Pop. 16,009.

Piqué, one of many forms of cotton fabric, used for making white dress shirts, shirt fronts, white waistcoats, and dress goods. Brit. worst fabrics are known as P., having distinct cords or welts running width-wise. Amor. corded or combed yarn fabrics are warp P.s. with narrow raised cords or welts running warp-wise. If there is a very narrow cord it is termed pin wale. Better qualities have additional coarser warp ends woven along back under each cord to help raise it. Fancy P.s. are compound fabrics with quilted or puffed designs, also known as vestings.

Piquet, long-estab. card game, in a sense the aristocrat of card games for a. Its polished technique and fr. termin-

ology bear witness to its courtly origin. It is played with a pack of thirty-two cards, all below the sevens being removed. The cards used rank in the whist order. The players out for deal. The player drawing the higher card (ace high) may, and should, elect to deal first: he is 'Younger Hand.' The non-dealer is 'Elder Hand.' Younger Hand must deal the cards out either by twos or threes until each has twelve. The remaining eight are called the stock. The object of the game formerly was to score 100 points before one's adversary, but since the introduction of the *Rubicon* game, no precise number of points constitutes a game; but the players play six deals or a 'partie,' the winner of the partie deducting the loser's score from his own, and adding 100. If, however, the loser fails to score 100, the winner adds the loser's score to his own prior to adding the 100. In this case the player who loses is said to be 'rubiconed,' i.e. has failed to cross the Rubicon. The scoring is by certain combinations, there being three possible scoring combinations, viz. (1) the *point*, i.e. the most of one suit; (2) the *sequence*, i.e. the greatest number of consecutive, not less than three, of the same suit, or, the *best* sequence if both players have an equal number; (3) the *quatorze* or *trio*, i.e. four aces, four kings, four queens, or four tens, or three of each. The *point* combination counts one for each card of the suit; if the players be equal, the scoring is by pips, the ace counting 11, the court cards 10 each. A *sequence* of three cards of any kind ('*tierce*') scores 3, of four cards ('*quart*') 4, beyond which 10 is added, e.g. five cards ('*quint*') score 15, six ('*sixième*') 16, and so on up to eight. Of two sequences the longer is always the better, e.g. knave, ten, nine, eight, are better than ace, king, and queen. As in *point*, if the best sequences are equal, neither player scores. A *quatorze* scores 14, and a *trio* 3; a *quatorze* of any kind necessarily destroys a *trio* of any kind. Each player after the deal has a right to reject some of his cards and take others from the 'talon' stock, Elder Hand (i.e. the non-dealer) having the right to begin. He must discard at least one, and may discard as many as five. The dealer in his turn must discard one, and may, if he choose, take all or any of those that remain. The actual play follows the ordinary rules of whist, i.e. the scoring is by tricks. Elder Hand begins the play, the dealer, prior to putting his card down, declaring his scoring combination. The scoring of the *play* is thus: the first player to every trick counts 1, but if the other wins the trick, the latter also counts 1, and the player who takes the last trick scores an extra 1 for it. A player who wins more than six tricks scores 10 'for the cards'; if both win six tricks there is no score 'for the cards' on either side. Additional scores for extra ordinary cases are: (1) *Carte blanche*, when a player who is dealt a hand without king, queen, or knave may claim 10; (2) *Repique*, when a player who scores 30 in hand where his opponent has not scored at all, 60 extra; (3) P., when

Elder Hand scores 30 extra, having scored 30 in hand and play where Younger Hand has nothing to declare and has not claimed equality in point of sequence; and (4) *Capot*, when a player winning all twelve tricks scores 40 instead of 10 for the cards.

**Piracy.** In its essentials P. by international law (*q.v.*) does not differ from P. according to the municipal law of any individual civilised nation. Writers on international law define P. as consisting in depredations on the seas not authorised by any sovereign state, and differentiate 'acts of hostility' from piratical acts. Where nations are at war with each other, robbery or other depredations committed by subjects of one warring nation against or on those of its enemy would be merely hostile acts; but if the person injured and the person inflicting the injury are either subjects of nations at peace with each other or of one and the same state, the injury amounts to P., and is recognised by all civilised nations as an act punishable by the courts and under the laws of the injured person's state. In short the essence of P. is 'the pursuit of private as contrasted with public ends,' and a pirate or sea-rover is primarily 'a man who satisfies his personal greed or his personal vengeance by robbery or murder in places beyond the jurisdiction of a state.' By the Eng. common law, P. is taken to include all those acts of robbery and depredation upon the high seas which, if committed upon land, would be classified as felonies (see **CRIMINAL LAW**). But a number of other acts, really amplifications of the underlying principle of P. *jure gentium*, have been made P. by various statutes passed in 1670, 1698, 1717, 1721, and 1744. Statutory P. includes, *inter alia*, the following acts: The voluntary cession by a commander, master, or seaman of his ship or cargo to a pirate; rendering assistance to a pirate; the running away by a commander, master, or seaman with a ship or cargo; boarding a merchantman and destroying the cargo; the rendering assistance to the enemy on the sea by a natural-born Brit. subject, or the commission by such a person against another Brit. subject of an act of hostility under the pretext of a commission from a foreign power; and generally having dealings with a pirate. The punishment was formerly death, but is now penal servitude to the extent of life or imprisonment not exceeding three years. But capital punishment would still be inflicted for P. accompanied with either an assault with intent to murder or with any act endangering life. Notable pirates of the past were the Corsairs (*q.v.*) of N. Africa, and the successors of the buccaneers (*q.v.*) on the Sp. Main (see also **KIDNAPING**, **WILLIAM**). Except perhaps in Chinese waters, P. is practically unknown in modern times.

**Piræus** (*Πειραιεύς*), Porto Leone, or Draco, tn. of Attica, Greece, the seaport of Athens since about 485 B.C., an important port and harbour both in anct. and modern times. Themistocles recognised its superiority to Phalerum and persuaded his countrymen to fortify it after the Persian wars, and connect it with Athens (about

5 m. N.W.) by the famous 'Long Walls.' Cimon and Pericles in the fifth century B.C. carried out the plan of Themistocles. It had three harbours, the largest being W. of the peninsula on which the tn. stood, and was the abode chiefly of the democratic Athenian pop. and of foreigners. Munychia to the S. was the Acropolis of the P., on a hill now called *Καστέλλα*. The fortifications were destroyed (404 B.C.) after the Peloponnesian war, but restored in 393. Sulla destroyed them again (86 B.C.), and from that time the tn. sank into obscurity until 1834. It was then rebuilt with arsenal depots and a naval and military school. A railway was constructed (1869) connecting it with Athens. It is the chief port of entry for imports, locally known as 'the Manchester of Greece,' and is the second largest city in Greece. Marble from the quarries of Pentellicus, Skyros, and Tinos, olives, and oil are exported. Cottons, silk, paper, machinery, iron, macaroni, and flour are manufactured, and there are tanneries, distilleries, and shipbuilding yards. Coal, railway plant, petroleum, and cattle are among the chief imports. In the Second World War it was bombed by It. aircraft (Jan. 1941) and later, when in Ger. occupation, Brit. aircraft bombed its military installations. Pop. 210,800. See further under **ATHENS**. See W. M. Leake, *Topography of Athens*, 1841.

**Piran** (Kiran), St., see **PERRANZABULOE**.  
**Pirandello**, Luigi, (1867-1936), It. novelist and playwright, b. at Girgenti, Sicily. He was educated at the univ. of Rome and afterwards at the univ. of Bonn. His first book, *Mal Gioconda* (poems), appeared in 1889, and during the next thirty years he produced novels and short stories, numbering some four hundred. Of his novels, *I fu Mattia Pascal* (1904) had an originality which influenced It. fiction in the reaction against the romanticism of D'Annunzio. In 1910 P. began writing for the stage, turning many of his short stories into plays. It is as a dramatist that he earned a European reputation, both for the technical brilliance and originality of his method and for his metaphysical choice of subject. His recurrent theme was the dislocation of the personality under the stress of circumstances, showing that character is not an absolute quality, but fluctuates between its inherited tendencies on the one side and the conditions of society on the other. His best-known plays are *Sei Personaggi in Cerca d'Autore* (or 'Six Characters in Search of an Author') (1921); *Enrico Quarto* (1922); and *Ciascuno a Suo Modo* (1924). Besides plays and stories he has written *L'Umore* (1908), a study in humour. With literature P. combined the profession of teaching, and was a prof. at the Istituto Superiore di Magistero Femminile, a higher training school for women in Rome. P. was awarded the Nobel prize for literature in 1934. Eng. trans.—*Sicilian Limes* (1921); three plays: *Six Characters in Search of an Author*, *Henry IV.*, and *Right You Are* (1922); *Each in His Own Way*, and two other plays (*The Pleasure*

of *Honesty and Naked* (1923); *The Late Mattia Pascal* (1923); *The Outcast* (1925); *Shoot!* *The Notebooks of Serafino Gubbio*, *Cinematograph Operator* (1927); *Horse in the Moon* (1932). See also W. Starkie, *Luigi Pirandello*, 1926, and *Luigi Pirandello and the Italian Drama*, 1937; F. Pasini, *Luigi Pirandello*, 1927; life by F. Palai, 1927; and D. Vittorini, *The Drama of Luigi Pirandello*, 1935.

Piranesi, Giovanni Battista (1720-78), It. engraver, b. at Venice, and studied at Rome. He afterwards led a wandering life, and spent his time in architectural designs, in which branch of his art he excelled, his work being characterised by its freedom. The number of his designs is considerably over 1000. He also executed the repairs of and restored some churches under the orders of Clement XIII. See A. Samuel, *Piranesi: a Critical Study of His Life and Works*, 1910, and life by H. Focillon, 1928.

Pirano, tn. of Trieste ter., on a peninsula, 13 m. S.W. of Trieste. It exports considerable quantities of salt, and also olives and wine. Pop. 13,500.

Pirene (Pelrene), Fons, fountain of Corinth, Greece, whose waters apparently rose in the Acrocorinthus (citadel), connected with four of the same name at the foot of the Acrocorinthus and on the road from the Agora to Lechaum (see Pausanias, ii. 3-5; Strabo, viii., p. 379; W. M. Leake, *Morea*, iii.). It was supposed to have gushed forth at the stroke of Pegasus's hoof.

Pirrenne, Henri (1862-1935), Belgian historian, b. at Verviers. After having studied at the univs. of Liège, Paris, Leipzig, and Berlin he lectured at Liège in 1885 and was prof. at the univ. of Ghent from 1886 to 1930. He specialised in the hist. of the Middle Ages, and of particular interest are his works on the historical growth of the cities and their first economical and social aspects: *Histoire de la ville de Dinant au moyen âge* (1889); *Les Anciennes Démocraties des Pays-Bas* (1910); *Étapes de l'histoire sociale du capitalisme* (1911); *Les Villes au moyen âge* (1927). His main work, however, is a monumental *Histoire de Belgique* (7 vols., 1900-32) in which predominates his thesis that Belgium as a nation has had a vital place in the hist. of W. Europe. Other chief works are *Bibliographie à l'histoire de Belgique* (3rd ed., 1931); *De la méthode comparative en histoire* (1923); *La Belgique et la guerre mondiale* (1928); *Histoire de l'Europe des invasions au XVI<sup>e</sup> siècle* (1936). From March 1916 to Nov. 1918 he was imprisoned as a hostage in Germany.

Pirke Abuth (i.e. Sayings of the Fathers), one of the treatises of the Jewish *Talmud*, a collection of representative sayings of anc. rabbis in the manner of the book of Ecclesiasticals.

Pirmasens, tn. in Bavaria, 44 m. S.W. of Mannheim. It is engaged chiefly in the manuf. of boots, shoes, and musical instruments. Pop. 43,000.

Pirna, tn. in Saxony, Germany, 11 m. S.E. of Dresden. Its chief manufs. are pottery, enamelled ware, and glass ware.

Tanning is also carried on. It was the scene of the surrender of the Saxons to the Prussians in 1756. Pop. 31,000.

Pivot, tn. and the cap. of the prov. of Piro, 36 m. S.E. of Nish, Yugoslavia. It was the scene of the Serbian defeat of 1885. Its pure wool carpets are dyed by local dyers with natural colours, both the dyeing and colour mixing being secret processes known only to the carpet-makers of P. Pop. 13,000.

Pir-Panjai, range of mts. bounding Kashmir on the S.W., and rising to a height of 15,000 ft.

Pisa: 1. Prov. of Tuscany, Italy, bordering the gulf of Genoa and the Tyrrhenian Sea, bounded E. by Florence and Siena, W. by Livorno (Leghorn) and the sea. Fertile in the W., hilly and mountainous S. and E., it is watered by the Arno and the Serchio. Wine, oil, and wheat are produced. Manufs. include silks, cottons, linens, glass, pottery, candles, and soap. Marble is quarried, and coal and copper are mined. Area about 1179 sq. m. Pop. 351,000. 2. Cap. of above, and of Tuscany, on the Arno, 12 m. from Leghorn. It is an archbishop's see. Once the rival of Genoa and Venice, its commerce has been transferred to Leghorn, and the pop. has declined considerably from the sixteenth century, the only large manuf. now being cottons. Its magnificent buildings remain, including the Piazza del Duomo (N.), containing the marble Gothic cathedral (1063-1118), with its fine dome and façade, bronze doors, and pulpit by Niccolò Pisano, founder of the Pisan school of sculpture; the Campanile or 'Leaning Tower' (about 180 ft. high, deviating about 16 ft. from the perpendicular), built between 1174 and 1350 with eight storeys; the Campo Santo or cemetery (thirteenth century); and the baptistery (1153-1278), with its conical dome. Other famous buildings are the univ. (about 1338), with its library and museum, and the circular church of St. John. The Bagni di P. (medicinal springs) are 3½ m. N. Called Julia Pisana by Livy, P. was subject to Rome in the fifth century, but was a powerful and independent republic by about 1000. The Pisans were crushed off Meloria by the Genoese (1284). The Milaneses took the city (1399), and sold it to Florence (1405). A short-lived republic under Fr. protection was overthrown by the Florentines (1509). P. was incorporated with Italy (1860), and suffered severely in the Second World War. The damage to the Campo Santo was a major disaster to world art, as much of it was irreparable. The Ponte de Mezzo was damaged and all the other bridges were blown up. Pop. 78,800. See J. Schubring, *Pisa*, 1902; Janet Ross and Nellie Erichsen, *The Story of Pisa and Lucca* (Medieval Towns Series), 1902; and J. de Foville, *Pise et Lucques*, 1914. (See illustration, p. 560.)

Pisagua, tn. in the prov. of Tarapaca, Chile, 45 m. N. of Iquique. It is chiefly engaged in the shipping of nitrate of soda. Pop. 1500.

Pisan, Christine de, see CHRISTINE.

Pisano, Andrea (c. 1270-1349), It.

sculptor, whose real name was Andrea de Pontedera, *b* at Pontedera a pupil of Giovanni P. He settled in Florence and became famous as a worker in bronze and marble. P. executed the door of the baptistery in Florence and the bas-reliefs designed by Giotto for the lower storey of the campanile.

**Pisano, Giovanni** (1240-1328), It. sculptor and architect, son of Niccolò P., *b* probably at Pisa. He worked with his father on the pulpit of Siena, and built the famous Campo Santo at Pisa and the

**Pisanus**, see LEONARDO OF PISA.

**Pisaurum**, see PESARO.

**Piscataqua**, riv. formed by the Salmon and Cocheco Rr., and part of the boundary between New Hampshire and Maine, U.S.A. At its mouth is the harbour of Portsmouth.

**Pisces** (the fishes'), twelfth and last sign of the Zodiac. It is a large constellation, bounded on the E. by Aries and Triangulum, on the W. by Aquarius and Pegasus, on the N. by Andromeda, and on the S. by Cetus. Its constellation consists

W. I. Mansell

PISA. THE LEANING TOWER AND THE CATHEDRAL

shrine of San Donato at Arezzo. See M. Sauerlandt *Über die Bildwerke des Giovanni Pisano* 1911.

**Pisano, Niccolò** (1308-78). It. sculptor and architect, *b* at Pisa. He built the Santa Trinita at Florence, Santa Margherita at Cortona, pulpit of the baptistery at Cortona, pulpit of the cathedral at Siena, etc. See A. Schmarow *Italianische Kunst im Zeitalter Dürers* 1928.

**Pisano, Vittore**, called Pisanello (c. 1400-1456). It. painter and goldsmith of 15th century. He worked as a goldsmith at San Vigilio. His horses and other animals were especially fine. The London National Gallery has a panel by P. of St. Anthony and St. George with a vision of the Virgin and Child, but he is chiefly remembered for his medals. He worked on medals for the court of Mantua (1439), and executed portraits of many of the princes of his time, including Leonello d'Este (1444). See G. F. Hill *Pisanello* 1905.

of two fishes linked by a string attached to their tails. One is under the right arm of Andromeda, the other under the wing of Pegasus. It is *Astrubus* or *Pisces Austrinus*, a constellation situated S. of Aquarius, contains Coma but a remarkable star of the first magnitude and *Pisces Volans* now *Volans* (the flying fish) is one of Boreas S. constellations lying W. of Coma (q.v.).

**Pisciculture**, artificial breeding and rearing of fish for food and sport. The Egyptians, Greeks and Romans practised P. to the extent of fattening edible fishes in specially constructed ponds. They may have been familiar with the art of breeding fish artificially, but the knowledge was lost, if it existed, until rediscovered by a monk in the fifteenth century, who learnt how to hatch and rear trout in boxes in a running stream. Further discoveries in the middle of the eighteenth century caused great interest in the subject, but

not till a century later were the practical possibilities much realised and applied. Most fish produce ova in enormous numbers, but the proportion of young that in nature reach maturity is very small owing to the great delicacy of the ova and young fish, and also to their numerous enemies. It is the object of *P.* substantially to diminish this mortality, beginning with the shedding and impregnation of the ova, at any rate in the culture of the Salmonidae. Males and females are, when 'ripe,' placed in separate tanks through which water is running. A few females are caught in a landing net and one by one taken into the operator's hands and the ova expressed into a clean dry basin. When the artificial spawning is completed, a male is taken and the milt expressed into the basin amongst the eggs and then stirred by hand. A little water is added, and after about thirty min. the eggs are removed to the hatching boxes. Water which has passed through a filter-box containing three layers of gravel is run over the eggs to a depth of about 2 in. The trays are covered to exclude light in a temp. between 40° and 50° F. Incubation takes from forty days to three months, according to temp. and other conditions. The ova stand handling for the first day, and then must be undisturbed until the eyes are visible, when they may be packed and transmitted long distances. The young that emerge from the eggs are called alevins. Each has attached to it a large transparent umbilical sac, which contains the nourishment necessary for thirty or forty days. At the end of this period they begin to look for food, which, naturally, consists of minute crustacea, but is artificially supplemented by grated liver and other meat. During this stage, the most difficult period in *P.*, the water entering the hatchery is no longer filtered; in fact, every effort is made to provide water which contains an abundance of suitable food. Later they are removed to ponds, and in a well-managed hatchery from 50 to 80 per cent reach the yearling stage, after which losses are normally small. In coarse fish culture spawning is allowed to be done naturally, and the eggs hatch much more quickly, but require warmer water. Adequate protection of the ova and young is the chief factor in providing large numbers of these fish. Marine *P.* has in recent times received much attention, particularly in the U.S.A. See C. B. Hall, *Ponds and Fish Culture*.

**Piscina** (Lat., fish-pond, swimming-tank), originally a pond, tank, or cistern of any kind. In eccles. usage a small sink or perforated stone basin (fr. *cuvette*) in a niche S. of the altar, at which the water used for rinsing the priest's hands, the chalice, and other vessels is poured away after the celebration of Mass. They were rare in England till the thirteenth century.

**Pisco**, port of N. Peru, in the dept. of Ica, 130 m. S. of Callao and Lima. It is on the Pan-Am. Highway and is an outlet for agric. products. P. Pueblo remains an old-world Sp. colonial tn.;

P. Plaza is modern and industrial, and exports cotton, grapes, and wine from the Ica, P., and Chincha valleys. Pop. 5000.

**Pisek**, tn. in Bohemia, Czechoslovakia, cap. of a dist. of the same name, 28 m. N.N.W. of Budějovice. It has iron and copper foundries, and there are manufs. of wool, cotton, and musical instruments. Pop. 17,000.

**Pisgah** ('boundary') (modern Rās Siāghah), O.T. name of a mt. peak of Syria, Palestine, 2 m. from Jebel Neba (Mt. Nebo of the O.T.), 6 m. from Hesban (anct. *Heshbon*), E. of the N. extremity of the Dead Sea. It formed part of the range of Abarim (*q.v.*). See Num. xxi. 20, xxiii. 14; Deut. xiii. 49, xxxiv. 1.

**Pishin**, dist. of Baluchistan, Pakistan. Until 1878 it was part of S. Afghanistan; in that year it was ceded to Britain and remained in Brit. hands until the transfer of power in 1947. Area 2720 sq. m. Pop. 75,000.

**Pishpek**, see FRUNZI.

**Pisidia**, inland dist. of Asia Minor, lying N. of Lycia and Pamphylia. It was a mountainous region inhabited by a warlike people, who maintained their independence against the successive rulers of Asia Minor in anct. times.

**Pisistratides** (Πεισιστρατιδαι), name generally applied to Hippias and Hipparchus, sons of Pisistratus, but sometimes extended to mean the grandchildren, descendants, and near connections of Pisistratus (see Herod. viii. 52). Hippas succeeded his father, but Hipparchus apparently had some share in the government (see Thuc. i. 54-59). It was the latter who set up the busts of Hermes as milestones on the high roads. The conspiracy of Harmodius and Aristogeiton to eject these 'tyrants' is well known. Their plan miscarried, and only Hipparchus was slain, while they themselves lost their lives. Hippas was expelled a few years later, and finally fled to the Persian court, witnessing the defeat of the Persians at Marathon (490 B.C.). See HARMODIUS and ARISTOTELIS.

**Pisistratus** (Πεισιστρατος), famous Athenian statesman (c. 612-527 B.C.), 'tyrant' of Athens three times between 560 and 527. He was the son of Hippocrates, of Pylion descent, and a relative and friend of Solon. After the estab. of Solon's constitution disturbances broke out between the rival parties of the plain, the highlands (Diacrii), and the coast, Lycurgus, P., and Megacles the Alcmaeonid heading the three respectively. P.'s military abilities were displayed in the war with the Megarians and the campaign against Salamis (565). Having pretended that he had been attacked by his foes, P. had a bodyguard granted him, and, after increasing its number, was strong enough to seize the Acropolis (560). He was exiled (c. 554) by the combined forces of the plain and the coast factions, but quarrels then arose between these two and Megacles helped to restore P. (550). He was soon exiled again, but finally returned (540-39). His despotism was mainly of a mild kind and beneficial to the state. He ensured the election of members of his own family to high offices, such

as the archonship, but upheld Solon's democratic laws. He built fine temples, including those of the Pythian Apollo and of Olympian Zeus (the latter being completed by Hadrian), and was a patron of literature. The first collection of Homer's poems was said to be due to him. He probably also instituted the Greater Panathenaea. See Herodotus, i, v., vi.; Thucydides, iii.; Aristotle, *Ath. Pol.*, 13-16; Plutarch, *Solon*, 29-31; Moralia, 763, 805; Pausanias, 1-14; C. T. Seltman, *Athens*, 1924; and P. N. Ure, *Origins of Tyranny*, 1922.

**Pisolate**, see **OOLITE**.

**Pissarro**, Camille (1830-1903). Fr. painter, b. in Normandy. He was influenced by Corot and Millet, becoming one of the most notable of the Impressionist school, and establishing a close friendship with Monet. His landscape paintings were his finest work. See life by J. Rewald, 1946.

**Pissarro**, Lucien (1863-1944), Fr. artist, painter, and wood-engraver, b. in Osny near Pontoise, son of Camille P. (q.v.). Under his father's influence he began to draw at an early age. He went to work in Paris for a firm of Eng. fabric merchants, but was unfitted for such a life, and took a job working with hand-made plates for colour impressions. At the age of twenty in 1882 he left France and settled in London. At first he was employed with musical publishers, and continued to draw and paint. He lived with Phineas Isaacson, his uncle, whose wife was a half-sister of his father's. Then he took a studio and devoted himself to giving drawing lessons and to wood-engraving. Later he set up the *Eragry Press* (Eragry was the name of the vil. where his father was born) and produced finely printed vols. illustrated with his own woodcuts or engravings. In his art P. was a neo-impressionist, and with Sickert, Wilson Steer, and others helped to introduce Fr. Impressionism to London. He was also in touch with W. Morris and the Kelmscott Press. He blended the Fr. science of colour with an Eng. sense of design and was notable for his feeling for the Eng. countryside.

**Pistacia**, genus of small trees (family Anacardaceae) with pinnate leaves and panicles or racemes of small dioecious green flowers, some of which have yellow anthers and crimson stigmas. *P. vera*, the pistachio-nut tree, bears small oval nuts containing a green kernel, much used in India and elsewhere in confectionery, and also in pharmacy as a restorative. *P. lentiscus* is the mastic tree, yielding the mastic of commerce. *P. terebinthus*, the turpentine tree, yields Chian or Cyprus turpentine, which exudes from incisions made in the trunk. The trees are sometimes grown out of doors in favoured dists., but even there need protection in cold weather.

**Pisti**, see under **BOTANY: FLOWERS**.

**Pistola**, or **Pistola** (anct. *Pistoria*), walled tn. and episcopal see of the prov. of P. Italy, near the Ombrone, on a spur of the Apennines, 20 m. N.W. of Florence. Its twelfth-century cathedral has a fine

silver altar. P. contains also a natural hist. museum, an academy, public libraries, the Palazzo Pretorio (1367), the Ospedale del Ceppo (1277), and the Palazzo del Comune (1294). The chief manufs. are gun-barrels, firearms, and pistols, which are said to have derived their name from this tn., where they were first made. Cottons, woollens, silk twist, iron and steel goods, glass, leather, wine-flasks, paper, and musical instruments are also manufactured. Rock-crystals, called the diamonds of P., are cut. It has a good climate and is a favourite summer resort. Catiline perished in battle here (62 B.C.). P. was important in the Middle Ages, and suffered from the feuds of the Neri and Bianchi (1296-1301). It came under the rule of Florence (1352). In the Second World War sev. of the noted churches of P. were destroyed or damaged. Pop. 74,000.

**Pistol**. The word is of unknown origin. The weapon is one development of the early hand-gun, heavier (infantry) models of which were fired from the shoulder with the help of a crutch on which the barrel rested. Lighter hand-guns, known as petronels, were made for the use of cavalry who could only use one hand for fighting. The petronel also rested on a crutch which rose from the pommel of the saddle; it had a straight horizontal butt, the end of which was pressed into a boss in the centre of the rider's breastplate with his free hand. From this evolved the pistol, primarily, and for centuries, a horseman's weapon. Ps. formed the prin. armament of dragoons (q.v.) who carried a pair in holsters on either side of the saddle. These horse-pistols were of heavy calibre and sometimes double-barrelled. Only its great weight and bulk prevented the multi-barrelled P. with six barrels mounted round a central axis from being developed further. Examples are extant from the reign of Henry VIII. of this arm, the ancestor of the revolver (q.v.).

**Automatic Pistols** have the advantage of being less bulky and more easily and quickly loaded than revolvers which they have largely replaced for military purposes. But their more complex mechanism renders them more likely to jam. A magazine of six or eight rimless cartridges is slid into the butt from below and the rounds are pressed upwards by a spring. The barrel and chamber are likewise held forward in the barrel-casing by pressure of a spring, so that the first round must be loaded and the pistol cocked by pulling the barrel backwards. When the first round is fired the recoil drives the barrel backward, the second round is automatically forced up into the breech, and the spent round ejected. Well-known military makes are Mauser, Colt, Browning, Luger, Walther, and Beretta.

**Pistole**, name given to certain gold coins, formerly current in Spain, Italy, and sev. parts of Germany, but now obsolete. It was first used in Spain, and was then equivalent to about eleven old Fr. livres. From 1728 to 1772 it was

worth 17s. 1d. sterling, but it gradually decreased in value and was finally withdrawn.

**Piston**, see under GAS ENGINES; STEAM ENGINES.

**Pitaka**, divs. in the Pan Scriptures (q.v.), which consist of three Ps., baskets, or collections. The first, *Vinaya P.*, deals with discipline and the Mahavagga (a hist. of the founding of the order); the second, *Sutta P.*, or collection of teachings, contains poems, fables, stories of Gautama, or Buddha, and about Buddhist saints, etc.; the third, the *Abidhamma*, contains speculations and discussions on various subjects.

**Pitcairne**, Archibald (1652-1713), Scottish physician and poet, b. at Edinburgh. He studied divinity and afterwards law at the univ. there and then medicine in Paris, whence returning to his native city he obtained a very extensive practice. He held the professorship of medicine at Leyden for a year, and during that time the celebrated Boerhaave was among his pupils. P. was the author of *Dissertationes medicæ* (1701). He also ridiculed the prevalent Puritanism, the satire on Presbyterianism, *Babel* (1830), being considered his work. He also wrote the comedy *The Ass, the Hy, or Scotch Reformation* (1722, 1752). See C. Webster, *An Account of the Life and Writings of the celebrated Dr. Archibald Pitcairne*, 1781.

**Pitcairnia**, genus of perennial herbs and shrubs (family Bromeliaceæ) from tropical America. Some species bear flowers in racemes of great beauty, and narrow or sword-shaped leaves which often have spiny margins. All the cultivated species are easily grown in the stovehouse in well-drained pots. They must be freely watered while making growth.

**Pitcairn Island**, is. in the Pacific Ocean, nearly equidistant from Australia and America, 25° 3' S. lat., 130° 8' long. It is a Brit. colony and, actually, the first Brit.-acquired land in the S. Seas. It has an area of 2 sq. m. Its length is about 2½ m., its breadth 1 m., and the coast is very rocky and inaccessible in most parts. P. I. has a fine climate; the soil is generally fertile, producing coconuts, bananas, breadfruit, yams, pineapples, tomatoes, etc. Oranges and pineapples are exported. It was discovered by Capt. Carteret in his sloop *Swallow* (1767) who named it Pitcairn after the midshipman who sighted it. After his return to England Carteret pub. an account of the *Swallow's* voyage; and there was a copy of the book in His Majesty's Armed Vessel *Bounty* when she sailed from Spithead in 1788. The is. remained unoccupied until 1790, when it was occupied by the mutineers of the *Bounty*, under Fletcher Christian, first officer and leader of the mutineers, with some women from Otaheite (see *BOUNTY, MUTINY OF THE*). Christian and his fellow-refugees destroyed the *Bounty* so as to sever all links with the outside world. For eighteen years they remained undisturbed, when, in 1808, an Amer. vessel, *Topaz*, called at P. I. not knowing what land it was, on the chance of seals and fresh water; and her crew, to

their astonishment, found that they had stumbled on the solution of the mystery of the *Bounty's* mutineers. The Amer. ship found that only one white man, John Adams, an able seaman of the *Bounty* was left. He had trained the children of P. I. with the help of a Bible and a prayer book brought ashore from the *Bounty*. No regular gov. was estab., but assistance of some kind was given on the subsequent visits of Brit. vessels. Later the Pitcairners so throve and multiplied on their small but fertile is. that they were threatened with over-pop., and in 1831 they were removed to Tahiti. But the land of their maternal forbears proved uncongenial, and in the following year all returned to P. I. By this time the is. was being increasingly visited by whalers, followed before long by passenger ships for fresh vegetables. In 1856, the pop. numbering 192 were, at their own request, shipped to Norfolk Is. (where the youngest member of the party brought from P. I. actually survived until 1943). Forty of the party, however, soon returned, and at the beginning of the twentieth century the pop. numbered nearly 200 and in 1936, it was 202. But in 1949 this figure had fallen to 125, owing to the emigration of numbers of young people to Australia and New Zealand. P. I. was brought within the jurisdiction of the high commissioner for the W. Pacific in 1898, and in 1902 there were annexed to it the is. of Henderson, Ducie, and Oeno, occasionally visited by the Pitcairners for the collection of wood and other purposes. The Pitcairners elect their chief magistrate and Is. Council annually by popular vote of all the islanders over eighteen. The latest revision of the regulations for the internal gov. of the is. was passed by a general assembly of all the native-born inhab. in 1940. Educational facilities exist, but there are no medical services or any regular steamer service between New Zealand and P. I. The Pitcairners were given proof of the interest of Great Britain in their affairs by the visit of H.R.H. the duchess of Gloucester, in 1947. In 1949 the original P. I. Bible was returned to P. I. by the Connecticut Historical Society, the islanders being now all Seventh Day Adventists. See H. L. Shapiro, *The Heritage of the Bounty*, 1936, and Sir H. C. Luke, *The British Pacific Islands*, 1943.

**Pitch**, complex mixture of hydrocarbons, which is obtained as a residue from the distillation of coal-tar. It is also found naturally in lakes in Trinidad. At ordinary temps. it is a black substance, breaking with a conchoidal fracture, but on heating it forms a viscous fluid, which is used for caulking the decks of ships, in the preparation of varnishes, for cementing wood and metal work, for making asphalt (q.v.) and patent fuel, etc.

**Pitch**. The exact height (or depth) of any musical sound according to the number of vibration that produces it; also the standard by which notes, with the A above middle C as a starting-point, are to be tuned, a standard which determines at how many vibrations to the second that A

is to be taken, as well as every other note in relation to it. P. varied at different times and in different countries. Early in the nineteenth century it was gradually raised, especially by makers of wind instruments, to secure more brilliant effect, but with results dangerous to singers, and in England two Ps. were in use, the higher for orchestral performances and the lower classical or Fr. P. for church and purely vocal music. The new philharmonic P., with 439 vibrations per second at 68° F., is now in general use, even by military bands, which until 1927 used the old philharmonic P., which was slightly higher. The internationally agreed standard of P. is broadcast by the B.B.C. as the Third Programme tuning signal. It has a frequency of 440 cycles per sec. and corresponds to the note A in the treble clef.

**Pitch**, in engineering, distance between two successive windings of a screw measured in a direction parallel to the axis of the screw. The P. of gear-wheels is known as *circular P.*, i.e. the length of that part of the P. circle between the centres of two consecutive teeth. P. circle being an imaginary circle on a gear-wheel along which the *circular P.* is measured. The diameter of a gear-wheel is always the P. circle diameter unless otherwise stated. For variable P. in airscrews see AEROPLANES, *Structural Development*.

**Pitchblende**, or **Uraninite**, uranate of uranyl,  $U(VO_4)_2$ , generally occurring massive or botryoidal. It is a brownish or black solid with a greasy lustre (h. 5.5; sp. gr. 6.4-9.7), and when crystalline it forms cubic crystals. At Joachimsthal, Bohemia, uranate of soda is manufactured from it. Its chief value is for the uranium (q.v.) and radium contained, and it is obtained for this purpose from Cornwall, where it is associated with tin ores, from Saxony (Marienberg), Bohemia, and Norway (Kongsberg).

**Pitcher Plant** (*Nepenthes*), large genus and family (Nepenthaceae) of insectivorous shrubs found in E. tropical forests, with alternate leaves and midrib enlarged into a pitcher-shaped receptacle with a partly opened lid. The thick corrugated mouths of the pitcher produce sweet secretions which attract insects. These collect within and are digested by other glandular secretions. The Californian P. P., *Darlingtonia californica*, bears leaves in the form of erect trumpet-shaped tubes with a swollen hood at the top, in which is the opening to the pitcher. In the E. U.S.A. the side-saddle plant, *Sarracenia*, also bears insectivorous pitchers.

**Pitch Lake**, see under **PITCH**.

**Pitchstone**, name given to glassy rocks, which are characterised by a resinous lustre. Such rocks have a microcrystalline gravel mass, peculiar groupings of microlites (q.v.) being observable in microscopic sections. The crystallites contained are generally of ferro-magnesian minerals. Ps. break with a splintery fracture, are black or dark green in colour, and are found as intrusive dykes (Arran) and as contemporaneous sheets (Sculr of Elgg).

**Pitesol**, cap. of the prov. of Argeesh, Rumania, 70 m. W.N.W. of Bucharest on the R. Arges. Pop. 15,700.

**Pithecanthropus erectus**, remains of a man-like skeleton found (1891) by Eugène Dubois in some volcanic tufts of probable Pleistocene age, near Trinil, Java. The relics discovered were the roof of a skull, two molar teeth, and a femur, the abnormal form of which indicated that its possessor walked erect. The forehead was low, frontal ridge prominent, and brain capacity two-thirds that of the average man. The characteristics, in general, indicated a type between man and his more remote ancestry, which is supposedly not similar but an independent phylum. The name P. is from Gk. *pithekos*, ape, and *anthropos*, man. See also ANTHROPOLOGY; MAN.

**Pithiviers**, cap. of dept. of Loiret, France, 25 m. N.E. of Orleans. Saffron is grown, and it is famous for its cakes and honey. Pop. 6000.

**Piti**, see under GUAM.

**Pitlochry**, tn. in W. Perthshire, Scotland, on the R. Garry, 6 m. S.E. of Blair Athol, between Perth and Inverness, amidst picturesque scenery. P. is a health resort with hotels. There are important distilleries, and tweed-making is carried on. Pop. 2200.

**Pitman**, Sir Isaac (1813-97), inventor of the system of shorthand known by his name, b. at Trowbridge, Wiltshire. While teaching as a schoolmaster at Wotton-under-Edge, he pub. his *Stenographic Sound Hand*, and later gave himself up entirely to the work of spreading the system there propounded. In 1842 he commenced the *Phonetic Journal*, which he carried on until his death. P. was a strong supporter of spelling reform. He founded the publishing house which bears his name, and pub. books on shorthand and commercial and technical subjects. He was knighted in 1894. See lives by T. A. Reed, 1890, and A. Baker, 1908. See also SHORTHAND.

**Pitomaos**, com. in Jugoslavia, 3 m. from the l. b. of the Drave, and 50 m. from Varazd. Pop. 3000.

**Pitot Tube**, instrument designed to measure high velocities of running water, such as rivers. It consists essentially of an L-shaped glass tube, the horizontal arm being placed under the water, and a graduated scale to note how high the water rises in the vertical arm of the tube through the force of the stream. The velocity is found from the formula  $V = c\sqrt{2gH}$ , where H = height of water in the tube in feet,  $g = 32.2$ ,  $c$  = a constant depending on the type of tube, and V = the velocity of the water in feet per second. For pressure tube see under MANOMETER.

**Pitri** (Sanskrit *pitṛ*, father), in anct. Hindu mythology, a class of divine beings who dwell in celestial regions and received into their company the souls of the righteous dead. Later, they were divided into two classes, the original divine beings and the manes of deceased ancestors, who became semi-divine.

Pittscottie, Robert Lindsay of, see LINDSAY.

Pitt, William, the Elder, see CHATHAM, EARL OF.

Pitt, William, the Younger (1759-1806), Brit. statesman, b. at Hayes, Kent, was the younger son of Wm., first earl of Chatham (q.v.). He was educated at Pembroke Hall, Cambridge, and called to the Bar in 1780. He did not practise as a lawyer, however, but entered Parliament in 1781 as a supporter of Shelburne. His maiden speech, in favour of Burke's Bill for economical reform, on Feb. 26, delighted the House of Commons, and drew encomiums from the leading orators, Burke, Fox, and North all praising it enthusiastically. His ambition was great, and he decided that he would not begin at the bottom of the ministerial ladder. He declined a minor office under Rockingham,

WILLIAM PITT, THE YOUNGER

but became chancellor of the exchequer under Shelburne in 1782, being then twenty-three years of age. When Shelburne resigned early in the next year, the king offered P. the Treasury, but, tempting though the offer was, the young man, after some hesitation, declined to take office, as he could not then command the necessary support. A coalition ministry was then formed by North and Fox, but was defeated in Dec. on the India Bill, and then P., being still under five-and-twenty, became first lord of the treasury and chancellor of the exchequer. He had everything to contend against. His youth militated against him, and he was in a minority in the House of Commons. He held to office until he felt he had the country with him, and then had recourse to a general election (1784), when he obtained a great majority. He himself was returned for Cambridge Univ., which he represented for the rest of his life. He now devoted his attention to the finances of the nation, and introduced many wise measures, among which was the institution of a sinking fund for the reduction of the

national debt. When George III. became insane in the autumn of 1788, P. defeated the claim of Fox that the Prince of Wales had the right to be regent, and insisted that the regent could only be appointed by Parliament. He maintained a neutral attitude towards the Fr. Revolution but in 1793 France declared war on England, and then P. entered into alliances with many great continental powers, and aided the coalition with large grants for the hiring of troops. The Brit. Navy was successful in its battles, but the coalition suffered severely on land, and there was much dissatisfaction at home, where the mob clamoured for P.'s resignation. He was anxious to make peace, but, being unable to do so on honourable terms, vigorously prosecuted the war. He effected the union of Great Britain and Ireland in 1800, but in the following year resigned office owing to the opposition of the king to a measure of Catholic Emancipation. He was succeeded by Addington, whose administration he at first supported, and he spoke in support of the Peace of Amiens. When war broke out again in May 1803, it was evident that the Addington ministry could not prosecute it effectively, and a year later P. was again called to the helm. He formed a third coalition, but Spain joined France, and the allied forces could not make headway against the combination. P. struggled manfully, but the capitulation of Ulm broke up the coalition, and it is said that the battle of Austerlitz gave him his death-blow. He d. in 1806, his last words being 'Oh, my country! how I leave my country!' He was buried in Westminster Abbey; his debts were paid by the nation. It was the ambition of P. to be a peace minister, and to devote himself to domestic legislation, but it was his destiny from 1793 to be a war minister, and a war minister during a period of terrific conflict. The general opinion is that as a war minister he was not as great as his father, the earl of Chatham, but it is doubtful, taking the different circumstances into consideration, if he was in any degree his inferior. Though without the fire and personal charm of Fox, P. was an excellent orator and a sound debater. His sole aim was the improvement of the state of his country, and the maintenance of its prestige abroad, and to those ends he laboured all his days. See lives by Lord Stanhope, 1862; Lord Rosebery, 1911; and J. H. Rose, 1934; also *Letters to his nephew, Thomas Pitt afterwards Lord Camelford* (2nd ed.), 1804; W. S. Taylor and J. H. Pringle (eds.), *Correspondence, 1838-40*; J. H. Rose, *William Pitt and the Great War*, 1934; D. G. Barnes, *George III. and William Pitt*, 1939; E. Eyck, *Die Pitts und die Fox*, 1946; and Sir T. Lever, *The House of Pitt*, 1948.

Pitta, genus of brilliantly coloured songless passerine b. is typical of the family Pittidae or old-world ant thrushes. One species occurs in W. Africa and the others range from Australia to the Himalayas; one is common in Burma.

Pittacus (c. 650-569 B.C.), noted Gk.

statesman, philosopher, and poet, one of the 'Seven Wise Men of Greece.' He fought successfully against the Athenians, slaying Phrynon (608), and became ruler (*anagorastos*) of Mytilene and Lesbos (c. 589-579). He was a contemporary of Alceus and Sappho. See *Diog. Laërt.*; *Suidas*, *Pittacus*.

**Pittosporaceæ**, family of trees and shrubs. Some species of *pittosporum* are grown in the garden and greenhouse.

**Pitt-Rivers**, Augustus Henry Lane-Fox (1827-1900), Eng. soldier and archaeologist. He entered the army in 1845, served in the Crimean war, and rose to the rank of lieutenant-general, specialising in the design and evolution of weapons. Always interested in ethnology, he formed a splendid collection, illustrative of the development and progress of human invention, which he presented to Oxford Univ. On succeeding to the Rivers estates at Rushworth in 1880 he instituted numerous scientifically conducted excavations, which he described in four vols. *Excavations in Cranborne Chase* (1897-1898). He also wrote many articles in scientific journals. P.-R. laid the foundations of modern excavation technique with emphasis on accurate plans and reliables, the significance of stratification, the use of percussion to determine silted pits and ditches, and the great importance of common everyday objects. At Farnham, Dorset, is the P.-R. Museum, with scale models of his excavations, fine ethnographical collections, and prehistoric antiquities. See memoir by H. St. G. Gray, 1905.

**Pittsburg**, city of Crawford co., Kansas, U.S.A., 130 m. S. of Kansas city. P. has large zinc works, and also manufs. of metal ware, bricks, cigars, and earthenware. It was first settled in 1876, and incorporated as a city in 1880. Pop. 17,600.

**Pittsburgh**, second city of Pennsylvania and co. seat of Allegheny co., at the confluence of the Monongahela and Allegheny Rs. (which hereafter form the Ohio), 254 m. W. of Philadelphia. It has a harbour frontage of 54 m. It has a riv.-level altitude 702 ft. above sea, but the suburbs are on the heights above the city, which covers an area of over 35 sq. m. The finest building is the Allegheny co. court-house, which cost over \$4,000,000 to build. P. Univ., Duquesne Univ., and the Pennsylvania College for women are all at P. P. Univ. buildings consist of a forty-two-storey skyscraper, accommodating all the students in the univ. There are over 12,501 ac. of park, Schenley Park and Highland Park being the two largest, there being large zoological gardens in the latter.

P. is the focus of many trunk railways, including the Pennsylvania, the Baltimore and Ohio, the Erie and P., and the P., Cincinnati, and Chicago, as well as being an important riv. port, handling about 30,000,000 tons of goods each year. The 'smelters' and furnaces make the city a glare of light by night. A quarter of the entire output of pig-iron in the U.S.A. is from P., which is often called the 'Iron City.' There are large petroleum refineries and famous steel works. Prin.

manufs. are nails, rails, steel-plate, stone, and all kinds of electric machinery, for which it is noted; it is also a great ship-building centre. There is much interstate commerce by means of the Ohio R. In 1948 one of the greatest amounts of wealth in the U.S.A. was concentrated in P., in the hands of the descendants of A. W. Mellon. P. occupies the site of Fort Pitt, built in 1759 during the war with Pontiac, an Indian chief. Washington, prospecting in those parts in 1753, saw the suitability of the spot; a stockade was built, but torn out by the Fr., who then here built their Fort Duquesne (1754), in marching on which Braddock was so heavily defeated. With Pitt Prime Minister, the Brit. in 1758 again advanced on Fort Duquesne. The Fr. blew it up and set fire to it. Gen. Forbes announcing success headed his letter 'Fort Duquesne or now Pitt's Borough.' After the opening up of N.W. ter. in 1785, the growth of P. was rapid. It is planned to give P. a new centre and the undertaking is to be called the 'Gateway Center,' because P. is a gateway to the W. The present buildings in an area of 23 ac. of the triangle, two sides of which are formed by the Allegheny and Monongahela Rs., will be demolished, and in place of some of them there will eventually arise nine skyscrapers, and three of these, at a cost of \$50,000,000, are to be built by 1952. Part of the plan is to build on only 20 per cent of the acreage and to make parks of the remainder, thus getting rid, the architects say, of the 'strait-jacket of 60-ft. streets and 200-ft. city blocks.' The Equitable Life Assurance Company of New York has agreed to help to finance the undertaking. Pop. 672,000.

**Pittsfield**, city in Berkshire co., Massachusetts, U.S.A., on the Housatonic R., 150 m. W. of Boston. It has manufs. of woollens and silks, electrical goods, etc. Pop. 50,000. See Smith, *History of Pittsfield*, 1876.

**Pittston**, city in Luzerne co., Pennsylvania, U.S.A., in an anthracite coal dist., on the Susquehanna R., 10 m. S.W. of Scranton. It has manufs. of machinery, flour, hosiery, and silk. Pop. 19,000.

**Pituitary Body**, or *Hypophysis Cerebri*, small reddish vascular body about the size of a pea; it is situated at the base of the brain, embedded in a cavity of the skull known as the *sella turcica*. It consists of two main portions, the anterior lobe, derived from the embryonic mouth cavity, and the posterior lobe, arising as a downgrowth from the brain. The P. B. is an important ductless gland (endocrine organ) secreting many hormones which influence other parts of the body. The secretion of the anterior lobe contains hormones which stimulate the thyroid, parathyroid, and adrenal glands, as well as the sex organs, and the mammary glands (*prolactin*). One anterior lobe hormone is concerned in the regulation of growth; deficiency of this substance is seen in midgeets, whilst excess causes gigantism (in adolescence) or acromegaly (in adults); the latter condition is characterised by overgrowth of bones in the

extremities and the face, the nose and lower jaw becoming especially prominent. The hormones secreted by the posterior lobe are concerned in the regulation of water balance in the body and also cause the contraction of unstriated muscle, including that of the uterus; hence an extract of this lobe is useful in childbirth. Removal of the posterior lobe in a frog causes the skin to become pale, showing that one of the hormones is responsible for expansion of pigment in the pigment cells (melanophores), with consequent darkening of the skin. Without the P. B. life ceases within a few days.

**Pit Villages.** pits dug out in the earth usually in circular form. The pits were roofed with clay or turf, or skins, raised up from the surface of the ground by a conical arrangement of poles, the sifted up holes for which can often be traced. Pit dwellings of the Mesolithic period, the earliest known in Britain, have been excavated near Farnham, Surrey, and in the Colne valley, Essex. Examples dating in the Neolithic period are recorded in Sussex; others were found under round and long barrows in Yorkshire. Many structures described as pit-dwellings were in fact underground storage pits for grain. They have been recognised in villa and hill-forts of the Early Iron Age. From the number and capacity of these sites, archaeologists have been able to assess the yield and acreage of the contemporary fields.

**Pit Vipers.** see RATTLESNAKES.

**Pityriasis** (Gk. *πυρρος*, bran), skin disease characterised by the desquamation of branny particles. *P. Seborrhoea capitis* is marked by loss of hair or lack of lustre, constant itching, and the shedding of dry or fatty scales from the surface of the scalp. It leads to baldness, at least in some individuals; 1 per cent to 2 per cent sulphur salicylic ointment forms the best dressing. *P. circinata* or *marginata* is characterised by the formation of pink spots on the limbs and trunk, with fever and itching. *P. rubra* is a chronic inflammatory disease, beginning with deep red patches, which gradually coalesce until the whole body is involved; there is usually a fatal ending. *P. rosea* commences as a rosy-red 'herald patch,' about the size of a shilling, on the trunk, and is followed by a generalised eruption of pink spots, which do not itch. It usually clears up in a few weeks without treatment. Sometimes it is mistaken for secondary syphilis. *P. versicolor* or *Tinea versicolor* is characterised by brownish patches of various sizes, itching, and exfoliation of skin. It is due to the presence of a vegetable parasite, *Microsporon furfur*, which invades the hair follicles. Potassium iodide ointment or mercurial ointment should be applied.

**Piura:** 1. Cap. of the dept. of P., Peru, 26 m. from the coast, and 80 m. S.E. of Cape Blanco. It was the first permanent settlement made by Pizarro. It is connected by a railroad with the port of Payta (60 m.) and is an important cotton and petroleum market. Catacaos, 12 m. away, has a large manuf. of Panama hats.

P. is on the air route from Cristobal to Santiago. Pop. 30,000. 2. Dept., has an area of 15,190 sq. m.; is mountainous in the E. and desert in the W. Cotton is grown, and petroleum, salt, sulphur, and soda found. Pop. 491,500.

**Pius**, name of twelve popes:

**Pius I.** *Saint*, was pope from c. 140 to 154. During his pontificate the heretics, Valentinus and Marcion, visited Rome. P. may have been b. a slave; his pontificate was one of energetic opposition to the Gnostics.

**Pius II.** (1458-64), Aeneas Sylvius Piccolomini, b. at Corsignano, was made cardinal by Calixtus III. in 1456, and elected pope in 1458. He was interested in eccles. reform and had a scheme of procedure drawn up by Nicholas of Cusa and Dominic de Dominicis (see life by C. Ady, 1913). The great object of his pontificate was the expulsion of the Turks from Europe, but the period of crusading zeal was over, and the discord between the various powers prevented any united action against the Turk. P. at last decided himself to head the crusaders, but d. on the way to Ancona.

**Pius III.** (1439-1503), Francesco Todeschini Piccolomini, b. at Milan, reigned for only four weeks (Sept.-Oct. 1503) after planning general reform of the Church.

**Pius IV.** (1499-1565), Giovanni Angelo Medici, belonged to the family of the Medici of Milan. He was elected pope in 1559. His main energies were devoted to carrying through the final sessions of the Council of Trent and his name has ever since been connected with the Profession of Faith which he issued after the council, and to which all holding an eccles. office must give assent.

**Pius V.** *Saint* (1504-72), Michele Ghislieri, b. in Lombardy. Becoming pope in 1566, he was notable for his zeal against heresy and for the vigorous manner in which he promoted and directed the reformation of morals within the Church, and the campaign directed towards recovery of the ground lost at the Reformation. From him came the excommunication of Elizabeth in 1570, and to him was largely due the victory over the Turks at Lepanto in 1571. His pontificate has been described as the most brilliant of the Catholic revival; but some historians have questioned the worth of his methods. He was canonised in 1712.

**Pius VI.** (1717-99), Giovanni Angelo Braschi, b. at Cesena. He became pope in 1775 and carried on an energetic campaign against Gallicanism and the 'Josephism' of the Emperor Joseph II. During the Fr. Revolution he refused to accept the *Constitution civile du clerge*, and aided the allies against the republic. As a result Napoleon attacked the papal states and forced P. to accept the Truce of Bologna (1796). In 1798 the pope was removed from Rom. and d. at Valence. P. was a great patron of the arts, but many of his schemes were halted by the revolution.

**Pius VII.** (1740-1823), Luigi Chiaramonti, b. at Cesena. A Benedictine, he

was elected pope in 1800, devoted most of his energies to a settlement with France, and concluded in 1801 the famous concordat with Napoleon I. Later relations with Napoleon became strained. Napoleon annexed the papal states and was thereupon excommunicated. P. was then arrested by Fr. troops and imprisoned at Fontainebleau. He was released on the emperor's fall and returned to Rome. P. re-established the Society of Jesus.

**Pius VIII.** (1761-1830), Francesco Xaviero Castiglioni, b. at Cingoli, carried through no works of importance during his brief pontificate (1829-30), which was notable, however, for the emancipation of the Eng. Catholics.

**Pius IX.** (1792-1878), Giovanni Maria Mastai-Ferretti, b. at Sinigaglia and elected pope in 1876, he marked the beginning of his pontificate by reforms of a liberal nature. He promulgated a constitution providing for a bi-cameral parliament (1848), which, however, really left untouched the greater problem of popular representation in the papal states. The constitution was prevented from being carried into effect by the revolt of 1848, when the popular enthusiasm for national It. unity overwhelmed all other aspirations. This enthusiasm culminated in bitter hostility towards Austria, but P. proclaimed his neutrality, with the result that two years later he was forced to leave Rome and take refuge in Gaeta, only returning with the assistance of foreign arms in 1850, embittered and reactionary in sentiment. Administration in the papal states now became unprogressive, their very existence being dependent on the continued support of their protectors, France and Austria. This protection, however, was lost after Napoleon had come to an arrangement with Cavour, with the immediate consequence that the pope lost the greater part of his dominions. The one barrier to national unity now remaining, the states of the Church, was removed by 1871 when the papal states were absorbed in United Italy, though P. never accepted the incorporation of the papal states and of Rome into the It. kingdom. As head of the Church P. supported the principles of the Ultramontane party and worked effectively towards that party's eventual success (see ULTRAMONTANE). His pontificate is memorable for the proclamation by the bull of Dec. 8, 1851, of the dogma of the Immaculate Conception of the Virgin Mary; for the Vatican Council proclamation in July 1870 of papal infallibility and the universality of the papal episcopate; and for the restoration, in 1878, of the hierarchy in England. See lives by A. O. Legge, 1875, and T. A. Trollope, 1878.

**Pius X.** (1835-1914), Giuseppe Melchiorre Sarto, b. at Riese. He became pope in 1903 and was a great reforming pope, as his motto *instaurare omnia in Christo* implies. He reorganised the Curia, set up a commission for the revision of the Vulgate, modified the Canon Law, revised the Breviary, promoted the

Gregorian Chant, condemned Modernism, and enjoined earlier and more frequent reception of Communion. He beatified Joan of Arc in 1909. P. also took steps to bring about the reconciliation between the papacy and the It. kingdom which P. XI. was to complete. Since his death there have been numerous petitions for his beatification. See lives by F. A. Forbes, 1918, and R. Bazin, 1939.

**Pius XI.** (1857-1939), Achille Ratti, b. at Desio, in the diocese of Milan. He studied at Lombard College, Rome, and at the Gregorian Univ. he obtained the triple doctorate in philosophy, theology, and law. From 1882 to 1886 he taught theology at the episcopal seminary in Milan. In 1886 he was at the Ambrosian Library and then librarian at Milan. He was an alpinist and made the first It. traverse of Monte Rosa from Macugnaga (1889). In 1911 he was called to Rome to administer the Vatican Library. He became apostolic nuncio to Poland, 1918, and in 1919 was made titular archbishop of Lepanto. Two years later he was created archbishop of Milan and a cardinal, and was thus only a cardinal of one year's standing when he was made pope (1922). He was a brilliant scholar, and greatly extended the diplomatic relationships of the Holy See. His most outstanding achievement was the solution of the 'Roman Question' in 1929 by the Lateran treaty (q.v.), which restored the temporal power of the papacy and established a concordat between the Church and the It. Gov. In a famous letter, *Non abbiamo bisogno*, he protested in 1931 against the pagan worship of the state in Fascist Italy, and the denial in matters of education of the natural rights of the family as well as the supernatural rights of the Church. In a yet more famous letter, *Mit brennender Sorge*, in March 1937, he protested against the violation of natural law and justice in Nazi Germany, and reminded Hitler that man as a person possesses rights which must be preserved against every attempt by the community to deny, suppress, or hinder their exercise. In the same week, in a letter *Divini Redemptoris*, he condemned atheism as 'a gospel full of errors and illusions' which destroyed the foundation of social order and denied the rights, dignity, and freedom of human personality. See life by W. and L. Townsend, 1930; also W. Solzhachel, *Pius als Verleider der menschlichen Persönlichkeit*, 1939.

**Pius XII.** (b. 1876), Eugenio Pacelli, b. near Viterbo. From 1904 to 1914 he was prof. of eccles. diplomacy at Rome. In 1917 he became titular archbishop of Sardes. He went as nuncio to Munich in 1917, and to Berlin in 1920, negotiating the concordat with Bavaria in 1924. He was made a cardinal in 1929, and became secretary of state the following year. He was P. XI.'s chief adviser in the latter's anti-Nazi policy, and his election as P. XII. on P. XI.'s death (1939) was interpreted as implying a continuation of the Vatican's anti-Nazi attitude. P. made many vain efforts to prevent the Second

World War by offers of mediation. In Dec. 1939 he denounced 'premeditated aggression' and 'contempt for freedom and human life from which originate acts which cry to God for vengeance,' and he made continual efforts to help Catholic and non-Catholic war victims on both sides. He attempted to prevent Mussolini from driving Italy into the Second

Associated Press

POPE PIUS XII.

World War, and after the close of fighting made efforts to aid the re-estab. of religion in Germany. He has continually and strenuously opposed the eccles. policy of Communist countries in E. Europe. See O. Walter, *Pius: Leben und Persönlichkeit*, 1939, and J. F. Dianeen, *Pius, Pope of Peace*, 1939.

**Pix, Trial of the, see PRX.**

**Pixy, or Pixie**, name given to one kind of fairy in Devon and Cornish folk-lore. The word is by some considered to be the same as 'pucksy', the diminutive *sy* being added as in Betsy or Topsy. 'Pisgy' is only P. transposed. Mrs. Bray derives the word from 'pygmy.' In Truro moths, which were regarded by some as departed souls, by others as faunes, were called 'pisgies' (cf. *ψυχή*, which is both 'soul' and 'moth'). Ps. were believed to kidnap children and to lead travellers astray, like will-o'-the-wisps, whence the phrase 'pixy-led.' In fairy mythology everything that is done elsewhere by fairies, bogbarts, or similar beings is done in Devon by Ps. According to Hunt the 'piskie' is a 'most mischievous and very unsociable sprite' and his favourite fun is to entice people into the bogs by appearing like the light from a cottage window, or as a man carrying a lantern. He partakes, in some respects, of the character of the Cornish

'spriggan.' But the P. is evidently a merry type of fairy, for to 'laugh like a Piskie' is or was a popular saying. See T. Keightley, *Fairy Mythology*, 1828; Mrs. A. E. Bray, *Traditions, Legends, Superstitions, and Sketches of Devonshire*, 1838; and H. Hunt, *Popular Romances of the West of England*, 1865, 1923.

**Pizarro, Francisco** (1478-1541), discoverer and conqueror of Peru, the natural son of Gonzalo P., an officer who served with great distinction under *el Gran Capitán* in the Neapolitan wars, b. at Truxillo. In early life he became a soldier and went to America. Among other expeditions, he took part in those of Ojeda and Nuñez de Balboa. When he had already served for fourteen years he joined Hernando de Lugo and Diego de Almagro in a project for extending the Sp. conquests along the S. coast. In 1524 he sailed from Panama with a single ship and about 100 men, leaving Almagro to follow with reinforcements as soon as possible. The expedition was not successful, and P. returned in 1528 to Panama, and then he returned to Spain. Here he got himself appointed governor over all the country to be discovered, with supreme authority in all matters. The new expedition started in 1531, and P. was now completely successful. Peru was at that time divided by a civil war between the two brothers Atahualpa and Huascar, and of this full advantage was taken. Almagro passed on to Chile, but a quarrel which arose between him and P. led to his execution in 1538. His son then formed a centre of dissatisfaction for the many who were dissatisfied with the conquistador's rule, and a party of these ultimately assassinated P. in 1541. See W. H. Prescott, *History of the Conquest of Peru*, 1889, and P. Shay, *Incredible Pizarro, Conqueror of Peru*, 1932; also life by L. Baudin, 1930.

**Pizzicato**, term used in music composed for stringed instruments to denote that the strings are to be plucked with the fingers as in a harp instead of sounded with the bow. It was first employed by Monteverde (1568-1643).

**Place, Francis** (1771-1854), Brit. reformer, b. in London, was a tailor there, but from an early age was interested in political affairs. He took an active part in securing the return of Sir Francis Burdett for Westminster in 1807, and became on intimate terms with Robert Owen, Mill, Bentham, and Hume. He issued many pamphlets, and left an autobiography, not yet pub. It was largely P.'s agitation which brought about the repeal of the Combination Act in 1824; but after the passing of the Reform Bill in 1832 his political influence declined. See life by G. Wallas, 1898.

**Place-names, see under NAMES.**

**Placenta, or After-birth**, structure which unites the foetal mammal to the womb of the mother until birth, in which foetal and maternal blood circulate, so establishing a nutritive connection between them. The connection is, however, merely by diffusion: there is no actual intermingling of foetal and maternal blood. The P. is

essentially mammalian, but is not found in egg-laying monotremes, and is only rudimentary in marsupials, which bring forth their young very imperfectly developed, after a very short gestation. In all other mammals it occurs as a double vascular sponge, which enables the fetus to obtain nourishment and oxygen from the blood of the mother, and to remove its waste (excretory) products. A somewhat similar structure occurs in two cartilaginous fishes and two lizards. The P. commences from the allantois (*q.v.*), which grows out into the space between the inner (amnion proper) and the outer (subzonal membrane) folds of the amnion (*q.v.*). The allantois unites with the subzonal membrane, and from this united area (true chorion) vascular villi grow out into crypts in the uterine wall. Simultaneously a part of the uterine wall becomes modified into a spongy vascular tissue. Thus the P. consists of two parts, the maternal, or the modified portion of the uterine wall, and the embryonic, or that part of the allantois fused to the subzonal region which gives off villi, and therefore a more or less intimate union is formed between the embryo and the mother. The embryonic part of the P. is naturally shed at birth, and in some cases the maternal part is also discharged. In the latter case the placenta is said to be deciduate and when only the embryonic part comes away, then it is said to be in deciduate. Of in deciduate placentations there are two varieties: (1) diffuse, as in lemurs, cetacea, and ungulates (except ruminants), when the villi are uniformly scattered over the embryonic sac; and (2) cotyledonary, as in ruminants, when the villi occur in patches. Of deciduate placentations three types may be noted: (1) zonary, as in elephants, carnivora, etc., when the villi form a band around the embryo; (2) discoidal, as in rodents, bats, and insectivores, when the villi form a disk; and (3) meta-discoidal, as in monkeys and man, when the villi are first diffuse or scattered, and afterwards collected into a disk. See ALLANTOIS, AMNION, FETUS, MAMMALS, etc.

Placenta, or Placenza, see PIACENZA.

Placenta, seaport of Newfoundland, at the E. side of P. Bay. Pop. 2,000.

Placer Deposits, see under MINING.

Placitum Regium, i.e. royal consent, term used to denote the approbation by a civil ruler of papal or eccles. enactments by which they acquire binding force within his territory. If this approbation is given by the ruler himself it is called an exequatur (i.e. let him act), if by a subordinate it is a P. R.

Placid Fishes, see ELASMobranchii.

Plagioclase, general name given by petrographers to the triclinic felspars, which may be regarded as mixtures in various proportions of albite (soda-felspar) and anorthite (lime-felspar). Oligoclase (soda-lime) and labradorite (lime-soda) are P. felspars, the latter showing a peculiar iridescence. Under the microscope the crystals show a fine parallel lineation, which indicates polysynthetic twinning and distinguishes them from

orthoclase. In polarised light P. shows grey and yellow colours, the twinning bands being clearly seen. P. is a characteristic constituent of basic and sub-basic igneous rocks, but also occurs as an accessory in the more acid rocks. On weathering these felspars decompose into kaolin, calcite, prehnite, and zeolites.

Plague, in general, any fatal epidemic disease. The modern application of the term is, however, restricted to that disease also known as bubonic (*q.v.*) and Oriental P. P. which is due to the presence of a specific micro-organism, *Bacillus pestis*. Although bubonic P. is usually associated with the formation of buboes, or inflamed lymphatic glands, there are three varieties recognised, in two of which no such manifestations are to be observed. In the variety which is specifically known as bubonic the most prominent symptoms are, in the early stage, headache, delirium, sleeplessness, and high temp.; constipation is usually an accompaniment, but it may be followed by diarrhoea in severe cases. The characteristic symptom is, however, the appearance of the buboes, which usually occur on the second day. They most commonly appear in the groin or in the armpit, and tend to suppurate with sloughing of the skin, though this should be anticipated by surgical measures. The lymphatic glands remaining become swollen the liver, spleen, and kidneys become enlarged, the lungs are engorged, and the tendency is towards collapse through the general congestion and oedema. The pneumonic variety of P. is accompanied by all the characteristic symptoms of broncho-pneumonia. The course of the disease is rapid and the chances of recovery small. Unless the disease is prevalent, its identification depends upon the discovery of the bacillus, which is contained in the sputum. The third, or septicemic, variety bears the general symptoms of the bubonic variety with the exception of the presence of buboes. The lymphatic glands are enlarged, but without the effect on the surrounding tissues observed in bubonic cases. The condition almost invariably terminates with death in a few days, after acute delirium and extreme prostration.

The nature of the disease known as P. has been investigated with some success during modern times, and although no specific cure can be said to have been elaborated, the adoption of precautionary measures is likely to restrict the area of its incidence considerably. The hist. of P. epidemic appears to point to the fact that the bacillus is operative in quite a small area as compared with the widespread attacks of earlier times. P. of the specific bubonic type was undoubtedly known in Europe and N. Africa in the sixth century, and the series of epidemics known as the Black Death in the fourteenth century appears to have consisted mainly, at any rate, of P. visitations. Observers of the time trace the origin of the Black Death (*q.v.*) to travellers from the E., probably China. By 1348 practically the whole of Europe was involved, and it is calculated that one-fourth of the

pop. of Europe, that is 25,000,000 people, perished in these epidemics.

In 1894 the *Bacillus pestis* was identified by Kitasato, and subsequent investigators have demonstrated that rats may be attacked, and that infection may be carried to man by means of the rat flea, which may attack human beings when rats are scarce. In 1910-11 septicaemic and pneumonic P. made its appearance in Manchuria; in this epidemic the infection seems to have been conveyed by marmots, which are trapped for the sake of their fur. The influence of animal infection seems now to be well estab., and precautionary measures aim at the elimination of this danger. Inoculation by

early in the year, producing an enormous number of buoyant eggs.

Plaid, see HIGHLAND DRESS and TARTAN.

Plain, geographical term applied to a level surface of land at a low elevation from the sea. Extensive tracts of level land at a high altitude are usually called plateaux or table-lands, but in certain cases, such as the Ps. E. of the Rockies, where the elevation from sea level to a great height is gradual, the term 'plain' is retained. The most characteristic Ps. are those which extend over the basin of a large riv., and are caused by erosion and deposition. Of such a kind may be noted the P's. S. of the Himalayas forming

Bibliothèque Royale de Belgique: MS. 13076-7, f. 24.

#### PLAGUE: THE BLACK DEATH

Hastkine's fluid procures protection in a majority of cases, and this method is employed in connection with Indian hospital staffs. As the period for which immunity endures is somewhat short it is hardly practicable to make a widespread use of inoculation. See D. Defoe, *Plague in London*, 1665, 1886; T. Dekker, *Plague Pamphlets* (ed. Wilson), 1925; A. M. Campbell, *Black Death and Men of Learning*, 1931; *Present Remedies against the Plague*, 1603 (News No. 62, 1665. Ed. Barratt), 1933; and A. Praviel, *Peste de Marseille* (1720), 1937.

Plaice (*Pleuronectes platessa*), valuable flat fish which is abundant around Brit. coasts, and is taken by the trawl. The mouth is small, the scales smooth and minute; the colour above varies from brown to black with bright red or orange spots and is white beneath. The eyes are on the right side. The lateral line is nearly straight. The average weight is about 3 lb., and though 15 in. is about the average length, specimens twice as large are sometimes caught. The female spawns

the basin of the Ganges, the Ps. of the Mississippi, Mesopotamia, the Rhine, etc. Ps. may also be due to denudation, such as the sandy wastes of Arabia, and the desert of Sahara in N. Africa. Large tracts of comparatively level land, only broken here and there by cliffs or low hills, are often called by various names, such as the prairies of N. or the pampas of S. America and the steppes of E. Europe.

Plainfield: 1. City in Union co., New Jersey, U.S.A., 24 m. W.S.W. of New York city. It has manufs. of printing presses, machine tools, silk and cotton goods. It is the headquarters of the Seventh Day Baptists. Pop. 37,500. 2. Tn. in Windham co., Connecticut, U.S.A., 10 m. N.E. of Norwich; it has manufs. of cottons, woollens, and yarn. Pop. 7600.

Plain Song, Plain Chant, or Gregorian Chant, sometimes known also as Canto fermo (q.v.), system of music used chiefly in the churches of the Rom. Catholic communion for the greater part of the liturgy. In the early Church there were

sev. forms of P. S., but the Rom. form gradually supplanted the others and acquired the name of Gregorian Chant on account of the tradition that it was systematised and perfected by St. Gregory the Great (590-604). In the eighteenth century there grew up a practice, particularly in France, of introducing grace notes and passing notes into the P. S. This was done *extempore* by the priest and in time led to textual corruptions, which were, however, swept away by the official adoption, under decree of Pius X., of the P. S. version pub. by the Benedictine monks of Solesmes, who photographed numbers of MSS. in the European libraries, collated them and set the text according to the weight of MS. evidence for any particular version. With the Catholic revival within the Anglican Church P. S. has been adopted in a large number of churches. See also NOTATION.

**Plains of Abraham**, see ABRAHAM, PLAINS OF.

**Plaintiff**. In law the P. is the party who sues in a civil action, the party who is sued being the defendant. In Scotland the parties are styled 'pursuer' and 'defender' respectively. The term P. is not used in reference to criminal proceedings, the analogous party being called the prosecutor, or, impersonally, the Crown or the prosecution, where the proceedings are taken in the name of the Treasury.

**Planarian**, group of non-parasitic flat worms of the subdivision Turbellaria which, with Trematoda and Cestoda, comprise the group Platyhelminthes. They are usually small, flat, soft creatures, common both in fresh water and in the sea, where they may be found under rocks and stones in pools. Some of them are brilliantly coloured, and a few tropical forms are sev. in. long. A common fresh-water P. is black, and may often be seen like a drop of black sealing-wax on the leaves of aquatic plants. It feeds on insects, small molluscs, and lower organisms. The mouth is on the under side of the body; the skin is furnished with the protective vibrating hairs or cilia, whence the name Turbellaria is derived. Ps. multiply sexually and also by div. From them the parasitic Trematodes (flukes) appear to be derived.

**Planck**, Max Karl Ernst Ludwig (1858-1947), Ger. physicist, b. at Kiel. He was the son of a prof. of constitutional law who was a joint author of the Prussian civil code. He was educated at Berlin and Munich Univs., and became assistant prof. at Kiel in 1885. In 1892 he was appointed prof. of experimental physics at Berlin, and from 1913 to 1914 he was rector of Berlin Univ. P. received the Nobel prize for physics in 1918, was made a foreign member of the Royal Society in 1926, and was awarded the Copley medal in 1929. He was invited to England in 1946 for the Royal Society's celebrations on the Newton tercentenary. Kirchhoff, under whom P. had studied, had shown that, in an enclosure where all the objects were at the same temp., the heat radiation was divided between different parts of the spectrum in a way that was independent

of their nature. P. set himself to discover the formula relating the energy of particular wave-lengths with the wave-lengths and temp., using as a guide the accurate measurements made by Lummer and Pringsheim. Thus in 1900 P. initiated the quantum theory (*q.v.*) now one of the foundations of physics, with applications in nearly every branch of the subject. P.'s works include *Hauptsätze der mechanischen Wärmetheorie* (1879); *Gleichgewichtszustände isotropischer Körper* (1880); *Prinzip der Erhaltung der Energie* (1887); *Grundrisse der allgemeinen Thermochemie* (1893); *Vorlesungen über Thermodynamik* (1897); *Vorlesungen über die Theorie der Warmestrahlung* (1906); *Einführung in die Theorie der Elektrizität und des Magnetismus* (1922); *Physikalische Rundblicke* (1922); *Die Ableitung der Strahlungsgesetze* (1923); *Das Weltbild der neuen Physik* (1929); and *Wege zur Physikalischen Erkenntnis* (1933). See H. Hartmann, *Max Planck als Mensch und Denker*, 1938.

**Plane**, carpenter's cutting and surface-smoothing tool, of which there are many varieties according to the nature of the surface they are required to produce or some peculiarity of construction: (1) Ps. for producing smooth surfaces of indefinite width; (2) Ps. used to form P. surfaces of definite and usually narrow width; and (3) Ps. designed to produce curved or moulded surfaces.

**Planing Machine**.—Planing machines for wood-working are of various kinds, which may be classified into fixed-knife machines having the same action as a hand P. and used for producing a smooth surface on small stuff; and rotary block machines, of which there are two types, surface-planers and panel-planers or thicknessing machines. These latter are used to reduce boards or pieces to an even thickness ready for dressing to shape.

**Plane**, or *Platanus* small genus of trees (family Platanaceae) with large leaves and globular or button-like catkins, the female florets being followed by burr-like nuts. The bark of the trunk and main stems flakes off annually in rectangular scales, and this habit and the smooth polish of the leaves cause the harder species to be excellently suited for culture in smoky towns. The so-called London P. (*P. acerifolia*) has sycamore-like leaves, and many fine specimens grow in the London squares. *P. orientalis*, the oriental or common P., is a native of the Levant. It has a rounded outline, and the deeply five-lobed leaf has a wedge-shaped base. Some fine and massive specimens exist in England. *P. occidentalis*, the W. P., button-ball or button-wood of N. America, has less deeply divided leaves and a looser outline. It is not sufficiently hardy for successful culture in Britain. The timber of the P. is hard, tough, and fine grained, and has many special uses.

**Planetarium**, mechanical device for showing the orbital and rotatory movements of the prin. bodies of the solar system and also of the stars. See ORRERY.

**Planetoids**, see ASTEROIDS.

**Planets** (Gk., wanderers) were named to distinguish them from the stars, 'fixed' in

that stars keep their relative configuration. The ancients counted seven, including the Sun and Moon, Mercury, Venus, Mars, Jupiter, and Saturn. The Sun and Moon are not so reckoned now, but others shown in the table have been added, including the Asteroids (*q.v.*). All the planets revolve round the sun in elliptical orbits, those whose orbits are within that of the Earth are *inferior*, those without, *superior*. P. Mercury, Venus, and Mars are also classed as 'terrestrial,' being comparable in size, density, and geological stage with the Earth; the others, except Pluto, being larger, less dense, in an earlier stage. The inferior P. show phases like the Moon, appear to 'oscillate' across the heavens, i.e. their apparent motions are direct, retrograde, or stationary (as are those of the superior planets); they sometimes 'transit' at inferior conjunctions; are

of the figure is therefore the area generated by the rod to which the tracer is attached. This may be expressed by reference to the roll of the wheel mounted on the tracer rod and the angle through which the wheel turns. In general this angle is  $2\pi$ , as the wheel returns to its original position when the boundary of a closed figure has been described, so that the amount of rolling of the wheel gives a measure from which the area of the figure can be calculated or read off by reference to a scale.

**Plankton** (Gk. *πλαγκτος*, wandering), name given by Victor Hensen (1887) to plants and animals possessed of little or no means of independent locomotion and found floating or drifting in water. Most P. organisms are colourless or faintly bluish, inconspicuous, gelatinous, and transparent. Marine P. is much richer than fresh-water P. in both kind and

Name	Mean Distance from Sun (million miles)	Diameter (miles)	Velocity (m. per sec.) at mean distance from sun	Satellites
Mercury	36.0	3,000	29.7	None
Venus	67.2	7,600	22.0	None
Earth	92.9	7,927 (E), 7,900 (P)	18.5	1
Mars	141.5	4,200	15.0	2
Asteroids	135-100	10-243	11-15	None
Jupiter	483.3	88,700 (E), 82,300 (P)	8.1	11, 3 retrograde
Saturn	886.0	75,100 (E), 67,200 (P)	6.0	9, 1 retrograde
Uranus	1,783	30,900	4.2	5, all retrograde
Neptune	2,793	33,000	3.4	2, both retrograde
Pluto	3,666	3,000	2.9	Not Known

(E) equatorial

(P) polar

invisible at inferior conjunction; they are visible only for a few hours at the most, before or after sunset, except in high latitudes. The superior P. appear to move westwards relatively to the sun, invariably coming to the meridian earlier each night by solar time. In longitudinal motions the P. do not return on their tracks, but describe loops showing a latitudinal variation owing to the inclinations of their orbits.

Neptune, Uranus (generally), and the planetoids except *Vesta*, and all satellites except the Moon, are invisible to the naked eye. All P. appear as disks through the telescope, whereas no star shows any sensible disk. See ASTRONOMY, BODIES, and SOLAR SYSTEM.

**Planimeter**, instrument for the determination of the area of any figure. The best-known form is *Amsler's*. It consists of two metal rods joined by a hinge; one of the rods possesses a sharp point at the extremity which is driven into the drawing-board, while the other is fitted with a wheel capable of making an impression upon the measuring paper; the free end of the latter rod consists of a point known as the tracer, which is guided round the boundary of the figure to be measured. In using this instrument the hinge moves backwards and forwards over an arc of a circle whose radius is the length of the rod with fixed extremity. The area

number of species. The number increases in fairly still water, and consequently lakes and ponds have more P. than rivers. The P. plants are mainly diatoms and small algae. The animals consist chiefly of Protozoa, larvæ of Crustacea, Mollusca, Echinodermata, eggs of fish and other animals, small Crustacea, and a few pelagic worms, e.g. *Sagitta*, the arrow worm. Great numbers of the phosphorescent Protozoon, *Noctiluca*, form luminous areas in the sea. The P. varies not only seasonally, but also in adjacent small areas and at different depths of water. Much valuable information on P. was secured before the Second World War by H.M. research ships *Discovery I.* and *II.* (See DISCOVERY COMMITTEE.)

**Plantagenet**, surname used of the Angevin house which succeeded to the throne of England in 1154 in the person of Henry II., and ruled until the deposition of Richard II. (1399). The houses of York and Lancaster, which succeeded, being descended from Edward III., are generally included in the P. line. The name is said to have been derived from the custom of Geoffrey of Anjou, father of Henry II., of wearing a sprig of broom (*Planta genista*) in his cap. Still at the time of Charles II. P. has been applied to all descendants of Geoffrey, count of Anjou. It was a personal emblem of Geoffrey, but was never borne by any of his descendants

until Richard, duke of York (father of Edward IV.), who assumed it probably about 1448. See J. Harvey, *The Plantagenets, 1154-1485*, 1948.

**Plantaginaceæ**, family of plants, with ribbed or fleshy leaves usually radical, and flowers mostly borne in spikes. Sev. species are common plants in Britain; the two Brit. genera are *Plantago* (plantain) and *Littorella* (shorewedge).

**Plantain**, or *Plantago*, genus of herbaceous plants which includes five Brit. species, some of which are troublesome garden weeds. The greater P. or waybread (*P. major*) has radical ribbed leaves and long tapering spikes, bearing purple-anthered flowers; the seeds are used as a food for cage birds. Other species are the hoary P. or lamb's tongue (*P. media*), ribwort P. (*P. lanceolata*), *P. maritima*, and *P. coronopus*. One of the few species of horticultural value is *P. cornuaca*, which bears tall spikes of white flowers. Sev. Indian species have medicinal value.

**Plantain**, or **Pisang**, see under **BANANA**. **Plantain Eaters**, or *Musophaga*, genus of picarian birds, all of which are African forest birds, characterised by the hind toe being able to turn backwards or forwards, and by the base of the bill being dilated. They all have beautiful crests, which can be elevated or depressed at will. The colouring is blue or green with red primaries, the pigment of which is soluble and is washed out during the rainy season, though quickly renewed.

**Plantation**, assemblage of planted growing plants, especially trees; also an estate on which sugar, cotton, oil palm, tobacco, etc., are cultivated. The term was originally applied specifically to the Brit. settlements in America and then to any large estate in N. America, the W. Indies and E. Indies, which was cultivated chiefly by Negro or other slave labour, living in distinct communities on the estate under the control of the proprietor or manager. In this sense the term P. was synonymous with *colony* and the first separate organisation in Britain for the central administration of colonial affairs was a committee of the Privy Council, appointed by Order in Council of July 4, 1800, 'for the Plantations.' On Dec. 1, 1800, a separate 'Council of Foreign Plantations' was created by Letters Patent. In Sept. 1872 the council was united by Letters Patent, to the Council for Trade and was henceforward known as the 'Council of Trade and Plantations' (see further under **COLONIAL OFFICE**). P. song denotes the kind sung by Negroes on Amer. Ps. See also **NEGRO SPIRITUALS**.

**Plant-eating Beetles**, see **WEEVILS**. **Plant's Cell**, see **ACCUMULATOR**.

**Plant Hormones**, or growth-regulating substances, may initiate, inhibit, or accelerate growth activities in various parts of a plant. Charles Darwin postulated their existence in his *Power of Movement in Plants*, 1880. They may be extracted from plant tissues but are now synthesised in laboratories. First practical use of a plant hormone was made in 1929. Since then over a hundred chemicals have been synthesised which possess

the power to regulate plant growth in some way. Correct concentration is important; minute dilutions can cause major growth activities, large amounts can kill plants. The chief practical applications of P. H. at present are: (1) to promote rooting in cuttings, etc. The synthetic substances used are usually derived from phenoxy-acetic acid and may be used in powder or liquid form; (2) to induce fruit-formation by unfertilised ovaries, notably in tomatoes, and cucumbers, but also in apples and berry fruits. Substances based on beta-naphthoxy-acetic acid are used for this. Artificially stimulated fruits grow to some size, and are seedless; (3) to delay flower-bud development in fruit trees to avoid frost damage by use of iodo-acetate; (4) to control pre-harvest fruit drop, chiefly in early apples. Alpha-naphthalene-acetic acid (N.A.A.) is effective in this; (5) to selectively control weeds in cereals and lawns; 2-methyl-4-chlorophenoxyacetic acid (M.C.P.A.) and 2:4-dichloro-phenoxyacetic acid (D.C.P.A.) are widely used; (6) to prevent sprouting on stored potatoes and roots, using alpha-naphthyl-acetic acid. See also **GARDENING**; **LAWNS**; **WEEDS**.

**Plant-house**, see **HOthouse**. **Plantin**, Christophe (c. 1520-89), Fr. printer, b. at St. Avertin, near Tours. In 1535 he set up at Antwerp one of the largest printing houses in Europe. His works were famous for their accuracy, their beautiful workmanship, and finish, and he secured many influential patrons. The most noted of his publs. is the *Biblia Polyglotta* (8 vols., 1569-73). He also set up printing houses in Leyden and Paris, which were carried on by his sons-in-law. In 1876 the Antwerp house was purchased by the city and opened as the Musée P.-Moretus. One style of printer's type face is named after him. See M. Rooses, *Le Musée Plantin-Moretus*, 1913.

**Plants and Planting**. The term plant applies to every member of the vegetable kingdom, from the vast forest trees to the minute organisms such as bacteria. Between familiar and higher types of plant life and those of animal life are very obvious differences, but, as the lower members of the two kingdoms are examined and compared, the differences become much less obvious, and indeed it is impossible to draw a hard line of separation. In fact, it may be said, the living world, the world of organisms capable of reproducing themselves, is essentially one, the living substance within them being in each case *protoplasm*.

The group of organisms which the biologists have been most puzzled to classify is that known as the Mycetozoa or Myxomycetes, a commonly known member of which is *Plasmodiophora Brassicæ*, the cause of club root or finger-and-toe in cruciferous plants. The Myxomycetes have the appearance of being the oldest existing form of life, and there is considerable support for the theory that they have been, or differ but little from, the parents of the whole organic world. Though there are plants which essentially require organic life for their subsistence, it

is a general rule that green plants exist for the conversion of inorganic matter into the living substance necessary without exception for every form of animal life. A considerable part of the dry weight of plants consists of carbon, and yet green plants can flourish and increase when they are supplied with a solution of essential food materials from which carbon is absent. These plants are able to take in carbon dioxide from the atmosphere, and, in the presence of light, which provides the necessary energy, to build it into complex compounds. The changes are accomplished with the aid of the chloroplasts, which are usually small rounded structures containing chlorophyll, a green pigment of very complex chemical structure. Some plants, the algae in particular, have large chloroplasts of various shapes, e.g. basin-shaped in *Chlamydomonas*, a spiral ribbon in *Spirogyra*. Usually the first product of the synthesis is a soluble sugar which is rapidly converted into starch, a carbohydrate much more conveniently stored by the plant. Some green plants build other carbon compounds such as oil. The process of synthesising complex carbon compounds from carbon dioxide and water is termed carbon assimilation or *photosynthesis*, and is accompanied by the liberation of oxygen. Assuming that a hexose sugar such as glucose, is formed, the equation will be

This process seems to be the very basis of life itself. Chlorophyll is entirely absent from the fungi, and these and a few higher plants which have adopted a parasitic or saprophytic life, obtain their carbon in the form of organic compounds, from living or decaying animals and plants. (See SAPROPHYTES; PARASITIC PLANTS.) Many others utilise this source of carbon to a less extent.

Chemical analysis shows that besides carbon, the following elements are always present in the compounds which form the body of a healthy green plant: hydrogen, oxygen, nitrogen, chlorine, sulphur, phosphorus, silicon, potassium, sodium, calcium, magnesium, and iron. Other elements are frequently present, such as bromine and iodine which are rarely absent from seaweeds. But a plant can be grown with success in a solution containing those elements mentioned and apparently sodium, silica and chlorine are not indispensable, though almost universally met with. A great variety of chemical changes known as metabolic processes or metabolism (*q.v.*), are continually in progress in the plant, breaking down and building up complex compounds, constructing sugars and other carbohydrates from simple inorganic food materials, and converting nitrogen compounds in the soil (or, in the case of leguminous plants the nitrogen of the atmosphere) into proteins and other complex food materials. These are utilised by the plant in diverse ways, and after its immediate nutritive requirements are satisfied the excess may be

stored in various parts of the plant; in vegetative parts the store may be drawn upon for renewed growth after a resting period, or for the production of flowers and seeds. The seeds are stored with sufficient food to enable germination to proceed, and often with enough to allow the young plant to establish itself securely before becoming entirely dependent on its own ability to make food. Trees and shrubs store their reserve material chiefly in the stems. Herbaceous perennials in the rhizomes or root stock, and bulbous plants in the leaves of the bulbs.

It is in the production and storing of the surplus food that most plants become of economic importance, by selection and breeding the storage capacity is greatly increased. A very remarkable instance of this is the sea beet (*Beta maritima*), a perennial plant with a tough, moderately thick fleshy tap root, common on muddy seashores. From this has been derived the garden beet, the mangold or field beet, and the sugar-beet in all of which, as in the sugar cane, the sugar is dissolved and stored in the cell sap.

It is to a large extent due to the lack of an adequate proportion of the various essential plant foods in particular soils that much of the loss of cultivated crops by disease is due though hereditary susceptibility to disease has been proved by the experiments of Prof. Biffen at Cambridge, and of others.

The power of producing new and separate individuals is characteristic of all living organisms. For practical purposes there are two distinct modes of reproduction among plants. Sexual reproduction is the fusion of a male and a female reproductive cell. Amongst many fungi sexual reproduction has hitherto been undiscovered, amongst others it is of a very rudimentary form and there is no physiological sexual distinction, neither between the nuclei which fuse nor the organs or cells containing them. Since the fusion initiates the development of a fructification it is generally regarded as a form of sexual reproduction. Strictly, asexual terminology is used to describe the reproduction of such fungi. In the flowering plants or Phanerogams, the male reproductive cell is enclosed within the pollen grain produced in the stamens. The female reproductive cell lies in the ovule. In one section (Angiosperms) of the Phanerogams, the ovules are enclosed in the ovary of the flower, in the other section (Gymnosperms) they are exposed. The ovary is formed from a modified leaf or carpel, the tip of which is called the stigma and forms a receptive surface for pollen. This is usually brought from another flower by wind insects (mainly bees) humming birds in the tropics, rain, and by water currents. In the case of aquatic plants some flowers, however, have special devices for pollinating their own stigmas. Cross-pollination fails. The pollen grain sends out a tube which penetrates the tissue of the stigma, or of the exposed ovule, and continues growth until it enters the ovule and liberates the male nucleus from the tip of the tube. By

the fusion of this nucleus with the egg cell in the ovary, the act of fertilisation is completed. A number of plants (e.g. rice) are undoubtedly self-fertilised, including some of the commonest weeds, which are thus independent of any cross-pollinating agency.

Vegetative reproduction, the other mode of giving rise to new individuals, consists in the separation, naturally or artificially, of portions of the vegetative organs of the parent. It is an example of a sexual reproduction. The strawberry and many other creeping plants send out runners or stolons, the buds on which become rooted and form separate plants. The potato produces thin underground rhizomes, which thicken into tubers at their tips. This habit of vegetative reproduction is so strongly developed in some plants, e.g. the common couch or twitch, that the tiniest portion of the underground parts of the plant are capable of growth. Of the numerous methods of producing new plants artificially, that by means of a cutting or portion of a stem or leaf is the commonest, and immense numbers of garden plants are increased in this way. Another method is by layering, which consists in bending and pegging down a shoot of a plant into the soil, usually after making an oblique slit or ring from which adventitious roots are produced; this method is used for carnations. Budding, removal of a bud from one plant and its insertion into the stem or stock of another; and grafting, the insertion of a shoot with sev. buds upon it into a stock, are processes commonly applied to dicotyledonous plants of a woody nature, such as roses and fruit trees. By this means plants of different species and even of different genera can be united, e.g. the pear on the quince, the tomato on the potato, and the medlar on the hawthorn.

One main div. of the vegetable kingdom is the *Cryptogamia*, or flowerless plants, which have no flower and reproduce themselves by spores. Among these are the algae, mosses, and ferns. The other main div. is the *Phanerogamia*, or flowering plants, which bear obvious flowers consisting of stamens and pistil and usually a perianth; they reproduce themselves by seeds containing an embryo, and are divided into two main groups. Of these the Gymnosperms have the ovules developed directly upon the axis, as in the yew, or upon open carpellary leaves, as in the cones of the pine, fir, and larch. In the Angiosperms the ovules are contained in a closed ovary. This group includes the great majority of flowering plants and is subdivided into the dicotyledons and the monocotyledons, distinguished by the number of cotyledons or seed leaves present. The monocotyledons may usually be distinguished by the internal structure of their stem, the parallel venation of the leaves, and the arrangement of the floral leaves in series of three. The growth of the plant is accomplished by cell div. (see *CRYPTOGAMY*) and the production of additional mechanical supporting tissue as height increases is an

interesting feature of plant mechanics (see *CAMBium*). The growth of most plants is considerably influenced by the presence and intensity of light. Many interesting adaptations are revealed by the study of the plant in relation to its habitat. See *ECOLOGY*; *LEAF*; *MORPHOLOGY*; *NATURAL ORDER OF PLANTS*; *TRANSPIRATION*. See C. Baltet, *The Art of Grafting and Budding*, 1903; L. H. Bailey, *Manual of Cultivated Plants*, 1924; L. Cockayne, *New Zealand Plants and their Story*, 1927; F. T. Brooks, *Plant Diseases*, 1928; W. **Plaquemine**, tn. of Louisiana, U.S.A., on the Mississippi R., 85 m. W.N.W. of New Orleans. There is trade in cotton, rice, and sugar, and manufs. of lumber products from cypress wood. Pop. 5000.

**Plasma**, see under *BLOOD*.

**Plasma**, lack-green, feebly translucent variety of chalcidony. It is sometimes dotted with white, but when it contains red spots of iasper it is called 'bloodstone' (*q.v.*) or 'heliotrope'.

**Plasmodium** (*plasma*, and *Gk. idos*, form), a large jelly-like mass or protoplasm formed by an aggregation or fusion of amœbas. From the P. are developed fungoid organisms and their spores. It exists specially in myxomycetous fungals. It also denotes a parasitic organism found in the blood of patients with recent malaria, etc.

**Plassey**, former vil. of Bengal, India, famous as the site of Clive's victory over Suraj-ud-Dowlah, the nawab of Bengal, in June 1757. It is 83 m. N. of Calcutta. By 1801, the battlefield had been submerged by the R. Bhagirathi.

**Plaster Casting**. The fluid plaster is prepared by sprinkling thoroughly dry plaster into a suitable quantity of water. When it just rises to the surface of the water, it is well stirred, and then has the consistency of cream. The object from which a mould is first made is well vaselined, oiled, or soft-soaped to prevent adhesion of the plaster, which is then laid on uniformly until the cast is about half an inch thick. The plaster sets rapidly, and the mould may be lifted off in about ten minutes. The mould is sized and covered with soft soap and the plaster poured slowly into the mould, the formation of air-bubbles being carefully prevented. A loop of string or wire is pushed into the plaster for suspension when the mould is nearly full.

The mould is chipped away with a hammer and chisel about twelve hours after filling, except in the case of flat casts, which can be easily lifted off. To obtain sev. copies of an object (in other than flat casts) a 'gelatin' mould or a 'piece' mould can be used, which latter consists of sev. parts which can be bound together for the reception of each cast and then lifted off when the cast has set. In this case the plaster is poured into an aperture left for the purpose.

Plaster moulds are also used for the preparation of bronze, lead, and other metal casts. The moulds are made from the clay or plaster model by the same method as is used for plaster casts. The metal in each case is heated until liquid and poured into the plaster moulds in the same way as the plaster. This process is also used for terra-cotta casts, but here the clay may be liquid, or of a consistency of butter, in which case it is pressed into the plaster mould by hand. See J. C. Rich, *The Methods and Materials of Sculpture*, 1918.

**Plaster of Paris**,  $(\text{CaSO}_4)_2\text{H}_2\text{O}$ , formed by heating gypsum in kilns at a temp. very little over  $130^\circ\text{C}$ . When it is mixed with water the dihydrate is quickly reformed, and a rigid mass is produced thus:  $(\text{CaSO}_4)_2\text{H}_2\text{O} + 3\text{H}_2\text{O} = 2(\text{CaSO}_4 \cdot 2\text{H}_2\text{O})$ . If in the course of manuf. the water is all removed or the gypsum heated above  $130^\circ$ , the product when mixed with water does not set quickly, and is said to be dead burnt, and the product is useless for making casts. Apparently some P. of P. must contain some unchanged particles of the gypsum, which may act as nuclei, which play the same role as the crystal added to a super-saturated solution, without which crystallisation may be long delayed, or may even fail to take place.

**Plastics**, by definition, at some stage in their hist. possess plasticity and can be made to flow and take up a desired shape. They may be either natural or synthetic (man-made) in origin, but the latter comprise most P. dealt with by the industry, and it is with these almost exclusively that the term has become associated.

Natural P. were known by the anc. Egyptians and some possess qualities which enable them to maintain their popularity for some purposes, e.g. shellac for gramophone records, bitumen for beer-bottle stoppers, despite strong competition from synthetic resins. Celluloid (q.v.), the pioneer synthetic plastic, was discovered by Alexander Parkes at Birmingham in 1865. It was made from nitro-cellulose, camphor, and alcohol, and first appeared under the name of Parkesine, but is now called Xylonite. Cellulose acetate was discovered in attempts to reduce the dangerous inflammability of celluloid. Casein, long known as the protein of milk, was the second oldest plastic material, having been originally introduced in 1904. Although these materials and many of the reactions upon which the industry is based have long been known to chemists (stryrene was first prepared in 1831, acrylic acid in 1843) it was not until 1916, when Bakelcand

produced the first phenol-formaldehyde moulding powder, that the foundations of the modern synthetic P. industry were really laid. As Bakelite this material is world-famous.

P. fall into two main classes according to their behaviour on heating. Thermoplastics are those which can be repeatedly softened and resoftened by correct heat and pressure treatment, as long as no decomposition or degradation occurs. Thermosetting P. are made permanently rigid by heat, since they undergo an irreversible chemical change. Examples of thermoplastics are most natural waxes and resins, derivatives of cellulose, also synthetic polyethylene, polyvinyl chloride, polymethyl methacrylate, nylon, polystyrene, etc., and their derivatives. The phenolic, amino, and casein P. are thermosetting.

Chemically most P. are composed of carbon combined with various other elements, including hydrogen, oxygen, nitrogen, and chlorine. An interesting and very promising new class is the silicones which have silicon atoms instead of the carbon atoms of other groups, with corresponding differences in properties. In structure P. are composed of many similar units which unite to form exceedingly large, chain-like molecules, which may or may not be branched, and each containing many thousands of units. The length and shape of these chain-molecules determine the behaviour of the finished plastic to some extent, therefore they are carefully controlled during manuf. Studies relating chemical structure with physical properties have revealed much, so that it is possible to predict some of the properties of a new material merely from knowledge of its chemical structure.

The units which make up the large, or macro-molecules may be all of one species, as in the case of polyethylene,

where many ethylene molecules ( $\text{C}_2\text{H}_4$ ) join together by simple addition to form long chains of  $\text{-CH}_2\text{-}$  groups. This addition process is known as polymerisation and the resultant is a polymer. The compound possessing the composition represented by the unit is the monomer—in this case it is ethylene. Where units are of two or more species, e.g. A, B, C, etc., the chains are made up of mixed species, thus:

the frequency of the various species being dependent on the proportions of the components in the monomer mixture. This product is a copolymer.

In addition to polymerisation, P. are sometimes formed by condensation reactions. Here simple addition does not occur, but the plastic macromolecule and a small molecule, e.g. water, carbon dioxide, alcohol, etc., are formed simultaneously. An example of this type of reaction is the preparation of phenol-formaldehyde resin (see formula 1). Other

substances than the monomers are present in the polymer-producing reactions. The most important of these is the catalyst, or accelerator, without which the polymerisation would either not take place at all, or would proceed at an uneconomically slow rate. The catalyst is selected according to the reaction it is to promote and may be effective for only one reaction, or for sev.

If moulded articles were made from the unmodified polymers they would be dull and unattractive, as most polymers are white, cream, or similar neutral shades. Dyes and pigments are therefore incorporated into the resins. Other additives include fillers, e.g. fibrous asbestos, cotton linters, etc., which increase the strength of P. which tend to be brittle, or which lower the cost by diluting expensive resins with inexpensive materials, e.g. wood-flour, paper-pulp. Plastic foams may be made by the addition of blowing agents, chemicals which release gas under certain conditions, so producing very light, spongy materials which float easily, e.g. for lifebelts, and which are efficient heat insulators, e.g. for refrigerators. To combat brittleness, particularly in films and articles where flexibility is important, the addition of small amounts of non-volatile solvents, or plasticisers, is necessary.

The methods used in the fabrication of plastic shapes lend themselves to mass production. For this reason they can be sold cheaply, in spite of the many and complicated processes involved in moulding powder manuf. If supplied as moulding powder, the material is in the form of chips or fine granules, which are used for moulding, extruding, or calendaring. Moulds are of two main types, compression moulds in which a known amount of moulding powder is pressed into shape between the hot platens of an hydraulic press, and injection moulds in which heated plastic is injected through a nozzle into a cooled mould. In extruding thermoplastics the resin is heated and in its softened form is forced by a specially designed screw through a heated die, and is then cooled. Casting by pouring into moulds is a simple method which can be used where the polymer can be obtained in a sufficiently fluid state to be poured. It has been used for making gigantic statues in New York in 1939, and is the

usual method for producing sheets, e.g. Perspex. In calendaring powder is fused between carefully spaced, hot rollers from which it is removed as a film or thin sheet. Films are made by extrusion, calendaring, solvent casting or pressing, the particular method being determined by the properties of the plastic employed. Often P. are available as block, sheet, or rod which can be machined, cemented, drilled, sawn, or softened by heat and shaped into any desired final form.

The following are a few individual P. as representative of the main types produced by the industry.

**Phenol-formaldehyde** (formula 1) is prepared from phenol, or one of its homologues, by condensing it with formaldehyde in the presence of an acid catalyst. It forms a resin, which, if subjected to a short heat-pressure cycle, sets to a hard, infusible, but rather brittle, moulding. The general purpose moulding powder contains wood flour, paper pulp, cotton linters, or asbestos fibres, also colouring matter and other minor constituents. As black or dark colours are usually produced, the applications for which this substance, so well-known as Bakelite, is used are more utilitarian and less decorative than for some other P. Examples are ashtrays, beakers, electric light fittings, telephones, door-knobs, clock and radio cases, etc. In the plywood industry this resin is the adhesive used to bond the wood layers together. Other forms are cold setting adhesives, paint and varnish resins, and casting resins for both decorative and engineering purposes.

**Urea-formaldehyde** resins (formula 2) are formed by the condensation of aqueous solutions of urea and formaldehyde without the application of external heat. Fillers, e.g. paper pulp or wood flour, are then added. It resembles phenol-formaldehyde resins but has unlimited colour possibilities, although inferior resistance to water. The most important market is for manuf. into decorative articles. Other applications are stoving enamels, laminating agents, and cold setting adhesives.

**Casein** is the protein of milk, and is derived from it by coagulation with rennet. The precipitated particles are removed, washed with water, air-dried, and ground to fine granules. These are mixed with water, dyes and pigments before being extruded as rod. Casein is thermoplastic and it is treated with formalin, which makes it infusible and increases its water resistance. Casein maintains its popularity because of its infinite colour range and special effects, e.g. imitation horn, shell, mottle, and

metallic finishes, in addition to its cheapness and ease of working, although its water resistance is poor. Casein rods and sheets are available, and are fabricated and finished as buttons chiefly, also toys, radio and electrical parts, knitting needles, buckles, hairslides, etc.

Phenol-formaldehyde, urea-formaldehyde, and casein are all thermosetting materials, as are melamine-formaldehyde, alkyl and allyl and furane resins.

**Polyvinyl chloride** (formula 3) is formed by the polymerisation of vinyl chloride, a gas, under heat and pressure. The polymer resembles rubber in its properties, is a good electrical insulator, resistant to many chemicals, and non-inflammable. It can be moulded, extruded, and calendered in a wide colour range and in many grades of stiffness, both with and without plasticisers. Its main uses are as wire and cable sheathing, flexible sheeting for curtains, Mackintoshes, belts, and in shoe manuf. Where chemical resistance is important, e.g. petrol hose pipe, chemical plant linings, etc., it finds many applications. Polyvinyl chloride is also used extensively for coating fabrics, e.g. leathercloths.

**Cellulose nitrate and cellulose acetate** (formula 4) were early discovered polymers derived from wood or cotton linters treated with the appropriate nitric or acetic acid. Cellulose nitrate, or celluloid, was widely used, but its great inflammability was a serious disadvantage and it has been largely replaced by the less inflammable cellulose acetate. As a solution, the latter is used for rayon production, also for lacquers, varnishes, and coating compositions. It is commonly used for moulding every class of article.

**Polyethylene** (formula 5) is a white, translucent hydrocarbon obtained from ethylene by polymerisation under very high pressure and temp. It is light, tough, and flexible and possesses high resistance to water and chemicals, hence its wide use as a material of construction for the chemical industry for pipes and linings. Its outstanding electrical characteristics, combined with satisfactory mechanical properties, make it pre-eminent in the field of electrical insulation, especially for high frequency and high voltage work. The polymer can be injection and compression moulded, extruded, cast, and sprayed, and it is available in many forms, including powder, sheet, rod, and film.

**Polymethyl methacrylate** (formula 6) is an organic glass derived from acrylic acid, made from petroleum by a series of complicated processes. Its trade name in Britain is Perspex. It possesses excellent optical clarity, attractive appearance, high mechanical strength, and dimensional stability. It can be obtained as sheet or rod, which can easily be shaped when hot, also as an injection moulding powder. Its chief applications are in the aircraft industry, for surgical instruments where its unusual property of conducting light around corners is utilised, for lighting fittings, brush backs, trays, picnic

ware, toys, etc. It is available in transparent and opaque forms, each in a wide colour range.

**Polystyrene** (formula 7) closely resembles polymethyl methacrylate and is used for many of the same applications. Methyl methacrylate is preferred in the aircraft industry, and styrene in the electrical industry, where its excellent electrical properties and lower water absorption give it an advantage. Styrene is made from benzene and ethylene, i.e. from coal and petroleum. It is very popular in the U.S.A. owing to its low cost and ease of moulding.

**Nylon** (formula 8) is the generic term given to long-chain synthetic polyamide resins which have recurring amide groups as an integral part of the main polymer chain. The various nylons are products of the reactions between polybasic acids and poly-functional amines, carried out under carefully controlled conditions of pressure and temp. The main outlet for nylon is as a fibre for spinning and for manuf. into textiles and ropes. In the moulded form it is translucent, ivory-white in its unmodified form, but can be coloured. Mouldings possess toughness, abrasion resistance they can be sterilised in boiling water, so nylon is suitable for domestic and nursery items. Other articles include combs, belts, self-lubricating bearings, valve-seats, packaging film, fishing lines, and brushes for domestic and industrial use. Injection moulding and extrusion are the main methods of processing. (See also NYLON.)

The above P. do not represent a comprehensive list of all those available, but are merely representative of the more important types. New materials are constantly being developed in an ever-widening search for better products.

Even the few examples which have been briefly discussed above serve to show the great diversity of properties and applications existing in the field of P. They may be used to build houses, make furniture, decorate rooms, and for clothing; food may be served in plastic plates on plastic tablecloths, and may have been wrapped in plastic film, or have come from plastic-lined tins and so protected from contamination. P. are used both in work, for telephones, industry's corrosion-resistant pipes and vessels, radar, cables, protective clothing, and in leisure, for fishing lines and tennis racquets (made from nylon gut), billiard balls, table-tennis balls, radio sets, and films.

P. have certain limitations, however, e.g. thermoplastics are scratched easily and are unsuitable for use at temps. above 212° F., though some special types may be exposed to higher temps. without harm. Thermosetting resins tend to be brittle. The most careful consideration is needed therefore in choosing a suitable resin for any particular application. The properties of the plastic must be related to its required performance in order to avoid the use of wrong materials which has been responsible for most of the complaints against plastic products. P. have properties which make them superior to those

materials which they were originally supposed to substitute. They stand on their own merits—they may even be tailor-made to suit special purposes, should it be worth while. The industry is still in its infancy.

Brown, *Handbook of Engineering Plastics*, 1943; H. Barron, *Modern Plastics*, 1943, 1949; F. H. Lambert, *Moulding of Plastics*, 1948; and J. M. Edwards, *Elementary Plastics*, 1949.

**Plastic Surgery**, see under **SURGERY**.

**Plata, Rio de la, or River Plate**, estuary of the Paraná and Uruguay Rs., on the E. coast of S. America, discovered by Dias de Solis in 1515. Its total length is estimated at nearly 2300 m., and with its numerous tribs. it drains the whole of Paraguay, most of the Argentine, and large parts of Uruguay, Bolivia, and Brazil. The area of its drainage basin is estimated at about 1,200,000 sq. m. The estuary is shallow (5 to 10 fathoms) and is gradually silting up. It was in the battle of the R. Plata (Dec. 1939) that the Ger. pocket battleship *Admiral Graf Spee* (q.v.) was scuttled by order of Hitler rather than meet the attack of Brit. cruisers.

**Plataea**, anc. city of Boeotia. At an early period the Plataeans deserted the Boeotian confederacy and placed themselves under the protection of Athens, and when the Persians invaded Attica (490 B.C.) they sent 1000 men to the assistance of the Athenians and fought on their side at the battle of Marathon. Ten years afterwards (480) their city was destroyed by the Persian Army under Xerxes at the instigation of the Thebans, and the place was still in ruins in the following year (479) when the memorable battle was fought in their ter. in which the Persian Mardonius was defeated and the independence of Greece secured. In consequence of this victory, the ter. of P. was declared inviolable. It now enjoyed a prosperity of fifty years, but in the third year of the Peloponnesian war (429) the Thebans persuaded the Spartans to attack the t.n., and after a siege of two years at length succeeded in obtaining possession of the place (127). P. was now razed to the ground, but was again rebuilt after the Peace of Antalcidas (387). It was destroyed the third time by its inveterate enemies, the Thebans, in 374. It was once more restored under the Macedonian supremacy.

**Platanus**, see **PLANE**.

**Plate-Armour**, see under **ARMS AND ARMOUR**.

**Plateau, or Tableland**, broad, level area of land in a somewhat elevated position. Two of the most noteworthy Ps. are that in Tibet flanked by the Himalayas and called 'the Roof of the World' and that in the Lake Titicaca dist. of the Peruvian Andes, this latter having an area three times that of England.

**Plate-marks**, see **HALL-MARKS**.

**Platen**, see under **PRINTING**.

**Plating, Electro-**, see **METALLURGY, ELECTRO-METALLURGY. Electro-deposition**.

**Platinum** (Pt; atomic number 78; atomic weight 195.2), metallic element, originally found in gold-mines of Darien, but now obtained from Russia, Brazil, Australia, Tasmania, and S. Africa. It occurs, only native, in grey granules containing gold, copper, or iron, and some of the similar metals such as iridium, rhodium, osmium, etc. Ingots are prepared in two ways: (1) The ore is heated and digested with acids, and then heated with nitric and hydrochloric acids (*aqua regia*) and the dissolved P. precipitated by ammonium chloride; the precipitate is then heated and the P. forms as a spongy mass, or it is fused in lime crucibles. (2) The ore is smelted with galena and litharge, and the P. lead alloy formed is decanted, cast into moulds and cupelled, and then fused in the oxy-hydrogen furnace. P. has a blue or greyish white metallic lustre, is very ductile and malleable, with great tenacity; it is very heavy, sp. gr. 21.4, and its melting-point is 1755° C.; it welds at a red heat, its coefficient of expansion is low and allows sealing into glass vessels. This, and the fact that it is unaffected by the atmosphere and resists any single acid, cause it to be largely used in laboratories, and for electrical appliances. It is, however, corroded by chlorine, sulphur, phosphorus, by heating with alkalis, especially with the nitrate and hydroxide of potassium. It forms alloys with most of the metals, and they are more easily fusible, lead and bismuth alloy very readily, while iridium and rhodium alloys are more highly resistant to heat, for which reason they are used in pyrometers. Spongy P., already mentioned, is prepared by heating various of the compounds of P., and is used commercially in the manufacture of sulphuric acid, by virtue of its property of causing heated oxygen and sulphur dioxide to combine on contact; oxygen and hydrogen are also combined, a jet of hydrogen impinging on the sponge, igniting spontaneously. This is used in self-lighting devices for burners, and also in the 'Dobereiner' lamp. P. forms two oxides, sulphides, chloride, the platinumous oxide (PtO), platinumic oxide (PtO<sub>2</sub>), etc. Platinum chloride (PtCl<sub>4</sub>) is formed by solution in aqua regia and evaporation with chlorine. Hydrochloroplatinic acid (H<sub>2</sub>PtCl<sub>6</sub>) is obtained from the solution; it is a useful reagent for potassium ammonium, and the amines. Potassium chloroplatinate reduced from the higher salt is used in photography, platinumotype prints having the advantage of complete permanence. Fluorescent screens for X-rays are prepared with barium platino-cyanide.

**Platinum-black**, finely divided form of platinum, is prepared from platinum chloride by boiling with excess of carbonate of soda and grape sugar, or by adding alcohol to a boiling solution of platinumous chloride and caustic potash. It has the power of occluding and condensing oxygen and hydrogen; it will absorb 100

times its own volume of oxygen. *Platinised asbestos* is a deposit of the powder on asbestos used in the manufacture of sulphuric acid, oxygen and sulphur dioxide are combined with the formation of trioxide, from which the acid is formed by solution. *Colloidal platinum* is a suspension of extremely fine particles of platinum in water.

**Platinum Resistance Pyrometer, see under PYROMETER**

**Plato**, surname of Aristocles (427-347 B.C.), Gk philosopher b at Athens, his parents being Ariston and Perictione both of noble family. His education was a good one and was directed to the development of the body no less than of the mind for he was a sufficiently good gymnast to contend in the Isthmian and Pythian games. During his youth he wrote verse of various kinds but he later became convinced of the worthlessness of these early efforts and destroyed them. He must have come early to the study of philosophy for it is known that he had studied under Cratylus before he met Socrates at the age of nineteen. It is also probable that he took part in the military proceedings of the latter half of the Peloponnesian war. The setting up of the gov of Thirty at first pleased him for he came of an anti-democratic family and felt that wisdom and justice could never flourish in a democracy where matters would be decided largely in accordance with the mood of the moment. But the sad tyranny which ensued led him to withdraw from all connection with the oligarchy. He attached himself to Socrates about 409 and remained with this great teacher till the end of his life rendering him what assistance he could during the latter part of it. On the death of Socrates in 399, P left Athens and went to Megara where he visited Euclid. Thence he passed to Cyrene and thence to Egypt and the Gk colonies in Italy. He returned to Athens in 386 B.C., and numbers of eager students gathered at his house near the Academy, about a mile from Athens in the direction of Eleusis. Here he remained permanently except for three visits to Sicily. The first of these he made on the death of Dionysius I in 386, in the hope of persuading Dionysius II to set up a colony to be ruled according to laws devised by the philosopher. His last journey was made to attempt to bring about a reconciliation between Dionysius and his uncle Dion. He was unsuccessful and barely escaped with his life. During the latter part of his life he enjoyed an honourable position at Athens and his reputation in other parts was also great.

P's works consist of a series of dialogues, in all of which except in the *Laos*, Socrates is the principal interlocutor. Even from his own time down to the present day, P had been held in high repute as a philosopher, and hence his works have been preserved in excellent condition. After his death the MSS were kept in the school which he had founded. In the time of the succeeding Scholarchs, a complete copy of P's works was placed in the new library at Alexandria by

Demetrius Phalareus. It is almost certain that the 'canon of Thrasyllus' accurately represents the tradition of the Alexandrian library and agrees, so far as it can be investigated, with the list of works attested by Aristophanes. There has been much dispute among modern scholars as to the genuineness of many of these works, recourse having been made entirely to internal evidence. On such grounds, various scholars have rejected a greater or less number of the works anciently received. The *Epistles*, in particular, being very generally regarded as spurious. Much of the criticism from internal evidence has been guided by the idea that P wished to

PLATO  
V. A. N.

expound a regular system of philosophy. A. Schlegel has held that the various works could only rightly be understood when viewed as parts of the great scheme which the philosopher had worked out from the beginning. Grote disagrees with this view and it is indeed hardly possible to say that P has any philosophical system of his own. He began by accepting without criticism all the conclusions of Socrates and later he also accepted many of the characteristics of the Pythagorean philosophy. His writings also show that he had a good knowledge of the works of his predecessors. His method seems indeed to be critical and eclectic rather than dogmatical and many of his dialogues are rather reviews of the speculations of former philosophers than formal enunciations of any doctrine of his own. In such works as *Timaeus* and the *Laos* he is dogmatic, but such dialogues as the *Theaetetus* and the *Hippias Major* show him in a mood frankly sceptical. (Cero indeed says 'Plato affirms nothing, but after producing many

arguments, and examining a question on every side, leaves it undetermined.' In the course of P.'s long career as a philosopher there were indeed few opinions which did not undergo developments or change. At first, for example, he accepted the Socratic identification of virtue and knowledge, which also identifies ignorance and vice. In the *Laws*, however, he also gives incontinence as a cause of vice, and in another place he puts ignorance third among the causes of error, after anger and pleasure. Lewes in his *History of Philosophy* (fifth ed., 1880) thus sums up the question of P.'s development and manner of thought: 'Plato was not wanting in dogmatic impulse, but he was unable patiently to think out a system; and the vacillating lights which shifted constantly before him, the very scepticism which gave such dramatic flexibility to his genius, made him aware that any affirmation he could make was liable to be perplexed by cross lights or would admit of unanswerable objections.'

The philosophic doctrine with which P.'s name is most especially connected is that of Ideas. On the strength of it all Idealists have been ready to attribute their theories to the Gk. philosopher, and much confusion has been introduced. P.'s doctrine is an attempt to combine two opposing views. The disciples of Heraclitus taught that all things were in a perpetual flux, a doctrine that was modified by Protagoras into the dogma, *πάντων μετὰ αἰσθησις*, 'the individual man is the measure of all things.' On the other hand, there was the Eleatic doctrine that all is one, and that there is no multiplicity, that this one is immutable, and that there is no change. These views were combined by P. by his differentiation of the real and the sensible. In a famous passage in the *Republic* he likens the human race to men who are prisoners in a cave beneath the ground, chained, with their backs towards a fire, gazing at the shadows on the wall and mistaking them for realities. The education of the philosopher is represented by the toilsome struggle of some of these prisoners to reach the outer world and the clear light of the sun. According, then, to the Platonic doctrine, the things which we perceive, the objects of the sensible world, are not the objects of philosophical reasoning. But all these sensible objects have some feature in common. For example, from our personal knowledge we can have cognisance only of individual men, yet we have an abstract conception of Man. We see numbers of trees, yet we must have an abstract conception of the nature of a tree to enable us to describe so many varying things by the same term. To these general terms, the abstract conceptions of visible objects, P. gave a real existence; in the words of Aristotle: 'Those intelligible Essences he called Ideas; adding that sensible objects were different from Ideas and received from them their names; for it is in consequence of their participation (*μέθεξις*) in Ideas that all objects of the same genus receive the same name as the Ideas.' P.'s theory of Ideas,

however, had a lasting effect upon W. culture. Through the neo-Platonists it dominated all philosophical and theological thought until the scholastics founded their doctrine on the system of Aristotle. Further, the purely metaphysical theory involved the physical theory of natural kinds; but the two theories were not inseparable. Spinoza and Aristotle both firmly rejected the metaphysical theory, though it had provided a basis for their classifications in zoology and botany.

The works of P. are arranged by Schleiermacher in three classes: (1) Elementary dialogues, or those which contain the germ of all that follows, of logic as the instrument of philosophy and of ideas as its proper object; consequently of the possibility of the conditions of knowledge. This group comprises the *Phaedrus*, *Lysis*, *Protagoras*, *Laches*, *Charmides*, *Euthyphro*, and *Parmenides*, to which he subjoins as an appendix the *Apology*, *Crito*, *Ion*, *Hippias Minor*, *Hipparchus*, *Meno*, and *Alcibiades II.* (2) Progressive dialogues, which treat of the distinction between philosophical and common knowledge in their united application to the two proposed and real sciences, Ethics and Physics; these are the *Gorgias*, *Theaetetus*, *Meno*, *Euthydemus*, *Cratylus*, *Sophist*, *Statesman*, *Symposium*, *Phaedo*, and *Philebus*, with an appendix containing the *Theages*, *Erasia*, *Alcibiades I.*, *Meneceus*, *Hippias Major*, and *Critophon*. (3) Constructive dialogues, in which the practical is completely united with the speculative; these are the *Republic*, *Timaeus*, and *Critias*, with an appendix containing the *Laws* and the *Epistles*. Many criticisms have been directed against this arrangement, and Grote's criticism of the whole hypothesis of Schleiermacher has already been quoted. Others would accept the simpler div. of them into dogmatic and polemical, proposed by Sextus Empiricus.

**Bibliography.**—EDITIONS AND TRANSLATIONS: The earliest Gk. printed ed. of P.'s complete work is the Aldine ed., Venice, of A. P. Manutius and M. Musurus, 1513; the best is that of J. Burnet, 1899-1907. There is an Eng. trans. by B. Jowett (3rd ed.), 1892. See also J. Adam, *Platonis Protagoras*, 1893; W. H. Thompson, *The Phaedrus of Plato and the Gorgias of Plato*, 1894; S. Thompson, *The Meno of Plato*, 1901; J. Burnet, *Plato's Euthyphro, Apology of Socrates, and Crito*, 1924; B. Tarrant, *The Hippias Major* (commentary), 1928; R. G. Bury, *Symposium*, 1933; S. Leslie, *Symposium* (trans.), 1933; A. E. Taylor, *Parmenides* (trans.), 1934; F. M. Cornford, *Plato's cosmology: the Timaeus* (trans.), 1937, and *The Republic of Plato* (trans.), 1941; Sir P. Livingstone, *Portrait of Socrates: Apology, Crito, and Phaedo* (trans.), 1938. REFERENCE: v. Ast, *Platonis Leben und Schriften*, 1816; P. van Het. co. *Intra Philosophiae Platonicae*, 1825-36; T. **Platoon** (Fr. *peloton*), in the Brit. Army signifies the sub-units into which a company of infantry is divided; in the U.S. Army it means also a similar sub-unit of cavalry and of some other arms. In origin the P. was the fire-unit of infantry, and the tactics of the eighteenth century, and hence the ceremonial drill of to-day, are based on 'P. firing.' The Brit. Army infantry P. is commanded by a subaltern who is assisted by a sergeant; it is divided into three light machine-gun sections, each about seven men strong, and commanded by a corporal, and a headquarters section comprising the 2-in. mortar and P.I.A.T. teams (two men each), a signaller, a runner, and an orderly: total strength about thirty all ranks.

**Platt-Deutsch**, see GERMANY, *Language and Literature*.

**Platte**, or **Nebraska**, affluent of the Missouri R., U.S.A., rising in the Rocky Mts., Colorado, and flowing through Nebraska, entering the Missouri a little above Plattsmouth. Its total length, including both N. and S. forks, is 825 m. The depth of water is insufficient for navigation. The P. encloses many is., and in the summertime a large portion of the riv.-bed is dry. It drains some 90,000 sq. m.

**Plattsburg**: 1. Co. seat of Clinton co., New York, U.S.A., at the mouth of the Saranac R., and 140 m. N.E. of Albany. It has a commodious harbour and extensive water-power, and among its industries are flour and saw mills, pulp and paper factories, etc. It is an important military station and possesses some of the largest barracks in New York. Pop. 16,300. 2. Tn. of Northumberland co., New S. Wales, 70 m. N. of Sydney. It has coal-mines. Pop. 3793.

**Plattsmouth**, co. seat of Cass co., Nebraska, U.S.A., on the Missouri, near its junction with the Platte R., 20 m. S. of Omaha. It is engaged in the building of railway wagons and engines. Pop. 4300.

**Platyhelminthes**, or **Flat Worms**, lowest and simplest phylum of the worm-like animals. They are practically all hermaphrodite, and include some of the most important internal parasites, such as tape worms and the liver fluke. They are divided into three classes, of which one, Turbellaria, is non-parasitic (see PLANARIAN). The others are Cestoda and

Trematoda. The former contains the tape worms, which in the adult forms have long, flattened, ribbon-like segmented bodies, and a 'head,' or scolex, usually provided with hooks and suckers. They have no mouth and no digestive canal, absorbing nourishment by the whole surface of the body. Besides numerous Cestode parasites of mammals and birds, some are parasites of fishes. The Trematodes have non-segmented, flattened, oval, or lanceolate bodies, with a mouth and digestive canal. The most harmful parasite of this class is *Distoma hepaticum*, the liver fluke (q.v.). See PARASITES; TAPE WORMS.

**Platypus**, Duck-billed, see DUCK-BILLED PLATYPUS.

**Plauen**, tn. of Saxony, cap. of the Vogtland dist., on the Elster, 61 m. S.W. of Leipzig; it has manufs. of embroidery, lace, cotton goods, muslin, cambric, engineering, and radio goods, etc., and is an important railway junction. Pop. 110,000.

**Plautus**, **Titus Maccius** (c. 251-184 B.C.), Rom. dramatist and comic poet, b. at Sarsina in Umbria. In early life he was very poor, and entered the service of a baker for a time. He began writing plays (c. 223) before the second Punic war (218-201). P. adapted material taken from the new Attic comedy, but unlike Terence, who became famous considerably later, he made his characters utterly Rom. in nature, if not in name. About twenty genuine comedies are extant, including the *Amphitruo*, *Captivi*, *Indulus*, *Aulularia*, *Trinummus*, *Mosellaria*, *Menæchmi*, and *Miles gloriosus*. The titles are usually derived from a leading character or incident, or from an adjective giving a general description of the play. Dryden, Addison, Lessing, and others imitated P.; Molière used some of his plots, as in *L'Émule* (from the *Aulularia*), and Shakespeare based his *Comedy of Errors* on the *Menæchmi*. His style is lively and energetic, and his works were deservedly popular with the Romans, and maintained their reputation to modern times. There are complete Eng. trans. by R. Thornton (1764-74) and H. T. Riley (1880). Among the best eds. are those of F. W. Ritschl (c. 1848-78), J. L. Using (1875-86), G. Lowe, G. Goetz, and F. Schoell (1878-94); F. Leo (1885-96); P. Nixon (1938, Loeb); and various annotated eds. of separate plays including N. Moseley and M. Hammond, *Menæchmi* (1933). See Varro, *Questiones Plautinae*; K. A. Sonnenschein, *Bentley's Plautine Emendations*, 1883; P. Langen, *Plautinische Studien*, 1886; F. Leo, *Plautinische Forschungen*, 1895; J. W. Duff, *Literary History of Rome*, 1909; and G. Michaut, *Plaute*, 1920.

**Play**, **Pierre Guillaume Frédéric Le**, see LE PLAY.

**Player-Piano**. The first automatic P.-P. was invented in 1842. In 1860 a patent was taken out for a keyboard piano player, and the first pneumatic keyboard instrument was made in France three years later. Since then great improvements have in the technique of construction have

led to the modern instrument in which it is not only possible for the operator to control any performance to suit his own tastes, but also to reproduce the recordings of famous players quite automatically. The P.-P. is a piano in which the music is played by propelling a perforated 'music roll' through the piano. Corresponding to each note on the instrument there is a narrow tube whose aperture is uncovered when a perforation passes over it. Such a tube communicated directly with a chamber in which the air is at a pressure below that of the atmosphere; the uncovering of the aperture allows atmospheric air to rush into this chamber and set in operation a system of levers that causes the hammer to strike the note in question. In pedal instruments the roll is propelled by means of a pneumatic motor that also pumps air out of the control chambers. Silent electric motors are fitted to modern P.-P.s. to relieve the operator of the necessity of driving the pedals, thus leaving him free to concentrate on his performance. The tempo of any composition is under the control of the operator who can regulate the speed at which the roll moves by means of a lever that is coupled to the 'governor' of the motor. In addition to this lever there are others that control the blow struck by the hammer so as to enable the expression to be changed. The Eolian and Orchestral organs work on the same principle as the P.-P.

**Playfair, John** (1748-1819), Scottish geologist and mathematician, b. at Benzie, near Dundee. In 1785 he became prof. of mathematics at Edinburgh Univ., and in 1805 was transferred to the chair of natural philosophy there. Elected a member of the Royal Society in 1807, he wrote *Elements of Geometry* (1812-14); *Outlines of Natural Philosophy* (1812-16); and *Illustrations of the Newtonian Theory of the Earth* (1802). See memoir by F. Jeffery in *The Works of John Playfair*, ed. by J. G. Playfair, 1822.

**Playfair, Sir Nigel** (1874-1931), Eng. actor-manager, b. in London; son of Wm. S. Playfair, M.D. Educated at Winchester, Harrow, and Univ. College, Oxford, he was called to the Bar (Inner Temple) in 1900 and practised for a time. Gaining dramatic experience with the Oxford University Dramatic Society, the Old Stagers, and the Windsor Strollers, he made his professional debut at the Garrick Theatre in 1902. In 1918 P. assumed the management of the Lyric Theatre, Hammersmith, famous for its revival of old plays. He wrote *The Story of the Lyric Theatre* (1925) and *Hammersmith Hoy* (1930).

**Plea**, in law, a term used to denote either generally (1) an action or criminal prosecution, or specifically (2) that which is pleaded or alleged by a party to an action or defendant in criminal proceedings in

answer to the allegation of the other party or of the prosecution. In a third sense P. was the technical term before the Jurisdiction Act, 1875, for what is now called in the language of civil pleadings a *defence*. As to (1): This use is now obsolete. The old commentators, like Blackstone and Stephen, regularly divided P.s. into P.s. of the Crown, i.e. crimes in respect of which the Crown proceeded on behalf of the public in the king's bench court, and common P.s., or actions between subject and subject tried in the court of common pleas (*q.v.*). As to (2): Allegations in pleadings (*q.v.*) are either substantial, that is, go to the merits of the cause of action, or are merely dilatory, that is, offer some merely formal objection to the proceedings. Dilatory P.s. are now either obsolete or superseded by interlocutory proceedings. Substantial P.s. in civil actions are generally classified into: (1) Traverse (*q.v.*); (2) Confession and avoidance (*q.v.*); and (3) Objections in point of law. In criminal procedure P.s. are either: (a) Dilatory to the jurisdiction and in abatement; these are seldom resorted to at the present day, for relief can be obtained in other ways, such as by writ of error or moving in arrest of judgment, or, again, the court will cause the indictment to be amended. (b) Special P.s. in bar: (1) *Autofusus acquit*, i.e. a plea that the accused has already been acquitted of the charge; (2) *Autofusus convict*, a P. of former conviction on the same charge; (3) P. of pardon by the Crown. (c) The general P. of not guilty.

**Pleadings**, written or printed statements of the parties to an action which have for their object the arrival, by the process of eliminating all immaterial or admitted allegations, at the actual point or points in issue. According to legal historians, the method of arriving at an issue by alternate allegations was practised in England as long ago as the reign of Henry II. But it has taken centuries to free the science of P. from those really technical embarrassments which put a litigant out of court for the very smallest technical flaw. Formerly P. were oral, and the parties, either by themselves or a professional pleader, conducted a  *viva voce* altercation in the presence of a judge whose duty it was to superintend this oral contention and to compel the pleaders so to frame their alternate allegations as at last to come upon some one specific matter or matters upon which they were really at variance, and which they could both agree constituted the real question requiring decision. This result attained, the parties were said to be *at issue*, and they were ready to go before a jury or judge on the question of fact or law, whichever it happened to be. Thus the question for decision came to be called the issue. The evolution of written or printed P. is curious: In the early days the 'parcel altercation' of the pleaders was recorded officially on a parchment roll (i.e. the record of the court). Later each pleader borrowed the roll in turn and himself entered his allegation and counter-allegation on it; still later they were

drawn up on paper and interchanged, and when an issue was finally arrived at the P. were entered on the parchment roll. In the days when the old forms of action, e.g. *detinue* (q.v.), case (see *CASE*), *ACTION UPON TREASURY*, trespass (q.v.), conversion (q.v.), were sacred to the heart of the lawyer, the spirit and substance of the allegations in the P. were entirely subordinated to technical requirements of form. The Common Law Procedure Acts, 1852-60, effected considerable reforms in this matter, but it was not until the Judicature Act, 1873, was passed that the straightforward commonsense manner of pleading now in vogue was introduced into the high court. See E. Bullen and S. M. Leake, *Precedents of Pleadings*, 1860, 1948.

**Pleasure**, see *EMOTIONS*; *THINGS*; *FEELING*; *HEDONISM*.

**Plebeians, Plebs, or Plebes**, commonalty of ancient Rome, including all citizens not belonging to the patrician *gentes*. They were originally mainly derived from the conquerors. Late, settled on Rom. ter. Servius Tullius first made them serve in war and granted them the right of voting in the *Comitia Centuriata* with the patricians. Mommsen considers that the P. were simply the *clientes* (dependents), looked at as being deprived of political rights. Under the republic, between c. 510 and 286 B.C., the long struggle for equality of rights between P. and patricians continued. It was marked by the estab. of *tribuni plebis* (491 or 493), and gradually the P. gained admission to all the chief secular and religious offices of state. The name later was associated with the lower ranks of the people, as opposed to the *nobles*, holders of office, and hence was used for popular or mob. See Mommsen, *Römische Forschungen*, 1.; *Römische Staatsrecht*, II.

**Plebiscite** (*plebiscitum*), ordinance, decree, in ancient Rom. hist., a law enacted by the plebs in their *comitia tributa* or *comitia plebis* (estab. 449 B.C.) on the rogation of a tribune (first created 491 or 493). Originally these resolutions needed confirmation by the senate, but later they came to be binding on the whole nation (*universus populus*), as finally stated in the *Lex Hortensia* (286 B.C.). In modern politics a P. is an expression of popular opinion obtained by vote from all the electors of the state. In Great Britain the principle of the P., which is often confused with referendum (q.v.), is sometimes applied by local authorities over questions of local interest such as rating, etc. In the national sense, however, P.s. have been employed by the League of Nations under a section of the treaty of Versailles to decide the national destiny of areas which were involved in peculiar difficulties. P.s. were held and decisions resulting from them made in regard to Allenstein Marienwerder, the Burgenland, and Klagenfurt. In 1935 a P. took place in the Saar dist. to discover the wishes of the inhab. regarding their nationality, and, under the growing influence of National Socialism, it resulted overwhelmingly in favour of Ger. as against

Fr. nationality. A P. in Schleswig resulted in the div. of that area between Denmark and Germany. Another important P. was that of Upper Silesia in 1921, which, though conforming to the individuality of the ter., yet involved its partition between Germany and Poland, and by transferring a racial minority of Ger. Poles to the new Polish republic, sowed the seeds of future bloodshed. The actual result of the vote on that occasion was 707,000 for Germany and 479,000 for Poland, but the indignation from the dissatisfied minority led to the League of Nations ruling as to the partition. On Oct. 12, 1939, the Soviet Gov. held a P. in the E. provs. of Poland, in order that the inhab. might actually or apparently decide on the question of annexation (see under *POLAND*). A P. was held in 1946 in Greece, and a majority of more than two to one obtained for the king's return. See S. Wambaugh, *A Monograph on Plebiscites*, 1920, *Plebiscites since the World War*, 1933, and *The Saar Plebiscite*, 1940, and J. A. Gawenda, *Le Plebiscite en droit international*, 1946.

**Plectognathii**, see *BONY FISHES*.

**Pledge**, see under *PAWNBROKER*.

**Pleiade**, name applied to a group of seven Fr. poets of the sixteenth century, who united to reduce Fr. literature and language to a classical form. They were Ronsard, Du Bellay, Baif, Jodelle, Thibaut, Dorat and Belcau. See G. Wingham, *Ronsard and La Pléiade*, 1906.

**Pleiades**, in classic mythology, the seven daughters of Atlas and Pleione, 6 on the Arcadian Mt. Cyllene. Their names, Alcyon, Electra, Merope, Maia, Taygeta, Celaeno, and Asterope, with those of their parents, have been applied since Herodotus (1665) to the nine brightest stars of the group in Taurus. There were various legends to account for their being turned into stars. They rise in May (the approach of harvest) and set in Oct. (the time for new sowing), marking the season of navigation. They are sometimes known as Vergilae or Atlantides.

**Pleiades**, the most famous star cluster and known to man from the earliest times; the writer of the book of Job refers to the Pleiades in ch. 38, v. 31. This group of stars, which begins to appear above the horizon in the late evenings of autumn, forms a good test for the eyesight. Normal eyesight can detect six but those endowed with keen sight can see seven or even more. A small telescope or a pair of binoculars shows many more, and the astronomer's photographic plate has revealed thousands. The brightest star in the cluster— $\alpha$  Tauri, also known as Alcyon—is a quadruple and is a beautiful object when viewed through even a small telescope. The group has a number of nebulae and is surrounded by a fine nebulous mass extending out a considerable distance.

**Pleistocene**, see *PLEISTOCENE*.

**Pleistocene Period**, see *GLACIAL OR PLIOSTOCENE PERIOD*.

**Plenipotentiary, or Envoy Extraordinary**, person accredited to some foreign sovereign who is invested with unlimited

**Plimsoll, Samuel** (1824-98), Eng. politician, *b.* at Bristol. He entered Parliament in 1868, and became known for his interest in the sailors of the mercantile marine. One of his objects was to protect the lives of sailors by enforcing a compulsory load-line. To secure this end he devoted all his energies, and finally secured the passing of the Merchant Shipping Act in 1876. The compulsory load-line (*q.r.*) is now generally known as the P. line.

**Plinlimmon**, see **PLYNIMMON**.

**Plinth** (πλινθος, tile, brick), in architecture the lower square member of the base of a column or pedestal; or a block of stone used as a base or pedestal for a statue, bust, or vase, or the square base of a piece of furniture. The form is also applied to the projecting part of a wall immediately above the ground, two or more rows of bricks at the base.

**Pliny the Elder** (Gaius Plinius Secundus) (A.D. 23-79), Rom. writer of natural hist., *b.* at Novum Comum (Como). He served in Africa, commanded a cavalry troop in Germany (46), and returned to Rome (52). His scientific studies, pursued throughout his life, and especially between 55 and 68, won him fame as the most learned man of his age. P. was procurator in Spain (c. 68-72), held high office under Vespasian, and was commander of the fleet at Misenum under Titus. His zeal for research led to his death by suffocation in the eruption of Vesuvius (79). Of all his writings (hist., of the Germanic wars, of his own time, works on tactics, rhetoric, grammar, etc.) only the *Naturalis historia* remains, an encyclopaedic work on science, art, natural hist., and allied subjects, with digressions on human inventions and institutions. The style varies, but is vigorous if sometimes obscure through brevity. Good eds. are those of C. J. Sillig (1853-55); D. Diefen (1866-82); *The Elder Pliny's Chapters on the History of Art*, trans. by K. Jex-Blake and with notes by E. Sellers, 1896; Fr. trans. by A. de Grand-sagne, 1829-33; J. Bostock and H. T. Riley, Eng. trans. in Bohn's Library, 1855-57. See A. Wannowski, *Pliniana*, 1847; L. Ulrichs, *Chrestomathia Pliniana*, 1857; A. Fels, *De Codicibus Plinianis*, 1861; J. Müller, *Der Stil des alten Pliny*, 1883; D. Diefen, *Quellen*, 1904, 1908; and Pliny the Younger, *Epist.* iii and vi. See also J. O. Thomson, *History of Ancient Geography*, 1948.

**Pliny the Younger** (Gaius Plinius Caecilius Secundus) (A.D. 62-c. 114), Rom. orator and author, nephew and adopted son of P. the Elder, *b.* at Novum Comum (Como). He became an advocate (80), senator (c. 81), military tribune in Syria (c. 82), and after holding other high offices was finally consul under Trajan (100), and governor of Bithynia (111). P. was an intimate friend of Trajan and Tacitus, and studied rhetoric under Quintilian. His remaining works include the nine books of *Letters*, with a tenth containing his correspondence with Trajan, including the famous letter about the treatment of the Christians in his prov., and *Panegyric*

on Trajan. For eds. see those of G. E. Gierig, with notes (1796-1800); H. Keil and T. Mommsen (1870-71); and C. F. W. Müller (1903). The *Epistles* have been ed. by G. Korte (1734), and separate books by J. Cowan (1889) and J. D. Duff (1906). See also E. T. Merrill, *Selected Letters* (1903). J. D. Lewis, Eng. trans. 1879, is good. See Cellarius, *Vita*, c. 1693; J. Masson, 1709; M. Schanz, *Roman Literature*, 1890-1906; and E. G. Hardy, *Studies in Roman History*, 1906-09.

**Pliocene**, or **Pleocene**, name given to the topmost div. of the Tertiary system in geology. Strata of this age cover a large area in Norfolk, Suffolk, and occur also in a number of small areas, chiefly about Walton-on-the-Naze, in Essex, where they rest unconformably on the London Clay and Chalk. The beds are termed 'crags' from their 'shelly' nature, being typically marine shell-banks, deposited in shallow water near the shore, and indicating that this area underwent subsidence during P. time. The older P. had probably a warm temperate climate, and is represented by the Coralline Crag; the newer P. was probably cold temperate, and is represented by the Red, Norwich, Chillesford, and Weybourne Crags, the Forest Bed group, and *Leda myalis* beds. Arctic conditions prevailed at the close of P. time. The Coralline Crag, so called from the large number of contained Polyzoa (Corallines), consists of calcareous sands, occurs near Orford in Suffolk, and is 60-80 ft. thick. At its base occurs a conglomerate deposit with 'box-stones' and phosphate beds, containing early P. fossils. The fossils of the Coralline Crag are chiefly Polyzoa (*Alveolaria*, etc.), Lamellibranchs (*Astarte* and *Pecten*), Brachiopods, Gastropods, and over a hundred species of Foraminifera. The Red Crag consists of red ferruginous sands, and covers an area of 300-400 sq. m., but is usually concealed by the glacial gravels and sands. The fossils are chiefly Mollusca (*Erusus*, *Astarte*, *Pectunculus*), 273 species being known, of which 33 are extinct. The Norwich or Mammalian Crag has a wider distribution than any other P. formation. It ranges from the coast of Norfolk to Orwell in Suffolk (70 m.), and varies in thickness from 30 to 130 ft. Fossils such as *Avicula* and *Tellina* occur in these shelly sands of the Crag, and mammalian remains are common and include *Mastodon*, *Elephas antiquus*, *Felis*, *Ursus*, *Bos*, etc. Resting on the Red and Norwich Crags is the Chillesford Crag, which shows many shells of Arctic species (*Cardium*). The Chillesford Clay then follows, and this is succeeded by the Weybourne Crag with a still larger proportion of N. forms (*Astarte*, *Borealis*, etc.). The Forest Bed group which succeeds consists of fresh-water and estuarine strata, and contains the 'Cromer Forest Bed,' which is about 20 ft. thick. This bed is formed of clays, lignite, etc., rich in plant remains and stumps of trees (maple, sycamore, oak, beech, etc.), and bones of mammalia (hippotamids, elephant, and beaver). The terminal member of the Brit. P. is the *Leda myalis* bed, formed

of 20 ft. of marine sands and gravels, with *Leda myalis*, *Mya truncata*, etc. The P. of Belgium (*Diestian*) is arenaceous, and corresponds to Lenham beds (so called from solution 'pipes' exposed in chalk quarries on the escarpment of the N. Downs, particularly at Lenham, Kent), of the older P. In Britain, chipped flints (ooliths) have been recovered from Late Pliocene deposits. The Suffolk Bore Beds and other crag deposits in E. Anglia are well-known for the scrapers and beak-shaped tools which they yield, and certain levels can be recognised as old land surfaces. Most archaeologists now accept that man in Late Pliocene times lived on these surfaces and on the edge of the Crag sea, subsisting on shell-fish and other simple foods. In Italy the P. becomes a marine formation, covering a large area of the sub-Apeninines and the Is. of Sicily, and consists of clays, marls, and thick limestones. The Alps received their final elevation, and a host of volcanoes broke out along the S. borders of the Alpine regions (Etna, Somma, Santorin, etc.). In India P. strata of fluvial origin (Siwalik beds) are found in the Himalayas, and are characterised by mammalian remains. The P. of N. America (Colorado, Kansas) is remarkable for the oriental character of the fauna.

**Pliosaurus** or **Pleiosaurus** (Gk. πλειός, larger, τειρος, lizard), genus of extinct reptiles with fin-like paddles and a large head supported on a short neck. Remains have been found in the Jurassic rocks of England and elsewhere.

**Plock**, or **Plotzk**: 1. Dist. of Poland, bounded N.W. and N. by Germany, S. by Warsaw, S.W. by the Vistula. The surface is rather flat and marshy, area about 3641 sq. m., with forests and peat-bogs N. and W. There are distilleries, sugar-refineries, saw and flour mills, iron and wood manufs., and tanneries. Grain and agric. implements are also produced. Pop. 786,000. 2. Cap. of the above, on the Vistula, 58 m. W.N.W. of Warsaw. In the Middle Ages the dukes of Masovia resided here. It is a bishop's see, and has a twelfth-century cathedral, with tombs of the Polish sovereigns Vladislas I. (d. 1102) and Boleslas III. (d. 1139). There is also an old Piarist college. P. was captured by the Gers. in Nov. 1914 and again in 1939. There is trade in sugar-beet, timber, and grain, and manufs. of agric. machinery, soap, etc. Pop. 32,700 (in 1931).

**Ploegsteert**, vil. in W. Flanders, Belgium, 8 m. S. of Ypres, known as 'Ping Street' to Brit. troops; the vil. and its nearby wood were an important position in the battles of the Ypres salient in the First World War. Over 11,000 missing are commemorated by a memorial.

**Ploesti**, **Ploieshti**, or **Ploesti**, cap. of Prahova prov., Rumania, 35 m. N. of Bucharest. There are petroleum wells and refineries in the vicinity. It has trade in wool, and is a road and rail junction. The Rumanian oilfields at P. were of vital importance to Germany during the Second World War and were therefore heavily bombed by the Allies: 177

Amer. Liberator planes made a low-level daylight attack on Aug. 12, 1943, the raid involving a flight of 2480 m. Pop. 77,000.

**Plombières**, tn. in the dept. of Vosges, France, 14 m. S. of Epinal. It is a popular watering-place, with many medicinal springs, whose curative properties bring relief to thousands of patients annually. The Romans have left traces of their occupation in their well-preserved baths. It was here that Cavour signed the celebrated 'Paix de Plombières' with Napoleon III. (1859), which provided for the cession of Savoy and Nice to France. Pop. 1700.

**Plotinus**, see under **PHILOSOPHY**.  
**Plotinus** (c. 203-c. 262), Gk. philosopher, founder of Neoplatonism, b. at Lycopolis in Egypt. At the age of twenty-eight he began to attend the lectures of Ammonius Saccas, the chief forerunner of the Neoplatonists. In 212 he went with the Emperor Gordian to Mesopotamia and the E., whence two years later he returned to Rome. Here he taught philosophy for ten years, enjoying the admiration and favour of the Emperor Gallienus. About 262 he retired to Campania, where he died. His works were ed. by his disciple Porphyry in six groups, each containing nine books, and hence known as the *Enneads*. A Lat. trans. was pub. in 1492. P. is an idealist pure and simple. God is spirit, and all that can be attributed to him is goodness and unity. From him emanates Intellect (*Noûs*), from the *Noûs* comes the world-soul, from which emanate various forces (including the human soul), whence finally comes Matter. Man's work is to return to union with God by eliminating from his life the unreal and material, and the final step in this union is that of ecstasy. See **NEOPLATONISM**. See Eng. trans. by S. MacKenna, 1917; also W. R. Inge, *The Religious Philosophy of Plotinus*, 1914, and *The Philosophy of Plotinus* (3rd ed.), 1925.

**Plotzk**, see **PLOCK**.

**Plougastel-Daoulas**, tn. of the dept. of Finistère, France, on a peninsula of the Brest coast. The tn. was damaged in the Second World War, the church being almost entirely destroyed, and the fine seventeenth-century Calvary heavily pitted. Pop. 6914.

**Plough (Plow) Monday**, or **Hook Monday**, first Monday after Epiphany (Twelfth Day), termination of the Christmas holidays, and herald of the ploughing season. The anc. custom of celebrating it by a procession and drawing a plough from door to door in the par. and begging 'plough-money' for rustic festivities still survives in parts of England.

**Ploughs and Ploughing**. From a remote period the plough has been the most important implement of husbandry, but only since the middle of the seventeenth century has any advance been made on some of the oldest types which are still to be seen in use by primitive people. Modern ploughs are of various types, differing in essential features according to the varying conditions of soil and climate. The single-furrow ploughs include one wheel and two wheel types.

Disk ploughs which have the share and breast of the ordinary form displaced by a large, steel, concave cutting disk, are sometimes used in America, for work in very hard or heavy soil where a breast plough would be impracticable. Turn west ploughs are used horizontally on hill sides, turning the furrow all in one direction downwards. Double and multiple ploughs can be used on light land to economise manual and horse labour, if other motive power is not available.

Among special purpose ploughs are the double breast or ridging plough and the subsoil plough which travels in the furrows behind an ordinary plough, breaking up a panned subsoil. Other special types are constructed for drainage work such as the mole plough. The essential parts of a modern type of common plough are the beam to which the handles are attached, the frame or body which is bolted to the beam and which carries the breast or mould board, the cutting share and the hake or head and chain to which the horses are attached. The large or furrow wheel is placed on the right of the cross bar running in the furrow and regulating the width of the furrow slice. The small or land wheel is on the left of the cross bar running on the unploughed land; it heightens the depth of ploughing. The coulter attached to the beam makes the vertical cut of the furrow slice, and the skim coulter attached in front paces off the top of the furrow on the left side. The breasts of ordinary ploughs are fixed on the right hand side and turn the furrow slice on that side only. The work is therefore done in ridges or lands of equal width varying from 8 to 66 ft. The three forms of furrows are the rectangular, the crested or high cut and the wide broken furrow. The effect of ploughing is to invert the top surface of the soil so as to pulverise it and turn under the surface plant growth which is liable to decompose. The depth of ploughing depends on the condition of the soil and subsoil and whether the crop that is next to occupy the land is deep or shallow rooting. When the plough passes at the same depth year after year a hard pan or pan is formed through which the roots of cultivated plants cannot penetrate. Ploughing is done as early as possible in autumn so that, especially on the heavier soils, the weather may exercise its beneficial effects as long as possible. Ploughing is impossible during hard frosts and is undesirable in continuous wet weather. Ploughing by steam power is now ousted by the far more economical tractor, driven by internal combustion engines. Tractor ploughs with multiple breast embody the principles of the horse plough and are of two main types, the trail plough, with the breasts mounted on and regulated from the beam and the 'Unit' type plough, mounted directly on the tractor and being raised by the tractor's hydraulic lifting gear. For deep or difficult work specially strong and heavy tractor ploughs are used. They are frequently drawn by tracklaying machines. On small areas, hand guided

petrol tractors with one or more ploughs attached are in general use.

**Plodiv.** 1 Dist. of Bulgaria in the S E part of E Rumelia. Area 6116 sq. m. Pop 877 000. 2 Cap. of I. Rumelia, in the above dist., is seated on a small is. formed by the Maritza R. in W N W of Adrianople. It was founded by Philip of Macedon, the father of Alexander the Great, under the Rom. Empire it was the cap. of the prov. of Thracia, long in possession of the Turks. It contains several mosques. It is the seat of three bishops: Catholic, Greek and Bulgarian, and is situated in the midst of a vine and fruit growing country, being specially noted for its mulberries. The industries are connected with tobacco, dist. of roses, cotton, silk, leather, and cloth. The town was almost demolished by an earthquake in 1816, but was rebuilt later. Pop 100 000.

**Plover,** name for various limcoline birds of the subfamily Charadriidae, characterised by a short bill, weak at the base and strong at the tip, the nostrils in deep longitudinal grooves. A typical species is the golden P. (*Charadrius pluvialis*), which is plentiful on moors and on coasts of most parts of Britain in winter. It is about 10 in. long and in winter the upper part of its body black with large yellow spots, and white throat and under parts, changing to black in the spring. It nests on the ground, laying four yellowish eggs blotched with brown. It is these as well as the eggs of the lapwing or green P. which are highly valued as a table delicacy. The Kentish P. (*Spizella cantiana*) is a summer migrant breeding in considerable numbers in the Romney Marshes. The ringed P. or ringed plover (*A. hiaticula*) is a small bird with a black band on the throat. Colonisation in the London area was first noticed in 1944 and three years later the first pair were seen in Yorkshire. The Norfolk P. or stone curlew (*Idoneopus crepitans*) is also a summer migrant frequenting sandy lawns. See 1 A R Union. *The Jaybird* 1949.

**Plösch, 4. Professor.**

**Plücker, Julius** (1801-68) German mathematician and physicist, b. at Lüneburg. Educated at Düsseldorf and at the Univ. of Bonn, Heidelberg and Berlin he went to Paris in 1823 and conferred with Fourier. At Bonn he became privat-docent 1821, and prof. extraordinary 1829. His first great work was *Analytisch-geometrische Untersuchungen* (1828-1831). In it he introduced a concise notation now universally used by mathematicians. The first vol. applied this notation generally, but entered specially into the subject of curves, and the determination of the whole course of any curve from a limited number of points taken in it; the second vol. established the principle of duality or reciprocity. He became prof. of mathematics at Halle 1834, and Bonn, 1835. Then came the following works: *System der analytischen Geometrie* (1835), *Theorie der algebraischen Kurven* (1838), and *System der Geometrie des Raumes* (1846). In 1847 he became prof. of physics

at Bonn, and he soon appeared as an original worker in his new subject. His writings on physios were contributed to *Poggendorff's Annalen*. First he dealt with the magnetic properties of crystals, and the properties of magnetic and diamagnetic bodies; then, earlier than Hunsen, he announced that lines in the spectrum were characteristic of the chemical substance emitting them. Toward the end of his life he returned to his earlier field of study, and developed what is now called Line geometry, adapted to three-dimensional purposes in which the unit is, instead of the point, the straight line.

**Plum** (*Prunus domestica*), cultivated variety of *P. communis*, one of the most important hardy fruit-bearing trees. In planting regard should be had to varieties, which are very numerous. A strong retentive loam in which lime is present is the most suitable soil for *P.* culture, and the situation should be one freely exposed to light and air. For orchard culture, the standard form of tree is the most suitable, but the bush and pyramid forms are valuable for gardens. The fan-trained tree is the best for wall culture. *P.*s. are very successfully grown in pots in light, airy glass-houses. See H. V. Taylor, *Plums of England*, 1919.

**Plumage**, see BIRD; FEATHERS.

**Plumbago**, genus of herbaceous plants and shrubs. *P. capensis*, a native of S. Africa, is a valuable greenhouse plant, and may be trained on stakes or trellises. It bears blue spikes of flowers. Sev. species have medicinal value.

**Plumbago**, see BLACK-LEAD.

**Plumber-work**, see under BUILDING.

**Plumbism**, see LEAD POISONING.

**Plumer**, Herbert Charles Onslow, first Viscount (1857-1932). Brit. soldier, great-grandson of Sir Thomas P., one-time master of the rolls. Educated at Eton and Sandhurst, he began service in the York and Lancaster Regiment, 1876. He served in the Sudan in 1881, being mentioned in dispatches; in S. Africa 1896, where he raised and commanded a mounted Rifle Corps, and distinguished himself in the S. African war in the operations in Rhodesia, his most notable achievement being the relief of Mafeking. Major-general, 1902, he was quartermaster-general to the forces and a member of the Army Council 1904-5, and appointed general officer commanding N. Command in 1911. In the First World War he held successively the following commands: Fifth Army Corps (1915), Second Army Brit. Expeditionary Force (1915-17); 1st Expeditionary Force, (Nov. 1917-March 1918); and from 1918 the Second Army of the Brit. Expeditionary Force in France and Flanders. His outstanding achievement on the W. front was the victory of Messines Ridge in June 1917. It is worthy of record that he never favoured the offensive against Passchendaele Ridge. He was sent to Italy immediately after the disaster of Caporetto (q.v.). In the final advance on the W. front his army cleared the Gers. from the high ground E. of Ypres and from Ploegsteert (q.v.) Wood and Messines,

forced the evacuation of Lille and, by the armistice, had reached the Scheidt and Ghent. After the armistice he commanded the Brit. Rhine Army. On his return to Britain he received the thanks of Parliament, a grant of £30,000, and a barony. In 1919 he was made governor of Malta, and in 1925 high commissioner of Palestine and Transjordan. See life by Sir C. Harrington (his chief of staff in France and Italy), 1935. P. is buried in Westminster Abbey.

**Plumpton**, vil. of Sussex, England, 4½ m. N.W. of Lewes. Race meetings are held annually from Sept. to May. Pop. 760.

**Plumstead**, par. of London, England, in the bor. of Woolwich (Kent), which it adjoins. P. Marshes (about 5½ m. from Erith) are chiefly used as a military range, and contain powder magazines. The pop. is included in that of Woolwich.

**Pluralism** (eccl'es.), system of holding more than one living or benefice with cure of souls at the same time. This, among other personal privileges and emoluments of the clergy, was forbidden in England at the time of the Reformation by an Act of 1529. That Act, which deprived the clergy of the power of holding pluralities by virtue of papal licences purchased for money, and made residence obligatory, only permitted pluralities with respect to benefices above the yearly value of £8. In the eighteenth century, however, P. was rife. Pluralities are now regulated by Acts of 1837 and 1885, the former of which repealed the Act of 1529 and declared pluralities illegal except where the livings were of small value and situated in dists. of a small pop. The amending Act of 1885 provides that two benefices may, by dispensation from the archbishop of Canterbury, be held together if the churches are within 4 m. of each other and the value of one of the benefices does not exceed £200.

**Pluralism**, metaphysical theory that all existence is ultimately reducible to a multiplicity of distinct and independent beings or elements. As such, P. is directly opposed to monism (q.v.) and is distinguished from dualism in that it postulates many realities and allows greater qualitative diversity. To-day it is usual to notice only materialistic and spiritual P. There is an increasing departure from the postulations of materialistic P. since it offers no explanation of the origin of mind, declaring that mind itself is not real. Bertrand Russell formulates a variation on the theme by propounding that the world, so far as we know it, is composed of a number of elements, and one method of arrangement produces mind, while another 'pattern' produces matter. P. describes rather than explains mind, and critics hold that limit to be its chief weakness. Spiritual P. is the form most widely considered to-day. It is based upon the conception of Leibniz (q.v.) that reality is made up of an infinite number of individual forces, whose nature is psychic. These he terms 'monads,' and he claims that God has evolved them to fulfil His ultimate will.

He shows a movement of complete upward development from one level to the next. This theory is supported by Howison in America, though it has not yet been satisfactorily explained how there can be interaction between individual minds having a concrete existence as Wm James declares. P forms the basis of many theistic theories which begin by assuming the origin and ultimate development of individual minds. It is this assumption which provides critics with most of their material. See also MONAD AND MONADISM. See Leibniz *Monadology*, 1714, W James *A Pluralistic Universe*, 1910, C A Richardson *Spiritual Pluralism and Recent Philosophy* 1919, and W Carr *A Theory of Monads* 1922.

**Pluralism** (political theory) theory which regards the state as an institution essentially similar to churches, trade unions, etc. Thus follows a denial that the state has any theoretical claim to sovereignty over such other institutions. H J Laski (*q.v.*) is the main exponent.

**Plurality** (in logic) contention that a certain effect is not produced by one and the same cause, but that different causes can result in similar effects. The theory was laid down by J S Mill (*q.v.*), and is referred to as P of causes. While the statement may be superficially true, under close examination it is doubtful for many effects which appear to be similar or fundamentally different in kind or degree. For example, many causes will produce unconsciousness in the human mind and apparently this instance bears out P as a feasible contention but there are many kinds of unconsciousness, each very different from the other. Meticulous inquiry therefore rejects much of the evidence which is brought forward to support the theory. See J S Mill *Logic* 1871.

**Plural Voting**, electoral system that allows a person to have more than one vote at the same election. For parliamentary elections in the United Kingdom before 1918 there was a certain amount of P V inasmuch as a man could qualify as a landowner although not as a resident in several constituencies. By the Representation of the People Act 1918 P V was almost abolished and the position then was that a person could not have more than two votes and these had to be given in two constituencies. Thus he could be registered both in respect of a residential qualification and also as a voter in a university or again in respect of a residential qualification and in respect of business premises. But the Representation of the People Act 1928 provided for the complete abolition of P V by abandoning all university constituencies and removing the business premises vote.

**Plush** (contraction from *peluche*, hairy fabric), kind of cloth of silk, cotton or wool, or a mixture of these woven like velvet, but having a longer and softer nap. It is used chiefly for rich garments, cloaks, and upholstery, and especially for footmen's knee breeches and liveries. "Hatter's P" is used for the outside of top-hats.

**Plutarch** (Πλουτάρχος) (c. A.D. 46–after 120), Gk. miscellaneous writer, philosopher and moralist, and biographer b. at Chaironeia, Boeotia. He lectured on philosophy at Rome during Domitian's reign, winning the friendship of persons of distinction and holding high office under Trajan and Hadrian. He d. in his native town where he probably wrote most of his famous *Βίοι Παράλληλοι* (forty-six parallel lives of Gks and Romas, arranged in pairs for comparison) and four single lives. The interest of these biographies is mainly ethical and not historical, but they remain among the great books of the world and their influence has been vast. P's style is honest but sometimes cumbersome and obscure. Among the couples compared

W. F. Munsell  
PLUTARCH

are Theseus and Romulus, Pericles and Fabius Maximus, Alcibiades and Coriolanus, Alexander and Caesar, Demosthenes and Cicero. His philosophical and ethical works are usually grouped together as *Opera Moralia*. They treat of a variety of subjects and are valuable for numerous quotations from lost Gk. poems and dramas.

**Plutarchography**—*Plutarch's Lives* (Lindsay Kirk K. Ziegler (ed.), 1914, 39 B. Perrin (ed.), 1914, 26. *Moralia* G. N. Bernardakis, 1898, 90. C. Hubert W. Nachstad, 1925, 2. C. Babbitt, H. N. Fowler, W. H. C. Howell (ed.), 1927. *TRANSLATIONS* (in addition to Loeb texts above) *Lives* Sir F. North, 1879, 1928, 1929, 30. Dryden, revised by A. H. Clough (Everyman's Library). See A. Weisäcker *Untersuchungen über Plutarch's biographische Technik* 1931 and N. I. Barbut *Les Procédés dans les biographies de Plutarque* 1931.

**Pluto** (Πλούτων) or Hades. In Gk. mythology the god and ruler of the underworld (Hades) identified with the Roman Dis. He was son of Chronos and Rhea.

brother of Zeus and Poseidon, and carried off Persephone to be his queen.

**Pluto.** The discovery of Neptune (*q.v.*) in 1846 from its perturbations on Uranus suggested that a similar method could be used for detecting a trans-Neptunian planet, if such existed. Percival Lowell, working on lines similar to those adopted by Leverrier and Adams, indicated where the planet would be found, but did not live to see his prediction fulfilled. On Jan. 21, 1930, C. M. Tombaugh at the Lowell Observatory, Flagstaff, Arizona, was rewarded for his efforts, as a photographic plate showed the image of the new planet which he had sought for years. The result of examining the plate was announced on March 13 of the same year. Although it was nearly in the direction predicted by Lowell it was much nearer than he had suggested, and it was probably by good fortune that search in the right place was carried out. The new planet named P. was found to be moving in a very eccentric orbit, eccentricity 0.248, at an inclination of nearly  $17^{\circ} 9'$  to the ecliptic. It takes nearly 248 years to complete a revolution round the sun from which its mean distance is 3,666,000,000 m., but its high eccentricity makes it approach the sun to within 2,075,000,000 m. at one time and to recede to 4,657,000,000 m. at another, so that it comes within the orbit of Neptune during its revolution round the sun. Its period of axial rotation, diameter, and mass is unknown, but it is probably comparable with Mars in size and mass. If it has any satellites they are too small to be detected, even with the most powerful of modern telescopes. It is thought that there may be one or more planets beyond P. but this is mere conjecture.

**P.L.U.T.O.** (pipe line under the ocean), see under PIPE-LINE.

**Plutonium**, see under IGNEOUS ROCKS.

**Plutonium** (symbol Pu), metallic element made by bombarding uranium with neutrons. Its atomic weight is 239 and its atomic number 94. It can itself be disintegrated by neutrons, enormous amounts of atomic energy being liberated explosively (as at Nagasaki). At first P. was believed to be a purely artificial element, but later it was stated that it occurs naturally in minute amounts. Its atomic fission can be controlled, which makes it suitable as a source of atomic energy for industrial purposes.

**'Pluto, Operation,'** see under PIPE-LINE.

**Plutus** (Πλούτων), (Gk. personification of riches, son of Demeter and Iasion, often represented as both lame and winged. He was said to have been blinded by Zeus that he might bestow his gifts indiscriminately.

**Pluvius**, title given like 'Pluvialis' and 'Imbricifer' to the Rom. Jupiter as the sender of rain.

**'Plymouth,'** important naval and commercial seaport, of Devonshire, England, situated between the estuaries of the Tamar and Plym Rs. on the boundary of Devon and Cornwall, nearly 250 m. by rail W.S.W. of London. Originally three separate tns., Devonport, E. Stonehouse,

and P. An amalgamation took place in 1914 under the inclusive name of P. There are three harbours, Sutton Pool, Catwater (Cattewater), and the Hamoaze, which unite in P. Sound, a spacious bay which has a breakwater a mile in length across the entrance; nearly 4,000,000 tons of local stone were used in its construction. The chief gov. establs., viz. the dockyard, barracks, gun wharves, etc., are at Devonport. At Stonehouse are the naval hospital, Royal Marine barracks, victualling yards, etc., while P. is the centre of trade. After the Second World War a number of new industries were estab., giving employment to many thousands of workers in the manuf. of clothing, radio equipment, lubrication products, and processed foods.

Historically P. is one of the most interesting cities in Great Britain. It was from here that Drake, Hawkins, and Gronville sailed on many of their great voyages; the *Mayflower* set forth from P. with the Pilgrim Fathers to America; Capt. Cook led his first voyage of circumnavigation, and his last and fatal voyage of 1776, from this same port. Dominating the city are the mighty ramparts of the seventeenth-century citadel, built soon after the long and stubborn sieges when P. successfully withstood the attacks of the Royalists in the Civil war. In and around the city there remain very many relics of these aspects of her ant. past. The sect known as the P. Brethren (*q.v.*) originated here after 1830. The tn. returns two members to Parliament.

In the Second World War P. was subjected to many intense aerial bombardments, and the record of death and destruction made it proportionately the worst hit city in Great Britain. Civilian casualties alone were 5620, with 1172 killed; 72,102 houses were damaged, with 7354 completely destroyed. Nearly all the civic buildings, including the public library with its total stock of 80,000 books, were wiped out. As a result, many of the narrow winding streets of the old tn. completely disappeared and the city was faced with a vast problem of reconstruction. In 1913 a 'Plan for Plymouth' was pub. propounding a scheme of redevelopment which envisaged one of the finest city centres in Europe.

Amongst the city's many attractions to visitors is P. Hoe, on which Drake was playing his historical game of bowls when report was first received of the sighting of the Sp. Armada in 1588. P. has a marine biological station and aquarium. It is a point of departure for ocean-going steamers, and is a seaplane base. The estimated pop. of 220,800 in 1931 was reduced by over 50,000 as a result of the air raid destruction. The estimated figure for 1948 was 178,000.

**Plymouth**, chief tn. of Plymouth co., Massachusetts, U.S.A., situated about 35 m. S.E. of Boston. It is the oldest tn. in New England, having been founded by the Pilgrim Fathers, who left P. in England and settled there in Dec. 1620. It stands on a fine harbour, the commerce is considerable, and the chief industries are

the manuf. of iron goods and fishing. There are sev. handsome churches and a fine hall, where there are pilgrim relics and historical paintings. Pop. 18,000.

**Plymouth Brethren**, or **Darbyites**, religious sect which started in Dublin about 1830, and thence spread to Plymouth, Bristol, London, and other tns. Originally a reaction from formalism and clericalism, it gained numerous converts, many of them of high social position, through the work of John Nelson Darby (1800-82), a barrister, who gave his life to evangelistic work in Ireland, England, Switzerland, and other continental lands, as well as visiting America. P. B. were at one time widely known as *Darbyites*. Divs. in the Plymouth meeting led, after much controversy, to a separation of the 'Open' from the 'Exclusive Brethren,' the latter refusing fellowship with any but baptised believers of their own persuasion. There have been many other internal disputes, but the movement continues powerful in sev. countries. P. B. stand for a simple world-renouncing piety, regard 'the Bible as infallible, look for the speedy Second Coming of Christ, reject a professional ordained ministry, and 'break bread' together weekly in memory of the death of Christ. Each local meeting is regarded as autonomous under the guidance of the Holy Spirit.

**Plymouth Sound**, arm of the Eng. Channel between Devonshire and Cornwall, covering an area of 4500 ac., including the following inlets: the Catwater, Sutton Pool, Mill Bay, Stouehouse Pool, and the Hamoaze, the latter used as a naval harbour, and Cawsand Bay on the W. An immense breakwater was completed in 1841, and this shelters the harbour from the S.W. gales. It is nearly a mile long, and lies 2½ m. to the S. of the Hoe. There is a lighthouse at the W. end.

**Plympton**, mkt. tn. of Devonshire, England, 4½ m. N.E. of Plymouth. P. is a 'stannary' tn., comprising the pars. of P. St. Mary and P. St. Maurice; the latter was a bor. until 1842, and was the headquarters of Prince Maurice (1643) and the bp. of Sir Joshua Reynolds (1723), who was educated at the grammar school (founded 1658). St. Maurice has also an anct. guildhall, and there are ruins of an old castle. Pop. 10,000.

**Plymstock**, par. and vil. of Devonshire, England, on the Catwater and Plymouth Sound, 3 m. S.E. of Plymouth. Limestone and marble are found. Pop. 9000.

**Plympton**, int. of Wales, in Montgomeryshire, 10½ m. W. of Llanidloes. It is formed chiefly of clay-slate with veins of lead. Height 2469 ft. The Wye, Severn, Llynant, Rhedol, and Ystwyth Rr. rise on its slopes.

**Plywood**, thin layers of wood, with the grain running in opposite directions, glued together under pressure. P. is extensively used in much joinery which was formerly worked in solid wood, e.g. panelling (q.v.). Although the modern form of P. has only been produced in recent years, certain forms of lamination have been used by wood-workers from very early times. In an Egyptian tomb

a headpiece to a bedstead was discovered, which had been built up on the P. principle and veneered in laburnum wood, inlaid with gold, although it is not known how the laminations and veneers were cut and cemented or glued together. Joinery experts consider that the use of central heating in buildings, and the high temp. demanded on ships, necessitating the production of a medium that would stand up to these modern requirements, led, if not to the actual introduction of P. in recent years, certainly to its rapid development, which has had considerable influence upon the design of modern work. Its production on a large scale has revolutionised the joiner's craft. In the past, design and construction had been greatly modified by the nature of the wood, the joiner working in solid wood having always to allow for some amount of shrinkage in his material. The shrinkage in P., however, is almost non-existent; while the large sizes in which it is now produced (Glaboon sheets of 65×183 in. are not exceptional) and the invention of new joinery machinery, has meant the adoption of larger, less detailed designs. P. is widely used for doors, screens, and corridors in shops and offices, and in the fitting out and decoration of ships. The three types of P. in general use are multiply, laminated board, and block board. Multiply is built up of three, five, seven, or more layers of thin wood cemented together so that the grain of alternate layers runs at right angles. Laminated board has a core, consisting of narrow strips of wood set at right angles to the encasing plies, over which sheets are then cut across the grain and the cord finally faced on both sides with outer laminations. Block is similar in construction to laminated board, the difference being that the inner core of block board is made up of wide laminated strips or blocks. These three types are manufactured in three grades of different quality. See also PANELLING; VENEERING.

**Pilsen** (Ger. *Pilsen*), tn. of Bohemia, Czechoslovakia, 71 m. S.W. of Prague. It is well built and has some fine edifices, chief among them being St. Bartholomew's Church (fifteenth century), the Renaissance tn. hall, and sev. museums. It is famous for its beer, and manufs. wine, sugar, pottery, paper, leather, cut glass, etc. The first printing press of Bohemia was set up here. Near by is the Skoda armament works. Pop. 118,100.

**Pneumatic Chemists**, The, name frequently applied to those seventeenth- and eighteenth-century chemists who particularly applied themselves to the study of gases. Prominent among them were J. B. van Helmont, Joseph Black, Joseph Priestley, and the Hon. Henry Cavendish. The first of these invented the word *gas* (from *geist* and *chaos*).

**Pneumatic Despatch**, see TUBES, PNEUMATIC.

**Pneumatic Power Transmission**. The use of compressed air in modern engineering has sev. advantages to recommend it (see PNEUMATIC TOOLS). The famous Mont Cenis and St. Gothard tunnels, in whose

construction compressed-air engines were employed to operate the drills, drew attention to the possibilities of this form of engineering that has since risen to second place to electrical power in the world of general engineering. Compressed air is used in mines, where other forms of power are dangerous, for operating pneumatic tools, sump pumps, and hoists. Most engineering works also use compressed air in the foundries for operating moulding machines, for drying cores and cleaning completed castings by sand blast. In other parts of engineering works compressed air is used for drilling, riveting, chipping, grinding, etc., and for paint spraying.

For normal installations where the air main is not long the pressure is approximately 100 lb. per sq. in., but where long mains are used higher pressures may be used with a reducing valve near the scene of operation. To the qualities of convenience and safety of the compressed air system are added the general quality of convenience of installation. The compressed air plant generally consists of a compressor, with its prime mover, complete with drives and accessories, which may include after-cooler, moisture separator, receiver, and in addition air piping. It is important that the piping installation, particularly if it is to serve a large area, should be of ample diameter to ensure a sufficient velocity of air and to prevent undue loss of pressure due to friction. Usually a velocity of 30-40 ft. per sec. through the pipes is satisfactory, but care should be taken that there are no sharp corners, and wherever possible bends or sweeps should be used when the air stream changes its direction. To obtain dry air at the point of application it is important to arrange that all branches from the main supply pipe connect to the top of the piping, and there should also be a slope in the piping preferably away from the receiver so that any moisture or oil coming out of suspension will flow in the direction of the air stream. Such oil and moisture is drained away wherever necessary by arranging a downward branch to each length of main and fitting a drain valve at the bottom. The pipe need only be of a strength requisite to the pressure; the jointing of the pipes is important in order to prevent leakages. In cases where the compressed air is required at some distance from a power supply portable compressors are used. These are self-contained units mounted for easy transportation and the compressors can be driven by petrol or Diesel engine, or by electric motor.

**Pneumatics**, term now almost obsolete, since it merely implies the study of the properties of gaseous fluids, and is therefore included in the term *Hydrodynamics*.

**Pneumatic Tools**, tools and appliances using compressed air as their motive power. These may be conveniently classified under four main headings: rock drills; pneumatic tools (percussive); pneumatic tools (rotary); pneumatic appliances.

**Rock Drills**. This term is applied to all

machines using compressed air for the perforation of rock and similar substances by combined percussive and rotary action. A blow is delivered to the drill steel either directly or through an anvil block by a piston which reciprocates in the cylinder, the movement of the air to the piston being controlled by some form of automatic valve designed to make the piston strike a heavy blow at speeds varying from 800 to nearly 3000 blows per min. **Pneumatic Tools (Percussive)**. These are percussive tools for concrete breaking, clay digging, chipping, caulking, riveting, etc. The action is similar to the rock drill, but the shank does not rotate. **Pneumatic Tools (Rotary)**. This term is applied to rotary tools for drilling, grinding, tapping, reamering, etc., and describes the tool which produces and transmits rotary action to a twist drill or other attachment. **Pneumatic Appliances**. This term is applied to machines, etc., which use compressed air for purposes other than those specifically included under rock drills and pneumatic tools, such as air motors, hoists, coal cutters, etc. Also included are impact wrenches, spray guns, cement guns, air brakes, air chucks, air lift pumps, sump pumps, sand blasting.

The advantage of all P. T. lies in their efficiency in operation, in the fact that the tools and compressed-air plant can be transported with ease, and in that they are almost foolproof so that little training is required for their use.

**Pneumatic Trough**, vessel used for collecting gases over a liquid (generally water). The trough is filled with water, and jars to contain the gas are filled with water and inverted on a 'beehive' shelf. The gas passes up through the perforated shelf and fills the jars by displacement. For the collection of gases soluble in water, the latter may be replaced by mercury. The P. T. was invented by H. Boyle (1627-91), J. Mayow (1643-79), S. Hales (1677-1761), and J. Priestley (1733-1804).

**Pneumatic Tyres**, see TYRES.

**Pneumatolysis**, see under PETROLOGY.

**Pneumogastric Nerve**, *vagus* (i.e. 'rambling,' referring to its wide distribution), or tenth cranial nerve. It originates in the floor of the fourth ventricle and supplies the ear, pharynx, larynx, heart, lungs, oesophagus, and stomach by its branches, the auricular, pharyngeal, superior and inferior laryngeal, cardiac, pulmonary, oesophageal, and gastric nerves.

**Pneumonia**, inflammation of the lung. Used without qualification, the term denotes *lobar* or *acute crumous P.*, an acute infectious disease caused by a specific micro-organism and running a course divisible into the following stages: (1) *Congestion*: the lung substance is gorged with blood and is heavier than normal, though it still contains air. (2) *Red hepatization*: an exudation of fibrinous material mixt with epithelial cells and blood corpuscles takes place; the colour of the lung is dark red and the substance resembles liver tissue. (3) *Grey hepatization*: a degenerative change

takes place in the exudate, and the colour turns to grey, while the lung maintains its liver-like consistency. In favourable cases the exudate may be absorbed or expectorated, and the lung becomes rapidly free from fibrinous material. Where resolution does not take place, death may occur from poisoning of the blood or extension of the inflammatory process. The most common complications are pleurisy, empyema, endocarditis, pericarditis, and meningitis. The symptoms at the early stage are shivering, cough, and fever, the temp. rising to 104° or 105°. There is a characteristic dusky flush, laboured breathing, and pain in the side, particularly if pleurisy be present. The expectoration is at first viscid and colourless, but afterwards takes on a reddish hue, due to the presence of epithelium, blood corpuscles, etc. A dull sound is produced by percussion of the affected part and fine crepitation may be heard during the stages of congestion and red hepatization, while a coarser crepitation is audible when grey hepatization sets in. In a majority of cases there is a crisis between the sixth and eighth days; if the outcome is favourable the temp. rapidly falls, and the patient proceeds to recovery in a remarkably short time. The cause of P. is probably bacillary infection, but the *Diplococcus pneumoniae*, which is credited with the causation of the disease, is found in the secretions of healthy persons. In nearly every case the onset of the disease can be adduced to a lowered vitality occasioned by pre-existent disease. Alcoholic and diabetic conditions especially predispose to P. Treatment is usually symptomatic. Careful nursing, with attention to fresh air, is essential. Heart weakness should be treated with strychnine or digitalis. Hopeful results have been obtained by the use of sera and vaccines, particularly that prepared from the patient's own diplococci. The sulphonamide ('M. and B.') drugs are extremely useful in the treatment of P. Broncho, catarrhal, or lobular P. is a catarrhal disease of the bronchi which finally involves the parenchyma of the lungs; it is often fatal in children under five. Interstitial P. is a chronic inflammation marked by increase of the connective tissue; it is usually caused by the inhalation of dust, etc. For P. in horses see under HORSE (DISEASES).

**Pnom-penh**, Panompenh, Penomping, Phnom-Penh, or Namwang, cap. of Cambodia, situated on the Mekong, where a channel connects it with Lake Tonle-Sap, 130 m. N.W. of Saigon. There are factories at Khsach-Kandal near by for shelling cotton seeds. Rice, tobacco, salt fish, pepper, gamboge, indigo, maize, silk, cotton, and tortoise shells are exported. Boat-building is also carried on. Pop. 102,700.

**Pnyx** (Græc. from *πνυξ*, crowded), name of the public place of assembly in Athens. It was probably semicircular in shape, cut on a slope connected with Mt. Lycabettus, W. of the Acropolis and S.W. of the Areopagus.

**Po** (anc. Eridanus and Padus), largest riv. of Italy, irrigating the entire plains of Piedmont and Lombardy. It rises at the N. foot of Monte Viso in the Cottian Alps, on the Fr. border, flows N.E. to Saluzzo, Turin, and Chiavasso, thence in a tortuous course past Piacenza and Cremona E. to the Adriatic, which it enters by a delta (35 m. long). Its chief mouths are the P. della Maestra, della Tolle, di Goro, di Gnoca, and di Volano. At Paria the riv. is only 300 ft. above the Adriatic's level, having dropped from over 6000 ft. Among its chief tribs. on the l. b. are the Dora Riparia (near Turin), Dora Baltea, Ticino (draining Lake Maggiore), Adda (draining Lake Como), Oglio (draining Lake Iseo), and Mincio (draining Lake Garda). On the r. b. are the Tanaro, Trebbia, Parma, and Secchia. As the current carries much sediment from the mt. torrents feeding it, the P.'s delta increases as rapidly as that of the Mississippi. Below Piacenza embankments are kept up to prevent inundations. Canals connect the various tribs. with each other and with the P., the chief being Cavour Canal joining the Ticino and the P. The total length is 355 m., and the drainage area 29,000 sq. m. The P. is navigable beyond Turin. Sturgeon, salmon, and other fish abound, and its valley is a highly productive agric. area, rice being an important crop. It has been many times used as an invasion route, and was the scene of many Austro-It. conflicts. In the Second World War campaigns on the It. front the Allies under F.M. Alexander reached the P. on April 23, 1945, having, after a long struggle, captured Bologna (April 20). The Gers., retreating across the P. valley on April 22, were bombed with devastating results. With the fall of Modena and Ferrara S. of the riv., the Allies were in a position to cross (April 24). Six days later all Ger. armies in Italy surrendered. See further under ITALIAN FRONT, SECOND WORLD WAR, CAMPAIGNS ON.

**Poaching**, see GAME LAWS.

**Pocahontas** (c. 1595-1617), Indian princess, noted in the colonial hist. of Virginia, daughter of Powhatan, an Indian chief of Virginia. She is famous for Smith's story in his *True Relation* (1608) and *General History of Virginia* (1624). Smith states that he was captured by the Indians and condemned to death, but was saved by the intervention of P., then a little girl. When she grew to womanhood she married John Rolfe (c. 1614), one of the Jamestown settlers, coming with him to England (1616). She d. and was buried at Gravesend, Kent, after giving birth to a son who subsequently returned to Virginia and is claimed as an ancestor by many prominent families in the state. John Randolph of Roanoke claimed descent from her. See Deane's ed. of Smith's *True Relation*, 1866; E. D. Neill, *Pocahontas and her Companions*, 1869; E. Eggleston and L. E. Seelye, *Pocahontas*, 1879; W. Robertson, *Pocahontas and her Descendants*, 1887; and C. Poindexter, *Captain J. Smith and his Critics*, 1893;

also lives by W. Robertson and D. Garnett, 1933.

**Pocatello**, tn. of Idaho, U.S.A., in Bannock co., situated near Fort Hall. It is a railway junction and manufs. cement blocks and malt liquors. Pop. 18,100.

**Poohard, or Red-headed Poker** (*Nyroca ferina*), handsome duck which occasionally breeds in Britain, but which is imported in considerable numbers from Holland for the market. The male's head and neck are chestnut-red; the breast, upper part of back, quill feathers, and rump are black; the sides and the under parts are greyish-white and the base and point of the bill are black, and the central portion pale blue. The female's bill is black and her plumage is greyish-brown except for the greyish-white under parts. Ps. feed largely on water plants, for which they dive. The nest is made in long grass on the borders of lakes and pools.

**Po-Chu-Li**, Chinese poet of the eighth century. He rose high in the civil service, but the tangle of intrigues and insurrections making life hazardous, he gave up his career when middle-aged, and devoted himself to poetry, achieving great fame in the E. His poetry shows a concentrated and powerful vision: a friendship is the chief emotional urge of his life. See A. Waley, *Life and Times of Po-Chu-Li*, 1919.

**Pocket Battleship**, see 'ADMIRAL GRAF SPEE': NAVAL OPERATIONS IN THE SECOND WORLD WAR, *Naval Operations in European Theatre of War in 1945*; NAVY AND NAVIES.

**Pocket Borough** ('rotten' borough), see ELECTORATE.

**Pocklington**, mkt. tn. of the E. Riding, Yorkshire, England, 13 m. S.E. of York. There are corn mills and breweries, and manufs. of agric. implements. Wilberforce (b. 1759) was educated at the grammar school (founded 1515), now a large public school. The church is a thirteenth- to fourteenth-century structure. Pop. (with Meltonby, Yapham, and Owssthorpe) 14,300.

**Poděbrad** and **Kunstat**, **Georg Boozkos von** (1120-71), king of Bohemia, b. at Poděbrad. On the death of Sigismund (1438) he joined the Utraquists, supporting Casimir of Poland as ruler, and becoming their leader (1444). By 1452 he was regent for Ladislas Posthumus, and elected his successor (1458). He was excommunicated by Pius II. (1463) and by Paul II. (1468) for failing to lead the country back to the Rom. Catholic Church. War broke out with Matthias Corvinus and the Hungarians, but peace was concluded about 1467. See L. Jordan, *Das Konigtum Georgs von Podiebrad*, 1881; A. Bachmann, *Georgs von Podiebrad Wahl* . . . , 1876, and *Böhmen* . . . , 1899-1905.

**Poděbrad**, tn. of Czechoslovakia, in Bohemia, on the Elbe, 31 m. N.E. of Prague. Pop. 5000.

**Podesta**, It. municipal officer of the twelfth to sixteenth centuries, the chief military and administrative official of the commune. Mussolini replaced the title of mayor by that of P.

**Podgoritz, Podgorica, or Titograd**, fort. tn. and cap. of Montenegro (Yugoslavia), 19 m. N.E. of Cetinje. In the vicinity are the ruins of Diocletia, where Diocletian was b. There are tobacco and saw-mill industries. Pop. 10,651.

**Podgorze**, tn. of Poland, in Galicia, on the Vistula, opposite Cracow, with manufs. Pop. 13,000.

**Podmokly**, see BODENBACH.

**Podolia** (low-lying land), area of the Ukraine, stretching from the W. Bug to the Polish-Rumanian frontier. It is the W. extension of the fertile black earth region of S. Russia. Along the S. edge of the Podolian plateau lies the Galician depression, which forms an important route, from Silesia, through Bessarabia and Rumania to the Black Sea, is watered by the Dniester (S.W.), an important channel for export trade, and by the Bug. Outliers of the Carpathians form a watershed between the S. Bug, the Dniester, and the Dniester. In N.W. P., between Lwow and the Dniester, lies a high plateau region, known as 'Opolye' (1200 ft. high), deeply fissured by the wide valleys of the rivers of the Dniester. The soil is very fertile, producing cereals, hops, flax, sugar-beets, fruits, and tobacco. There are flour and woollen cloth mills and distilleries. The market-gardening in the S. is noted, cherries, mulberries, melons, gourds, and cucumbers being especially fine. Kamienets-Podolsk is the chief tn. A railway runs from Odessa to Galicia through P. Occupied by the Gers. in 1941 it became the main centre of conflict in March 1944 when the Ger. defence system in the Ukraine was crumbling before the armies of Marshal Zhukov and Marshal Konev. See further UNDER EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

**Podolsk**, tn. of the Moscow Region of the R.S.F.S.R., 25 m. S.W. of Moscow on the railway to Tula. There are manufs. of glass and locomotives, and silk weaving is carried on. Pop. 72,400.

**Podophyllum**, or **May-apple**, genus of herbaceous perennials (family Berberidaceae) with large ornamental shield-shaped leaves, and white or reddish-purple flowers, followed by red berries. *P. peltatum*, May-apple, or wild lemon, a native of N. America, is sometimes grown in damp borders; its leaves are poisonous.

**Podostemaceae**, order of branched and floating herbs, resembling liverworts, chiefly occurring in S. America.

**Poe, Edgar Allan** (1809-49), Amer. poet, story writer, and critic, b. at Boston. His father was of a well-known Baltimore family and his mother was Eng. Both died while he was a child. He was taken into the family of John Allan, a well-to-do tobacco merchant of Richmond, Virginia. Though he added the name of Allan to his own, he was never legally adopted. He was educated at Stoke Newington in Eng., and (1816-21). Then he entered Richmond Academy, Virginia, and went to Virginia Univ. in 1826. His irresponsible behaviour displeased his guardian and he was put into Mr. Allan's office. P., unable to endure business life,

soon left for Boston to make his first efforts at self-support by literature. He pub. *Tamerlane and other Poems* under a pseudonym, in 1827. Becoming destitute he enlisted in the U.S. Army under an assumed name, but was bought out next year by Mr. Allan and appointed to a cadetship at the U.S. Military Academy. After six months he was court-martialled and dismissed for neglect of duty. From this time he made a scanty living by contributing to Amer. Jours., and by the pub. of such masterpieces as *Tales of the Arabesque and Grotesque* (1840) and *The Raven* (1844), gained a very considerable

EDGAR ALLAN POE

reputation. He became editor of the *Southern Literary Messenger* of Baltimore, in which he initiated a style and freedom of criticism new to Amer. readers, and later of *Graham's Magazine*. He had married in 1836 his fourteen-year-old cousin, Virginia Clemm, a false statement as to her age being made at the time of the marriage. Their life was marked by poverty, which caused the bitterness in much of his work. She died in their little cottage at Fordham, near New York city, in 1847. *Annabel Lee* (1819) was written in memory of her. Save for *Ulalume* (1847) and *The Bells* (1849), his work was at an end. Having occasion to visit Baltimore in 1849 he became ill there, and was found in the streets in a dying condition, expiring on Oct. 7.

The world has produced few more subtle or successful poetical craftsmen, for his verse, though small in bulk, exhibits extraordinary powers of technique and acquaintance with the subtleties of rhythm

and syllable change. Perhaps even more surprising was his ability to bring into play and weave into his tales and poems such an atmosphere of wonder and terror. He was the first to give a definition of a short story and one of the first to practise the art. In *The Mystery of the Rue Morgue* (1841) and other tales he was the originator of the modern detective story. He was no less notable as a critic, analytical and knowledgeable in literature. He was not given to light praise, but he was among the first to celebrate Tennyson, Dickens, Hawthorne, and others.

In Dec. 1949 a tablet was unveiled in Stoke Newington Central Library with the inscription: 'Edgar Allan Poe, b. 1809, d. 1849, American romancer, poet, and critic, was a pupil at the Manor House School which stood near this spot, during his boyhood, 1817-1820.' His prin. works, besides those named, are *The Fall of the House of Usher* (1839); *The Gold Bug* (1842); *Tales of Mystery and Imagination* (1850), etc. His *Letters* were ed. by J. Ostrom, 1949. See J. H. Ingram, *E. A. Poe: His Life, Letters, and Opinions*, 1880; J. W. Krutch, *E. A. Poe*, 1926; and A. H. Quinn, *Poe*, 1942.

**Poet Laureate**, see LAUREATE.

**Poetry**. 'Epic poetry and tragedy, as also comedy, dithyrambic poetry, and most flute-playing and lyre-playing, are all viewed as a whole, modes of imitation' (Aristotle). As the means of imitation, Aristotle enumerates rhythm, melody, and verse, but in comparing Homer with Empedocles he explains that writing in verse does not necessarily make P. This distinction is echoed by Hazlitt: 'All is not poetry that passes for such: nor does verse make the whole difference between poetry and prose. The *Iliad* does not cease to be poetry in a literal translation; and Addison's *Campaign* has been very properly denominated a Gazette in rhyme. Yet didactic P. (q.v.) from Empedocles to Pope is a recognised genre of P., and for practical purposes verse or rhythm is an essential part of P. Hazlitt recognises this: 'The best general notion which I can give of poetry is, that it is the natural impression of any object or event, by its vividness exciting an involuntary movement of imagination and passion, and producing by sympathy a certain modulation of the voice or sound expressing it.' This is an expansion of Milton's lines:

'Thoughts that voluntary move Harmonious numbers.'

No poetic theory denies harmony, although a repetitive metrical system has been dispensed with by Milton himself. The theory of Free Verse (q.v.) is, however, usually associated with certain twentieth-century groups of poets—Imagists, Dadaists, etc. A continuance of one kind of verse is characteristic, as Aristotle points out, of epic P., and in this it differs from dramatic P., although epic and tragic P. agree in being 'an imitation of serious subjects in a grand kind of verse' (see EPIC POETRY). The repetition of the verse form in lyric P. is proper to song

(see LYRIC), while the Gk. dramatic choruses and Pindar's odes represent a more sustained and ceremonial form of song. The false Pindaric or irregular ode has had an honourable tradition in Eng. from Spenser downwards (see ODE). The sonnet (q.v.) originated in Italy, and other intricate forms of P. (triolet, etc.) in France (see VERSE). Ballad (q.v.) P. combines lyric and narrative, while storytelling in P. from Chaucer to Massfield represents an epical form of P. in a lighter vein than that known to Aristotle. No account of P. and its various forms is complete without reference to the relations of P. with the age in which it is created. Shelley says truly: 'Poets, not otherwise than philosophers, painters, sculptors, and musicians, are in one sense the creators, and in another the creations, of their age.' W. J. Courthope, in his *History of English Poetry* (1910), adopts this conception of art, which is liable to be forgotten in the present age. He sums up P. in the definition: 'The art of Poetry is a mirror for the imagination of men living in a society at once historic and free. Its time-honoured forms, epic, dramatic, didactic, and lyric, are so many vehicles for the expression of ideas not merely existing in the mind of the individual poet, but representative of the action and character of those who live in his age and speak his language.'

For the P. of specific nations or national groups see the sections *Literature* under the heading of various countries. See also PASTORAL POETRY. See P. B. Shelley, *A Defence of Poetry*, 1821; G. Saintsbury, *A History of Criticism and Literary Taste in Europe*, 1900-4, 1917-1922; J. Massfield, *Saltwater Ballads*, 1902; E. Marsh (ed.), *Georgian Poetry*, 1911-12; F. W. Moorman, *Yorkshire Dialect Poems and Traditional Poems*, 1917; A. St. John Adcock (ed.), *The Bookman Treasury of Living Poets*, 1925; Sir H. Newbolt, *New Paths on Helicon*, 1927; F. H. B. J. C. Grierson and J. C. Smith, *A Critical History of English Poetry*, 1917; C. D. Lewis, *Poetic Image*, 1947; and C. Brooks, *Modern Poetry and the Tradition*, 1919, and *The Well Wrought Urn*, 1949.

Poggibonsi, tn. of Siena, Italy, linked by rail with Florence. The church of S. Lucchese has frescoes by the Gaddi school. A fire caused by artillery shells in the Second World War burnt off the roof of the church, destroyed Raffello de Carli's 'Noli me Tangere' and a valuable triptych, besides damaging the frescoes.

Poggio Bracciolini, Giovanni (Gian) Francesco (1380-1459), It. scholar and humanist of the Renaissance, b. at Terranova. He became secretary to the Rom. curia (c. 1403), but never showed interest in eccles. or political affairs,

devoting all his energies to unearthing old classical MSS. Among his discoveries were sev. orations of Cicero, some plays of Plautus, Lucretius' *De Rerum Natura*, Quintilian, and fragments of Valerius Flaccus, Silius Italicus, and others. He himself wrote moral essays, *Historia Florentina, 1350-1455* (1476), in imitation of Livy, and *Liber Facetiarum* (see Lisleux's ed., 1878; Hazlitt, *Old English Jest-Books*, iii., 1864), a collection of humorous but often indecent stories aimed chiefly against the monks. Of his polemical invectives those against Filelfo and Valla are best known. He retired to Florence about 1452, becoming chancellor and historiographer in 1453. His *Opera* were printed at Basle (1539).

See Thomschmidt, *Dissertation*, 1713; J. Lentant, *Poggiano*, 1720; H. Hallam, *Lit.*, 1837-39; G. Voigt, *Wiederbelebung des klassischen Alterthums*, 1859; M. Nisard, *Les Gladiateurs de la république des lettres*, 1860; and J. A. Symonds, *Renaissance in Italy*, 1875-86; also lives by W. Shepherd, 1802, and E. Walker, 1914.

Poggio, Casalino, Barone di, see BATTISTINI, MATTIA.

Pogrom, Russian word, meaning 'devaluation,' and originally used to denote any organised persecution of any class of persons obnoxious to the Russian Gov., but generally applied to the massacres of Jews. The word 'pogromy' is used by Herman Roth in his article on 'Russia' in the *Jewish Encyclopedia* as meaning 'riots.' Y's. (of Jews) ceased altogether in Russia after the Bolshevik revolution. They were introduced in Germany by Hitler as an integral feature of the racial doctrines of *Mein Kampf* (q.v.). The immediate cause or excuse for the general P. organised on Nov. 10, 1938, was the assassination of von Rath, an official of the Ger. Embassy in Paris, by a Jewish youth from Poland.

Pohutukawa, tree of New Zealand, commonly called the New Zealand Christmas tree because it flowers in Dec. It grows mainly along the coasts, and in summer time is a blaze of brilliant scarlet blossom.

Poietiers, see POITIERS.

Poincaré, Jules Henri (1854-1912), Fr. mathematician and physicist, b. at Nancy, where he was a pupil of the Polytechnic School. He was at first prof. at Caen, but was made prof. at the Paris Univ. in 1886, and elected to the Academy of Sciences at the following year. He discovered a new series of functions, to which he applied the term 'Fuchsian,' after Fuchs. In 1889 he won the king of Sweden's prize by his essay on the problem of three dimensions and dynamic equations, whilst the Royal Society of London gave him the Sylvester medal in 1901. Among his works may be mentioned *Sur la théorie des fonctions fuchsienues* (1881); *Cours de physique Mathématique* (13 vols, 1890-99); *Théorie de tourbillons* (1893); *La Théorie de Maxwell et les oscillations herziennes* (1899); *La Science et l'hypothèse* (1903); etc. See lives by G. Lebon (2nd ed.), 1912, and P. Appel, 1925.

**Poincaré, Raymond Nicolas Landry** (1860-1934), Fr. statesman; b. at Bar-le-Duc, son of Nicolas Antoinin Hélène P., civil servant and meteorologist. Educated at the Lycée de Bar-le-Duc and the Lycée de Louis le Grand, he entered the law and was for some time law-editor of *Le Voltaire*. He served more than a year in the Dept. of Agriculture. P. was elected Republican deputy for the Meuse in 1887; for Commercy in 1889, 1893, 1898, and 1902; was senator from 1903; minister of public instruction, 1893, and 1895; minister of finance, 1894-95 and 1906. In 1909 he was elected to the Academy. In Jan. 1912 he succeeded Caillaux as Prime Minister, becoming also foreign minister. He pursued a forward policy in Morocco, obtaining the sultan's recognition of the Fr. protectorate. He also enlarged the fleet. In 1913 he was elected president of the republic in succession to Fallières: Briand became Premier. P. visited Britain that year, and was in 1914 made lord rector of Glasgow Univ. In July 1914 he visited Russia; on his way back he heard of the Austrian ultimatum to Serbia, and wrote a remarkable letter to King George V. on the crisis (July 31). Amid the reverses of the war at the end of 1917 P. accepted as Premier his old opponent Clemenceau. P.'s term as president ended in 1920: he was succeeded by Deschanel, and re-entered the Senate. In Jan. 1922 he again became Prime Minister and foreign minister. Holding that Germany had defaulted, his gov., with that of Belgium, occupied the Ruhr, 1923. In 1924 he had to impose fresh taxation: the elections of that year went against him, and he resigned. An acute financial crisis, which destroyed one ministry after another with rapidity, occasioned his recall to power in July 1926. By new laws and drastic administrative decrees, he rapidly stabilised the franc, and his gov. endured until July 1929, when he resigned on grounds of health. P. pub. his memoirs under the title of *Au Service de France* (1926-33). They are obtainable in Eng. He also wrote literary, political, and scientific essays. See lives by H. Girard, 1913, and S. Huddleston, 1924; see also G. Wright, *Raymond Poincaré and the French Presidency*, 1933.

**Poinading**, in Scots law, denotes the process of 'attaching' the movables of a debtor to satisfy his debts. P. is either *real* or *personal*. *Real P.* or *P. of the ground* is the remedy of the *real* creditor or creditor whose debt is secured by a lien over or charge on land, or who holds a heritable security. *Personal P.* is the remedy of creditors in ordinary personal obligations and affects the debtor's goods and effects generally.

**Poinsettia**, or *Euphorbia* (*pulcherrima*), handsome greenhouse plant (family Euphorbiaceae) bearing brilliant scarlet, crimson, or white bracts in whorls. It is raised from cuttings inserted in a light compost in spring or late summer.

**Point de Galle**, see **GALLE**.

**Pointe-à-Pitre**, seaport of Grande-Terre, Guadeloupe, Fr. W. Indies, 18 m. N.E. of

Basse-Terre, with a large trade and a good harbour.

**Pointed Architecture**, see **ARCHITECTURE**, *Gothic*.

**Pointer**, popular sporting dog, descended from Sp. dogs imported in the eighteenth century and crossed with foxhounds, a cross which has been employed to impart additional speed and dash. The P. is easily trained to point (i.e. stopping dead and remaining rigid when it finds game at close quarters), and in America has been taught to retrieve. Some very good Ps. have been of small size, but a big dog stands about 25 in. at the shoulder and weighs 60 lb.

POINTER

T. Fall

The colour of the coat may be black, black and white, orange and white, lemon and white, or liver and white, probably the most popular colour. The skull should be rather wide between the ears with marked drop at the top, the muzzle long, nose dark liver or flesh colour, ears set low and hanging flat to the head, neck well arched, shoulders sloping, chest wide and deep, body well ribbed up the loins, forelegs straight, hind-quarters powerful, and tail short and tapering.

**Pointillism**, see under **IMPRESSIONISM**.

**Points Rationing**, see under **FOOD CONTROL**, **BRITISH**, in **WARTIME**.

**Point System**, see under **TYPE AND TYPESetting**.

**Point-to-Point Steeplechases**. Steeplechases were so called in the first instance because they were races run from 'point-to-point', the most prominent point, near which the finish was to take place, being a steeple or church spire. These early steeplechases were genuine races across country between two or more persons, and required a very good 'eye for country' as well as a sure seat in the saddle. One of the earliest steeplechases run was that in Ireland between a Mr. O'Callaghan and a Mr. Blake in 1752, from the church of Buttevant to the spire of St. Leger church, a distance of 4½ m. Records exist of other steeplechases of a similar nature being run in 1792 and 1824, but prior to 1831 there were generally only two or three participants, and no reference is found to a regular 'field'. As these fixtures grew in popularity and the number of entries increased, the nature of the races gradually

became changed; the spectators grew in number, and naturally wished to see all the race if possible. Thus the modern steeplechases, of which the Grand National is the most important, came into being; they are, however, not at all similar to the early 'point-to-point' chases, of which those held by modern hunts at the end of a season are the only surviving representation. Those contests are open only to horses that have been hunted locally, and no other races are run at the same time. See rules for P.-to-P. S. in *Ruff's Guide to the Turf, etc.*

**Poison Gas, see CHEMICAL WARFARE; PHOSGENE.**

**Poisoning, Food, see under FOOD AND FEEDING.**

**Poisonous Plants.** A large number of plants contain poisonous principles, many of which, under proper control, are valuable drugs. Among the commoner Brit. plants that are poisonous wholly or in part are the crowfoots, monkshood, the hellebores, baneberry, pasque flower, greater celandine, horned poppy, white bryony, hemlock, fool's parsley, water hemlock, water dropwort, wood sanicle, deadly nightshade, bittersweet, henbane, thorn apple, foxglove, spurge laurel, the spurge, dog's mercury, black bryony, daffodil, bluebell, meadow saffron, cuckoo pint, sorrel, wood sorrel, the elders, box, buckthorn, yew, as well as many fungi. Many commonly cultivated plants and trees are poisonous.

**Poisons.** There is no satisfactory definition of P. which will embrace all the examples, but substances which on entering the body and being in any degree absorbed produce death or injure health, though not by mere mechanical derangement, are poisonous. Introduction to the body may be by the mouth, by injection, or by absorption through the skin. Further, a poisonous substance is usually considered such by virtue of its own inherent qualities. Most drugs are poisonous if the dose is large enough, and the possibility of deciding a commonly injurious dose might form the basis of definition, were it not that different constitutions react with marked difference, and the dose may be increased by habitual taking. P. have been known and used for a very long time, and in particular the Borgias are reputed to have reduced poisoning to a 'fine art.' Classification may be according to source: vegetable, animal, or mineral; or to chemical nature: organic inorganic, acid, alkaloid. Blyth employs the following classification: Poisonous cases; P. capable of separation by distillation; alkaloids; P. extracted with alcohol; P. derived from animal substances; the oxalic acid group; inorganic P. A common classification is: narcotic, corrosive, irritant, convulsant. Narcotics produce giddiness, drowsiness, headache, disturbance of the sight, paralysis of the voluntary muscles; they may act specially on the brain and spinal cord, and may at first produce excitement. Opium, henbane, chloral, chloroform, ether, are examples. Corrosives, such as spirits of salt, stain and blister the lips and mouth, burn the

throat so that breathing and swallowing are affected. Vomiting, diarrhoea, and intense stomachic pain ensue. Corrosive perforation, gangrene, and perforation of the alimentary tract to a varying distance are found. Irritants include oxalic and tartaric acids, ammoniac, white and yellow arsenic, mercury salts, sugar of lead, copper arsenic, blue vitriol, verdigris, phosphorus, croton oil, various zinc, antimony, and iron salts, such as green vitriol, cantharides, etc. In continued small doses they cause indigestion, occasional vomiting, discomfort after food, general illness, and wasting. Convulsants such as strychnine create spasms of the throat and limbs and trunk, the breathing being difficult, the jaws and fists clenched. Death is due to suffocation or exhaustion, but consciousness is not affected. Among cumulative P. are the salts of mercury, antimony, lead, trional, strychnine, and digitalis. Certain gases are poisonous; carbon monoxide, carbon dioxide, hydrogen sulphide, coal gas, arsine, are among these. Accidental or unintentional poisoning is often due to fungi mistaken for mushrooms, yew berries, mountain-ash berries, laburnum seeds, foxglove, deadly nightshade, hemlock, privet, thorn-apple, monkshood, etc., among plants. Tinned meats, shell-fish, sausages, fish, etc., give rise to ptomaine poisoning. Phosphorus poisoning is occasional in the manuf. of matches; lead poisoning, with blue line on the gums and wrist-drop, in the manuf. of lead-glass. Arsenic has been mistaken for sugar; carbolic, oxalic, prussic acids, are, through inadvertence, sometimes taken, as also overdoses of sleeping draught. Opium smoking and laudanum drinking (see DR. QUINCEY) become a habit which leads to greater and greater doses and to grave moral as well as physical degeneration. White arsenic is taken by mountaineers of Syria to add to endurance, and by some women for the complexion. Injections of morphia to relieve pain or to induce sleep, etc., are used regularly. Strychnine is useful in small doses as a tonic, and digitalis is employed in diseases of the heart. One S. Amer. arrow poison, curare, is now employed in medicine for its relaxing effect on the muscles, e.g. in anæsthesia and in the treatment of tetanus.

**Treatment.**—In narcotic poisoning emetics should be given; a tablespoonful of salt or mustard in warm water; ipecacuanha wine, a tablespoonful every two or three minutes; half a teaspoonful of sulphate of zinc in a wineglassful of water. The throat may be tickled with a feather, or the finger passed to the back of the mouth. Meanwhile the patient should be clothed warmly, and hot things applied to the feet and over the heart. Cold water dashed in the face will rouse from stupor. After the emetic has acted well, plenty of strong coffee should be given. In the case of opium, laudanum, morphia, morphine, recognised by pin-point pupils, administer emetic, rouse from stupor; it is necessary to keep the patient walking long after he seems all right;

strong coffee should be given frequently from the first; potassium permanganate is an antidote. Wherever there is great prostration stimulants are given; when breathing is slow or shallow, it is advisable to apply artificial respiration. Emetics should not be given for chloroform poisoning. For irritant poisoning, if an acid has been taken, alkaline substances should be given such as magnesia, powdered chalk, whiting, carbonate of soda, washing soda, soap, plaster scraped from the ceiling and mixed with milk. After neutralising the acid, the pain can be soothed by administering milk, white of egg, flour and water, thick barley-water, linsed tea, olive oil, yolk of egg. For alkali poisoning vinegar, citric acid, lemon-juice and water, tartaric acid, are administered. Emetics are never given for poisoning by alkali or acid. Carbolic acid poisoning should, however, be treated by emetics as well as soothing drinks. Coal-gas poisoning: the patient should be taken into the fresh air; windows should be opened or broken; clothing of neck, chest, and waist should be loosened; if the patient is unconscious cold water can be dashed in the face. Artificial respiration should be applied, and oxygen given if available. In any case the doctor, who may apply the stomach pump, should be sent for. Injected P. require counter injections. For further specific remedies see ANTIDOTE. For poison gas see CHEMICAL WARFARE.

See J. Ogier, *Traité de chimie toxicologique*, 1899; C. Vibat, *Précis de Toxicologie*, 1900; E. W. Dwight, *Toxicology*, 1905; M. Takayama, *Beiträge zur Toxicologie* (Gegal), 1905; R. A. Witthaus *Manual of Toxicology*, 1911; and A. W. Birt, *Poisons* (5th ed.), 1920.

Poisson, Jeanne Antoinette, see POMPADOUR, MADAME DE.

Polsay, tn. of the dept. of Seine-et-Oise, France, on the R. Seine, 10 m. N.W. of Versailles. It was the scene of a conference between Rom. Catholics and Protestant in 1561. Iron and steel are produced. Pop 8000.

Portiers, Diana of, see DIANE DE PORTIERS.

Portiers (formerly Poitiers), from the Lat. Pictavium), cap. of the dept. of Vienne, France, 60 m. S.W. of Tours, is built overlooking the streams of the Boivre and the Clam, which meander round its base. The tn. contains a twelfth-century cathedral (St. Pierre) and two anc. churches, St. Hilaire le Grand and St. Radegonde, the latter containing the tomb of the saint, whose shrine was once a place of pilgrimage. Other notable buildings are the *hôtel de ville*, the Palais de Justice, the univ., and the library. There are manufs. of textiles, gloves and hosiery, and brewing. In and around P. are numerous Celtic and Rom. antiquities, including an amphitheatre and a triumphal arch. The main interest of the tn. centres on its historical associations. Not far from here Clovis defeated and slew Alaric II., the Visigoth king, in A.D. 507, and Charles Martel defeated the Moors in A.D. 732. Near here, also, in

1556, Edward the Black Prince, with about 14,000 men, totally defeated the Fr. army of 60,000 men under King John, who with his son were taken prisoners and brought to England. Pop. 41,000.

Poitou, former prov. of W. France, is now mainly comprised in the depts. of Deux Sèvres, La Vendée, and Vienne, and was divided into two parts, Upper and Lower P. Cap. Poitiers.

Poker. This is a game essentially Amer. in origin. It has sev. variations—'Draw', 'Straight', 'Stud', and 'Whisky'. 'Draw' P. appears to be the most popular form, and is practically synonymous with P. In 'draw' P. a single pack of cards is used. Five cards are dealt to each of generally half a dozen players, with the right to 'draw' five more. The object of the game is to make the best 'hand' according to certain combinations of cards. The degrees of these combinations in their order of value are: (1) A *straight flush*, i.e. a sequence of five cards. As between two sequences, the player whose sequence begins with the higher card has the preference. The ace may be regarded either as the highest or the lowest. (2) *Four*, i.e. four cards of the same denomination with one indifferent card, the higher four having preference. (3) A *full*, i.e. three cards of the same denomination and a pair. (4) A *flush*, i.e. any five cards of the same suit. (5) A *straight*, i.e. five cards in sequence, but not of the same suit. (6) *Three*, i.e. three cards of like denomination, with two indifferent cards. (7) *Two pairs* with an indifferent card. (8) A *pair* with three indifferent cards. (9) *Highest card*, where no hand has any one of the previously enumerated combinations. As between pairs or sequences in opposing hands, the highest wins. Where each holds two pairs the two best are compared, and the highest wins. Where pairs are equal the highest indifferent card wins. If the equality is absolute the pool is divided.

A certain amount is fixed upon as the limit to the initial stake. One player starts the pool with a preliminary stake called the 'ante', which must not exceed half the limit. Such preliminary stake is made without looking at the hand, and is for that reason also called a 'blind'. The player who has the privilege of putting up the preliminary stake is the 'age', or person who sits on the left of the dealer; the deal passes from right to left. A player whose hand is so bad as to offer small chance of winning may 'pass', i.e. go out of the game altogether for that hand. If not he puts in the pool *double* the stake put in by the 'age', and the other players may do the same in rotation. When the turn comes round to the 'age' he may either put into the pool an amount equal to his 'blind' or pass. If, however, the 'age' has put in as the 'ante' the minimum, the next player may if he choose first make good the 'ante' by doubling it and then 'raise', i.e. offer a higher stake not exceeding the limit. Each subsequent player who wishes to go still better must first put in as many

counters as his predecessors and then something in addition. When under these circumstances the turn comes round to the 'age' again, he may regain the lead by putting in the same amount less one (his 'ante') as that of the highest stake. After this bidding comes the time for 'drawing' cards. After the 'draw' is completed, betting is resumed. The 'age' has the right of reserving his stake until the other players have declared whether they will stake more. Where a player at this stage does not elect to stake higher than his neighbour, but yet wishes to remain in the game, he says 'I'll see you'; this simply makes good the last 'raise.' When this last round of betting is over the players turn up their cards; the best hand according to the classification above wins and takes the pool. In the ordinary 'draw' P., where the whole table declines to 'go in,' the 'age' reproaches his 'ante' and the deal passes to the next player, no one being any the worse off. In the 'Jack Pots' variety of 'draw' P. each player, in such a contingency, puts up an equal amount to the 'ante,' and the cards are dealt by the next player. There is no 'age,' but if any player happens to hold a pair of jacks, or anything better, he opens 'the jack-pot,' putting down any stake he pleases. The other players in rotation must either make this good or go out. Any one may 'raise.' This goes on until one player says he will 'see' his predecessors. The cards are then declared and the best hand wins.

'Straight' P. or 'Bluff' differs from 'draw' in these particulars: (a) The 'age' has no privilege; (b) the deal passes to the winner of the pool, and not in rotation; (c) a player who has passed is not excluded altogether unless some other player has raised in the meantime; (d) each player puts up an amount agreed upon beforehand by way of 'ante'; and (e) there is no 'drawing,' each retaining the first cards dealt him.

Other games are 'stud,' a species of 'straight' P., and P. patience.

**Poker-drawings, or Pyrography,** decoration of wood by partially burning or charring. The design is thus produced in various shades of brown and black. It may be executed with small heated skewers of various sizes, with an electrically heated platinum point, with a blow-pipe, and with a hollow platinum point heated internally by vapourised benzoline. Woods generally chosen include cedar, elm, and chestnut. Leather and velvet materials are often decorated.

**Pokhur, or Pushkar,** holy tn. of Rajasthan, India, near Ajmer, containing the only temple to Brahma in India. Pop. about 5000.

**Pola,** seaport of Yugoslavia, in Istria. It was the chief naval station of Austria-Hungary before the First World War. Italy obtained possession of it at the peace treaties, and until the Second World War it was an It. fortified seaport and important naval station. In 1947 it passed to Yugoslavia. It occupies an eminence overlooking the Adriatic Sea, 38 m. S. of Capo d'Istria. The bay is well sheltered

and is spacious enough to accommodate the largest fleet. The tn. is surrounded by bastioned walls, and is overlooked by the citadel, by which it and the bay are commanded. Under the It. it was a bishop's see, and there is a fine cathedral. It is a centre of trade and shipbuilding is carried on. P., a very anc. tn., is said to have been founded by the Colchians, who were sent in pursuit of Jason. It was destroyed by Julius Caesar, but rebuilt by Augustus at the request of his daughter Julia, of which account it was named *Pietas Julia*. It contains interesting Rom. remains, among which are a well-preserved amphitheatre, 436 ft. long and 346 broad. A temple and sev. anc. gates and a triumphal arch are also extant. It suffered during the wars with the Venetians and Genoese in the thirteenth and fourteenth centuries and from bombing in the Second World War. Pop. (1936): 34,000 (tn.); 12,000 (com.).

**'Polacca,'** It. merchant vessel at one time used on the E. waters of the Mediterranean. It was built with three masts each made in one piece, square rigged, with neither tops, caps, nor cross-trees, and with square or lateen-shaped sails.

**Pola de Lena, see LENA.**

**Poland,** republic of Europe, lying S.E. of the Baltic, with an area of 121,131 sq. m. It has few natural boundaries. In the W. the provisional boundary follows the Oder-Neisse line; in the E. the boundary passes through the former Ger. prov. of E. Prussia, which is now divided between Russia and P., to follow the Curzon line (q.v.), which runs S. behind the R. Niemen to Brest-Litovsk and then follows the course of the R. Bug to the Carpathians, which mark P.'s S.W. frontier. The country is largely flat and low-lying, sloping down to marshland in the E. P.'s only mountainous region lies in the S.W., where the Carpathian range begins. In 1946 the pop. numbered 23,929,800, the largest tns. being Warsaw, the cap., with an estimated pop. (1948) of 606,400; Lodz, 576,000; Cracow, 307,400; Poznan, 297,000; Wrocław (Breslau), 241,000; Gdansk (Danzig), 161,000; and Bydgoszcz, 150,000. The country is divided into sixteen administrative provs. (*województwa*). These are Białystok, Gdansk, Kielce, Cracow, city of Lodz, prov. of Lodz, Lublin, Olsztyn (Allenstein), Pomorze, Poznan, Rzeszów, Śląsk (Silesia), Szczecin (Stettin), city of Warsaw, prov. of Warsaw, and Wrocław.

**Communications.**—The Polish state railways extend over 14,407 m. national gauge and 2283 m. narrow gauge lines. There are over 4000 m. of inland waterways, including 2350 m. of navigable rivers, and 510 m. of canals. The chief ports are Gdansk, Gdynia, Szczecin, Kolobrzeg (Kolberg), and Elbląg (Elbing). Elbląg is an inland riv. harbour. The Polish mercantile marine, as a gross tonnage of about 200,000 tons. There is a national air-line ('Lot') which has a number of airfields, the most important being at Poznan, and internal air traffic increases annually. Most aircraft in use are of

Russian manuf., and many pilots are Russian trained.

**Agriculture and Industry**—Before the Second World War P was mainly agric., the chief crops in order of average being rye, potatoes, oats, wheat, barley, and sugar beet. The shifting of the W boundary to the Oder-Neisse line after the Second World War resulted in the acquisition of vast industrial resources. P also gained by frontier changes a dense transport network and a longer coast line. The basis of the national

control and a planned economy imposed on all branches of industry. P's mineral resources are considerable being found mainly in Silesia. There are large bituminous coal deposits, with a yield of over 10,000,000 tons in 1947 and of nearly 4,000,000 tons of coke. Other minerals are iron ore, potash, salt, crude petroleum, zinc, steel and natural gas. In 1947 128,000 tons of crude petroleum, 67,100 tons of pig iron and 1,579,100 tons of raw steel were produced. Other leading industries are cotton, woollen yarn, paper making, and chemicals. The centres of industry are as follows: Silesia and Kattowitz for coal, iron and steel, Bialystok for textiles, Warsaw, Lodz, Bydgoszcz, and Poznan for metallurgical industries and the Carpathians for naphtha and oil refining. In 1947 P's largest single customer was Russia, 28.7 per cent of Polish exports went to the U.S.S.R., whence came 26.3 per cent of her imports. Britain was the fourth largest importer, supplying 9 per cent of the Polish import total. In the same year 3 per cent of Polish exports went to Britain. In Jan. 1949 a five-year trade pact was signed between P and Britain under which P should export to Britain goods valued at £1,000,000.

**Government and Justice**—P has been a republic since 1918. In Jan. 1947 general elections were held for the first time since the Second World War. These resulted in an overwhelming victory for the Communist-Socialist bloc (Democratic front). The *Sejm* (Diet) thus elected passed an interim constitution in Feb. 1947. Under it power is divided between the *Sejm*, the executive and the president who has a wide prerogative similar to that allotted him under the 1921 constitution. The constitution brought into existence a council of state consisting of the president, the presidents and vice-presidents of the *Sejm* and the chairman of the Supreme Court (Chamber of the body responsible for state accounts). The *Sejm* meets biennially, but in the intervals between sessions it may authorise the gov. to govern by decree except in matters relating to fiscal changes or conscription. There is universal suffrage and a system of proportional representation is used. Justice is administered through a supreme national tribunal, a supreme court nine courts of appeal, eight special criminal courts, fifty-eight circuit courts, a number of labour courts, and some hundreds of city courts. In 1947 3,500 local citizens' courts were established, and there are also special courts to try 'fascists and traitors'. The members of the security police are not known. The system of maintaining a separate security police force apparently derived from the U.S.S.R. is modelled on Italian lines. Its function is to prevent counter-revolution. In 1947 there were over 100,000 reserve police, a force recruited to assist the regular police force.

**Education and Religion**—There is free and compulsory elementary and secondary education up to the age of eighteen. In 1947 there were 3,589,763 pupils at the

Polish Embassy

POLAND THE TATRA MOUNTAINS  
The Munch peak at M. K. Ok. S. S. S.  
Lake

economy was thus transformed. In 1948 the gov. announced a six-year plan for agriculture and industry, both were to be modernised and developed, but particular stress was laid on the development of industry, and a future P was envisaged which should have a well-balanced agricultural and industrial economy. A beginning was made in land collectivisation, but in 1948 the agric. structure had not been greatly affected by agrarian reforms, and in addition the land was still suffering from the loss of labour and livestock resulting from the Second World War. As well as dividing the *latifundia* land reform has increased the size of the small farms, by combining dwarf holdings to make economic units. Industrial progress was more rapid. The major industries were nationalised or subjected to rigorous state

elementary and secondary schools, and 140,000 pupils at secondary professional schools. There are a large number of technical, agric., and commercial colleges. In the same year there were eleven univs. and fifteen other institutions of univ. rank, with nearly 80,000 students of whom 25 per cent were women. The univ. of Krakow is the most important, with over 10,000 students in 1947. The other prin. univs. are at Warsaw, Lodz, and Poznan. There is no state church but Rom. Catholicism is the predominat religion. In 1939 65 per cent of the pop. were Rom. Catholic and there was a large Gk. Orthodox minority, living chiefly in the region which has been, since 1945, incorporated with the U.S.S.R., with an archbishopric at Lwow. Present religious statistics are not known owing to the great territorial changes which have taken place since the Second World War; the 1946 census did not deal with religion.

**Defence.**—For defensive purposes P. is divided into six areas, Lublin, Poznan, Cracow, Slask, Warsaw, and the coastal region. There is a large infantry training centre at Rembertow and work has begun on the organisation of a military academy and a high milit. college. Army strength is estimated at over 200,000. In 1947 the army was still to some extent officered by Russians, and the present Polish Army is closely modelled on Red Army lines, including its political training, and is equipped with Russian arms, tanks, and artillery. Military leaders have repeatedly emphasised that in the case of war the two armies would be able to operate together. In 1949 the Polish-born Soviet general Konstantin Rokossovsky (q.v.) was appointed minister of national defence in the Polish Gov. The Polish Navy consisted in 1947 of 2 destroyers, 4 submarines, 13 minesweepers, and 12 submarine chasers. There is a large air estab.

**History.**—The Poles are a branch of the Slavic (q.v.) family. The name appears first in hist. as the designation of a tribe, the Polani, who dwelt between the Oder and Vistula. Polish historians claim that they can trace P.'s hist. back as far as the fourth century, but the lists of rulers which they give are probably those of separate tribes and not of the combined race now known as Poles. At any rate, the hist. of P., previous to the middle of the ninth century, is so intermingled with fables as to be very untrustworthy. Ziemowicz, said to be the second monarch of the Piast dynasty, is considered to be the first ruler whose hist. is to any extent reliable, and it was not till a century later, when his descendant, Mieszko I. (962-92), occupied the throne, and became a convert to Christianity, that P. took her place as one of the political powers of Europe. Mieszko divided his dominions among his sons, but one of them, Boleslas I. (992-1025), surnamed the Great, soon reunited the separate portions, and extended his kingdom beyond the Oder, the Carpathians, and the Dniester, and sustained

a successful war with the Emperor Henry II. of Germany, conquering Cracovia, Moravia, Lusatia, and Mlsnia. To the E. he extended the Polish frontier as far as Kiev. He is regarded as the real founder of the Polish state. After a period of anarchy he was succeeded by his son, Casimir (1034-58). Boleslas II. (1058-81) who succeeded Casimir, murdered the bi-hop of Cracow in 1079. P. was then laid under the papal interdict, and he is said to have committed suicide (1081). Boleslas III. (1102-39), an energetic monarch, annexed Pomcrania, defeated the pagan Prussians, and defended Silesia against the Ger. emperors. A div. of his kingdom among his sons caused much internal dissension, under cover of which Silesia was severed from P., though still nominally subject to it. Ultimately Casimir II. (1177-94) reunited the severed portions, with the exception of Silesia and estab. on a firm footing the constitution of the country.

The Mongols swept over the country in 1241 bringing it near ruin, and defeating the Poles in a great battle near Wahlstatt. P. began then to decline; various dists. were ceded to the margraves of Brandenburg, while many dists. began to be colonised by Gers. Numbers of Jews, persecuted in W. Europe about this time, took refuge in P. Wladislas (1305-33), surnamed Lokietek (the Short), again restored unity to the country.

Judicial abuses and all illegally acquired privileges were abolished, and the first Diet (1331) assembled for legislative purposes. In conjunction with Gedymin, grand duke of Lithuania, a vigorous and successful war was carried on against the Teutonic Knights. Wladislas's son, Casimir III. the 'Great' (1333-70), greatly increased the power and prosperity of P. by pursuing a peaceful policy, amending the laws and consolidating his territory by profitable exchanges with the neighbouring powers. With Casimir the Piast dynasty became extinct, after 516 years, according to the old Polish chroniclers. His nephew, Lewis the Great, king of Hungary, succeeded him, by the will of the deceased monarch and the election of the Diet, but during his reign P. was treated merely as an appanage of Hungary.

On his death without male heirs, the crown fell to Jagello (Wladislas IV.), grand duke of Lithuania, the son-in-law of Lewis, who founded the dynasty of the Jagellons (q.v.) (1386-1572), and for the first time united Lithuania and P., thus doubling the extent though not the pop. of the kingdom. However, his successor, Wladislas V., was acknowledged only in P. proper, the Lithuanians preferring the rule of the younger son, Casimir. Wladislas was also chosen king of Hungary, and fell at the battle of Varna, being succeeded in P. by Casimir IV. (1427-92), who again united it to Lithuania. Casimir recovered W. Prussia from the Teutonic Knights, and compelled them to do homage for E. Prussia. Sigismund I. (1505-48), surnamed the Great, the fourth son of Casimir, gave P. great

prosperity; he was, however, forced into a war with Russia, in which he lost Smolensk, but he was partly compensated by obtaining lordship over Moldavia. His son, Sigismund II. Augustus, was a worthy successor. During his reign Lithuania was finally joined indissolubly to P., and from this time there was to be but one Diet for the united realm. The pop. almost doubled itself under the two Sigismunds, but this dynasty, under whom P. profited greatly, ceased with them. The warrior class decided to preserve their own freedom by making the monarchy elective. The first elective monarch was Henry of Valois (III. (q.v.) of France), who, however, soon abandoned the throne for that of France, and was succeeded by Stephen Batory (1575-86), *voivode* of Transylvania, a man of energy and talent, who carried on war successfully against the Russians. His successor, Sigismund III. (1586-1632), who was succeeded by his sons, Wladislas VI. (1632-48) and John Casimir (1648-68), was of the Vasa family, and was the crown prince of Sweden; but his election, far from cementing a bond of union between the two countries, only embittered former dissensions. These three Swedish monarchs had neither talents for governing nor characters and sentiments congenial to a warlike nation. But the Polish armies, though, like the rest of the nation, neglected, were victorious everywhere; the Swedish and Muscovite armies were both annihilated; Moscow was taken, and the Russians completely defeated. During the reign of this dynasty, Wallachia and Moldavia were snatched by the Turks from under the Polish protectorate; Livonia with Riga was conquered (1605-1621), along with part of Prussia (1629), by Sweden; and Brandenburg established itself as an independent power.

In the reign of John Casimir, P. was attacked simultaneously by Russia, Sweden, Brandenburg, the Transylvanians, and the Cossacks. The country was entirely overrun, War-saw, Vilna (Vilno), and Lemberg taken, and the king compelled to flee to Silesia. Gen. Czarniecki, however, succeeded in defeating all P.'s enemies, and they were driven from the country. But in the subsequent treaties, Ducal or E. Prussia was wholly given up to Brandenburg, almost all Livonia to Sweden, and Smolensk, Severia, or Tohernikov, and the Ukraine beyond the Dnieper were given to Russia. Michael Wisniewski (1668-71), the son of a famous general, was elected as their next monarch. A war with Turkey, concluded by an ignominious peace, was the chief event of his reign. After some dissensions concerning the election of a successor, John (q.v. Sobieski) (1674-96) was chosen, but his reign, though it brought military glory to P., did not improve internal administration. As Sobieski's successor, the prince of Conti was legally elected and proclaimed king, but the cabinet of Versailles allowed this splendid opportunity of becoming supreme in Europe to escape, and Augustus II. of Saxony, a

protégé of the house of Austria, entered P. at the head of a Saxon army, and succeeded in obtaining the throne. His war with the Turks restored to P. part of the Ukraine and the fortress of Kaminiec, but that with Charles XII. brought nothing but misfortune. The war with Sweden was unpopular in P., in fact, the Poles of the E. provs. received Charles gladly; but his attempt to force upon them Stanislas Leszczynski as their king severely wounded their national pride. Augustus returned after the battle of Poltava (q.v.), his rival retired without a contest, a close alliance was formed with Russia, and the Russian troops who had campaigned in P. against the Swedes were, along with his Saxon army, retained. The Poles demanded their extradition, but in vain, and the Russian cabinet interfered (1717) between the king and his subjects, compelling both parties to sign a treaty of peace. This was the commencement of P.'s dependence on Russia, and her consequent obliteration as a great power.

The succeeding reign of Augustus III. of Saxony (1733-63) was of the same character; the gov. fell more and more under Russian influence, and its political relations with other countries gradually ceased. On the death of Augustus the cabinets of St. Petersburg and Berlin presented to the Poles Stanislas Poniatowski, who was totally incapable for such office, as their king. This led to a Polish bid for independence. The 'Confederation of Bar' (so called from Bar in Podolia) was formed by a few zealous patriots, an army was assembled, and war declared against Russia. Frederick the Great of Prussia, who had formerly gained the consent of Austria to a partition of P., now, in 1770, made the same proposal to Russia, and in 1772 the first partition was effected. The country now fully realised its danger, and classes which had long been divided began to unite. The Diet of the diminished kingdom laboured to amend the constitution and strengthen the administration. In this they were encouraged by Prussia, whose new king, Frederick William II., swore to defend them against Russia, but Prussia proving traitorous a second fruitless resistance to the united Prussians and Russians, headed by Joseph Poniatowski (q.v.) and Kosciuszko (q.v.), was followed by a second partition (1793), which the Diet were made to sanction by the threat of armed force. The Poles now became desperate; a general rising took place (1794), the Prussians were compelled to retreat to their own country, and the Russians were seven times routed; but then a new enemy appeared on the scene. Austria was chagrined at having taken no part in the second partition, and was determined not to be behindhand on this occasion. Her army accordingly advanced, compelling the Poles to retreat, and, fresh hordes of Russians arriving, Kosciuszko, at the head of the last patriot army, was defeated, and the sack of Praga, followed by the capture of War-saw, finally annihilated the Polish monarchy. On the third and last partition (1795) King

Stanislas resigned his crown, and died at St. Petersburg in 1798.

The subsequent success of the Fr. against the Russians, and the tempting promises of the Emperor Napoleon to reconstitute P., rallied round him a faithful army of patriots, who distinguished themselves in the campaigns of the Fr. against Russia and Austria; but all that Napoleon accomplished in fulfilment of his promise was the estab., by the treaty of Tilsit (1807), of the duchy of Warsaw. On the fall of Napoleon the remnant of P. was granted a constitution which continued to 1830, its separate gov. lasting till 1864. Four years later P. became Russian ter., its name being erased from the map. Polish independence was regained after the First World War. Russian-P. was captured by the Ger., who promised independence and set up a regency council, a monarchy being intended. In 1918 a constituent assembly was called and on Nov. 9 a republic was proclaimed, recognised under the peace treaties. The boundaries of P. were: in the N. the Baltic Sea, E. Prussia, and Lithuania (fixed by the council of ambas., March 15, 1923); in the S. Czechoslovakia and in the S.E. Rumania; in the E. Russia, determined by the treaty of Riga, March 18, 1921; in the W. Germany, the Ger.-Polish frontier in Upper Silesia being decided by plebiscite. The corridor, called the prov. of Pomerze (the seaside) in official Polish usage, was given to P. in 1919 as an outlet to the sea. It passed across former Ger. ter., cutting E. Prussia off from the rest of Germany. It was a stretch of land connecting P. with the Baltic Sea, narrowing towards the coast (smallest width 10 m.), broadest at its base (60 m.). P. then had an area of 119,958 sq. m. consisting of sixteen cos.: (1) Central cos.: Warsaw and the city of Warsaw, Lodz, Kielce, Lublin, and Bialystok; (2) E. cos.: Wolyn, Polesie, Nowogrodek, and Vilna; (3) Meridional cos.: Cracow, Lwow, Stanislavow, and Tarnopol; (4) W. cos.: Poznan, Pomerze, and Silesia. The pop. was about 31,756,000, of whom 69 per cent were Polish and the remainder Ukrainians, Jewish, Ruthenian, Ger., etc. The provisional gov. under Maracewski collaborated with Marshal Pilsudski (q.v.), president, and by arrangement Paderewski, head of the Polish National Council in Paris, returned to P., becoming Premier in Jan. 1919. In Dec. he resigned in favour of Skulski. In war with Russia the Poles captured Kiev, May 8, 1920, but a Russian counter-offensive was only checked outside Warsaw. A peace conference opened at Minsk on Aug. 17, but hostilities continued until P. concluded an advantageous peace at Riga on Oct. 12, 1920, ratified on March 18, 1921.

P. quarrelled with Lithuania over Vilna. Zelignowski seized the tn. unofficially for P., but the League of Nations intervened. Vilna eventually became Polish (Jan. 8, 1922). In 1921 the Upper Silesian plebiscite was carried out. A financial business gov. lasted under Ponikowski from Sept. 1921 to June

1922. General elections were held in Nov., after the passing of the electoral laws by the Constituent Assembly, while in the presidential elections (Dec. 7), Pilsudski refusing nomination, the Left party secured election of Narutowicz, who was assassinated (Dec. 16). Wozelchowski became president, but ministerial crises during 1923 brought in the finance minister, Grabski, with dictatorial powers. In 1924 the budget was balanced and inflation stopped. Economic crises following financial rehabilitation caused Grabski's resignation, Nov. 13, 1925. Skrzynski, former foreign

E.N.A.

POLAND: A YOUNG GIRL OF LWOV

minister, formed a coalition ministry. In May 1926 a cabinet was formed by Witos, Peasants' party leader, whom Pilsudski opposed. A military stroke put Warsaw and President Wozelchowski under Pilsudski's control (May 12). Pilsudski declined the presidency, which went to Moscicki, but on the fall of Bartel, Premier of the provisional gov., Pilsudski became himself Premier. Pilsudski's dictatorship was marked by improved foreign relations. In Sept. 1926 P. was admitted to the League of Nations. In Dec. 1927 the 'state of war' with Lithuania ended. P. adhered to the Kellogg Pact and the Russian protocol, agreeing to an E. European peace pact. On June 25, 1928, Pilsudski resigned, becoming minister of war in Bartel's Cabinet, which in April 1929 was succeeded by Switalski's Government of the Colonel. The opposition of the *Sejm*, which at last met on Dec. 5, again brought in Bartel's ministry (Dec. 20). In foreign affairs a mutual agreement cancelling

war debts was signed with Germany (Oct. 3, 1929) and a provisional commercial treaty to end tariff war on March 17, 1930. On March 16 Bartel resigned and Pilsudski decided to crush the Centre and Left opposition in the *Sejm*, which was prorogued. Pilsudski assumed the premiership. General elections in which the opposition was intimidated were held in Nov., resulting in a gov. majority. Pilsudski then retired from politics.

A major cause of P.'s insecurity arose from the fact that the republic of 1918 contained large racial minorities carved out of the Polish-speaking parts of Austria, Germany, and Russia, totalling more than 10,000,000 people. These minorities caused friction between P. and her neighbours. She therefore relied increasingly on her alliance with France. Economic and social difficulties also caused unrest, though under Pilsudski these troubles were not apparent. In the succeeding period P. was ruled dictatorially by the military clique known as the 'Colonel's Group' in collaboration with the owners of large estates. In 1934 a non-aggression pact was concluded with Germany, which weakened P.'s ties with France. Under Pilsudski's successor, Marshal Smigly-Rydz, with Moscicki continuing as Premier, a new constitution was adopted, which, in effect, ousted all but non-partisan or gov. candidates from Parliament. A 'National Unity Movement' was estab. under Col. Koc in 1937 as a kind of totalitarian party, but the old parties, including Conservatives, Socialists, National Democrats, and Peasants, continued their activities outside Parliament and boycotted the election of 1938.

In 1939 P. still hoped for peaceful relations with Germany. It was known that Hitler regarded Danzig (now Gdanak) and also the corridor to the sea as part of the Ger. *Lebensraum* (f.r.) but it did not seem that Germany was prepared to go to war for them. However, the situation changed after the Ger. annexation of Bohemia in March 1939. Germany began to mass troops and P. was given a guarantee by Britain and France. The Polish foreign minister, Colonel Beck, negotiated an Anglo-Polish pact of mutual assistance, and Hitler annulled the pact of 1934. P. concluded a trade agreement with Russia, though she showed no eagerness to have that country as an ally. On Aug. 29 Hitler sent an ultimatum to P. and read out to the Brit. ambas. in Berlin a number of demands for acceptance by P. before midnight of Aug. 31; but the demands were never communicated to P. On Sept. 1 Ger. troops crossed the Polish frontier. P. was quite unprepared and no general mobilisation had been ordered. Of 2,000,000 first-line troops only one-third were in the field. Against the Ger. mechanised divs. P. could put only cavalry. The passes over the Carpathians were unfortified; the country was full of spies.

P. mistakenly tried to defend her strategically indefensible W. border. The

long S. border was protected by only two infantry divs. The Russian frontier was covered by a weak frontier guard corps. The Polish Air Force possessed only a few first-line aircraft. Germany concentrated 54 front-line divs. against P.'s 22 infantry divs. and 7 cavalry brigades. On Sept. 3 Britain and France declared war on Germany, but it was clear that they could tender no direct military assistance to P. Ger. forces overran Pomerania, Poznania, and Silesia, took Cracow, and, crossing the Polish corridor, seized Gdynia. By Sept. 12 Germany had conquered nearly all W. Poland. After a severe defeat at Kutno Polish forces retired on the line of the Rta. Vistula, San, and Narew, a good strategic position. But the gov. added to the confusion by leaving Warsaw, and a haphazard evacuation of the cap. began which resulted in a congestion of the roads and railways. On Sept. 17 Russian troops, violating the non-aggression pact, crossed the E. frontier. Attacked from the rear the defence of P. finally collapsed. By Sept. 20 the war was over, except around Warsaw, which stood a siege. Ger. bombers first appeared over Warsaw on Sept. 1, but a concentrated attack by sov. squadrons of the *Luftwaffe* did not begin until some days later. There was practically no defence, as P. only possessed about a hundred anti-aircraft guns and these were defending military positions. On Sept. 20 the Gers. demanded Warsaw's unconditional surrender. This was rejected, and fierce fighting occurred around the city. On Sept. 23 water and electricity supplies broke down. The next day Nazi bombers, flying in close formations, came over the cap. and began a ruthless and concentrated bombardment lasting from 8 a.m. to 10 p.m. The only buildings left undamaged were the military c-tabs., since the Gers. hoped to use these when the city was occupied; the residential quarters were systematically obliterated. On Sept. 22 Germany and Russia partitioned P. by agreement, Germany occupying 72,000 sq. m. in the W. and Russia 78,000 sq. m. in the E., with pops. of over 20,000,000 and 15,000,000 respectively. Vilna was added to Lithuania. Germany incorporated about 34,000 sq. m. of Polish ter. in the Ger. Reich. This included the W. provs. of Pomerania, Poznania, and Slask, and large parts of the provs. of Bialystok, Cracow, Lodz, and Warsaw. A reign of terror, aiming at extermination, then began. The Poles were driven out of whole cities, which were repopulated by Gers. brought from the Baltic states, Czechoslovakia, and Germany. Much property was confiscated. Any opposition by the Poles was answered by reprisals involving, frequently, mass killings. Jews from Germany, Austria, and Czechoslovakia were deported to a 'Jewish reservation' in Lublin prov., covering 9000 sq. m. and already inhabited by about 2,500,000 Poles who had to find room for the Jews. Russia in annexing E. Poland gave some semblance of legality in her action by holding plebisc-

cites. The results showed an apparently unanimous vote in favour of annexation.

Guerilla warfare continued in various places until the end of the war. Mlosiecki, the president, resigned, and nominated Rackiewicz, Speaker of the Polish Diet, as his successor. The latter dismissed Smigly-Ridz for incompetence. Gen. Sikorski became Premier and commander of the Polish forces which were to be reorganised in London and Paris. About 10,000 Polish officers escaped to rejoin the forces in France and most of the Polish mercantile marine also escaped. In addition P. saved all her gold reserve, amounting to approximately £25,000,000.

At the end of 1940 Ger. colonists in P. numbered about 350,000. Over 1,000,000 Poles had been deported from the annexed area. Germany now began to exploit P. systematically. Having sequestered Polish property, the Ger. Gov. instituted an organisation of trustees (*Treuhänder*) with head offices in Berlin. Whole streets and even peasant holdings were confiscated; 500,000 Poles were sent forcibly to Germany as agric. labourers, and 100,000 were sent into Ger. factories. Intellectuals were arrested; 8000 univ. profs., schoolmasters, lawyers, and other professional men were put in prison. The contents of Warsaw Univ. library were burned. All Polish manuals of the Polish language and literature, hist., and religion were destroyed, to prevent the private continuation of these studies. Education for a slave-race was considered unnecessary. Ger. policy aimed at the rapid assimilation in the Reich of the incorporated area in both legislation and administration.

The Central Gov. was an area of 10,000 sq. m. extending to the Rta. Bug and San which was subject to a Ger. governor-general at Cracow. Originally the Nazis hoped to convert this part of Ger. P. into an autonomous residual state under a Polish puppet gov., but no Poles of any importance would collaborate. All Poles driven out of the annexed ter. were forced into this area, regardless of its capacity to absorb them. Public services were re-estab. here, but the Poles were admitted to them only in the lowest grades. Economic life was subordinated to the Ger. four-year plan of 1936. Most Polish goods were exported to the Reich. Russian P. was also divided into two parts, the S.E. provs. of Stanislawow, Lwow, Volynia, and Tarnopol being incorporated in the Ukraine and the N.E. provs. of Bialystok, Polesia, and Nowogradek in White Russia. Administration was nominally autonomous, but all important measures were enacted by the Moscow Gov. Russian methods in P. have been condemned as being as inhumane as those of the Nazis, if less sanguinary. Later events suggest that Moscow's overriding consideration was the defence of Russia against the Ger. attack which Stalin knew he would eventually have to meet, and that this necessitated the Sovietisation of P.

Throughout 1941 the central gov. remained a kind of colony where the Nazis

experimented with methods designed to enforce the Ger. 'New Order' (*g.v.*). To further the policy of suppression of the educated classes and the reduction of P. to a reservoir of slave labour the W. provs. suffered even more than the Central Gov. in 1941. By the end of the year nearly 100,000 Poles had been murdered and 150,000 were in concentration camps.

In the course of the campaign against Russia, begun on June 22, 1941, the Ger. drove the Russians out of the E. provs. of P., but the Russians had previously deported over 1,500,000 of the inhab. so that the country now occupied by the Ger. was in a state of extreme destitution. The Ger. incorporated the S.E. provs. in the Central Gov. and the N. provs., including Vilna, into an administrative unit called Ostland. The Poles abroad, however, continued to resist. A Polish ship took part in the raid on the Lofoten Is. in Dec. 1941. Polish airmen took part throughout the war in raids on Ger. ter. A new Polish Army was organised in Russia, numbering 150,000 men. Gen. Sikorski followed a policy of collaboration with Russia and resumed diplomatic relations in 1941. According to official Polish figures, some 200,000 Poles had fallen victim to Nazi executions or were in concentration camps by the end of 1942. But poverty, hunger, and exposure to cold caused the deaths of at least 1,500,000 more. To combat guerilla resistance in the forests around Lublin, the Ger. organised mass deportations of Poles from this area in 1942, and there were widespread executions in the Warsaw and Upper Silesia regions. Ger. reverse that year on the E. front made it necessary also to organise a defence in depth in E. Poland against the Soviet forces. The Polish Jews were the victims of the most extreme brutality. Polish official figures give the figure of Jews killed in P. as over 1,000,000, and in addition vast numbers were brought from Europe for extermination.

Polish resistance remained strong, both inside the country and abroad. Part of the Polish Army organised in Russia was sent to the Middle E. under Gen. Anders, and fought in the Libya campaign. The Polish Army in Britain took part in the allied invasion of Europe, and another army, formed in Russia, fought alongside the Red Army, taking part in the liberation of Warsaw. On June 23, 1944, almost on the third anniversary of the Ger. attack on Russia, the Red Army broke the Ger. front in White Russia on both sides of Vitebsk, and soon afterwards, with the fall of Mordov, Minsk, and Polotsk, the Ger. front over a width of 200 m. had ceased to exist. The fall of Polotsk, freeing the way to Drinsk, was quickly followed by the capture of Molodetchno, pointing the way to Vilna. The Russian armies, surged towards Lithuania and Latvia and, at the other end of the line, extended their advance to the S. of the Pripet marshes and occupied Kovel, on one of the routes to Warsaw. Vilna, with 5000 prisoners, fell on July 13, Pinsk on the 14th, Grodno

on the 16th. Lublin and Siedlce fell on July 24, Deblin, on the Vistula, on the 26th; Lwów, Białystok, Stanisławów, Przemyśl, Yaroslav, and Brest-Litovsk on July 27-28. Early in Aug., however, the Red Army had to halt, and for a time the Gers. rallied and beat back the Russian spearhead thrusts before Warsaw and E. Prussia. But winter fell before the Russians could retrieve their repulse E. of Warsaw, where the Polish resistance movement had organised a great insurrection in support of the advancing Soviet armies, only to be tragically disillusioned. For some weeks the Gers. offered an impressive façade of defence, but the façade was hollow. Radom, Warsaw, Łódź, and Craców were all taken by the victorious armies of Marshal Zhukov and Marshal Konev by Jan. 19, 1945. Toruń was reduced on Feb. 1, but Poznań was not captured until Feb. 23, when at length the Red Army was in possession of the whole of P. See further under EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS IN THE SECOND WORLD WAR.

On April 21, 1945, a 20-year treaty of 'friendship, mutual assistance, and post-war co-operation' between the Soviet Union and P. was signed in Moscow by Stalin and Osóbka-Morawski, Polish Premier in the Polish provisional gov., then at Lublin. The period immediately following the termination of hostilities was one of mounting political and social disorder in P. arising from the fact that the social structure of the country had been completely shattered and that the essential task confronting all Poles was to rebuild their whole economy. Confusion was enhanced by the forced immigrations E. and W. of large elements of the Polish and Ger. pops., displaced to conform the new delimitations of the Polish frontiers. These remained (1948) to be settled finally by the peace treaty with Germany, but, meanwhile, it had been agreed at the Potsdam conference (July-Aug. 1945) that some changes should be made to compensate for terr. occupied by Russia E. of the Curzon line. P. received part of the terr. E. provs. to the extent of over 40,000 sq. m., and into this region the Polish pop. of the provs. ceded to Russia migrated. The minority problem in P. thus disappeared after the Second World War. The Jews had been almost exterminated, the Russians absorbed into the Soviet Union, and the Gers. expelled beyond the Oder. Facing the great tasks of reconstruction in 1946 was a young and inexperienced administration headed by the 'Polish Provisional Gov. of National Unity.' The two groups which had joined during the Moscow negotiations to form this gov. remained distinct and independent. On the one hand there was the original 'Lublin' group, the actual regime, in which the Communist Polish Workers' party (*Polska Partja Robotnicza*) was dominant, in association with the Peasant party and the Democratic party. On the other hand there was Mikolajczyk's Polish Peasant party. Besides the support of his own party, Mikolajczyk had the goodwill

of sev. mixed elements, who adopted a negative attitude to the regime. The Polish Socialist party was non-belligerent rather than neutral, as it leaned heavily towards the Lublin group. Mikolajczyk's position was difficult; he was the leader of the opposition who had joined the Cabinet for a common purpose pending the general elections. The most important factor in the regime was the Polish Workers' party, which held most of the key positions in administration and economic affairs. But the political situation could only be clarified by a general election and the first election was not held until the beginning of 1947. Meanwhile foreign policy was strictly assimilated to that of Russia, and the Warsaw Gov. was scrupulous to avoid displeasing its great E. neighbour. The presence at this time of large numbers of Russian troops on Polish soil was, however, inimical to the growth of popular friendship for Russia and aggravated the tasks of the Polish Gov. Ultimately, when the elections were held, the 'democratic bloc' (mainly Workers' party) of pro-Russians obtained an overwhelming majority and the Peasant party of Mikolajczyk and other parties virtually disappeared. Mikolajczyk fled from P. The Polish Gov. of 1947 was not democratic in the W. sense, nor was the election of 1947 conducted on W. principles. But the majority of Poles appeared to have ignored these irregularities in their recognition of the undoubted efficiency of the gov. They had feared that a Mikolajczyk Peasant Gov. would be followed by a reactionary regime leading inevitably to internal strife. The Polish Communists gave the appearance at first of pursuing an independent policy; it was not until they were well estab. in 1948 and 1949, that their close ties with and dependence on the Soviet Union became obvious. In any case, Polish hatred and fear of Germany had tended to lessen the traditional Polish enmity with Russia.

By 1948 P. presented a remarkable picture of post-war recovery to the outside world. After the war Warsaw was a heap of rubble; Gdansk, Poznań, and Wrocław were also in ruins. But by 1948 Warsaw had become once more an animated, vital city. The banditry which was prevalent all over P. immediately after the war had been suppressed. P.'s rapid recovery owed much to the considerable industrial facilities which she acquired in Silesia and Pomerania, though these facilities had in many cases suffered severe damage during the war. Other factors in the Polish recovery were the efficiency of the gov. and the \$5,000,000,000 relief given by U.N.R.R.A. which had also supplied, in the first half of 1946, nearly 80 per cent of the total imports into P. of \$254,000,000; while in the second half of 1946 U.N.R.R.A. imports were valued at \$191,000,000.

In Dec. 1948 the Socialists merged with the Communists and the Polish United Workers' party was formed. This enjoyed almost complete immunity from parl. opposition, since the other four

parties also joined the gov. bloc. An extensive party purge, carried out at all levels throughout the country, and directed at elements opposed to a Marxist-Leninist state, even removed from office Gomulka, one of the leading Communists. After this P. began to mirror Soviet policy in every detail, and a campaign against the Church began. An increasing number of Polish intellectuals began to escape from the country, dissatisfied with the actions of the gov. In 1949 Marshal Rokossovsky's appointment as minister of national defence suggested that the links between Russia and Poland would become even firmer. Polish exiles reported that the gov. was attempting to enforce Communism with increasing ruthlessness.

**Polish Language and Literature.**—The Polish language is a W. branch of Slavonic and employs the Lat. alphabet, varying it with diacritical marks. Polish literature has influenced the literatures of Russia, Serbia, and Czechoslovakia, and is marked throughout the centuries by its clarity and depth of feeling. Early Polish writers, including Copernicus, wrote in Lat. P. also possesses a number of distinguished medieval chronicles, written in Lat. The *Chronicle of Martin Gallus* (c. 1110) is the most important. In 1475 the first Polish printing press was set up in Cracow, but Lat. was still used, and the first book in Polish was not written until the early sixteenth century. Polish literature proper began in the sixteenth century with the poet Nicholas Rev and the prose writer Orzechowski, while the Polish court of Cracow was mirrored in the works of Gornicki. The greatest figure of the Renaissance in P. was the lyrical poet, John Kochanowski, but the seventeenth century was marked in literature mainly by tracts, and evidences of foreign influence. The epic poet Potocki and the lyric poet Kochowski may be mentioned. The eighteenth century was a didactic age, in which writers such as Naruszewicz, a bishop, and Konarski, a priest, moralised against the evils undermining P. With independence gone, P. became in the nineteenth century the object of a romantic national literature. The greatest poet was Mickiewicz, whose poem *Pan Tadeusz* is the national epic. Krasiński and Slowacki were two other great poets of a lost nationalism. Polish novelists of the nineteenth century—Kraszewski, Korzeniowski, and Rzewski—were influenced by Scott, but their real tendencies were carried further by the greatest of Polish novelists, Sienkiewicz, author of *Quo Vadis?*, and his contemporary, Prus. Two later novelists, both born in 1868, usher in the modern contemporary novel. Reymont, the delineator of peasant industrial life, and Przybylski, a psychological analyst. Novelists who were famous between the two World Wars are Andrew Strug and Eugene Malaczewski. Meanwhile the Polish drama had been backward until the eighteenth-century comedies of Fredro appeared, and their excellence has not since been surpassed.

Many poets mentioned above attempted the drama, but the greatest poetic play is Wyspianski's *The Wedding* (1901). The younger dramatic poet, Rostworowski, must also be mentioned. The philosophic poet Adam Asnyk (1838-97) was also a writer of comedies and historical plays, as was the poet Rydel (1870-1918). The work of another poet, Marya Konopnicka (1846-1912), was humanitarian, but the release of the personality in Polish poetry was due to Przybylski, while the best living poet is Jan Kasprowski.

Polish Embassy

CRACOW: THE GOTHIC WAWEL CATHEDRAL. The Renaissance Sigismund and Vasa Chapels (sixteenth and seventeenth century) are seen on the right.

(b. 1870), the translator of Shakespeare. Other modern poets include Leopold Staff, Edward Slonski, Julian Tuwim, and Casimira Ilakowicz.

**Art.**—Most of P.'s finest architecture is of the twelfth to fifteenth centuries. Before the Second World War Cracow possessed many of the finest historic buildings of this period, including the magnificent cathedral, begun in 1142. Medieval Polish architecture followed generally the W. European pattern, except in the E., etc., but in detail some of the richness and fantastic decoration typical of E. European styles was assimilated. The later Gothic shows increasing Ger. influence and Polish architecture after the sixteenth century though often

very fine, lacks national distinctiveness. Polish baroque owes much to Hungarian ideas, many baroque craftsmen being Hungarians, though the finest of them, Słonecki, was a Pole. Polish classical architecture is modelled on Ger. styles, while the twentieth-century architecture shows marked Amer. influence. Polish medieval painting consists chiefly of church frescoes and religious illuminations; in these the mingling of E. and W. European characteristics is more clearly shown than in architecture of the same period, natural and stylised forms appearing side by side in the same painting. During the Renaissance Polish painting declined, but the patronage given to the arts from 1764 onwards by the last king of P. not only attracted many foreign artists, such as Jean Pierre Noblin, but also encouraged native exponents. Patrons were also found among the magnates and the wealthier townspeople, and P.'s paintings, china (Korzec, Cmiczów, Baranówka), tapestries, and embroideries became the pride of the nation at a time of political misfortunes. Among painters the names of Kucharski, Orłowski, Brodowski, Stattler, Wankowicz, and Micholowski may be mentioned. Jan Matejko (1838-93) was the finest exponent of the school of historical painters, which flourished in P. alongside the nationalist movement throughout the nineteenth century. Jan Chelmonski (1850-1914) expressed his nationalism by painting every side of contemporary Polish life as he saw it. Naturalism and symbolism inspired the work of the 'Young P.' artists, and a group of them, known as Sztuka, formed in 1895 when Julian Fałat succeeded Matejko as president of the Academy at Cracow, followed Chelmonski. Their leader, Jan Stanisławski, is, with Fałat, chiefly known as a landscape painter. Most outstanding of 'Young P.' artists was Wiczolowski (1852-1936). After the decline of sculpture at the Reformation there is little of note to be found until the middle of the nineteenth century, but since then artists like Dumkowski, Wittig, Karny, and Szymanowski have made famous a school which though dependent in origin on Fr. ideas, has evolved into something distinctively Polish. A large number of fine Polish buildings and works of art were destroyed or badly damaged in the Second World War.

Polish church music was particularly fine during the fourteenth and fifteenth centuries. In the sixteenth century Cracow was the centre of music in central Europe. When the nationalist movement began in the eighteenth century Polish composers began to incorporate the national songs and dances in their compositions. These dated back for centuries, in many cases, and had many E. characteristics; the rhythm was particularly distinctive. K. Kurpiński (1785-1857), M. Kamiński (1724-1821), and J. Elsner (1769-1854) were the earliest composers to use the national music as a basis for their compositions; Elsner was Chopin's teacher, and it was Chopin

who perfected the blending of national music and that which had international traditions. J. Paderewski (1860-1941) was P.'s leading modern composer.

**Polar Axis**, axis of an astronomical instrument or an equatorial, which is parallel to the earth's axis. The term is used in connection with the mounting of a telescope; in the equatorial form of mounting the telescope can rotate about two axes; one, the P. A., directed towards the celestial pole and the other, the declination axis, at right angles thereto, in the plane of the celestial equator.

In mineralogy P. A. denotes a crystallographic axis with different arrangement of faces at the two ends of the crystal. Its presence may also be detected by the development of positive and negative terminal charges when the crystal is heated or cooled uniformly (pyro-electric effect). Examples of minerals with a P. A. and which reveal true pyro-electricity are tourmaline, blende, and diopside.

**Polar Bear**, see BEAR.

**Polar Exploration**, see ANTARCTIC OCEAN AND EXPLORATION; ARCTIC EXPLORATION.

**Polar Front**, term used in meteorology to describe a surface of discontinuity between polar and tropical air. The term was invented by the Norwegian meteorologists, V. and J. Bjerknes, for the discontinuity often observed dividing the air masses of a typical depression of temperate lat.; the P. F. can be traced in waves from one depression to another, the depression forming on a front of one depression being known as a secondary depression. The part of the P. F. in which tropical air overtakes polar air is called the warm front; the part in

which polar air overtakes tropical is called the cold front. See further under METEOROLOGY.

**Polaris**, polo-star; a Ursa Minoris, magnitude 2.1, situated (1950) 58' from the pole. There is a companion star 18' away and of the 9th magnitude, and an invisible attendant inferred from spectrographic observations round which P. revolves in four days. Distance about 400 light-years; candle power about 4000 times that of the sun. The function of pole-star is distributed among a number within a circle of 23½°. About 3000 B.C. a Draconis was not more than 10' from the N. pole; while 12,000 years hence a Lyrae will be within 5° of it.

**Polarisation**, see CELL.

**Polarisation**, Elliptic, see ELLIPTIC.

**Polarisation Microscope**, instrument in which objects are viewed microscopically by polarised light (see POLARISATION OF LIGHT). The P. M. is extensively used in geology and mineralogy, and to an increasing degree in metallurgy, biology, and chem.; it greatly assists in the identification of minute particles of crystals, minerals, biological tissues, etc.

**Polarisation of Light**. Light is conceived as being caused by vibrations in the medium known as the universal ether. When these vibrations fall on the eye they give rise to the sensation of sight. These vibrations take place in all planes perpendicular to the direction of propagation of the light. When light is transmitted perpendicularly through a plate cut from a crystal of tourmaline in a direction parallel to the prin. axis the emerging light possesses a certain peculiarity in that if it is passed through another similar plate of tourmaline, the axis of which is at right angles to that of the first plate, the light becomes extinguished. If the two axial directions are parallel, light comes through. In intermediate positions some light emerges through the second plate. In this way the apparently paradoxical result is obtained whereby by placing two transparent bodies together, the resulting body is opaque. This leads to the conclusion that light waves consist of vibrations, transverse to the line of propagation. When the light has passed through the first plate, these vibrations are limited to one plane perpendicular to the direction of the ray, and then the light is said to be plane polarised. The second plate is only capable of letting through light corresponding to vibrations in one particular plane. Thus if the axial directions in the first and second plates are parallel to each other light can emerge. If they are completely crossed, i.e. inclined at 90°, there are no vibrations which the second plate can allow to pass. In intermediate positions there will be a 'resolved part' parallel to the direction in which the second plate allows light to emerge. Light may be polarised by reflection from the surface of a transparent body. Clearly polarised light may be detected by interposing a crystal of tourmaline in the path of the light and by rotating the crystal about the path as axis. If the light becomes duller by the rotation the light

is partially polarised, whereas if no effect is produced, the light is not polarised. Polarisation by reflection may be noticed by observing light reflected from the surface of water or glass by means of a

tourmaline crystal. The brightness of the transmitted light will vary as the crystal is rotated. When light is reflected from a plane surface, the incident ray AB, the normal BN, and the reflected ray BC all lie in the same plane, called the plane of incidence, and the angle which the incident ray AB makes with BN, i.e. ABN, is called the angle of incidence. The vibrations of an incident ray take place in all planes perpendicular to its direction. Thus in the above diagram some of these vibrations are in the plane of incidence, while others are perpendicular to it. It is found that at a certain angle of incidence all vibrations in the plane of incidence are transmitted, while only those perpendicular to this plane are reflected; thus the reflected light consists of rays polarised in the plane of incidence, vibrations taking place only in the plane perpendicular to plane of incidence. The particular angle of incidence at which this takes place is called the angle of polarisation, and according to Brewster's law  $\tan \theta = \mu$ , where  $\theta$  is the angle of polarisation and  $\mu$  the refractive index of the reflecting medium. Polarisation is also exhibited in the phenomena of double refraction. Bartholinus discovered that a ray of light incident on a crystal of Iceland spar does not obey the ordinary law of refraction, but gives rise to two refracted rays (unless light travels along the trigonal axis, where there is only one). On looking through a crystal of Iceland spar over an ink spot, two images will be seen. If the crystal be rotated, one image called the ordinary image remains fixed, while the other rotates with the crystal. This image is termed the extraordinary image. Instead of the ink spot, suppose a well illuminated pin-hole is substituted and viewed through a crystal of calcite. If a crystal of tourmaline be placed between the eye and the calcite, it will be found that, for a certain position of the axis of the tourmaline, only the ordinary image can be seen. As the tourmaline is rotated about the path as axis, both images come into view, the extraordinary image becoming brighter until, when rotated through 45°, both images appear equally bright. Further

rotation diminishes the brightness of the ordinary image, until at  $90^\circ$  it is totally extinguished. Hence the rays of the ordinary and extraordinary images must be polarised in planes perpendicular to one another. Iceland spar may be used for polarising and for detecting polarised light.

The most important instrument in this connection is the Nicol prism, which is made of Iceland spar. A crystal of Iceland spar is cut perpendicular to its principal section and divided into two parts, which are then cemented together by a film of Canada balsam. A ray incident on the prism gives rise to two refracted rays,

Netherlands National Tourist Office

#### POLDER

Polder andscape n Holland

the ordinary ray being totally reflected out of the prism by the balsam, while the extraordinary ray is transmitted. Thus the ray transmitted is one which is polarised. In the Polarimeter one Nicol prism is used as the 'polariser' to produce the polarised light, and the other as the 'analyser' to examine it. The phenomenon of double refraction and resulting polarisation occurs in many other crystals besides Iceland spar. Another peculiar result is that when polarised light is incident on a crystal of quartz, the plane of polarisation is found to be rotated through a definite angle. Many organic and some inorganic substances exhibit this property either by themselves or in solution rotating the plane to the right or left. Those which rotate the plane to the right are called dextrorotatory, and those to the left levorotatory. This forms a basis of estimating the percentage strength of such a solution, the amount of rotation being proportional to the quantity of substance present in the solution. See also LIGHT; OPTICS.

**Polarity** of a body is the tendency which some bodies possess to set in a definite direction. This direction is often called the direction of the mathematical axis of the body. The property may be natural or it may be induced by external agencies. Thus a piece of lodestone tends to set in a definite direction, as also does an artificial magnet. In these and similar bodies, it also denotes the existence of two points possessing properties quite opposed to one another. Various other instances may be found in the study of electrostatics and current electricity.

**Polar Light**, see LIGHTS, NORTHERN.

**Polar Regions**, see ARCTIC OCEAN; ANTARCTIC OCEAN.

**Polozyn Zdrój** (Ger. Polzin), tn. of Poland, 35 m. from Kolobrzeg (Kolberg). There are chalybeate springs near by. Pop. 5300.

**Polder**, name given in the Netherlands to the low-lying, marshy coastal regions, which from the sixteenth century onward, by dint of unremitting toil, have slowly been reclaimed from the sea and converted into arable or pasture land. See under NETHERLANDS.

**Pole**, de la, name of an illustrious family in Eng. hist.

*William de la P.* (d. 1366), merchant of Hull, who advanced loans to Edward III.

*Michael de la P.* (11330-89), first earl of Suffolk, a son of the above. As chancellor of England and trusted adviser to Richard II. he aroused the jealousy of lords and commons, and in 1387 was obliged to seek refuge in Paris, both his estates and life being declared forfeit.

*William de la P.* (1396-1450), first duke of Suffolk, compassed Henry VI.'s marriage with Margaret of Anjou, and the disgrace of Humphrey, duke of Gloucester. He was assassinated for having, according to parliament, 'sold the realm to France.'

*John de la P.* (1461-97), earl of Lincoln, a loyal supporter of Richard III., whom he was ambitious to succeed. The leader of Lambert Simnel's conspiracy, he died at the battle of Stoke.

*Sir Edmund de la P.* (1472?-1513), earl of Suffolk, brother to the above. A descendant of Edward IV., he was executed by Henry VIII. because of his dangerous nearness to the throne.

*Richard de la P.* (d. 1525) brother of the above. He aspired to the throne, but died at Pavla, where he fought for Francis I.

**Pole, Matthew**, see POOLE.

**Pole, Reginald** (1500-58), cardinal and archbishop of Canterbury, b. at Stourton Castle, Staffs, son of Sir Richard P. and Margaret, countess of Salisbury, and educated at Magdalen College, Oxford, later studying abroad until 1527. On his return he was given the deanery of Exeter, and might have at once secured high preferment if he had expressed his approval of Henry VIII.'s divorce. P., however, retired abroad. In 1536 he wrote *Pro Ecclesiasticæ Unitatis Defensione*, in which he formulated his views on eccles. affairs, with special reference to Henry VIII.'s conduct; and in the same year the pope made him a cardinal.

In 1540 he was one of the three legates appointed to open the council of Trent. P. was one of a number of prominent churchmen who worked hard to effect a reconciliation with the Protestant theologians, and was at one time suspected of heresy. He came again to England in 1554 as papal legate, and two years later was appointed archbishop of Canterbury. He died at Lambeth Palace on Nov. 17. It was the main object of his life to counteract the Reformation in England, and he is generally considered primarily responsible for the deaths of large numbers of Protestants in Mary's reign. See lives by J. Halle, 1910, and F. A. Gasquet, 1927.

**Pole** (measure of area), see **ROD**, **POLE**, or **PERRIT**.

**Pole and Polar.** If any two points  $P$  and  $P_1$  (see figure) are taken on a given straight line and tangents  $PT$ ,  $P_1T_1$ ;  $P_1T$ ,  $PT_1$  be drawn from them to a circle, the chords of contact  $T_1T$ ,  $tt_1$  meet in a fixed point  $X$ , called the pole of the line  $PP_1$ .

Conversely, if through a point any two straight lines are drawn to cut a circle and tangents drawn from the extremities of the chords resulting, the straight line joining the intersection of the pairs of tangents is called the polar of the point. Thus in the figure  $X$  is the pole of  $PP_1$  and  $PP_1$  the polar of  $X$ .

**Polecat** (*Mustela putorius*) quadruped belonging to the weasel family, Mustelidae, and to the same genus as the stoat and ermine. The Lat. adjective *putorius*, derived from *putere*, refers to its fetid smell, which probably accounts for its never being tamed. The common European variety is 18 in. long, 5 in. being tail. White markings occur on the face, with its short ears and pointed nose, but otherwise its fur is dark brown above and black below. Its skin is called 'fitch' and makes excellent artists' brushes, but poor fur. The P. preys on poultry yards, and for that reason has been almost exterminated in the Brit. Isles. It lives also on mice, rats, rabbits, eggs, frogs, and pigeons. In winter it frequents deserted barns; in summer it prowls in the open or goes down rabbit warrens or fox-holes. Its young (from three to eight at a time) are born in the spring. Many regard the ferret as a domesticated P.

**Polemo**, or **Polemon**; 1. (c. 315-270 B.C.), son of the Athenian Philostratus, was persuaded to renounce his drunkenness and debauchery by Xenocrates's eloquence, and on the death of that philosopher took his place as master of the

Old Academy (315 B.C.), as an eminent Platonic philosopher. (2) The son of the rhetorician Zeno, was appointed in 39 B.C. to the gov. of a part of Cilicia by Mark Antony, and subsequently obtained in exchange the kingdom of Pontus. Although he opposed Augustus at Actium, he afterwards profited by that emperor's clemency, and was made king of Bosphorus after conquering that country. Was succeeded by his wife Pythodorus. (3) A sophist at Laodicea in Asia Minor, taught rhetoric at Smyrna, and won the reverence both of Hadrian and Antoninus Pius. His most famous disciple was Aristides. (4) Author of two books on physiognomy, was probably a Christian, and lived before Origen (d. A.D. 254). He describes the features and characteristics of the impudent and the talkative man, etc.

**Poles**, ends of the earth's rotational axis. The P. are known to be subject to slight variations; one due perhaps to meteorological causes is an elliptical movement of about 30 ft. diameter counter clock with a period of a year; the other, a circular movement in the same direction, and a diameter of about 26 ft. in a period of 428 days. The other movements, considerably greater, are of a different nature, and are due to precession (q.v.) and nutation (q.v.). The celestial Ps. are the two points on the celestial sphere where it is intersected by the prolongation of the earth's axis.

**Polesden Lacey**, property of the National Trust acquired in 1942, situated near Leatherhead, Surrey, England. In early documents P. L. appears as Polesden or Poul-down, the suffix Lacey being added in the late eighteenth century. The house built in 1821 took the place of a Caroline house of 1632 owned by Richard Brinsley Sheridan. Sheridan bought the property in 1797 as part of the marriage settlement of his second wife, Elizabeth Ozle. No trace of the original Caroline house now remains. Sheridan found the house in a dilapidated state and in fact called it a 'ruin,' but his ambitious plans for rebuilding came to nothing, probably owing to the increasing financial embarrassment of his later years. The only visible trace of his ownership to-day is the long terraced walk, which he greatly extended. On the base of one of the urns adorning the walk is a quotation from Pope's *Essay on Man*, which may have been inscribed in Sheridan's time. In 1821 there was built on the site of Sheridan's demolished house, a Regency villa, built to the design of Thomas Cubitt, in the neo-Grecian style, with an elegant Ionic colonnade on the S. front. Though the interior was completely altered in 1906, the exterior preserves something of the aspect of a villa of the Regency period and the main front facing S. with its Ionic colonnade remains much as when first erected. The house is famous for its setting crowning a ridge of the N. Downs. Its great beeches probably planted by Sheridan.

**Pole-Star**, see **POLARIS**.

**Pole-Star Recorder**, instrument invented by K. C. McKering, consisting of a telescope camera. The pole-star, which

describes a small circle every twenty-four hours, owing to its distance of 53' (in 1950) from the pole, is photographed, and from its trace on the photographic plate the amount of cloudiness of the atmosphere at night is estimated. See STARSHINE CAMERA OR NIGHT-SKY RECORDER.

Polesworth, coal-mining centre, on the Anker, between Tamworth and Atherstone in Warwickshire, England. The church is partly Norman. Pop. 7,100.

*Pollanthes* (Tuberose), genus of bulbous plants (family Amaryllidaceae). *P. tuberosa*, the tuberose, a native of Mexico, bears fragrant white flowers in autumn and winter. Sev. varieties have been raised, including the double African, the tubers of which should be potted in the autumn, and the Amor, or pearl varieties, which are potted from Jan. to April.

**Police.** Some kind of compulsion has always been necessary in the most primitive communities for securing effective observance of law and order. The P. force, though the term is one of recent origin, probably originated in primitive Asiatic tribal customs, and evolved through those of central European tribes into one of its most developed historical forms, the tithing system of A.-S. England, in which the community was organised into groups each of ten families, who were collectively responsible for the observance of laws by each group member. The group representative was called the tithingman, and from him the evolution of the modern Brit. and Amer. policeman can be traced.

In England the tithingman became the unpaid, elected, or appointed par. constable of the eighteenth century. The failure of the latter to cope with the changed conditions resulting from the Industrial Revolution gave rise to a period in which, at first in London, and later throughout the country, uncontrollable crime and riots are acknowledged by contemporary writers to have menaced the existence of the state. An effective P. force was estab. in London by Peel's Police Bill of 1829, but the structure and detail of the organisation were conceived and planned by the two first commissioners, Col. Charles Rowan and Richard Mayne. The New, or Metropolitan P. became the model for the estab. later of prov. forces. These were the Bor. P. (Municipal Corporations Act, 1835), and the Co. P. (Rural Police Acts of 1839 and 1856). The first thousand of Peel's new P. began their patrol in blue tailcoats and top hats, on Sept. 29, 1829. An Act of 1839 enabled the metropolitan P. dist. to be extended to any par. within a distance of 15 m. (now 16) of Charing Cross. (See also METROPOLITAN POLICE.) The municipal bors. followed suit before many years had passed, and by the middle of the nineteenth century nearly all of them had estab. a paid P. force constituted as nearly as possible on the same footing as that of the metropolis. But even at that time the co. organisation remained archaic and defective, only a few of the quarter sessions courts availing themselves of their statutory powers under the Act of

1839 to institute a P. force for rural dists. This was remedied in 1856 by an Act which converted the *discretionary* powers of the justices into compulsory powers; which powers of appointment and discretion have by the Police Act, 1890, been transferred to a standing joint committee composed of an equal number of justices and members of the co. council.

The metropolitan P. are the only exception (apart from the railway P. and similar bodies) to the principle of local control which characterises the Brit. P. organisation and sharply differentiates it from the state-controlled P. of continental countries. Outside Greater London the P. are administered by a local authority, known as 'the police authority' while, as indicated above, the co. P. authority is the standing joint committee. In the bors. it is the watch committee of the tn. council. The metropolitan P. are under the control of the home secretary and its prin. officers are appointed by the Crown. State control or nationalisation of the P. forces has often been urged since the passing of the County Police Act, 1938, and that local independence and diversity of control has drawbacks is obvious, particularly as regards the detection of crime. The principle of nationalisation has lost most of its supporters. In 1949 the obvious defects of small police authorities and small local forces were being remedied by many local amalgamations.

Under the Special Constables Act of 1831 special constables might be appointed only in the event of tumults and riots. They were employed with success during the Chartist alarm of 1818, the Fenian disturbances of 1868, and the railway strike of 1911, being discharged as soon as the emergency was over. On the outbreak of the First World War a force of special constabulary was raised by the Special Constables Act of 1914, and there is now a general power to maintain a body of special police under the Special Constables Act of 1925. At the end of the war the Metropolitan Special Constabulary was made a permanent force as the Special Constabulary Reserve. They are eligible to receive allowances by way of repayment of expenses but otherwise receive no fee. for their service. Generally speaking, the appointment and swearing in of the various ordinary P. constables are vested in either local justices or watch committees; under the Police Act of 1919 the justices appoint the chief constable and the latter appoints the petty or ordinary officers, while the home secretary has the power to make rules for the government of the P. The Metropolitan P. are appointed by the commissioner of P. under the direction of the Home Office, and the City P. are a body appointed and controlled by the common council of the City.

**Recent Reforms.**—A P. strike in 1918 led to the setting up of the Desborough committee of inquiry. In consequence of its report the Police Act of 1919 was passed. This Act granted increases of pay and standardised terms of service, and estab. the P. Federation. This was fol-

owed by the Police Pensions Act (1921). Between 1928 and 1933 the commissioner, Lord Byng, and his successor, Lord Trenchard, reorganised the Metropolitan P. New duties, such as traffic patrol, were provided for without any addition to the strength. The beat system was reorganised into ordinary beats and patrols in touch by wireless and telephone boxes with Scotland Yard, and motor cars, telephones, teleprinters, wireless, and other mechanical aids, as distinguished from the old fixed point boxes, enabled the P. to respond more quickly to calls. Another important feature of Lord Trenchard's reform was the scheme for recruitment to the higher posts, which materialised in the estab. of a P. college at Hendon for outstanding men from the force or young men direct from the univs. and secondary schools. This training scheme was criticised as undemocratic, and after the Second World War it was decided not to reopen the Metropolitan P. College at Hendon, which had been closed at the outbreak of hostilities. A new P. college was opened at Ryton-on-Dunsmore near Coventry in 1948. It trains only serving constables for senior positions in the force.

Recruiting difficulties after the Second World War presented a serious problem. These were believed to be due to higher rates of pay available in other callings; increase in costs of living; housing difficulties; less favourable prospects of promotion; and to some extent, the physical strain of the P. life. In 1918, the gov. appointed a committee under the chairmanship of Lord Oaksey to consider and report on the question, and their first report was issued early in 1949. This recommended the granting of some increases of pay and salaries together with some alterations in pension rates, measures which were promptly enacted by the gov. but these were accepted, on the whole, coldly by members of the force as being inadequate to meet needs. The present (1950) scales of pay and pensions for P. came into effect on July 1, 1949. They represent substantial increases on emoluments prior to that date, and conform to the recommendations of the Oaksey committee report (Cmd. 7671) issued in April 1949. The gov. statement (White Paper: Cmd. 7707) accepting the recommendations said that the gov. shared the committee's view that the circumstances of the P. service rendered it essential in the public interest that effect should be given to the recommendations at the earliest possible moment. The pay for men constables starts at £330 a year, rising by ann. increments after the second year to £390 a year after seven years, and to a maximum of £420 a year after twenty-two years' service. The scale for women constables starts at £290 a year, rising to a maximum of £380 a year after twenty-two years. For men sergeants the scale starts at £445 a year, rising to £485 a year; for women sergeants, £400, rising to £440. Inspectors (excepting in London) start at £530, rising by ann. increments of £15 to £575. For Metropolitan inspectors and station

inspectors the scale is £555, rising to £600. Sub-divisional inspectors in the metropolises have the same scale as Class II. superintendents in the provs., i.e. £700, rising by £25 to £750, and chief inspectors in the metropolis a scale equal to the prov. Class I. superintendents, i.e. £800 by £25 to £850. The pay of chief superintendent is £900, rising by £25 to £950. For Metropolitan superintendents, with their greater responsibilities, the pay is £1000, rising by £50 to £1100. Payment of chief constables depends on force estab., ranging from those forces under forty, where pay is £700, by £50 to £850, to those of over 2500, where pay is £2700. The above scales for constable, sergeant, and inspector are exclusive of what the Home Office describes as 'concealed emoluments.' These refer to the value of quarters or tax-free rent allowance, boot allowance, value of uniform, and value of pension (25 per cent of pay). Taking these concealed emoluments into account the following is an assessment of total pay and emoluments for the above three ranks of the P. under the new scales: Constable: minimum of scale of pay, £482 19s.; maximum of scale of pay, £591 2s.; sergeant at maximum scale of pay, £688 14s.; inspector at maximum scale, £805 6s. These are figures for prov. policemen; the London allowance has to be added for the Metropolitan and city of London constables and sergeants.

*Auxiliary Services.*—The river P., or Thames div. of the Metropolitan force, patrol the Thames from Teddington lock to Dagenham and are the oldest part of the force, having been estab. in 1798 as 'marine police' in the interests of the W. India merchants. They were effective in their early days in ending piracy and pillage. Since then their usefulness has lain in preventing crime and in retrieving drowning persons or dead bodies. They work in liaison with the Port of London Authority and patrol the riv. in motor launches and motor boats. The next oldest branch of the Metropolitan P., the mounted P., originated in 1763 under Sir John Fielding, but in an age of motor cars and motor cycles their value for patrolling the outer areas has necessarily declined though they may still be useful in some conditions of traffic control, i.e. crowds. The dockyard P. were formerly a separate branch of the Metropolitan P., their duties being to prevent and detect larceny of gov. property and military estabs. generally, and to exclude unauthorised persons from prohibited areas. Later, air stations came within their jurisdiction. After the First World War they were replaced by less costly constabularies recruited by the services depts. The special constabulary attached to the Metropolitan P. represent an even older branch of the service than the riv. or mounted P., for the appointment of temporary special constables to assist the ordinary constabulary dates from the reign of Charles II. The employment of women as police was suggested before the First World War. Women had long been associated with the

P. in such capacities as that of matron to supervise female prisoners, but it was not until 1918 that a small body of women patrols was formed as an integral part of the Metropolitan P. The women P. have had a somewhat chequered existence for in 1922 these patrols were disbanded and only a small nucleus of women P. was retained. Since then, however, more women have been recruited and a woman superintendent appointed.

**The Police and Public Carriages:** *Traffic Control.*—From the passing of the Public Carriage Act, in 1869 until 1933 public carriages, their drivers and conductors were licensed by the P. commissioner. In 1933 the London Passenger Transport Board was created to take over the entire control and operation of practically all public carriages. But the P. still have a general responsibility as to the operation of the vehicles so far as that affects general traffic conditions, and the commissioner licenses all drivers and conductors and also all cabs and cab-drivers in the metropolitan traffic area (1800 sq. m. covering London and its environs within a radius of 25 m. from Charing Cross). The commissioner has wide powers to require a certain standard of fitness of cabs before they may be licensed. New designs of cabs and a specimen vehicle must be submitted to Scotland Yard for examination and test. Cab standings or ranks are fixed by the commissioner under powers given by the Hackney Carriage Acts and it is an offence for a driver to ply for hire elsewhere. Property left in cabs is dealt with by the P.; property left in any other public carriage by the operators of the vehicles. One of the most important results of the Road Traffic Act, 1930, was the estab. throughout the country of a system of P. traffic patrols. Their primary or special duty is to supervise traffic, but they have all the other obligations of constables and must attend to any other matter calling for P. action which may be reported to them when on patrol. The patrols do not form a separate estab.; a proportionate number of them is allotted to every div. and for general administrative purposes they form part of the divisional strength. The direction of the P. in traffic matters is assigned to the traffic branch of Scotland Yard under an assistant commissioner. Developments in connection with traffic control include the evolution of a code of standardised signals for P. and motorists and the introduction of automatic signals to regulate traffic at crossings.

**Police Duties.**—Officially, the following constitute some of the prin. P. duties. A P. constable must prevent breaches of the peace and assaults. This class of misdemeanour, indeed, is that with which he may be said to be mainly concerned. He is justified in arresting persons who commit a breach of the peace in his presence only when the affray is serious and the participants will not desist. To arrest for an assault not committed in his presence is justified only where there are plain signs that an assault has really

occurred; if not, he should content himself with taking names and addresses. Under the Licensing Act, 1921, the P. may arrest any one who appears to be drunk, and incapable of taking care of himself, or any one who is drunk whilst in charge of a child apparently under the age of seven. They may arrest persons in public places or on licensed premises who are drunk and riotous, or drunk while in charge of any carriage, horse, cattle, or steam engine. A P. constable may, under the Vagrancy Acts, 1824, 1838, 1873, and 1898, apprehend any person 'found offending' as a vagrant (*see VAGRANCY*). The comprehensive legal idea of 'vagrancy,' including as it does most of the begging, betting, and soliciting fraternity, together with all loiterers and suspects, gives the P. ample scope for dealing under this heading alone with the great majority of offenders against the received conventions of society. Persons who assault the P. in the execution of their duties are liable to a fine of £20 or six months' imprisonment; and resistance to or obstruction of the P. in the execution of their duties is punishable with a fine of £5 or two months' imprisonment. The P. have the useful power to license pedlars and hawkers. Under the Chimney Sweepers Act, 1875, the chief officer of P. in each dist. is empowered to issue certificates to any person who desires to carry on business as a chimney sweeper. Under the Criminal Law Amendment Act, the P. have important duties to carry out for the protection of women and girls, especially in regard to the execution of search warrants issued by a magistrate where there is ground for believing that a woman or girl is being unlawfully detained for immoral purposes. Under the Prevention of Crimes Acts the P. have wide powers and duties relative to convicts out on ticket-of-leave, publicans harbouring thieves, dealers in old metals, receivers of stolen goods. The P. have manifold duties in the administration of the Public Health Acts, *e.g.* though they may not interfere with or seize unsound meat, they must at once report any case to the medical officer of health or inspector of nuisances; the P., if authorised by a magistrate, may enter premises where some nuisance from any cause whatever is alleged to exist, for the purpose of investigation. During elections the P. are required to render assistance to the sheriff and other authorities to prevent rioting and to preserve order at the polling stations. Where a fire breaks out on a constable's beat, he should endeavour to send a message to the P. station and fire brigade, his own place being on the spot to protect life and property. There are most minute details as to what constables ought to do at the scene of a murder or any other crime, but it is scarcely necessary to detail them here, for the investigation of crime must obviously be largely a duty the mode of executing which may be left to the discretion and cleverness of the officer concerned.

**Arrest and Summons.**—A P. constable

may either arrest without a warrant, or by warrant, or merely cause a summons to be served on the offender. He *must* arrest, without waiting to obtain a warrant, any one who commits a felony (q.v. and CRIMINAL LAW) in his presence; he can also arrest without warrant for murder, rape, and other crimes against the person, robbery, arson, burglary, larceny, embezzlement, and other felonious crimes against property; and he can similarly arrest any one who is charged by another with having committed a felony, or whom another, or the P. constable himself, on reasonable grounds, suspects to be guilty of a felony (but the complainant must accompany the P. constable to the station). Vagrants (see above) are liable to arrest without warrant. Where a P. constable cannot by himself effect the arrest he may call upon bystanders to assist him in 'the king's name.' Handcuffing is not essential, and a P. constable must be able to show 'good special reasons' for handcuffing unconvicted persons. A P. constable may question a suspect, but only to the point of satisfying himself that he is justified in arresting. In cases of arrest by warrant, or indeed in any case where the P. constable actually has a person in custody, he has absolutely no right to interrogate him touching the crime for which he is under arrest (see CONFESION).

Recent developments in P. organisation are along the line of mechanical ingenuity as an aid to the frustration or prompt arrest of crime (see above). P. questions of internal administration have formed the subject of a Royal Commission under Lord Lee in 1928, with special reference to the limits within which the P. might question prisoners, suspects and others—a matter which involves what is called 'the third degree.' As a result of the commission the limits referred to were considerably narrowed, this action being, obviously, in accordance with the essential spirit of Brit. justice.

**Police Courts.**—The P. court (and by the name P. court is generally meant the court of a stipendiary) is in theory merely a criminal court of summary jurisdiction, but in practice so wide and heterogeneous is the business transacted in it that it would be truer to say of it that it is the poor man's forum in a number of matters which primarily at least could be dealt with in the co. courts. The P. court jurisdiction and business generally comprises: (1) The investigation of charges of serious crime, like murder, arson, burglary, etc., with the view of either dismissing the accused or committing him for trial at quarter sessions or assizes. (2) The trial of persons charged with (a) indictable offences of a less serious kind, the magistrate having an option of trying the cases himself or sending them for trial by jury at assizes or quarter sessions, and the accused, where the punishment is upwards of three months, having the option of trial by jury instead of a summary trial by the magistrate; (b) non-indictable offences, the bulk of which are charges for assault, drunkenness, begging,

sleeping out, gambling, cruelty to children, malicious damage, and trifling offences against P. regulations or local by-laws. (3) Civil cases of certain kinds, such as summonses for rates and maintenance orders. (4) Applications for summonses or other relief. (See also under METROPOLITAN POLICE COURTS.)

**United States.**—Organisation of the P. forces varies in the different states. Except in Washington and the Dist. of Columbia, where the P. are under the Federal Gov., the city P. force is under municipal control, but there are many exceptions. In Boston three commissioners appointed by the governor of Massachusetts are at the head of the force. The force of New York City is the most important in the states. Its commissioner is appointed by the mayor; he has four deputy commissioners. All orders are issued through the chief inspector, who is assisted by 18 inspectors, 1 acting inspector, 25 sergeants, 1 superintendent of telegraph, 2 assistant superintendents of telegraph, 1 chief linesman, 5 linesmen, 2 boiler inspectors. After service of 25 years they may retire on half pay, or sooner under certain conditions.

**Rank, see RANK, Police.**

**Statistics.**—The strength of the P. force in England and Wales was 65,137 in 1947, and 7300 in Scotland. The Metropolitan P. numbers were 20,598. See S. Stone, *Justice's Manual*, 1914, 1930; Sir C. E. H. Vincent, *Police Code*, 1844, 1931; Snowden's *Magistrates' Assistant and Police Officers' Guide* (4th ed.), 1859; F. W. Maitland, *Justice and Police* (Citizen series), 1885; E. Carpenter, *Prisons, Police, and Punishment*, 1905; H. P. R. Gannon, *The London Police Court*, 1907 (with bibliography); J. F. Archbold, *Metropolitan Police Guide* (4th ed.), 1922; S. and B. Webb, *English Local Government*, 1922; Sir J. F. Moylan, *Scotland Yard and the Metropolitan Police*, 1929, 1934; and C. Reith, *British Police and the Democratic Ideal*, 1943, and *A Short History of the British Police*, 1948.

**Polidoro da Caravaggio, see CARAVAGGIO, POLIDORO CALDARA.**

**Polignac, Melchior, Cardinal de** (1661-1741), Fr. diplomat, b. at Puy in Languedoc, of an illustrious family. He studied at Paris and took holy orders. In 1619 he was employed as a negotiator between France and the court of Rome. In 1693 P. was sent by Louis XIV. as ambas. to Poland, where after the death of John Sobieski in 1696, he endeavoured without success to estab. Francois Louis de Bourbon, Prince of Conti, as king of Poland. In 1706 he was appointed by Louis XIV. auditor of the rota at Rome. In 1709 he returned to France, and in 1710 he was one of the Fr. plenipotentiaries at the congress of Utrecht. In 1713 he was created cardinal, and from 1724 to 1732 he was Fr. minister at Rome.

**Poliburo, see under RUSSIA, Government.**

**Politian, or Poliziano, Angelo** (1454-94), It. humanist, b. at Montepulciano, in Tuscan; son of Bonedetto Ambrogini, doctor

of law. At the age of ten he began his studies at Florence. Before he was twenty P. had produced Lat. letters and essays in Gk. verse, trans. the first four books of the *Iliad* into Lat. hexameters, and produced an ed. of Catullus. His talent was noticed by Lorenzo de' Medici, in honour of whose brother Giuliano he had written *La Giostra* in 1468. Lorenzo appointed him tutor to his two sons and custodian of his library and collection of antiquities; and P. enjoyed the friendship and patronage of 'Il Magnifico' until the latter's death. As secular prior of St. Paul's in his native city P. was prof. of Gk. and Lat. literature and of philosophy. Towards the end of his life he took orders and was made a canon of Florence. He was much affected by the death of Lorenzo, and himself died when on the point of being created cardinal. P. was the author of *Miscellanea* (1489), dealing with philology and criticism; an ed. of the *Pandects*; Lat. trans. of Herodian's *History*, the *Manual* of Epictetus, the *Aphorisms* of Hippocrates, and numerous other works. But P.'s genius was many-sided, and amid his learned labours he continued to write original Gk. and Lat. verses which have been declared the best modern examples of their kind. See F. O. Mencke, *Historia vite inque litteras meritorum Angeli Politiani*, 1736, and G. de Robertis, *L'Arte di Politiano*, 1939.

Political Commissars, see under RED ARMY.

Political Economy, see ECONOMICS.

Political Offences. For all practical purposes except extradition, P. O. stand on the same footing in Eng. law as any other crimes; indeed, in the municipal law of most civilised countries the term P. O. is in no sense a term of art, and any Brit. subject who hoped to found his defence on the ground that his offence was committed in order to further some political object would in an Eng. criminal court find that his motives would be ignored and his act judged on its merits purely as a criminal one. Formerly most P. O. in England generally brought the offenders within the pale of the treason statutes. For example, in the case of *Damarce and Purchase* (1710), two men, Daniel Damarce and George Purchase, in the course of the riots arising out of the impeachment of Dr. Sacheverell, set fire to certain meeting-houses, and the court held that such burning, as it afforded sufficient evidence of a design to burn down all meeting-houses, constituted an overt act of levying war and hence treason. In strict theory, the outrages committed by the body of agitators popularly known as militant suffragettes constituted treason, for academically acts of war against the Crown for the attainment by force of a public object come within the Treason Act of 1351. But events proved that any attempt to check the activities of these agitators by the use of this rusty weapon of the legal armoury would have been no less ineffective than the whole machinery of the criminal law.

Where a diplomatic representative of a foreign state makes a requisition to

the home secretary for the surrender of a fugitive offender, the home secretary may, if he be of opinion that the offence is one of a political character, refuse to order the magistrates at Bow Street to issue a warrant for the arrest of the offender, and he may at any time order a fugitive offender, accused or convicted of a political offence, to be discharged from custody. The Extradition Act, 1870, enacts that a fugitive criminal *shall not* be surrendered if the offence in respect of which his surrender is demanded is one of a political character. If the home secretary issues his order against a political offender and the magistrates act on it, the accused can move in the high court for *habeas corpus*.

Political Parties. For the origin and development of party government generally, and in particular of the Eng. party system, see under PARTY and PARTY GOVERNMENT. P. P. exist in every modern country basing its political system on what may best be called the W. European tradition: Fascism and Communism are incompatible with them, and though, in countries which have become Communist since the Second World War, P. P. still exist to some extent, their survival appears to be only a temporary measure, coexistent with a muzzling of their powers of criticism and expression, before they are later dissolved or merged with the gov. party. P. P. may be regarded as the inevitable outcome of government by representation. But the phenomena of P. P. in different countries present some curious points of contrast, and a knowledge of the individual hist. of each is essential to an explanation of their existence and true meaning. Until the twentieth century, and the rise of Socialism, Eng. P. P. were in many ways strongly assimilated, and this situation still prevails in the U.S.A.; but elsewhere, notably on the continent of Europe, P. P. were divided by much deeper lines of cleavage, and the whole meaning of party government was invested with a far greater degree of reality. This is readily to be accounted for by the fact that on the Continent party differences either corresponded to religious or racial differences, or were based upon fundamental differences in political views which could not in the nature of things be fused together. This position remains largely true in Europe, and is now much more applicable to England in the last respect. It is quite true that upon some points parties in England during the nineteenth century were, or seemed to be, for a time irreconcilably opposed to one another; but in practice these differences were enduring mainly on points of detail, and the political hist. of the century shows that in fact the two major P. P. interchanged and absorbed each other's ideas and philosophies to a remarkable extent, e.g. the Tories were, in 1832, fiercely opposed to Grey's Reform Bill, but their literal descendants, the Conservatives, passed a Bill extending the franchise still further in 1867. The close similarity in viewpoint upon fundamentals which existed between the two main Eng. P. P. in the second half

of the nineteenth century resulted in a series of political changes so constant and regular that they became known as the 'swing of the pendulum.' The Irish Nationalists, on the contrary, consistently displayed a hostile front, and for the very reason that their whole political creed was racial and religious. This rapidity of interchange of political power was of course accounted for by the electoral turn-overs, there being always a large percentage of electors who, acknowledging no particular political beliefs, would vote according as certain projected reforms would or would not affect them personally. Since the rise of the Labour party the differences between Eng. P. P. have become much more marked. The div. between Conservatism and Liberalism, on the one hand, and Socialism, on the other, would appear, on certain fundamental issues, to be insuperable, for all Eng. P. P. claim to serve and represent, and do indeed contain representatives of, all classes; but in fact a certain element of class conflict has entered Eng. political life. Nevertheless, 'the swing of the pendulum' remains valid. Though each political party can now rely at each election on a certain constant reserve of support in certain areas, a large proportion of the electorate, known as the 'floating vote,' continues to ignore the fundamental cleavages between the parties, and votes according to how the outgoing gov.'s record, or the projected plans of the different parties, has affected or will affect it personally. The tradition of voting against the administration, as old as the Eng. party system itself, still commands support. But continental electorates, especially those of Germany and France, were, in the nineteenth century, more stable in their adherence to a party. In Germany and Austria the absolutist and bureaucratic system of government which, towards the middle of the nineteenth century, was rapidly approaching decay, reflected itself in an almost total want of progression of liberal ideas and an unquestioning acceptance of the tenets of the different ruling Houses. The rise of the new liberal and national ideas of 1840-47 did not, however, efface from Ger. and Austrian political life the sum of the prin. features of the auct. bureaucratic and military system, and those features survived up to the First World War, though not in their former vigour. The adoption, since the end of the nineteenth century, of the system of proportional representation by many continental countries has resulted in some cases in the emergence of a large number of P. P., often distinctive only in detail. Consequently, the electorate has had a wide choice of candidates, and while a political party, basing its fundamental appeal on a religious faith or a tenet such as Marxism, is always assured of a reservoir of support from its members, support for minor parties has varied considerably from election to election. Often no political party has had a clear majority, and coalitions in France have, since the First World War, been the rule rather than the exception. The policy of such coal-

tions has sometimes differed a great deal, depending upon the dominant party in it, and the consequent instability has affected the electorates, and has caused violent fluctuations in the fortunes, even of the major groups. Party stability thus no longer exists in many cases, though cleavages between the major groups, and much bitterness, remain.

Amer. party lines, though drawn very closely and severely, not only in the nation as a whole, but also in the forty-eight states, and even in most of the cities and towns, are based to a large extent on local and historical associations, and actual differences between the parties are hard to define. The general tendency in the U.S.A. has been to favour the two-party system. There have been, of course, others, and are still, but they do not, as a rule, carry much weight. Since the civil war, as a general rule, the political battles have been fought between the Republican and the Democratic parties (*see further under DEMOCRATS; REPUBLICAN PARTY; PARTY AND PARTY GOVERNMENT; UNITED STATES OF AMERICA, History.*)

In Britain the contending parties strive for control of the House of Commons, because the leader of the majority becomes Prime Minister and forms the Cabinet. In the U.S.A. as a nation the parties strive to elect the President and, secondly, to secure control of both Houses of Congress in order to assure the passage of party measures. In Great Britain, while the life of Parliament is five years, an election may be called at any time upon the advice of the Prime Minister to the king. Elections in the U.S.A. come at regular fixed periods, and nothing can change them unless the law itself is amended. The officials chosen hold office for four years, even if one or both Houses of Congress are overwhelmingly of the opposition party. They can be removed from office only by impeachment, but this has seldom been invoked.

For a discussion of government by a single political party *see under PARTY AND PARTY GOVERNMENT. See further under ELECTORATE; PARTY AND PARTY GOVERNMENT; PARLIAMENT; PROPORTIONAL REPRESENTATION; REPRESENTATION* (includes parl. representation of various parties after the elections of 1933, 1945, and 1950); *UNITED STATES OF AMERICA, History; GERMANY, History; FRANCE, History, etc.*

**Politics**, science which is concerned with the citizen in his relations to the state. It therefore embraces a study of the foundation and general constitution of that highly complex structure, the state, the different politics of different nations, the administration of gov., and the principles and method of legislation. As a science, it is the general view that Aristotle was its classic founder, and his fundamental classification of forms of gov. into royalty, aristocracy, and commonwealth, with their respective parallels, tyranny, oligarchy, and democracy, though criticised, is still a useful basis. The value of Aristotle's *Politics* lies in that he fixed the general terminology and classification of

forms of gov. (see GOVERNMENT), and considered the sev. possible types of gov., the institution of a model state, and the meaning of 'citizen.' With Aristotle a constitution conceived in the exclusive interest of a class, even though it be of the majority, is wrongful and perverse (Pollock), an opinion the force of which must be admitted in considering the problem of the representation of minorities (see REPRESENTATION). Again, he lays down that a normal or right constitution is one that is framed and administered for the common good of all, whether the sovereign power be vested in one, with a few, or with the many—a position adopted in every allied science by every utilitarian philosopher of more modern times. Permanent as much of his work may seem to be, it cannot be denied that the limitations of social progress in Aristotle's time are reflected in his analysis of governmental forms. Many of his definitions and classifications are sterile, and sound dangerously like mere truisms, offering little from which a modern progressive statesman can learn. He conceived of the small city state as the norm of political life, in which the people could enjoy direct participation in gov.; the problems of the modern nation-state can thus in many cases find no answer in his theories. He knew, and could know, nothing of the indirect form of legislation and executive power which is conferred by the right of sending representatives to form a legislative assembly out of which all the members of a modern cabinet are chosen (see CABINET), nor could he know anything of party gov. (q.v.). Again, his analysis is too circumscribed in at least three directions. First, he has nothing useful to say about international relations and, inferentially, the force of treaty obligations (see also COMMERCIAL TREATIES); secondly, his deductions from the true type of the city state leave no room for the science of governing colonies and dependencies; and, thirdly, he altogether underrated the importance of the allied science of political economy. Aristotle, however comprehensive his survey of sciences, did not, in the spirit of Novalis, appreciate the essential oneness of all sciences: he considered political economy as a study of society apart from any constitution or particular form of gov., as something indeed which was 'merely auxiliary to the general welfare of the state and the promotion of the most desirable type of life' (Pollock). So lasting was the teaching of the Gk. philosopher that the mental attitude which could regard the pursuit of wealth as not necessarily interwoven with P. subsisted till the most recent times, and there is hardly a great writer on political economy of the last century who does not work out his science as a separate study related in merely the most perfunctory manner with the problems of gov. It may well be conceded that from the point of view of mere convenience it is alien to the study of the forms of gov. or the conception of a state to enter upon questions of economy, but the recognition of a convenient

demarcation of one science from another for purposes of clear exposition ought not to result in forgetfulness of their essential interdependence.

Modern political scientists have greatly extended the conception of the democratic form of gov., and of the functions of any kind of gov. The coercive action of trades unions bringing about the amelioration of the social condition of the working classes, and the recognition by the legislature of their claim to act without undue interference on the part of the state; the whole of modern factory legislation, laws of public health, and statutory regulation of industrial and provident organisations, find in classic times nothing to indicate an analogous conception of state duties beyond the vaguest generalities about the 'common good of all' and a 'complete life in the associated state.' No doubt these generous expressions are ample enough to connote almost anything, but both Aristotle and a host of later philosophers regarded gov. as the privilege of the cultured and leisured, and the state itself as a limited and privileged class, sentiments which are by no means dead. Plato, whose *Republic* Bertrand Russell has described as a 'totalitarian tract', was, no less than Aristotle, in the highest degree of an aristocratic cast of mind, and his notion of an ideal state is a pure *a priori* deduction from the perfectly wise ruler ('philosopher king') as Plato imagined such a being. Full citizenship was the monopoly of an upper caste, trained for the purpose, and segregated from the masses.

From the time of the merging of the political genius of the Gks. into the Caesarism of the Rom. Empire until the Renaissance there was no room for speculation in P. The Rom. had without doubt a peculiar genius for practical gov., but not only was the very omnipotence of the Caesars hostile to all independent political life, but the various peoples over whom Caracalla had thrown the yoke of Rom. citizenship themselves seem, during the decline of Rome, to have manifested a political apathy not unnatural in an age that recognised without question the inevitable ascendancy of the Romans over the known confines of the civilised world. When the empire of the Caesars gave place to the Holy Rom. Empire and the great feudal kingdoms of W. Europe, the all-dominant question of the times, far from having any bearing on theories of the state or constitutional limitations on political sovereignty, was the controversy between the temporal power and the spiritual autocracy of the papal see. No medieval writer thought of disputing that unlimited monarchy was the sole guarantee of peace or any measure of freedom, and even the works of Dante (*De Monarchia*) and Aquinas (*Summa Theologica*) are concerned merely with scholastic arguments in favour respectively of the divinely appointed and universal rule of the emperor and the pope. The real revival of the science of P. in a form in any way adapted to the civilisation of modern Europe comes only with Hobbes',

*Leviathan* (1651), though the details of statecraft were first worked out by Machiavelli in the *Prince* (1532). Machiavelli's works, though in themselves hardly a contribution to the theories or analysis of the state, are significant for their revival of the long-forgotten separation of ethics and P., a separation (made first by Aristotle) which may be said to be intimately bound up with his unique if somewhat maligned reputation. In his view no it. state of the sixteenth century could hope for sovereign independence if morality were allowed to obstruct the free play of the principles and motives of human self-interest upon the art of P.; in a word, he appears to postulate absolutism as the only form of gov., and is concerned only with the means of conserving that acquired sovereignty. Hobbes, believing that security was the greatest wish of human beings, twisted the doctrine of the 'social contract' to reach the conclusion that absolute monarchy must be preferred to its sole alternative, anarchy. In many points he was anticipated by Jean Bodin in his *Six Livres de la République* (1576). The cardinal point of departure in the work of these two publicists is the recognition of the essential attributes of political sovereignty, whether inherent in one or the many. In particular the recognition of the superiority of the political sovereign over the laws as a necessary condition of the very conception of a sovereign. There is, however, in the political theories of both Bodin and Hobbes a curious but highly instructive inconsistency. Both incline strongly in favour of despotic power, or sovereignty unrestricted by any legal limitations; yet both, especially Bodin, set such moral limits to this absolutism as upon the face of them have a force no less real than that of law. The significance of this detraction (however unconscious) from genuine absolutism lies in the fact that it contains the very germ of modern constitutional sovereignty, and marks an important advance on such ant. and medieval notions of personal and feudal kingship as were consistent only with the view that society was based upon *status* and not *contract*.

The analytical jurist Austin, more clearly than any other writer, and with a vast tediousness of formal logic, insists upon hard and fast distinctions between sovereignty, morality, and positive law, and so carries the work of Hobbes to its legitimate conclusion; but though even in the present state of the science of P. there is an element of truth in these distinctions, the speculations of Hobbes and Austin on sovereignty were very far removed from the later conception of the co-existence in every independent state of both a legal and 'political' sovereignty (see GOVERNMENT). In a word, though it is impossible to deny that that sovereignty is a contradiction which is expressed to be limited by *morality* or *policy*, yet there is no paradox in saying that in England Parliament, or the elected representatives of the people, is legally omnipotent, but morally subordinate to the will of the

electorate. Hobbes saw clearly enough that sovereignty could not be divided, and held that the rights and powers of the sovereign (viz. the powers of legislature and judicature, of making war and peace, of choosing counsellors, of punishing, and of regulating titles) are indivisible and incommunicable, and that though they may be delegated, cannot be abandoned. Pollock considers that whatever source of error there may be in Hobbes's theory of sovereignty lies in the fact that it did not occur to him that sovereignty might be vested in a compound as well as in a simple body. Even Austin, with all his narrow formalism, saw this, though his sovereign body of king, lords, and commons is no more than the 'legal sovereign' of Dicey.

The latter part of the seventeenth and the eighteenth century saw a considerable advance in the science of P. The great names (leaving Bentham for later consideration) associated with this period of its development are those of Locke and Burke in England, and Rousseau and Montesquieu in France. All four, each in very different manner, dealt with the theory of the social contract, and to Burke belongs the credit of having finally disposed of it, though not before Rousseau had brought down the storm of the Fr. revolution upon his country by its almost direct instrumentality. There is a curious point of contrast between the work of Locke at the end of the seventeenth century and that of Rousseau a century later. Locke, in his *Essay on Civil Government* (1690), defines a political society as one in which every member has quitted his natural powers of preserving his property and punishing others, and 'resigned it up into the hands of the community in all cases that exclude him not from appealing for protection to the law established by it.' He refutes the claims of absolute monarchy on the ground that an absolute monarch, being no 'common judge with authority' to decide between himself and his subjects, is therefore in a state of nature with regard to them. The *Essay* was intended to justify the revolution of 1688 and the estab. thereby of a truly limited or constitutional monarchy in place of the Stuart dynasty claiming to rule *jure divino*. Rousseau, on the other hand, contemptuous of the shifts and evasions of Locke, boldly using the fiction of the social contract as a convenient metaphor for the expression of democratic truths, constructed in his brilliant *Contract social* (1762) a theory of gov. and civic rights which appealed so powerfully to the imagination that many of its propositions found their way into the *Declaration of the Rights of Man*; they have equally been claimed for the Hegelian school. Locke, founding to a certain extent on Hooker's *Ecclesiastical Polity* (ed. Keble 1836), postulates as the distinguishing mark of society in a stat. of nature the want of a common judge with authority; but he disagrees with Hobbes's theory that men in a state of nature are no better than 'brute beasts,' and that the hand of all is

raised against all in war, by asserting that even prior to the beginnings of actual political society men in the aggregate are at least ruled in their actions by reason. He endeavours to establish, at least in outline, all the cardinal private rights of civilised mankind as resting upon their own inherent basis of reason before he comes to the point of sealing them with the guarantee of a true political society. Pursuing this purely arbitrary and *a priori* method, Locke, having estab. his commonwealth through the social contract and the election of a 'common judge with authority,' goes on to justify the right of the majority to be the ultimate source of political power upon the apparently safe ground of practical necessity. Exactly in what body Locke vests the sovereignty is difficult to say, for not even the philosophers of his age seem fully prepared to deny that the king was politically the head of the state. But with the object lesson of the Bill of Rights before him, Locke was safe in saying that the legislature was vested with the supreme power, though he immediately qualifies this by assuming such investiture to be in the nature of a trust. This is merely another way of saying that all government is founded on consent, though, in an age of a corrupt and practically non-existent franchise, it was necessary for Locke somehow to distinguish, so far as England was in his mind, between a dissolution of gov. and a disruption of the political society by war. In short, Locke's purpose was to demonstrate that a moderate constitutional gov. was the only gov. justified by the law of nature, the actual form of government being immaterial, though throughout his works it is patent that his hypothetical case is, and could only be, the Eng. constitution. But he was far more concerned to outline a practical concept of government than to produce a complete and tidy theory. Locke limits the powers of the supreme legislature by prohibiting the taxation of property without the consent of the people given by themselves or their deputies, the dispensation of justice otherwise than by estab. law and authorised judges, and the transference by the legislature of its powers to any other person or body.

With Rousseau political science, in its *a priori* and analytical stage, reached the limits of its possibilities. The theory of the social contract, as metamorphosed in the crucible of Rousseau's intellectual wizardry, took the form of a surrender by each and all of their natural rights, not to any sovereign, but to the whole society under the sovereign direction of 'the general will.' Since, therefore, each individual receives in exchange, as it were, an inseparable part (however infinitesimal) of the whole communal sovereign power, he is, in the last resort, as free as he was prior to entering into the *contrat social*. The resulting paradox is that there is no sovereign in Rousseau's state in the sense in which Hobbes, Locke, and other writers use that term, the community itself being at once a corporate

sovereign entity and an aggregate of unrelated subjects, governed not directly but only mediately by whatsoever form of gov. may happen to exist in the particular community. Rousseau's theories have but little to say on *legality*, for the simple reason that with him the laws imposed by the general will cannot be unjust, and to be the true expression of the general will must themselves be characterised by generality. The most obvious and far-reaching deductions from Rousseau's theories are: (1) that all men are equal; (2) that no monarch has any title to sovereignty; (3) that all existing govts. inevitably strive to monopolise sovereign power; (4) that political society is generally overwhelmed by its rulers and so perishes (a palpable invitation to the Fr. people to save themselves); and (5) the futility of Eng. representative gov. as an alternative to the ideal Gk. city-state, because it is utterly inadequate to express the general will. The greatest difficulty lies in the trans. of the general will into actual government. Rousseau himself provides no satisfactory solution, and perhaps the only answer is to equate 'general will' with the common sense of the whole community acting as the final court of appeal.

Against Rousseau's somewhat nebulous theories stands the *Esprit des lois* (1748) of Montesquieu, 'who,' says Pollock, 'with all his faults and irregularities, is the father of modern historical research.' Too much stress cannot be laid upon the importance of this statement; for although his own contemporaries did not fully appreciate the greatness of Montesquieu's work, its significance in the science of P., and indeed in all philosophy, lies in the fact that it heralded the dawn of the historical as opposed to the analytical method. No doubt Montesquieu's information was 'often crude and imperfect, his inferences often hasty, and his judgment often misdirected,' but they were a sure beacon to posterity in that they substituted the method of induction from actual facts for the *a priori* sophistries of mere dogma or guesswork. Besides this method of political science, Montesquieu's contributions to P. included a comparative theory of legislation and institutions suited to the political needs of different forms of government and a comparative theory of P. and law based on a comprehensive observation of the actual systems of different countries and epochs. Bentham carried the former of these ideas into execution (see under BENTHAM, JEREMY), while Maine, Labnitz, Savigny, Seeley, Brinton, and Spencer evolved, though in markedly different ways, the latter idea. Burke's *Reflections on the French Revolution* (1790), which, together with his other works, is the true precursor of the historical method, may be excluded from detailed consideration, because it is almost purely destructive and contains next to no political theory at all, and what there is is marred by inconsistency; for at one time he champions legality, at another pits his eloquence against formalism of all kinds. His

importance in the development of the science of P. lies in his recognition of the fact that civil society is not a machine but a social organism and a social discipline, and that therefore the guiding light of any politician should be nothing but such rules of equality and utility as are favourable to the preservation of all existing rights and liberties.

Bentham's *Fragment on Government* (1776), though contemporaneous with Rousseau and Burke, is better left for separate consideration, because the man and his work generally are unique and apart. If a dichotomy into analytical and historical schools of thought be necessary, he belongs rather to the former; but at the same time his breadth of mind enabled him to put something like life into the dry bones of *a priori* dogma. This is not the place to discuss all his ideas (which are summarised in the article BENTHAM, JEREMY) but it is appropriate to notice here his view of sovereignty and his theory of the final cause or purpose of any sovereign. Bentham, eschewing formality of definition, regards the salient feature of a political society as the *habit of obedience* manifested by a number of persons towards other persons 'whom we may call governor or governors. The power of the sovereign he treats as unlimited, though there is all the difference possible between the legal duty of obedience to the supreme legislature and the political doctrine of non-resistance. Even later writers on sovereignty, like Dicey, recognise the fallacy of a limited supremacy, though to Dicey belongs the credit of making anything like an adequate distinction between legal and political sovereignty. But it is due to Bentham to realise that his was an age when it was still necessary seriously to consider the nature and authority of the state *qua* state and to assert the sanction of positive law. Much of Bentham's work is now merely of historical interest, but that a great number of his deductions were far in advance of his time is demonstrated by the fact that reform has almost down to the present day been consistently along the lines of his suggestions.

The science of P. as it stands to-day, has gone far beyond the stage of theorising about sovereignty and the state, the distinctions between P. and ethics, positive law and morality, and taking these things as axiomatic concentrates upon the science of legislation, or, in other words, the discussion of what matters are fit to be controlled by the state and what left to individual discretion. The science of P. as viewed from this standpoint relates, therefore, to what older theorists would have regarded as mere political expedients; but then societies had not become accustomed to law-making and much was left to the undisputed sway of custom or local laws. Yet the objects of legislation are all important at the present day, and theories of the state and of sovereignty, if they require detailed discussion, may do so in view of three developments: (1) the interrelations of states bound together in a federal union, (2) the promulgation of written or rigid

constitutions, and (3) international law (*q.v.*). According to Dicey, the legal sovereign power in states having a written constitution (as have all federal states) is strictly a dormant power called into play only when changes in the letter of the constitution are contemplated. In a manner of speaking the wealth of discussion at the present day on the appropriate sphere of legislative activity, or the limits of state intervention, whether directly or through the medium of bodies with delegated sovereign powers, was rendered possible by what may be fitly regarded as Bentham's most important contribution to P., viz. the obligation of the sovereign to make laws. Prior to the nineteenth century comparatively few Acts will be found in the Statute Book, the duty of the state not being considered to extend far beyond the irreducible minimum of preserving order within the ter. and repelling external aggression.

The work of Bentham's contemporary, John Austin, is important in further differentiating the various allied topics of political speculation by his masterly if laborious separation of the theory of political sovereignty from that of the ethical and historical foundations of political society, with the object apparently of merely arriving at a pure science of positive law, an object which has since been far more concisely and readably done in Sir Thomas Erskine Holland's and John Salmond's works on *Jurisprudence* (see JURISPRUDENCE).

The prin. Eng. exponents of the historical method, as opposed to the analytical or deductive are Sir H. Maine (*Ancient Law, History of Early Institutions, and Village Communities*) and Herbert Spencer. But this method has attained its perfection rather in Germany at the hands of Savigny, Ahrens, and others, who, however, arrive as Pollock points out, at very much the same results as to the meaning, nature, and functions of political institutions as the school which is commonly opposed to them. A more important school of continental publicists is the ethical, who, 'throw their main strength on investigating the universal moral and social conditions of gov. and laws, or at any rate civilised gov. and laws, and expounding what such gov. and laws are or ought to be, so far as determined by conformity to those conditions.' The weight attached by continental writers to this method is explained by the fact that their legal and political institutions are permeated by the study of *Naturrecht*, a legacy of the traditions of the Rom. empire, or rather the Stoic philosophy, through the Rom. *Digest* and the writings of Cicero (see JURISPRUDENCE). It is probable, however, that to whatever extent the Ger. publicists may have attempted to apply transcendental ideas to the treatment of P., their results are not in the main very far removed from those of the Eng. empirical schools of thought.

To-day political theorists bring philosophy to bear more closely upon the science

of P. Duguit in France and Laski in England contend that a system of direct representation of economic and professional interests should take the place of representation based upon ter. and pop. Modern life being a condition of economic warfare, it is held that occupational group representation will solve many of the problems left untouched by the present system. Syndicalism goes beyond this in condemning all political action as hitherto understood, on the ground that the state, being built upon force and obedience, cannot achieve for the individual a minimum of restraint; and in making the claim that the trade union group is the foundation of society, and should therefore control society. Thus there would be no state as we know it and the evils of majority rule would, in the syndicalist view, disappear. On the other hand, public opinion is as important an element in the foundation of the 'state' as is force, and few would be found to agree that the trade union group is the foundation of society. G. D. H. Cole, who does not go so far as the syndicalists, contends that the state 'should own the means of production, the guild should control the work of production.' His guild state may be described as a federation of groups. Bernard Shaw says 'democracy is merely the substitution of the incompetent many for the corrupt few,' and meets the currents of idealism that inform political philosophy to-day with the criticism 'there is no sincere public opinion to-day that a man should work for his bread if he can get it for nothing.' In America, Lippmann observes that the new ideal can be found in mastery, founded on an increasing knowledge of man over nature and over himself. Writers of the Hegelian or idealist school maintain that the state has a will apart from the will of its individual members and that the purification of the state will must be the goal of every endeavour. This has been stated by Bonanquet, and, with some hesitations, by T. H. Green. Fascism puts into practice this theory of the final supremacy of the organic state.

The U.S.A. present unique political problems of a special interest. For the U.S.A., as also Canada and Australia, illustrate the principle of federalism, probably the only political system which has more or less successfully solved the great problems in the transference of people of an old civilisation to virgin soil. These people of every stage in civilisation and education have been promptly admitted to citizenship and have settled peaceably in their new country. Peculiar problems are a natural consequence, such as the kind of nationality which is ultimately to emerge as really 'American,' and the balance between E. W. and the Middle W. (q.v.).

There is always a time-lag between new political ideas and the conditions which favour their application in practical P. and, as has been well said by Zimmern, ideas in all ages have been forces and most of all when the so-called practical men

who were impregnated by them were not conscious of their motive power. Among the ideas and doctrines which are active to-day or which play or have played a large part in the formulation of contemporary international policies may be mentioned those especially of Karl Marx and Friedrich Engels, which supplied the driving power to Lenin's political experimentation. Yet behind Marx lies the Dialectic of Hegel, though the latter's undoubted influence on Brit. Idealism would have been slight had not Marx been his disciple. Together Hegel and Marx achieved a real revolution in the orbit of political ideas, a revolution which involved the reinterpretation of the axioms of the rationalistic philosophy of Liberalism as a new attitude to the historical process and to man's place in that process, a reinterpretation founded on Hegel's 'historical relativism.' Marx reconciled Hegel's concept of the historical process with his belief in man's freedom to remould his own world by his theory of Dialectical Materialism. Freedom, declares Marx, is only possible when the historical dialectic is regarded as the conflict of social and economic forces, directed not by any world-spirit, but according to laws ascertainable by social science. Engels, like Marx, was insistent both that political democracy must be abolished and that independent states must disappear, so as to pave the way for a world revolution which would subvert capitalism in all countries and convert the world into a union of socialist republics. The influence of this philosophy on Soviet Russia is too obvious for further comment.

Modern European political authoritarian thought has many of its roots in Hegel's *Grundlinien zur Philosophie des Rechts* (The Fundamental Lines of the Philosophy of Right), particularly in his conceptions of the rational character of the state, of freedom as service to the state, and of hist. as the revelation of the reality of the spirit. Nietzsche's influence on political thinking is seen chiefly through his idea of the superman and the pseudo-messianic manner in which he conveyed this conception. But the slogans or catchwords (what Georges Sorel called 'myths'), as well as philosophical doctrines, have not seldom in modern times exerted a profound influence in P. The theory of the myth was first expounded in Sorel's *Reflections on Violence* and developed into a philosophy by Pareto. Hitler and Mussolini showed that, in an age of slogans and propaganda, men of action can, for their own ends, distort ideas that have long been current in more or less academic discussion. Thus Hitler's nationalist slogans owed something to the impetus given by Herder to national consciousness and to Fichte's arrogant *Addresses to the German Nation*; while Mussolini's Fascist utterances were related to the philosophy of Hegel and to Mazzini's nation-state theories, and also to the doctrines of Sorel. Hitler's racial theories, if they may be so styled, were mere political window-dressing directly traceable to the

confused ethnical theories of Gobineau, Houston Stewart Chamberlain, and others. The principle of self-determination, as conceived by Woodrow Wilson, is merely a statement of the nation-state doctrine, but with a clearer perception of the connotation of 'nation,' 'race,' and 'people,' and of their interrelationship. See also COMMUNISM; IDEOLOGY. See H. Sidgwick, *Elements of Politics*, 1850; H. Spencer, *Social Statics*, 1851, and *Sociology*, 1877-96; Sir G. C. Lewis, *Methods of Observation and Reasoning in Politics*, 1852; J. K. Bluntschli, *Theory of the State*, 1868; Sir F. Pollock, *History of the Science of Politics*, 1890; W. **Poliziano**, see POLITIAN, ANGELO.  
**Polizzi Generosa**, tn. of Palermo, Sicily, 23 m. N.W. of Caltanissetta. Pop. 8000.

**Polk, James Knox** (1795-1849), eleventh president of the U.S.A., b. in Mecklenburg co., N. Carolina, and educated at N. Carolina Univ. In 1820, P. was admitted to the Bar. From law he turned into politics. The first public capacity in which he served was the chief clerkship of the Tennessee House of Representatives. He was nominated by the Democrats of Tennessee as governor of the state and was elected. From 1835 to 1839 he was Speaker of the U.S. House of Representatives. In 1844, he was nominated by the Democrats for the presidency. The convention advocated the annexation of Texas, and the immediate occupation of Oregon. The Whigs nominated the famous Henry Clay. P. was elected. Before he was inaugurated, Texas had already been annexed to the U.S.A. P., as president, said the country must settle the Oregon boundary and acquire California. Oregon, as then thought of, was a remote unsettled region between 42° and 54° 40' N. lat., and extended from the

Rockies to the Pacific. Both England and the U.S.A. claimed it on account of discoveries and explorations of their nationals. Had England yielded, Canada would have had no Pacific coast. England proposed that 49° be the boundary line, and this was accepted. The Californian question was settled by the war with Mexico. As a result of the Oregon settlement, and of the annexation of Texas and California, the U.S.A. acquired about 1,200,000 sq. m. and completed its continental expanse.

**Polka**, lively round dance of Bohemian origin, danced to music written in two-four time. It was invented about 1830.

**Poll**, see ELECTIONS.

**Pollack** (*Pollachius virens*), fish closely related to the cod-fish; belongs to the cod-fish family, Gadidae. It has no barbel depending from its chin, and its lower jaw projects beyond the upper. Like others of its genus, it is carnivorous.

**Pollaiuolo, Antonio** (1429-98), Florentine painter and metal worker. He studied under the goldsmith Bartoluccio, stepfather of Ghiberti, and later assisted the latter in modelling the gates for the Baptistery of Florence, completed in 1452. He also worked as a goldsmith and as a sculptor in bronze, and the monuments to Popes Sixtus IV. and Innocent VIII., in St. Peter's at Rome, are his work. His pictures are lively and vigorous. With him worked his brother Pietro (1443-96).

**Pollaiuolo, Simone del** (1454-1509) Florentine architect. He studied in Rome, and on returning to Florence was employed by Strozzi to complete the palace begun for him by Benedetto Maiano in 1489. He also designed the council hall of the Signoria and the sacristy of San Spirito.

**Pollan**, see COREGONUS.

**Pollard, Albert Frederick** (1869-1949), Eng. historian, b. at Ryde. Educated at Portsmouth Grammar School, Felsted School, and at Jesus College, Oxford. He was assistant editor, *Dictionary of National Biography*, from 1893 until 1901, and was prof. of Eng. hist. univ. of London, from 1903 to 1927. Later he was director at the Institute of Historical Research. Besides 500 articles in *Dictionary of National Biography* and considerable portions of *Cambridge Modern History* and *Political History of England*, P.'s works include *The Jesuits in Poland* (1892); *Henry VIII.* (1902); *Reign of Henry VII.* (1913-14); *Short History of the Great War* (1920); *Factors in American History* (1925); and *Wolsey* (1929).

**Pollard, Alfred William** (1859-1944), Eng. bibliographer, b. in London, and educated at King's College School and St. John's College, Oxford. He worked for nearly forty-two years in the dept. of printed books, Brit. Museum, for the last five as keeper. He succeeded Burnhull as director of the Early Eng. Text Society, and ed. Herrick in the Muses' Library. Produced *English Miracle Plays* for the Clarendon Press, and ed. Chaucer. He became secretary of the Bibliographical Society which, in 1926, produced the

**Short Title Catalogue** of books printed in Eng. (1475-1640) and, in 1939, Greg's *Bibliography of the English Printed Drama to the Restoration*. P. planned and directed the *Catalogue of Books printed in the XI<sup>th</sup> Century now in the British Museum*, 1908-16. In 1909 appeared the famous *Shakespeare Folios and Quartos* with its support of the integrity of the ordinary early printers and publishers. After this appeared his *Records of the English Bible* and, in 1910, he pub., in collaboration with H. C. Bartlett, *A Census of Shakespeare's Plays in Quarto* (1594-1709).

**Pollarding**, the practice of lopping off the top or head of trees to the main stem to cause it to form a number of young branches. Willows and poplars are the only trees commonly so treated.

**Pollen**, male fertilising cell of flowering plants, formed in the P. sacs of the anther. It is a rounded or polygonal cell, and contains a dense granular protoplasm, and

its outer surface is often covered with oil; its colour is generally yellow, but sometimes blue or red; when it reaches the stigma it germinates, and the P. tube penetrates to the ovary, which it fertilises.

**Pollen Analysis**, in archaeology, see under PREHISTORY.

**Pollensa**, tn. of Majorca, Balearic Isles, 28 m. N.E. of Palma, with a trade in wine. Pop. 8500.

**Pollenzo**, tn. of Italy, 4 m. N. of Macerata. There are numerous Rom. remains. Pop. 6000.

**Pollination**, transfer of pollen from one flower to another by the agency of insects or by the wind. The P. of plants of different species is hybridisation.

**Pollack**, Sir Frederick (1845-1937), Eng. jurist, grandson of Lord Chief Baron P., first baronet, b. in London; educated at Eton and Trinity College, Cambridge, where he was Pitt scholar in 1865 and first chancellor's medalist in 1867. He became a fellow of Trinity in 1868; and

was called to the Bar in 1871. P. was prof. of jurisprudence, Univ. College, London, 1882-83; Corpus prof. of jurisprudence, Oxford, 1883-1903; prof. of common law at Inns of Court, 1884-89. He was made P.C. in 1911; and in 1914 he was appointed judge of Admiralty Court of Cinque Ports, and became K.C. in 1920. Among his many pub., sev. of which are standard works, were textbooks on common law, torts, ship, land laws, and, in collaboration with Sir R. Wright, *Possession in the Common Law* (1888). In collaboration with F. W. Maitland he wrote a *History of English Law* (1895). His *Principles of Contract* went into its tenth ed. in 1936. He also wrote *Spinoca: his Life and Philosophy* (1880), *Leading Cases done into English* (2nd ed., 1876); *An Introduction to the History of the Science of Politics* (1890); and *Outside the Law* (prose and verse, 1927). *The Etching-ham Letters* 1899 is an entertaining jeu d'esprit written in collaboration with Ella Fuller Maitland. He was ed. of the Law Quarterly Review from 1885 to 1919, and ed.-in-chief of the 'Law Reports' from 1895 to 1936. P. ed. the Lincoln's Inn MS. of Selden's *Table Talk*, 1927.

**Pollak**, Robert (1789-1827), Scottish poet, b. in Renfrewshire; educated at Glasgow Univ., and became a minister in the United Secession Church. He wrote *The Course of Time* (1827), a didactic poem in ten books, after the manner of Cowper and Young. It is very uneven, but had a great contemporary reputation. His *Tales of the Covenanters*, a work in prose, was pub. in 1833 (A. Thomson's ed. 1895, 1928). See life by D. Pollak, 1843.

**Pollakshaws**, dist. of Glasgow, Scotland, on White Cart Water, incorporated into Glasgow in 1912, with textile industries, particularly cotton.

**Pollakshields**, S.W. suburb of Glasgow, Scotland, incorporated in the city in 1891.

**Pollonarius**, see POLONNARUWA.

**Poll Tax**, or **Capitation Tax**, tax levied on the individual. It was employed in anc. Athens, and sev. famous levies have been made in England. The first was in 1377, and the poll-tax levied in 1380 led to Wat Tyler's rebellion. It was a favourite means of raising money under the Stuarts. Many Amer. states have employed a poll-tax, to prevent Negroes and 'poor whites' from voting.

**Pollution**, see NUISANCE; PUBLIC HEALTH, *Pollution of Water*; WATER SUPPLY.

**Pollux**, see GEMINI.

**Polo**, Marco (1251-1324), Venetian traveller. He was b. of a noble family, and at the time of his birth his father and uncle were absent on a commercial expedition to China, where they were asked to return by Kublai Khan. This they did in 1271, taking Marco with them. They travelled by way of Mesub, Bagdad, Khorassan, the Pamir, Kashgar, Yarkand, Khotan, Lob Nor, the Gobi Desert, Tangut, and Shantung, and reached the Khan's court in 1275. The Khan sent Marco as an envoy to Yunnan, Burma,

Korakorum, Cochín China, and India, and for three years he acted as governor of Yangchow. The Ps. finally left China in the train of a Mongol princess, and returned by way of Sumatra, India, and Persia to Venice, which they reached in 1295. In 1298 Marco received the command of a vessel in the fleet fitted out against Genoa, and was made prisoner after the Venetian defeat at Curzola. While in captivity he dictated an account of his travels to Rusticiano of Pisa. This work, which suffers from the monotony of its style, has been trans. into many

languages; Eng. eds. are those of J. Marsden (1818), T. Wright (1831), H. Murray (1841), Sir H. Yule (1871, revised and augmented by H. Cordier, 1903), and in Everyman's Library, ed. by J. Marsden. See life by G. Danilelli, 1911; also G. K. Hudson, *Marco Polo and the Discovery of China*, 1949.

Polo, ball game played on horseback, is one of the oldest, if not the most ant. of games. It is impossible to trace its commencement, but it was played in Persia certainly before 500 B.C. Persia may be regarded as the home of P., most interesting records of its early hist. being contained in many illuminated Persian MSS. in the Brit. Museum. The game was early known in Byzantium, afterwards finding its way into Japan and China, and thence to Tibet and India. The first recorded description of an international P. match is given in Firdusi's *Shāhnāma* (eleventh century), the game being between Persian and Turkish teams. The beginning of the modern game of P. in England dates from the nineteenth century. The game quickly became popular, especially in the army, clubs being formed in London, Rugby, and Dublin. A P. ground is usually 300 yds. by 160 yds.; it must not be less than 275 yds. in length. The ideal goal posts are made of basket work, as these may be repaired easily, though it is very usual to have them made of Willow paper, so that they may break easily if collided with. The height of the goal posts is 10 ft. The stick consists of a cane handle about 52 in. in length, set into a head

which takes various forms according to the particular fancy of the owner. The ball, usually made from the willow-tree root, is 3½ in. in diameter and 5½ ounces in weight, though sometimes balls made of 'Exhote' are used. There are four players on each side. P. ponies are bred and trained for the game, and are now almost always thoroughbreds. Owing to the shortage of small ponies for P. since the First World War, the regulation height of P. ponies is not now insisted on, but a pony should not be more than 15 hands. The best-known clubs near London are at Hurlingham, Ranelagh, and Roehampton. The Co. P. Association has a large membership of affiliated clubs, and the Irish Co. Club Union has also a large membership. The Eng. P. season is May, June, and July. In America and the Argentine, P. ponies are far less expensive than in England, and such proficiency have the Amers. reached in the game that they now number among them some of the finest of the world's players. The Amer. game is faster than the Eng., both with the pony and on the ball. Meadow Brook Club, where P. was first played in 1879, is the Hurlingham of America, and before the Second World War over 100 P. clubs belonged to the U.S.A. P. Association. In 1886 the first P. match was played between Great Britain and the U.S.A., and Great Britain won. The second match was played in 1900 and Great Britain again won, but since that date the U.S.A. have won every match. Owing to economic stringency following the Second World War the recovery of the game in England was slow, being handicapped especially by the lack of Argentine ponies. Thrown on indigenous resources there may be an opportunity for breeders of Anglo- or part-bred Arabs. It is, however, only in England that the game is in serious difficulties; in America in the spring of 1949 a series of international matches were played between the Argentine and America; in Italy the game has been revived at Rome and in Spain there is regular play at Madrid. There are more than forty clubs in S. Africa, and there is regular play in Malta. In England, however, there is P. sev. days a week at the surviving clubs, which also include (besides those mentioned above) Cowdray Park, Henley, the Ham Club (now at Petersham), the Rhinefeld (in New Forest), the Taunton Vale club, Billericay, and others. Hints for playing P., its 'Rules and Regulations,' and the 'Rules of the County Polo Association' will be found in the *Encyclopædia of Sports and Games*; and a full hist. of the game, ant. and modern, is contained in *Polo, Past and Present*, 1925, by T. F. Dale. See also J. Moray Brown, *Riding in Polo*, 1891, and *Polo*, 1895, T. B. Dryborough, *Polo*, 1898, 1906; R. L. Rickotts, *First Class Polo*, 1928; and N. Bent, *American Polo*, 1929.

**Polo Pony**, see under HORSE.

**Polo, Water**, see WATER POLO.

**Polonaise**, stately Polish dance, originating in a ceremonial procession. The music is in three-four time, and the form

was a favourite with Chopin and other composers.

**Polonium**, first radio-active substance to be recognised by the Curies in 1898. Symbol Po; atomic number 84; approximate atomic weight 210. It was named after Poland, Mme Curie's native country. It is found in combination in pitchblende, and is identical with radium F. See RADIUM.

**Polonnaruwa**, second cap. city of anct. Ceylon from A.D. 769. Situated 76 m. N.E. of Kandy on the road to Trincomalee. Most of the historic ruins, which belong to the twelfth century, have been partially, or almost fully, restored, and they are in a better state of preservation than those of the older cap. city of Anuradhapura. Most impressive and spectacular, the remains at P. belong to a period when the famed Parakrama Bahu the Great made an epic of Ceylon hist. The city owed much of its beauty and magnificence to this great king, who combined the professions of warrior, student, artist, agriculturist, builder, and administrator.

In spite of the ravages of time and weather for the past eight centuries, much survives of the viharas, dagabas, monasteries, palaces, bathing pools, shrines, statues, and inscriptions in an oasis of ruins surrounded by forest inhabited by wild elephants, leopards, and other wild animals, and gay birds like the golden oriole and the paradise flycatcher. Among the ruins (some of which show evidence of Tamil influence in rich architectural design), the Vata-da-go (round relic house), the Kalmal Vihara (black granite temple), the king's winter palace, the Rat-mahal-pasada (seven-storeyed palace), the royal lotus baths, the Kiria, Pabulu- and Rankot-Viharas, and the temples of Lanakattil-cke. Jetavanaraina, and Thuparama need special mention. A mile away, on the other side of the P. resthouse, the large stone statue of King Parakrama Bahu (though some experts think it is that of a Hindu saint), holding an ola, or palm-leaf, MS. which was found among the ruins of the Potul Vihara (Parakrama's library) is of special interest. The city is also surrounded by large tanks (irrigation reservoirs) including the recently restored 'Parakrama Samudra,' which, besides presenting glorious scenic views, provide a most convincing indication of the advanced culture and high civilisation that then obtained in Ceylon. The ruins are a clear display of past glories and grandeur.

**Polotsk**, tn. and region in the Byelorussian S. S. R. The tn. is situated at the confluence of the Polota and Dvina, 62 m. by rail N.W. of Vitebsk. The prin. articles of commerce are flax, linseed, corn, and timber. Once a flourishing city, the continuous wars and the ravages of the plague have left but little of the original tn., and only ruins of the anct. castles now remain, and an eighteenth-century cathedral has replaced the older structure; while the more modern tn. suffered heavily in the fighting of 1944.

P. was an independent principality, with a prince ruling it until the twelfth century, falling under Lithuanian rule in 1320. After five sieges it was taken by Ivan the Terrible, 1563. It became Polish again in 1582, and after many vicissitudes became definitely Russian in 1772. P. was taken by the Ger. invaders in July 1911 and lost again three years later. See further under EASTERN FRONT, or RUSSO-GERMAN CAMPAIGNS, IN SECOND WORLD WAR. Pop. 21,000.

**Poltaratsk**, or **Poltotsk** (formerly **Askabad** or **Askhabad**), cap. of the Turkmen S.S.R. It is a commercial and industrial tn. and linked by rail with Tashkent. It contains textile, glass, and meat-packing factories. Since 1881 it has been much westernised, but it retains an essentially Asiatic character. The pop. consists of mixed nationalities of Russians, Persians, Jews, Armenians, and Kurds, and numbers about 127,000.

**Poltava**: 1. Region of the Ukrainian S.S.R., with an area of 19,265 sq. m. The R. Dnieper forms its S.W. boundary, and the dist. is watered by its tribs, the Sula, Psiol, Vorskla, and Trubezh. The surface is a level, sparsely wooded plain. The soil is fertile, and grain, potatoes and other vegetables, melons, tobacco, and sunflowers (for oil) are grown. Livestock is largely reared, and other industries are distilling, flour-milling, and tobacco manufacture. 2. Cap. of the above region, on the R. Vorskla, 70 m. S.W. of Kharkov. Cotton weaving is the chief industry; there are also woollen cloth mills. Peter I. defeated Charles XII. at P. in July 1709, and it was the centre of Khemelutsky's rising. It was captured by the Gers. in Sept. 1941. It became an important objective in the Russian-Ukraine offensive of 1943 after the recapture of Kharkov, but the Russians did not succeed in retaking P. until Sept. 23, after the three-day battle in the tn. Pop. (1939) 130,000.

**Poltergeist** (Ger. 'noisy ghost'), name given to an alleged ghost, agency, or spirit manifesting unpleasantly in a house. Identical phenomena attributed to Ps. have been reported from all parts of the world and throughout all ages. Classic alleged P. cases include the Drummer of Tedworth (1662), Epworth Rectory (the Wesley P.) (1716), Ballechin House (1892), and Borley Rectory (1929-39). The late Harry Price (q.v.) conducted extensive researches into the latter case and pub. two books on the alleged poltergeistic and other supernatural phenomena there, *Most Haunted House in England* (1940) and *The End of Borley Rectory* (1946), which should be consulted. P. disturbances include noises of every description, especially bell-ringing; movement, appearance and disappearance of objects; articles thrown about, strange smells, and fire-raising. Serious physical injury is rare, although on occasions great force is displayed. Hotels, rectories, farms, and cottages, old and new, are all apparently liable to infestation, which ceases after a period of time, sometimes a few days, sometimes years as suddenly

as it began and for no apparent reason. An adolescent is frequently a member of the household concerned and she (it is more often a girl than a boy) appears to be the nexus of the disturbances, apparent phenomena increasing when this person is asleep, a condition comparable to the spiritualistic trance state. (On occasions the disturbances are found to be the result of fraud, conscious or unconscious, on the part of the adolescent. Only rarely is P. phenomena accompanied by an apparition. See H. Dreisch, *Psychical Research*, 1933; W. H. Salter, *Ghosts and Apparitions*, 1938; E. Bennett, *Apparitions and Haunted Houses: a Survey of Evidence*, 1939; S. Sitwell, *Pollergeists*, 1940; and H. Price, *Pollergeists over England*, 1945.)

**Polyænus**, (Gk. author and rhetorician, of the second century, b. in Macedonia. He served in the army, and later entered political life. His chief work, *Strategemata*, in eight books, was trans. into Eng. by Shepheri, 1793.

**Polyandry**, homologue of polygamy, and therefore conveys the idea of one woman being the mother of children of more than one man. See FAMILY; MARRIAGE; POLYGAMY.

**Polyanthus**, spring flower (family Primulaceæ), of which many varieties, gold-laced, double, and self-coloured, have been raised. The P. is believed to have been originated as a cross between the primrose and the cowslip.

**Polybius** (c. 204-122 B.C.), historian of Rome, son of Lycortas, b. at Megalopolis in Arcadia. After the Rom. conquest of Macedonia, P. was conveyed to Rome with 1000 Achæans on the charge of refusing to assist the Romans against Perseus (167 B.C.). The prisoners were settled in the Etruscan Æne, but through the influence of Æmilius Paulus, P. was treated with exceptional leniency and was permitted to settle in Rome. Scipio offered liberal patronage to the exile, and granted him access to public records relative to his great work. P. accompanied Scipio on his campaign against Carthage. After the destruction of Carthage P. crossed to Greece, where his countrymen were in open rebellion against Rome, and secured lenient terms of peace for the defeated insurgents. The *History* of P. covers a period of Rom. hist. extending from the first Punic war to the destruction of Corinth. The hist. of P. is one of the most valuable works that has come down to us from antiquity; but unfortunately the greater part of it has perished. The first five books are extant, but of the rest only fragments and extracts remain. The best Eng. ed. is that of Shuckburgh (2 vols.). See J. P. Mahaffy, *Greek Life and Thought*, 1896; J. B. Bury, *Ancient Greek Historians*, 1909; and K. Lorenz, *Untersuchungen zum Geschichtswerk von Polybios*, 1931.

**Polyeap**, Saint (c. 69-156), bishop of Smyrna and one of the Apostolic Fathers. Knowledge of his life is gathered from Irenæus, Eusebius, and the anonymous *Martyrium Polycarpi*, partially incorporated into Eusebius's *Ecclesiastical*

*History* (iv. 15). He was visited by Irenæus as the latter passed through Asia Minor on his way to martyrdom at Rome, and from him, also, he later received an epistle. P. himself was the author of an epistle to the Philippians. Irenæus was indeed a pupil of P., while P. himself is said to have spoken with St. John the Apostle and to have been converted to Christianity by him in 80. Shortly before the end of his life, P. visited Rome to confer with Pope Anicetus as to the date for the celebration of Easter, and on his return to Smyrna suffered martyrdom at the stake, showing great courage and constancy. Eusebius places his martyrdom in the year 166, but modern research has made the date 156 more probable. See J. B. Lightfoot, *Apostolic Fathers*, II, 1877-85, and H. Rahner, *Die Märtyrer des zweiten Jahrhunderts*, 1941.

**Polycarpon**, genus of ann. herbs, with flat-whorled leaves and minute flowers in cymes. P. *tetraphyllum*, four-leaved all-seed, a small prostrate plant, is Brit.

**Polyeetus of Argos** (fl. 440 B.C.), Gk. sculptor, pupil of the Argive sculptor, Ageladas, and a contemporary of Phedias and Myron. See A. Mahler, *Polyeetus und seine Schule*, 1902.

**Polycotyledonous Plants**, those which have more than two cotyledons, an uncommon condition almost confined to the Gymnosperms.

**Polyerates of Samos** (fl. c. 500 B.C.), Gk. tyrant. Having estab. a tyranny at Samos, he collected a fleet, mastered the Ægean, and by ubiquitous piracy amassed a great fortune. P., according to the legend, had formed an alliance with Amasis, king of Egypt, but the latter, fearing the continual prosperity of the tyrant, dissolved the alliance. P., to avoid the enmity of the gods, threw his most valuable possession, a ring of rare beauty, into the sea. The ring, however, was discovered in the maw of a fish which had been presented to the tyrant, and shortly afterwards P. was captured and crucified.

**Polydeuces**, see CASTOR AND POLLUX.

**Polydorus**: 1. King of Thebes, son of Cadmus and Harmonia. 2. Youngest son of Priam, was slain by Achilles. This is Homer's account, but later tradition gives a different account of his death.

**Polyethylene**, see under PLASTICS.

**Polygalia**, see MILKWORT.

**Polygamy**. The institution of P., which at the present day survives only among the Hindus, Muslims, Mormons (in doctrine at least), and a few unimportant races low in the scale of civilisation, will in every case be found co-existent with a marked inferiority of status as assigned to women. Everywhere it does survive it is quite an exceptional institution, kept up only in the teeth of the opposition of some dominant sovereign power; e.g. in Utah, the Morrill Act of 1862 and the Edmunds-Tucker Act of 1887 forbade P. and co-habitation with more than one woman as wife, and the Mormon Church has now abandoned the practice. In the hist. of the Church of Latter-Day Saints of Utah, the institution of P. was first openly

promulgated in 1850, and up to 1890 all the prominent members of that Church had plurality of wives. Utah was only admitted as a constituent state of the U.S.A. in 1896 on condition that P. should be prohibited by the Utah constitution. Among Hindus P. is virtually confined to the noble classes, for economic reasons. By Islamic law a man can have four wives, and any marriage in excess of that number will be dissolved by a judge on the woman's application. Apparently P. has almost died out among the Eskimos and the Chinese, where formerly it was widely prevalent. See MARRIAGE.

**Polygenetism**, see under LANGUAGE, ORIGIN OF.

**Polyglot** (Gk. *πολύς*, many, and *γλῶττα*, tongue), book which contains sev. versions of the same text in different languages, arranged side by side in parallel columns so as to facilitate comparison. By far the greater number of such works have been eds. of the whole or part of the Bible, and the term is usually applied to P. Bibles. In the absence of any express notice to the contrary. The oldest is the *Complutensian Polyglot* (1514-17), ed. in six folio vols., under the supervision of Cardinal F. Ximenes in Alcalá (the Rom. Cornplutum), in Spain; vol. i. contains the N.T. in Gk. and Lat.; vols. ii.-v. contain the O.T. in Heb., Vulgate, Septuagint (with Lat. trans.), the Aramaic Targum Onkelos (with Lat. trans.), and a Gk.-Lat. dictionary. The *Antwerp Polyglot* (1569-72, 8 vols. folio) included, besides the languages given in the *Complutensian Polyglot*, a Syriac version and the Targums on parts other than the Pentateuch, as well as dictionaries and archaeological treatises. The *Antwerp Polyglot* is also known as *Plantiniana* after the printer Plantin. The cost of its pub. was defrayed by Philip II. (of Spain), hence this P. is also called *Biblia Regia*. The editor of this work was the famous theologian Arias Montanus. The *Paris Polyglot* (1629-45, 10 vols.) gave another Syriac version (*Peshitta*), together with a version in Arabic (with Lat. trans.) and the Samaritan Pentateuch (with Lat. trans.). Most important of all is the *London Polyglot* (8 huge vols., 1654-57), to which the *Prolegomena* forms a most valuable addition. The *London Polyglot* was edited by Brian Walton (hence it is also known as Walton P.) and E. Castellus (prof. of Arabic in Cambridge); it contains all the material of the *Paris Polyglot*, and also parts of the *Vetus Latina*, of the Ethiopic and Persian versions (with Lat. trans.), sev. important treatises, in part an *apparatus criticus* (thus, being the only one amongst all the Ps. of any critical value), and readings of about thirty MSS. (In 1669, a lexicon *heptaglotton* was pub. by Prof. Castellus.) Of much less importance are a few Ps. ed. in Germany, such as the *Hamburg Polyglot* (1587 ff.) and the *Nuremberg Polyglot* (1599 ff.), ed. by Elias Hutton, the *Wiesfeld Polyglot* (Heb., Gk., Lat., Ger.), ed. nearly a century ago by R. Stier and K. G. W. Thelle. **Polygnotus** (fl. 500-425 B.C.), Gk. painter, b. on the is. of Thasos, came to

Athens in the time of Cimon, and was honoured with the citizenship. At Athens he executed mural paintings of the 'Sack of Troy' in the Stoa Poecile and of the 'Rape of the Leucippidae' in the shrine of the Dioscuri. His most famous works, however, were the 'Sack of Troy' and 'Ulysses in the Underworld' at Delphi. P. excelled chiefly in the delineation of character in the human face, and this quality of his work receives unqualified praise from Aristotle and other anc. critics. See H. E. Walters, *Greek Art*, 1903, and *The Art of the Greeks* (31st ed.), 1934.

**Polygon**, plane figure bounded by straight lines. The simplest P. is the triangle, but the name is usually restricted to figures with more than four sides, pentagons, hexagons, heptagons, octagons, etc. The general mathematical theory of plane Ps. defines them as any finite series of points joined in pairs by straight lines, which allows for forms with re-entrant angles and intersecting lines.

**Polygonaceae**, family of herbaceous plants, bearing leaves with sheathing stipules and spikes or panicles of flowers. Among the genera are *Polygonum*, *Phagopyrum*, *Rumex*, *Rheum*.

**Polygonatum** (Solomon's Seal), genus of herbaceous perennials (family Liliaceae), with handsome leafy stems and axillary bell-shaped flowers, followed by red or blue-black berries. Three species are Brit., and these and others are grown in gardens.

**Polygonum**, genus of herbaceous plants, the most important of which is *P. polygryum* (buckwheat), which is cultivated in N. America and Europe.

**Polygon Wood**, see under YPES, BATTLES OF.

**Polyhedron** (Gk. *πολύς*, many; *ἔδρα*, a base), in solid geometry a solid figure bounded by plane faces. Polyhedra are said to be regular when the faces are similar and equal regular polygons; there are five such forms, often known as Platonic solids. They are: (1) The regular *tetrahedron*, of which each solid angle is formed by three equilateral triangles; it has four faces, four vertices, and six edges. (2) The regular *octahedron*, of which each solid angle is formed by four equilateral triangles; it has eight faces, six vertices, and twelve edges. (3) The regular *icosahedron*, of which each solid angle is formed by five equilateral triangles; it has twenty faces, twelve vertices, and thirty edges. (4) The cube, or regular *hexahedron*, of which each solid angle is formed by three squares; it has six faces, eight vertices, and twelve edges. (5) The regular *dodecahedron*, of which each solid angle is formed by three regular pentagons; it has twelve faces, twenty vertices, and thirty edges.

**Polyhymnia**, muse, who favoured eloquence, vocal music, and mimicry.

**Polymerism**, term used in chem. to denote the phenomenon shown by those compounds that have the same empirical formulae but different molecular weights, those with the higher molecular weights

being directly obtainable from those with the lower. Thus paraldehyde,  $C_6H_{12}O_3$ , is a polymer of acetaldehyde,  $C_2H_4O$ , since it has the same atoms in the same ratio, and is directly obtainable from acetaldehyde. Similarly, benzene,  $C_6H_6$ , is a polymer of acetylene,  $C_2H_2$ . On the other hand, acetic acid,  $C_2H_4O_2$ , is not a polymer of formaldehyde,  $CH_2O$ , since, although it has the same atoms in the same ratio, it cannot be directly obtained from formaldehyde. Some polymers with very large numbers of atoms in their molecules ('macromolecules') are the basis of many modern synthetic fibres. Another, polyethylene (q.v.), is an excellent insulator. See also PLASTICS.

**Polymethyl Methacrylate**, see under PLASTIC.

**Polynesia**, properly the E. Pacific Is., comprising a number of distinct archipelagos of small is. within 30° N. and 35° S. of the equator, and between 135° E. and 100° W. long., roughly within a triangle, bounded by the Hawad Is. in the N., New Zealand in the S.W., and Easter Is. in the S.E. The term P. is sometimes restricted to the groups most centrally situated in the Pacific (comprising the archipelagos of Hawaii or the Sandwich Is., Union or Tokelau Marquesas, Samoa, Tonga, Society, Cook, Tubuai, Kermadec, Tuamotu, and the isolated Easter Is.); the S.W. group of the archipelagos is classed as Melanesia (comprising the Fiji Is., the New Hebrides, the Solomon Is., New Britain, New Ireland); whereas the N.W. group forms Micronesia (Marshall, Mariana, Caroline, Gilbert, Ellice, and many lesser is.). The is. may be divided into two chief classes, volcanic (such as the Friendly, the Marquesas, the Hawaii) and coral is. (Caroline, Gilbert, Marshall, Society, and others); the volcanic rise to a great height (Mauna Loa, in Hawaii, 13,600 ft., is the highest peak in the Pacific), the coral do not exceed 500 ft. in height. Although lying in the torrid zone, most of the Polynesian is. have a comparatively moderate temp. owing to the influence of the ocean, and on many is. the climate is delightful and salubrious. Most of the is. are Brit. The only independent native kingdom now surviving in the Pacific is Tonga Is., a Brit. protectorate. The 'kingdoms' of Hawaii and Tahiti belong respectively to the U.S.A. and to France. Also the Samoa is., Howland, Baker, Palmyra, Jarvis, Johnston, and many other is. belong to the U.S.A., while Marquesas, Paumotu, Society, Tubuai, Wallis, Futuna, and others belong to France. Easter Is. belongs to Chile. The commercial products of P. consist chiefly of coco-nuts, bread-fruit, fruits, sugar, bananas, cotton, coffee, pearls, and trepang.

The indigenous pop. of P. in the widest sense of this term, may be divided, according to the aforementioned geographical distribution, into three races, distinct in physical type, speech, and customs, the Polynesians, the Melanesians (see under MELANESIA), and the Micronesians (see under MICRONESIA). The Polynesians are a well-proportioned,

tall (indeed one of the tallest in the world), brown-skinned race of seamen, who, according to some scholars, might be called the vikings of the Pacific. They depend for their food largely on a combination of gardening and fishing, and drink *kava*, made from pepper root. Their clothing is mostly of bark cloth, painted with various designs. They are clean, intelligent, friendly, and cheerful, and have a rich sense of art. They are fond of music, dancing, songs, and other amusements, as well as of swimming and athletic pursuits. The indigenous musical instruments are flutes (blown with the nose), wooden gongs, and bamboo cylinders. The Polynesians, unlike the Micronesians, have not learnt the art of weaving, but they are skilled in the arts of war and navigation. They build well both canoes and houses, which vary a great deal from is. to is., and their wood and stone carving is developed and elaborate.

The Polynesians speak various languages or dialects, belonging, however, to the same linguistic family. The main characteristics of the Polynesian languages are as follows. They have only eight or nine consonantal sounds and five vowels; every syllable and word end with a vowel. There is, however, a wide vocabulary. Only one of the is. of P. has a native script—the isolated Easter Is. (q.v.).

The Ladrões were discovered by Magellan in 1521, the Marquesas by Mandaña in 1595, Easter Is. by the Dutch admiral J. Roggeveen on Easter day, 1722, but it was not until 1767 that Wallis, and subsequently Cook, explored and described the chief is. What is known of the previous hist. of P. has been learnt from Polynesian chiefs, and it is very little. The 'well-educated' youngsters had to learn by heart their family tree (sometimes as far back as twenty generations or more), and the princ. exploits of their more important ancestors: these traditions tell us of the discovery of many is.; of the voyage of Ui-te-rangiora to the Antarctic seas (A.D. 650), and of the voyage 300 years later of Te Aru-tangamahi, who 'reached the land of snow and described icebergs'; also perhaps of the discovery of the W. coast of N. America, of long romantic voyages in search of wives, and so forth, but next to nothing of the origin and the hist. of the Polynesians. The following are the main modern theories on these problems, but none of them is quite satisfactory. According to one theory the Polynesian ancestors were of Indo-European origin, they left N.W. Europe during the Old Stone Age before pottery was invented. They crossed Asia and occupied Japan, from which they were driven by the Ainu, another Caucasoid race. They then moved S. over the chain of is. that led to the Pacific. These is. must then have been much larger and more plentiful. Amongst the many things which point to their probable Indo-European origin, the following are mentioned: (1) Their stature, physique, and colouring, and the fact that a blond strain persists, coupled with their tradition

of a blond ancestry who came from a land where the trees are leafless half the year and men walk on the water; (2) their mythology is supposed to show Indo-European affinities; and (3) their language is supposed to be akin to Indo-European forms of speech. As a matter of fact, there is very little in common between the Polynesian and the anc. Indo-European mythologies and languages, and it is rash to assume as certain that the paleolithic pop. of N.W. Europe was of Indo-European speech or race.

The second main theory asserts (see, for instance, S. P. Smith, *Hawaiki: the Original Home of the Maori*, 1904) that the parent stock of the Polynesians can be traced to India about 450 B.C., and that a migration to Java took place in 65 A.D. All these early dates are very problematical. It is more probable that the Polynesians have ethnical affinities with the Malaysians. From the linguistic point of view, these affinities may be considered as certain; the inhab. of P. and of the Malay Archipelago speak languages and dialects of a single general stock known as Malayo-Polynesian, one of the most widespread linguistic families in the world. Its hundreds of branches extend all the way from Madagascar through the E. Indies and the Philippines to Formosa in the N. and to New Zealand in the S. and across the Pacific to Hawaii and Easter Is.

The latter hist. of P. seems easier to trace. Apparently c. A.D. 600 Polynesians were living in Tonga-nui and Samoa. Hawaii seems to have been settled c. 650 and Marquesas probably one generation later. In 850 New Zealand was visited, and the definite occupation of this region by 'the Fleet' took place in 1350. Hawaii was visited in 1100 and 1225, but all voyages to that group seem to have ceased after 1325. When the Europeans arrived the Polynesians had still the stone-age culture, i.e. they had not discovered metals and depended on stone tools; their prin. weapon were clubs, and they also used slings and sling-stones. They had no wheels and no pottery. They worshipped many chief or high gods, including the creator god Tane, the war god Oro, and the fishing god Tangaroa, and many lesser gods, spirits of natural forces, of trees, etc. The priests were a powerful body. Sacrifices (including human ones) were made, and cannibalism was not unknown (e.g. in the Marquesas Is.). Nowadays they are nominally Christians. Since their first contact with Europeans their numbers have declined sharply, mainly through tribal warfare, epidemic diseases, tuberculosis, and leprosy; it is thought that their collective number has fallen from over 1,000,000 to about 150,000; but to-day, especially in New Zealand, they appear to be increasing. See C. Forrander, *Origin of the Polynesian Nations*, 1885; G. M. Brown, *Maori and Polynesian*, 1907; T. R. St. Johnston, *Islanders of the Pacific*, 1921; J. M. Brown, *People and Problems of the Pacific*, 1927; E. S. C. Handy, *Sources of Polynesian Culture*, 1931; R. W. Wil-

lamson, *Religion and Social Organisation in Polynesia*, 1937; Sir H. Jukes, *Britain and the South Seas*, 1945, and *From a South Seas Diary, 1938-42*, 1945; and R. Gibbings, *Over the Reefs*, 1948.

**Polype**, name given to various members of the group Coelenterata, typified by the common fresh-water hydra, which is tubular in shape, one end being attached to a solid aquatic object and the other having a small mouth surrounded by slender tentacles. Its colour is green, due to the symbiotic presence of green algae containing chlorophyll. A more familiar type is coral (q.v.).

**Polyphemus**, in Gk. mythology chief of the Cyclopes (q.v.), son of Poseidon and Thoosa. He dwelt in a cave in S.W. Sicily, and when Odysseus and his companions were wrecked there on their return from Troy, he imprisoned them and devoured many of them. Finally, Odysseus succeeded in making the giant drunk and blinding him, and in escaping from the cave with his comrades by clinging to the sheep and goats as they were let out to pasture. A later story relates the love of P. for Galatea, and his slaying of her beloved Acis.

**Polyphony**, combination of two or more melodies or melodic strands in such a way that they make musical sense. It is essentially the same as counter-point, but the latter term is used more specifically for the scientific way of writing P. and applying it to musical composition.

**Polypi**, see under NOSE.

**Polyplidity**, see under VARIATION, IN BIOLOGY.

**Polyypus**, tumour possessing a stem, or pedicle, by which it is attached to a tissue surface. Polypl are usually found on mucous membranes, as in the nose, bladder, uterus, rectum, etc. The most satisfactory treatment in most cases is to remove them by forceps or ligature. Radium can be applied to prevent a recurrence.

**Polystyrene**, see under PLASTICS.

**Polythalamia** (Gk. πολύς, many, θάλαμος, chamber), term applied to those species of marine rhizopods in the family Testacea which are many-chambered. The term is used in opposition to Monothalamia, containing the single-chambered species.

**Polytheism** (Gk. πολύς, many, and θεός, god), belief in many gods, as opposed to monotheism or atheism. Some authorities hold that it is a degradation of monotheism, others that it preceded monotheism, being necessary stage in the evolution of the religious spirit. In certain of the great nations of antiquity, such as Assyria, Babylon, Rome, and Greece, it is to be found in a highly developed form. The same state exists in modern India. Many passages in the O.T. show how difficult it was for the Israelites to free themselves from polytheistic practices.

**Polytonality**, system of composition of the twentieth century, the principle of which is that music may be written in sev. keys at once.

**Polytrichum**, genus of acrocarpous mosses. *P. commune*, a handsome moss

with almost woody stems, occurs on  
heaths and moors

**Polyvinyl Chloride, see under PLASTICS**  
**Polyzoa, or Bryozoa** (mossy animals), group of plant like animals, which, with the exception of a single genus, form colonies, which arise by the continual budding of the cells. The majority are marine, but many occur in fresh water. The colonies exhibit wide variation in form and habit, occurring as crusts on rocks, as masses, broad fronds branched growths, etc., and the texture and consistency may be gelatinous, horny, and flexible, or stony. Many are of great beauty. A typical form is *Plasma foliacea*, the broad leaved hornwink or sea mat, common in heaps of seaweed cast up on sandy Brit. coasts. Its brown horny fronds branching from a narrow flit stem are reticulated with little oblong boxes or cells (zoecia) through a lid in which a coronet of tentacles emerges to set up currents which convey food to the mouth. Reproduction is by means of eggs which hatch into ciliated embryos, each of which after a few hours free swimming settles down and by budding gives rise to a new colony. An example of a fresh water species is *Plumakilla repens*.

**Polzin, see POLYN / DRÖI**

**POMACEAE**, or **POMEAE**, one of the tribes of the family **Rosaceae**. Among its genera are *Pyrus* which includes the apple and pear, *Crataegus* (hawthorn) and *Coleaster*. See **SOULANGI**.

Pomaria, see TILMICH

**Pome**, in botany false fruit being formed from the receptacle of the flower which grows up to surround the true fruit or core itself developed from the ovary.

**Pomegranate** (*Punica punaum*) kind some deciduous tree (family Lythraceae). Though a native of Iran it is often grown in the open in Butim for the beauty of its scarlet flowers. The tree is sufficiently hardy for ornament but unless protected does not produce the reddish yellow fruit the seeds of which are eaten. Various parts of the tree have medicinal use.

**Pomerania** (*Gcr*) **Pommern**, *Polish*  
**Pomorze**), former ter of Germany and  
maritime prov of Prussia whose Baltic  
coastline stretched fr in Puszyn to W of  
the Gulf of Danzig to Ahrenshoop about  
30 m. W of Stralsund. Its area is 11,620  
sq. m. and its pop. in 1933 was 1,920,000.  
Its main divs were Vor pommern and  
Hinter pommern but thogly there were  
three dists: Stalsund-Stettin (*Szczecin*)  
and Koslin (*Koszalin*). After the Second  
World War the greater part of the ter  
was assigned to Poland, whose new W  
frontier in relation to P was found by  
the Oder. P is that (except for a low range  
of hills in the E, the prin rivs are the  
Oder, the Pene, the Ucker and the  
Ibna. Off the W coast are the is. of  
Rügen, Usedom, and Wollin. There are  
numerous lakes. Agriculture is the chief  
occupation. Shipbuilding is carried on at  
Szczecin. Governor of P was one of the  
titles of the heir to the Prussian crown.  
In the Second World War the Russians

under Marshal Zhukov crossed into P on Jan 28 31, 1945. Szczecin fell on Feb 28. The Russians reached the Baltic at Kolberg (Kolobrzeg) on March 4 but that in did not fall until March 18. The advance in P was delayed by the tenacious German resistance at Konigsberg (E Prussia), which was not taken until April 9. Thereafter the Russians advanced to the Oder. Szczecin was occupied on April 26. The attacks on the flying bomb and rocket experimental station at Peenemuende (and others) delayed the launching of the robot offensive by six months. See further under EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

**Pomeranian Dog**, bred common in many parts of Europe especially Germany, where it is known by the name of "Spitz". The Gers claim it as one of their national breeds but it is certain that, wherever it originated it is a N or

### ROMANIAN DOG

**Artic breed.** The P. D. became popular in the early 19th century during the latter half of the nineteenth century following its being a favorite with Queen Victoria. It is a well built dog with fox like face and thick small erect ears and intelligent expression. It may be either pure white, black or brown. The early type weighed from 20 to 25 lb. but through the exertions of breeders many now weigh under 8 lb. Toy Poms have been growing in popularity during the last thirty years.

**Pometinæ Paludes** under PONTINE  
MARSHES

**Pommern, see POMERANIA**

Pomona, Rom. zodd. of the fruit trees. Pomorum Patrona beloved of rustic deities like Vertumnus and Silvanus. See Ovid, *Met. morphoses* xiv 62), 11. *patius* iv 2.

**Pomona**, correctly **Mainland** largest of the Orkney Is. off the N of Scotland, divided by Kirkwall Bay and Scapa Flow into two main parts (E and W). The

name Pomona is the result of G. Buchanan's misapprehension of a Lat. text, and is never applied to the is. by Oreadians. The surface is mountainous, but has fertile tracts, and lochs abounding in trout. Stromness Harbour (W.) is the best in N. Scotland, situated N. of Hoy Sound. Between the tns. of Kirkwall and Stromness are the Standing Stones of Stenness (Stennis) and Maes Howe with runic inscriptions on the wall (see *Scott's Pirate*). The Pictish vil. of Skara Brae is on the bay of Skail, 8 m. from Stromness. The chief occupations are agriculture and fishing. The climate is mild. Scapa Flow, the headquarters of the Brit. fleet during the First World War, lies between Hoy and S. Ronaldshay, and here the surrendered part of the Ger. fleet was scuttled by von Reuter's orders, June 21, 1919. Area 150 sq. m. Pop. 22,000.

**Pomona**, banking city and health resort of Los Angeles co., California, U.S.A., in the San Bernardino valley. 2 m. from Spadra, with extensive fruit, vegetable, and wine industries. P. College (opened in 1888) is nearby. Pop. 21,000.

**Pomorze**, see POMERANIA.

**Pompadour**, Jeanne Antoinette Poisson, Marquise de (1721-64), mistress of Louis XV., b. in Paris. The king estab. her at Versailles in 1745 and bought her the estate of P., from which she took her title. Here she at once became the leader of a brilliant artistic and literary circle, amongst whom figured Voltaire, Quenon, Boucher, Vanloo, Greuze, and many other noted men. She became the patroness of learning and arts, and soon turned her attention to state affairs as well, filling the most important offices with her favourites, and making and unmaking, by turns ministers, diplomats, and generals. No one obtained office except through her, and, like Mme de Maintenon, she prepared all business to come before the king with the ministers. An Eng. trans. of her letters from 1753 to 1762 was pub. in 1771. See J. B. Capetigue, *Mme la Marquise de Pompadour*, 1853; H. Bonhomme, *Mme de Pompadour, general d'armée*, 1880; P. de Nolhac, *La Marquise de Pompadour*, 1903; life by A. Leroy, 1938; and study by D. B. Wyndham Lewis in *Four Favourites*, 1918.

**Pompeia**, third wife of Julius Caesar, whom she married in 67 B.C., and granddaughter of Sulla. Clodius had an intrigue with her, and when in 61 his presence was discovered in Caesar's house during the celebration of the mysteries of the Bona Dea, Caesar divorced P. (61). See Suetonius, *Caesar*, vi.

**Pompeii**, ant. tn. of Campania in Italy, 2 m. from the shore of the bay of Naples and situated at the foot of Mt. Vesuvius. There is very little of its hist. recorded before 79 B.C. It was not originally a Gk. colony. Strabo asserts it was first occupied by Oscans, afterwards by Etruscans, and lastly by Samnites; it was one of the last to be reduced by the Romans. A military colony was settled there and the pop. rapidly became romanised. It grew into a fashionable place for Rom.

nobles, who possessed villas in the neighbourhood. The city took a prominent part in the Social war (91-89 B.C.), and withstood a siege by Sulla. The industrial part of the pop. was chiefly employed in wine making and manufacturing millstones out of lava. In A.D. 63 an earthquake destroyed a large part of the tn., and the inhab. were actively repairing and rebuilding their city when the whole place was overwhelmed by the great eruption of Vesuvius in A.D. 79. The city was entirely buried by cinders, stones, and ashes, and over 2000 persons perished. The younger Pliny gives a description of the eruption, but not of the destruction of the tn., although his uncle perished there. During the Middle Ages the very site of the city was forgotten; vineyards and mulberries grew over the ground and obliterated all that was left. In 1594, during the construction of an underground aqueduct, two inscriptions were found, and a little inspection proved the fact that the ruins of a considerable place lay entombed in the soil. In 1763 systematic excavations were commenced. Since 1861 the It. Gov. has carried forward the work on a system devised by G. Fiorelli, and the greater part of the whole tn. has now been unearthed. The chief buildings of interest are the great amphitheatre to seat 20,000 persons, one of the finest that has been discovered; the forum, with the public buildings on all sides of it; the paved way to the forum which was for foot passengers only and adorned with many statues; the temples of Jupiter, of Apollo, of Isis and Zeus Mithelus, of Vespasian and Fortuna Augusta, and the Doric temple which stands in another forum with a large and a small theatre adjoining, and three separate estab. for public bathing, with the complete apparatus for hot and cold water, etc. Joining the theatres were the barracks of the gladiators, where objects of personal use were discovered just as they were left on the day of destruction. The streets with their shops and houses have now been unearthed, and among the most interesting of these are the house of the Vettii, the house of the Faun, and the mansion of Sallust, etc. In the street of Abundance, one of the winesellers' shops contained all the vessels and pots and pans for daily use in good preservation. The private buildings are of great interest because of the light they throw on the domestic side of Gk. and Rom. life of that period. Of the numerous objects of art found, many are very beautiful, though inferior to those found at Herculaneum, and some of the green bronze statuettes are of exceptional workmanship, among them the dancing Faun and that called the youthful Bacchus or Narcissus. Many of the mural paintings and fresco works are of high artistic excellence. The mosaics especially call for attention. The most complete and beautiful was found in the house of the Faun, representing Alexander at the battle of Issus, now in the museum at Naples, where practically all of the movable artistic objects were placed. Great care has been taken to pre-

serve the remains of the upper storeys, with their balconies and pillared openings, and these assist largely in giving a true picture of the architecture and house-planning of the time. The volcanic matter that buried the city and suffocated the people as they tried to escape preserved the very forms of the men and women, whose bodies were practically moulded into the mixture of ashes and cluders that later formed a plaster to preserve the very attitudes and costumes in which the people died. The house of the Vettii has been restored as far as possible to show the actual conditions in which the wealthier classes of P. lived at that time. Excavations in 1921 on the N.E. side disclosed, among the more interesting objects, sev. fine paintings, including a large one of the twelve custodians or penates of P.; a house with the remains of a balcony on the first floor; a bar or thermopolium; and two beautiful porticoes, almost intact, and a pergola above four shops. These pictures were discovered at the *compita*, i.e. street-crossings, which were held sacred and generally marked with sacred pictures and an altar. Below one such *compitum* was found an altar of masonry, built into the wall, on which were still preserved the ashes of the last sacrifice that was held before the fatal Aug. 24, A.D. 79. The bar is interesting for its many terra-cotta amphorae found still fixed in the ground and for its furnace situated at the end of the counter. Above the furnace was found a cauldron in which remained some liquid placed there on the day of the catastrophe. This bar was no doubt much resorted to, because on its walls were found many election manifestoes, one being on behalf of a man named Lollius, and between each letter of his name were smaller letters announcing that he was a *duumvir* who looked after the streets and the sacred buildings. The pergola is situated above four shops and is almost intact. In the entrance to one of the shops were found the remains of a little staircase leading up to the pergola.

Another well-preserved building has a fine crypto-portico of three long corridors facing on to a garden. The walls of these corridors still retained their decorations, which take the form of imitation encaustic marble slabs dating from the second century B.C. During excavations in 1941 some 465 inscriptions, figures, and sketches on the columns of the palaestra (gymnasium) were discovered. At the same place the excavators found the skeletons of eighty-five people killed or buried by volcanic debris while fleeing for safety. Near these remains was also found a case containing surgical instruments for oculistic operations, sev. of them in a very good state of preservation. P. was bombed in the Second World War and damage was done, especially in the area of *Nuovo Scavi*. See A. Mau, *Pompeii in Leben und Kunst*, 1900 (Eng. trans., 1902); A. Plea and W. Mackenzie, *Pompeii*, 1910; H. Engelmann, *New Guide to Pompeii*, 1925; R. C. Carrington, *Pompeii*, 1936; A. von Gerkan, *Der*

*Stadtplan von Pompeii*, 1940; and F. Kriechen, *Die Stadtmauern von Pompeii*, 1911.

**Pompeius, or Pompey, Cn. Pompeius Magnus** (106-48 B.C.) (Pompey the Great), son of Cn. Pompeius Strabo. At the age of seventeen he fought under his father against the It. allies. When the Marian party obtained the upper hand at Rome, P. raised an army and opposed the Marian generals with great success. In the year 81 B.C. P. engaged in a successful campaign in Africa against Cn. Domitius Ahenobarbus and the Numidian king, Juba. It was on his return from this campaign that Sulla honoured P. with the surname *Magnus*. In 76 B.C. P., as proconsul, crossed to Spain in order to quell the rebellion of Sertorius, but his campaign was unsuccessful until Sertorius was treacherously murdered by one of his own officers in 72 B.C. In a few months after the death of the rebel leader, Spain was completely subdued. P. now repudiated his aristocratic policy and identified himself with the popular faction. During this phase of his political life he came into close touch with Julius Caesar, and a coalition was formed between these two leaders and Crassus. In 67 B.C. P. was appointed to the command against the pirates with extraordinary power, and in six weeks he swept the Mediterranean sea of the piratical menace. In 66 B.C. P. was given command against Mithridates, and victory was easily secured, as the power of the Pontine king had already been broken by the arms of Lucullus. P. then pursued his victories E. In 64 B.C. he subdued Antiochus, king of Syria, and estab. a Rom. prov. in the kingdom. In 63 B.C. he marched into Phoenicia and Palestine and captured Jerusalem after a siege of three months. In 62 P. entered Rome on his third triumph. The Senate's action in refusing to ratify P.'s measures in Asia brought him into closer touch with the popular party and cemented the agreement between P., Caesar, and Crassus. This coalition became known as the first triumvirate, and the aristocratic party for a time was completely overruled. The marriage of Caesar's daughter Julia with P. drew closer the bonds of union. Caesar's continued victories in Gaul, however, were fatal to P.'s supremacy in Rome, and the union of the two great leaders became merely nominal. The death of Julia (51 B.C.) and the fall of Crassus in the Parthian expedition (53 B.C.) further loosened the bonds. P. now aimed at the dictatorship, and by encouraging civil strife secured his election as sole consul in 52 B.C. In the civil war which followed between Caesar and P., the latter affiliated himself to the aristocratic party. The decisive battle was fought at Pharsalus in 48 B.C., and Caesar became master of the Rom. world. P. fled to Egypt, but while landing he was stabbed by Septimius, his former centurion (48 B.C.). See Sir C. Oman, *Seven Roman Statesmen*, 1902, and E. Meyer, *Cæsars Monarchie und das Principat des Pompeius*, 1922.

**Pompey's Pillar**, fine monolith of red granite, erected in the Serapeum at Alexandria in Egypt at the beginning of the fourth century A.D., and dedicated to the Emperor Diocletian. It took its name through its site being confused with that of Pompey's tomb.

**Pom-Pom**, name given during the S. African war to a large calibre Maxim quick-firing gun used by the Boers. Two-pound P.'s. were first mounted in destroyers in 1913. After the First World War multiple-barrelled P.-Ps. were developed as part of the close range anti-aircraft armament of Brit. ships, each barrel firing 200 rounds per min.

**Pomponius Atticus**, see ATTICUS, T. POMPONIUS.

**Pomuk, John of**, see JOHN, ST.

**Ponani**, seaport trading in salt, at the mouth of the Ponani, 38 m. S. by E. of Calicut, in the Malabar dist. of Madras, India. Pop. 15,000.

**Ponapé**, see CAROLINE ISLANDS.

**Ponce** (so called after P. de León), seaport, 50 m. S.W. of San Juan, on the S. of the is. of Porto Rico. It is the centre of a dist. growing sugar-cane besides cacao and tobacco, and itself manufs. sugar and molasses, etc. P. has a fine harbour and a cathedral. Pop. 65,200.

**Ponce de Leon, Juan** (1460-1521), Sp. explorer, b. at Servas, León. He accompanied Columbus on his second voyage, in 1493, and was appointed lieutenant to the governor of Hispaniola. In 1508, having received intelligence from the natives that the neighbouring is. of Boriquen, or Porto Rico, abounded in gold, he succeeded in conquering it after many hard-fought battles, but was superseded in the command of the conquered country. The Sp. consul of the Indies in 1509 appointed P. de L. governor, and later 'captain,' of the is. of San Juan (i.e. Porto Rico), but Diego Columbus (son of Christopher) protested against this appointment as an infringement of his rights. He next appears to have conceived the idea that there was yet a third world to be discovered: but he decided to sail first to a certain is. of the Bahama group, called Bimini, where, according to a tradition, there was a fountain possessing the power of restoring youth. He did not, however, discover either the is. or the fountain, but came in sight of what he supposed to be an is., which he called Pascua Florida. P. took possession of the country in the name of Ferdinand and Isabella. In a subsequent expedition he came upon the W. coast of Florida, where he made a descent, but was fatally wounded by the Indians. P. de L. was the first early governor of the new Sp. colonies to be promised by the crown the title of *adelantado*, an old one belonging to the mediæval polity of Castile. See O. H. Haring, *The Spanish Empire in America*, 1947.

**Ponce de León, Luis** (1520-91), Sp. poet and theologian, b. of noble parentage at Belmonte del Tajo. In 1581 he was elected to the chair of theology at Salamanca. He was imprisoned from 1572 to 1577 by the Inquisition on account of

his prohibited trans. of the Song of Solomon. In his fine prose poems *De los Nombres de Cristo* (1583-85) and *La Perfecta Casada* (1583), as well as in his charming lyrics, such as *La Noche Serena* and *De la rida del cielo*, will be found a rare blend of Gk. purity and Heb. passion. See life by A. F. C. Bell, 1923, and A. G. Palencia, *Frays Luis de León en la poesía castellana. Historias y leyendas*, 1942.

**Poncho**, sort of cloak with a hole for the head, worn by the Indians of S. America, and also by many of the Sp. inhab. It resembles a narrow blanket with a slit in the middle through which the head passes, so that it hangs down loosely before and behind, leaving the arms free. Catamarca, cap. of the small Argentine Andine prov. of the same name bordering on Chile, is famous for the handweaving of P's.

**Pond, John** (1767-1836), Eng. astronomer-royal, attained that office in 1811. He revolutionised almost all the methods of observation by availing himself of mural circles and reflected vision.

**Pondichery**, or **Pondicherry**, cap. of Fr. India, with an area of 115 sq. m. and a pop. of 222,600. It lies on the Coromandel coast, 123 m. by rail S. of Madras. A canal separates the white from the black tn. There are native dye-works, three cotton-mills, and many weaving estabs. Oil-seeds, rice, and cotton materials are the staple exports. The tn., which is well laid out, and which draws its water supply from artesian wells, was founded in 1674. After Eyre Coote captured P. from Lally in 1761, it was many times temporarily in the hands of the Eng. At P. is the residence of the governor of the colonies. One senator and one deputy represent the colonies in the Parisian Parliament. During the Second World War P. declared for Gen. de Gaulle and was used as a base for allied operations against Japan. Pop. 54,000.

**Pondoland**, so called from a Kafir people, the Pondo, lies N.E. of Tembuland, between the Indian Ocean and the Kwanthlamba Mts. in S. Africa. Since 1894 has been annexed to Cape Colony. The vegetation is luxuriant. Pottery, basket-work, and wood-work are the best industries. Money has now been absorbed into Pondo culture and is commonly used in transactions between Pondos. In 1930 P. instituted its own agric. training school at Flagstaff. The school is now under the United Transkeian Terc. Council. Area 3918 sq. m. Pop. 210,000. See M. Hunter, *Reaction to Conquest*, 1936.

**Pondweed** (*Potamogeton*), genus of floating or submerged plants (family Najasaceae) with leathery leaves and spikes of small green flowers. More than half the known species occur in Britain; among the most common are *P. natans*, *P. polygonifolius*, *P. lucens* (the largest Brit. species), with leaves from four to ten in. long, *P. crispus*, and *P. densus*.

**Poneyezh**, tn. in the Lithuanian S.S.R., 86 m. N. of Kovno (Kaunas). It has a large trade in flax and wheat. Pop. 15,900.

**Ponnani**, seaport of Madras, India, on the Malabar coast, at the head of the riv. of the same name. It is connected by road to Tirur. Pop. 19,100.

**Ponsonby of Shulbrede, Arthur Augustus William Harry Ponsonby**, first Baron (1871-1946), Eng. author and politician, educated at Eton and Balliol College, Oxford. Entering the diplomatic service in 1894, he was abroad for three years and at the Foreign Office from 1899 to 1902. In 1908 he was elected Liberal M.P. for Stirling. His political life was governed by his efforts for peace, and his advocacy of a negotiated peace during the First World War lost him his seat in Parliament in 1918. He became Labour M.P. for Brightside (Sheffield) in 1922, and held office during the Labour Govs. of 1924 and 1929, being raised to the peerage in 1930. Following differences over foreign policy, he resigned from the Labour party in 1935 and devoted himself to the activities of the Peace Pledge Union. As a literary historian he made a close study of diaries written since the sixteenth century, and the results of his researches were pub. in *English Diaries* (1923), *More English Diaries* (1927), and *Scottish and Irish Diaries* (1927). His political writings include *The Decline of Aristocracy* (1912), *Democracy and Diplomacy* (1915), *Wars and Treaties, 1815-1914* (1917), *Now is the Time* (1925); he also wrote a life of his father (1912). His personal beliefs were expressed in *Life Here and Now* (1936).

**Ponsonby, Sarah**, see BUTLER, LADY ELEANOR.

**Ponsonby, Vere Brabazon**, see BESSBOROUGH, EARL OF.

**Pons Winnecke Comet**, see under COMET.

**Ponta Delgada**, cap. of St. Michael's Is. in the Portuguese Azores. It is a cathedral city, health resort, and port. Cotton fabrics, straw hats, spirits, and pottery are manufactured. Pop. 21,400.

**Pontel**, see PONZA.

**Ponta Grossa**, tn. of Brazil, in Panama state, 200 m. from São Paulo. It is a communications centre for its dist., and produces beef, cattle, tobacco, rice, and bananas. A great deal of timber and yerba maté from P. G. is exported from Paranguá. Pop. 41,100.

**Pont-a-Mousson**, tn. in the dept. of Meurthe-et-Moselle, France, 17 m. N.N.W. of Nancy. There are furnaces, ironworks, and a communal college. It has many historic buildings. It had strategic importance in the Franco-Prussian war, since it guarded a Moselle bridge.

**Pontarlier**, frontier tn. and railway junction in the dept. of Doubs, France, 35 m. S.E. of Besançon. It has paper manufs. and trade in cheese and cattle. Clocks are also made. Pop. 12,700.

**Pont du Gard**, vil. in the dept. of Gard, France, 16 m. W. of Arignon. Here the Gard is crossed by a fine Rom. aqueduct with three tiers of arches, one above the other. The famous cave of La Vache-pétrière, discovered in 1871, is near by.

**Ponte, Giacomo da**, see BASSANO.

**Pontefract**, or **Pomfret**, tn. and bor. constituency 13 m. S. of Leeds, in the W. Riding of Yorkshire, England, near the

junction of the Rs. Aire and Calder. Tanning, brewing, corn-milling, iron-founding, are the chief industries and there is coal-mining in the vicinity. Liquorice is still grown in large quantities for the famous 'Pontefract' or 'Pomfret' cakes. There are ruins of the Norman castle (founded in 1069), where Richard II. and Earl Rivers were put to death. The first bor. charter was granted at the end of the twelfth century by Robert de Lacy, a descendant of the man who received the honour of P. from William the Conqueror. Pop. 23,800.

**Pontevedra**: 1. Densely populated prov. of N.W. Spain, having an area of 1695 sq. m. It is well watered by the Minho, Ulla, and other rivs., all of which flow to the Atlantic. The inhab. depend on the fisheries and on agric. produce, which grows well in their fertile though mountainous country. Vigo is the chief port. Pop. 691,700. 2. (So called from the Rom. *Pons Ictus*.) Cap. of the above prov., 30 m. S. of Santiago. It has a cathedral, and trades in hats, cloth, grain, and sardines. There is a naval wireless telegraphic station. Pop. 29,500.

**Pontiac** (c. 1712-69), chief of the Ottawa Indians. He engineered a vast conspiracy in 1763 against the Eng. With the help of the Wyandot, Potawatomi, Ojibwa, and other tribes, he captured many forts, arranged successful ambuscades, and slew and captured many Eng. He besieged Detroit and Fort Pitt in vain, however, and in 1766 yielded to his enemies. Three years later he was assassinated by one of his own race while living in the Mississippi valley. P. possessed a faculty for organisation rare among his race. He and his friends had been allies of the Fr. in the long struggle between them and the Brit. for possession of Canada and the W. After the Fr. were beaten P. retained all his hostility to the Brit. His plan was nothing less than to drive them all E. of the Alleghenies. See E. Parkman, *The Conspiracy of Pontiac*, 1895, and H. H. Parkman, *Pontiac and the Indian Uprising*.

**Pontiac**: 1. Manufacturing cit., which also trades in agric. produce, 26 m. N.W. of Detroit, in Oakland co., Michigan, U.S.A. There are manufs. of automobile parts, bricks, radio sets, varnish, and paint. It is a holiday resort and has gravel pits. Pop. 66,600. 2. Coal-mining and railway centre in the heart of Livingston co., Illinois, U.S.A. Pop. 8000.

**Pontian, Saint** (d. c. 236), succeeded St. Urban I. as pope about 220. Five years later he was exiled to Sardinia by the emperor Maximus, and is said to have d. from ill treatment.

**Pontianak**, port on the Kapuas, on the S.W. coast of Dutch Borneo. It exports diamonds. Pop. 18,000.

**Pontifex** (Lat. *pōns*, bridge, *faciō*, to make; Eng. *Pontiff*), member of the chief sacred college of Rome, at whose head was the *pontifex maximus* (high priest). Up to the days of Sulla, when the number was raised to fifteen, the college had nine members (four patrician and

five plebeian), elected at first by co-optation, but after 103 B.C. by the *comitia tributa*, under the presidency of a pontiff. The college supervised religion, and was the last court of appeal when any religious dispute arose. It further possessed considerable political power through its control of the calendar and its power to intercalate days and regulate festivals. The *pontifex maximus* chose the flamines, vestals, and the *rex sacrorum*, and was in fact the pope of anct. Rome. From Augustus onward the Rom. emperor assumed his functions and title. The title was assumed by the popes when Christianity became estab.

**Pontifical**, liturgical book for the use of the bishops in the Rom. Catholic Church, containing prayers and rubrics for episcopal ceremonies other than the Mass. Books of this nature are found as early as the eighth century. The *Pontificale Romanum* appeared in 1485. See P. de Puniet, *Pontifical Roman*, 1931.

**Pontine Marshes** (Lat. *Pometinæ Paludes*) stretch from Velletri to Terracina on the coast in the Rom. Campagna, Italy. As early as 312 B.C. Appius Claudius tried to drain this dist., and further efforts were made by Augustus, Trajan, and many of the popes. The Fascist Gov., however, made more successful efforts at its drainage, the reclaimed area constituting the new prov. of Littoria. It is crossed by the great Appian Way, and was formerly dangerous to travellers on account of poisonous exhalations.

**Pontius Gavius**, general of the Samnites, who subjected the Rom. consuls Postumius and Veturius and their army to the memorable disgrace in the Caudine Forks (321 B.C.).

**Pontius**, Paul (b. 1596 or 1603), Flem. engraver, famous for his reproductions of the pictures of Rubens and the portraits of Van Dyck.

**Pontius Pilate**, Rom. procurator of Judaea. He belonged to the equestrian order and was appointed to his office by Tiberius in A.D. 26. During his rule Christ was crucified. Recalled in A.D. 36, after endless quarrels with the Jews, he is reported by Eusebius to have taken his own life at Vienna in Gaul, the scene of his banishment. The Coptic tradition says he was martyred as a Christian and he is claimed as a saint by the Ethiopian Church. Authorities for P. P.'s life are the N.T., Eusebius, Josephus, and Philo. See M. Radin, *The Trial of Jesus of Nazareth*, 1931; A. V. Juckin, *Jesus and Pilate*, 1941; K. L. Schmitt, *Der Todesprozess des Messias Jesus*, 1945; and C. M. Franzén, *The Memoirs of Pontius Pilate* (novel), 1945.

**Pontius Pilate's Bodyguard**, see ROYAL SCORNS.

**Pontivy** (formerly Napoléonville), tn. 29 m. N.E. of Borient, in the dept. of Morbihan, France. There are linen and paper manufs. The tn. was damaged in the Second World War. Pop. 10,900.

**Pontoise**, tn. of Seine-et-Oise, France, on the junction of the Viosne and the Oise, 22 m. N. of Versailles. Its manufs.

include chemicals, and there are flour-mills and shipyards. Pop. 11,000.

**Pontoon** signifies a floating dock or, more strictly, a floating bridge. The floating bridge has been used for military purposes from very anct. times, early examples being that thrown across the Bosporus by Darius, and the one formed by Xerxes over the Hellespont, of which Herodotus has given a full description. In more recent times they were much used by Marlborough in his campaigns. Military Ps. in the twentieth century were generally constructed to float on cylindrical floats of tin or copper. The Gers. used rubber Ps. during the Fr. 1940 campaigns in the Second World War. Later, Ps. were often replaced by the Bailey bridge. For a description of floating docks, see DOCK, Floating Docks.

**Pontoon** (card game), see VINGT-ET-UN.

**Pontoppidan, Erik** (1698-1764), Dan. historian and topographer. He wrote *Annales ecclesiarum danicæ* (1741-47), a *Danske Atlas*, containing an elaborate description of Denmark, and a hist. of the anct. Danes abroad (1740).

**Pontoppidan, Henrik** (1857-1943), Dan. novelist and poet, b. at Fredericia; he studied mathematics and physics at Copenhagen Univ. In his three novels, *Muld* (1891); *Det forsvundne Land* (The Promised Land, 1892); and *Dømnens Dag* (1895), which together give the life-hist. of a minister who weds a peasant wife, he draws with remarkable force an intimate and sympathetic picture of country folk, though his work is coloured by extreme pessimism and bitterness. Both Georg Brandes and Goldschmidt had an important influence in his work. His early realistic tales of Dan. peasant life have probably never been equalled. His poetry is pessimistic and sceptical but it harmonised with the spirit of Denmark at the time he wrote it. In 1917 he and Gjerløff gained the Nobel prize for literature. See lives by V. Andersen, 1917, and K. Thomsen, 1930.

**Pontormo, Jacopo da** (1494-1557), It. painter, b. at Pontormo. He belonged to the Florentine school, and at different times fell under the influence of Andrea del Sarto, Albrecht Dürer, and Michelangelo. His two Medici portraits are good.

**Pontremoli**, tn. and the seat of a bishop, on the Magra, 49 m. S.W. of Parma in Tuscany, Italy. Pop. 16,200.

**Pontresina**, vil. much frequented by tourists, 3 m. E. of St. Moritz, in the canton of Grisons, the Upper Engadine, Switzerland. Pop. about 800.

**Pontus**, most N.E. dist. of Asia Minor, along the coast of the Euxine. The dist. first acquired a political importance through the foundation of a new kingdom, about the beginning of the fourth century B.C., by Ariobarzanes I. This kingdom reached its greatest height under Mithridates VI., who for many years carried on war with the Romans. In A.D. 62 the country was constituted by Nero a Rom. prov.

**Pontus Euxinus**, see BLACK SEA.

**Pontypool**, urban dist. and mkt. tn. with manufs. of iron ware, tin-plate,

nylon yarn, soft toys, and glass. 8 m N of Newport in Monmouthshire, England. The first tin plate to be made in Britain was produced here in 1670. It is on the border of the S Wales coalfield. Pop. 42,300.

**Pontypridd**, urb. dist. and mkt. tn. of Glamorganshire, Wales, situated at the junction of the R. Taff and Rhondda. It is an important centre for the mkt. of the tv. Rhondda valleys, the Taff Valley, and a considerable surrounding area. The tn. is industrial in character but possesses pleasing residential areas and the spacious and well-known Ynysangharad Park. There are chain and cable works and iron and brass foundries. Lying 2 m from the centre is the Ffronist Trading Estate comprising seventy factories laid out on modern lines. The 'Old Bridge', from which the tn. takes its name, was erected in 1755 and is still one of the largest single span bridges in the Brit. Isles. The council owns transport (including trolley vehicles), refuse destruction, open air swimming bath, parks, libraries and public offices and controls a crematorium, which was one of the first to be provided in Wales. Pop. 39,400.

**Pony**, see HORSE.

**Ponza** (anc. *Pontia*), chief of a small group of is. in the Mediterranean, 70 m W of Naples, Italy. Pop. 41,000.

**Pood**, or **Pud** (from Low Ger. *pund* pound), Russian weight equivalent to 40 Russian lb. and 36 lb. avoirdupois.

T. Fall

POODLE

**Poodle**, breed of dogs which first appeared in the seventeenth century. P's are usually jet black like the Pomeranian or pure white like the Ger. but modern breeders have introduced other shades. Their coat is a mass either of short curls or long ropy ringlets. The eyes are dark, bright, small and full of intelligence; the muzzle is square, long and not snappy; the skull is broad and high with a well-developed brow. The ears are low set long and close to the cheek, and the body is

lifted well above the ground. The weight varies from 20 to 60 lb. The P. is remarkably sagacious. It is frequently clipped or trimmed and its flesh is often left bare even in winter except for a few fringes and tufts on the legs, tail and shoulders.

**Pool**, see under BILLIARDS.

**Pool**, or **Pole**, **Matthew** (1624-79), Eng. biblical commentator, attended Emmanuel College, Cambridge and in 1651 accepted the living of St. Michael le Quenue, London. In 1662 he was ejected from this cure through his inability to subscribe to the Act of Uniformity. His *Synopsis criticorum biblicorum* (5 vols., 1669-76) is a learned digest of all the exegetical works he had read.

**Pools**, seat and port constituency with 6,000 electors in W. of Bournemouth in Dorsetshire, England. There is trade in pottery, clay tiles, bricks, sanitary pottery and chemical rope and sail cloth and there is engineering, boat building and repairing. P. is a holiday resort and P. Hotel on a stretch of water 7 m. long containing Brownsea or Blanksea Is. is a favourite yachting centre. Pop. 80,600.

**Pools Dinding**, see under RINDINGS.

**Pools**, **Football**, betting on football results by postal orders with pools promoters. In 1931 the estimated turnover from this form of betting was £20,000,000. In 1935 the taxation of pools produced £12,000,000, which as the rate of duty was 20 per cent revealed a turnover of about £12,000,000. The big football pool promoters in 1949 employed 23,531 persons comprising 24,500 men and 21,046 women.

**Poonah**, or **Puna**, dist. and city in Bombay, India. The dist. is diversified with highlands belonging to the W. Ghats in the W. whilst level stretches cover the E. Oil seeds, pulse, wheat, rice, fruit and millet are cultivated and blankets, silk and cotton are manufactured. The area is 341 sq. m. and the pop. 1,300,000. The city lies at the confluence of the Mula and Mutha 68 m W. S. W. of Ahmednagar and 119 m S. E. of Bombay. Before the transfer of power in 1947 it was the chief military station in the Deccan and in the hot season the centre of gov. in the Bombay presidency. An important intellectual centre it depends for its prosperity on dairies, mill stone flour and paper mills. There is also ivory carving industry and silks and h. w. h. w. are made. In 1925 a meteorological observatory was opened here. P. has, of course, a large vil. population and is the headquarters of the P. & S. Sudan Society which trains women for independence and to undertake teaching and medical work among women of India. It has suffered greatly from plague epidemics. P. was once the cap. of the Marhattas and was taken by Britain in 1818. Pop. 2,80,000.

**Poon Wood**, name given to the wood of *Calophyllum thymocarpum* and other species. It is used for masts and spars.

**Poopo**, lake of Bolivia connected with Lake Titicaca by the Desaguadero R. It is situated 185 m S. E. of Lake Titicaca.

but is 500 ft. lower. Its normal area is 400 sq. m. Old cartographers call it Pampa Aullagas.

**Poor Clares, see CLARE, St.**

**Poor Laws: *Historical Sketch.***—The hist. of the Eng. poor law system is generally taken as commencing with the passing of the Act of 1601 (cited as the 43 Eliz. c. 2). This important statute estab. the fundamental principle of a compulsory assessment for the relief of the poor on the occupier of land or house property. But long before the end of the sixteenth century 'a persuasion seems to have been gaining ground that severe punishments alone would not prove effectual, and that something else was necessary for putting down vagabondage and mendicancy, with their auxiliary train of evils' (Nicholl's *History of the Poor Law*, 1858). By an Act of 1536 the head officers of tns. were directed to succour and charitably relieve the impotent poor, and also to set and keep vagabonds and beggars at continual labour. The money required for the purpose of this Act was to be derived from voluntary contributions collected partly by the head officers of corporate tns. and the churchwardens of par., and partly in the churches, and on various occasions where the clergy had opportunities for exhorting the people to charity. This voluntary system was continued by an Act of 1552, which provided that a register of the poor should be kept, and parishioners 'gently exhorted and admonished' to contribute, according to their means, for similar objects. The system was evidently not crowned with success, for by an Act of 1563 justices were empowered to use compulsion towards persons obstinately refusing to contribute; and by an Act of 1597 nearly all the means were provided, short of an absolute and regular assessment of property, for effectually relieving the destitute poor, and for giving employment to such of them as were able-bodied. The Act of Elizabeth directed the overseers of every par. to set people to work who had 'no ordinary trade to get their living by,' and for that purpose empowered them to raise by taxation of every inhabitant, person, and occupier of lands, houses, tithes, mines, etc., such sum as they required for providing a sufficient stock of flax, wool, or other material on which to set the poor to work. They were also empowered to raise sums for the relief of lame, blind, old, and impotent persons and for putting out children as apprentices. Churchwardens and overseers were authorised to build poorhouses at the expense of the par. (for the impotent poor only), and justices were given power 'to assess all persons of sufficient ability for the relief and maintenance of their children, grandchildren, and parents.' This was the state of the P. L. right down to 1832, when, in consequence of the long-matured abuses of administration, a royal commission was appointed to inquire into the evils alleged and to suggest remedies. The result was the Poor Law Amendment Act of 1834, in which the prin. recommendations of the

commission were embodied. This important Act made no change in the law respecting the rateability of property or the mode of collecting the rate, its provisions in this connection relating exclusively to a more equitable distribution of the rate when collected. The prin. administrative changes effected by the Act were (a) the appointment of a central supervisory board (subsequently the Local Gov. Board and now the Ministry of Health) having control over all local bodies entrusted with the management of poor law funds, and power to order workhouses to be built with the consent of a majority of the guardians. (b) The union of sev. par. for the more economical administration of poor relief. But each par. in the union was to defray the actual charge in respect of its own poor. Each union was to be managed by boards of guardians annually elected by the par. rate-payers. (c) The discontinuance of the system of paying wages out of poor-rates, and the prohibition, generally, of relief to able-bodied paupers and their families, otherwise than within the walls of a workhouse. To all intents and purposes the poor law system in principle remained stereotyped from 1834 until 1948, the changes effected by the Act of 1930 relating mainly to administration.

The Act of 1834 was essentially an instrument for disciplining a people as yet not habituated to the wage-earning urbanised industrialism introduced by the Industrial Revolution. During most of the Victorian era the relief of distress was left to private thrift and charity, with the threat of a 'well-regulated workhouse' held in reserve. The poor law was the only public relief service for every kind of distress, accentuating deference rather than constructive assistance. Wherever possible the pauper was offered 'the house' or nothing. Outdoor relief, when granted, was almost always inadequate, and, for the able-bodied, conditional on labour tests in which tramps, loafers, and genuine unemployed were grouped together on practically useless work. The Act gave a sharp spur to working-class thrift, above all to the friendly societies built up mainly by skilled workers who could afford to save. Out of the old local network of small benefit clubs and fraternities, disorganised by the Industrial Revolution, there gradually arose large-scale centralised, affiliated, or collecting societies, run by agents for, rather than by, the workers. In burial insurance these in turn were increasingly outstripped by commercial companies formed by business men for the sake of gain. The National Insurance Act of 1911, by allowing these companies to administer cash benefits under the National Insurance scheme, ensured their eventual control of this type of working-class thrift, and greatly accelerated the decline of the 'fraternal' spirit in bodies already ceasing to be in any real sense either 'societies' or 'friendly.' But by the beginning of the present century public opinion was coming to realise that pauperism was the symptom of a social disease which should be prevented

by social action. The first step towards this was the creation of a system of public education, with its own medical service and feeding schemes, the rise of municipal medical services increasingly detached from the poor law, the development of an infant welfare movement, and the recommendation of a royal commission that the mentally defective should be entirely removed from the poor law.

The majority report of the royal commission of 1908 tried to remove the stigma attaching to poverty by the recommendation that the div. of the Local Gov. Board which dealt with poor relief should be known as the 'Public Assistance Division.' It would abolish the poor law guardian by recommending the formation of a new local authority composed of nominees of co. and co. bor. councils and persons experienced in poor law work, to be called the Public Assistance Authority, for central administration and control within an enlarged area (*cf.* Parish), together with local committees for dealing with applications, investigating and supervising cases, and undertaking such other duties as might be delegated by the Public Assistance Authority. In so far as it advised the continuation of the workhouse system, or, rather, the grant of indoor relief, the commission recommended it only in those cases in which constant supervision satisfied the authorities that 'institutional treatment was productive of the result desired. For the able-bodied, the commission recommended a national system of labour exchanges. Correlatively with these recommendations, the report deprecated the system of out-door relief, or 'home' as opposed to 'institutional' assistance, and advised that out-relief should be given only after thorough inquiry (except in cases of sudden and urgent necessity). In regard to children, the report advocated the extension of the boarding-out system, but insisted on the strictest inquiry into the character of the foster parents and the suitability of the home.

The minority report was far more revolutionary. It recommended the repeal of all Acts relating exclusively to poor law relief, the abolition of boards of guardians, and the transfer of their powers to the co. and co. bor. councils; the duty of organising the national labour market, so as to prevent or minimise unemployment, to be placed upon a responsible minister, to be designated the minister for labour; the appointment of a Ministry of Labour; and the repeal of the Unemployed Act and the abolition of distress committees. The efforts of the royal commission of 1908 proved more or less abortive, for some of the majority members favoured organised charity of an impracticable nature, while the minority members recommended the abolition of the poor law and the exercise of its functions by other local authorities. The gov. rejected the fundamental proposal to alter the whole basis of relief and the report was shelved. Thus the position remained until the First World War when by reason of

the creation of new social services, the overlapping of functions became more evident, and, moreover, the union had ceased to be an efficient unit of administration. An Act of 1927 did not improve matters, for it did no more than state the existing law, and that law was to be found scattered in some ninety-nine different Acts of Parliament. Then, at length the Local Government Act, 1929, was passed, which in the sections pertaining to the poor law transferred as from April 1, 1930, the poor law functions to co. and co. bors., and abolished the boards of guardians. But this Act left the principles of the poor law unchanged, and the close control of the Ministry of Health over the guardians through inspectors and auditors, etc., was still exercisable over the new authority. Then came the Poor Law Act, 1930, which was a consolidation measure and contained all the statute law on the subject. The introduction, however, in 1908, of the state 'means test' pensions for persons aged seventy or over implied the first major breach with the poor law; and it was followed by whole or partial removal from the poor law of one sector after another of distress, to be dealt with by more specialised *ad hoc* public agencies. From 1911 the National Health Insurance scheme provided cash benefits and treatment by general practitioners for the worker during his incapacity; from 1926 contributory pensions were paid to widows and orphans and, from 1928, to persons aged 65-70; in 1920 the state means test pension was extended to blind persons over fifty (reduced to forty in 1938).

*Authorities and Officers for the Administration of the Poor Laws prior to 1948.*—The entire management of poor relief was placed in the control of the Ministry of Health through the agency of the co. councils and the co. bor. councils, under the Local Government Board Act of 1929 (*see* LOCAL GOVERNMENT). The guardians were superseded by the Ministry of Health as a result of the recommendations of the Poor Law Commission of 1908, and the Metropolitan Asylums Board similarly disappeared. The burden of poor relief was thus spread over wider areas. A scheme of administration had to be submitted by each council for the approval of the minister of health, and a Public Assistance Committee had to be formed of which at least two-thirds of the members were councillors, together with some women members.

*Poor Law Relief under the old Poor Law.*—The general duty of giving relief extended to the following cases: setting to work the able-bodied unemployed; relieving those who were unable to work; and setting to work or apprenticing children whose parents could not maintain them. Relief was of two kinds, out-door relief and institutional relief (as the latter, it may be noted that the only statutory word was 'workhouse' and the general rules for administering workhouses remained in essentials unchanged). The Act of 1930 authorised out-door or any other kind of relief to be given to

those who were unable to work and under the Relief Regulation Order the relief might be given unconditionally in the case of urgent necessity (as in the case of sickness, mental infirmity etc. whether arising out of old age or not). Further, a court of summary jurisdiction might order such relief to be given in these cases whether in kind money or medical relief. As regards the able bodied, the above order provided that men must be set to work or given training and instruction and at least one half of the relief must be otherwise than in money and relief was granted only on the orders of the council or the appropriate committee. Actually the relief was given by the relieving officer whose precise duties will be found described in Article 167 of the Public Assistance Order. A justice of the peace having jurisdiction might order relief in cases of sudden and

such as voluntary institutions or public health hospitals (as to former miscellaneous forms of relief see under BURIAL ACTS, VAGRANTS). It may be noted that there were special provisions relating to casuals in London as under the old law, because the care of casuals was one of the functions vested in the Metropolitan Asylums Board at the charge of the whole of London.

*Cost of Poor Relief*—The cost of poor relief under the old poor law was drawn from the 'general dist rate of the co. or co. bor. area under the Rating and Valuation Act of 1925' while grants from exchequer contribution accounts were paid in to the union common funds with such sums as were recovered from paupers or their relatives. The cost of poor relief in England and Wales during the year 1913 and subsequent years is shown in the following table.

Year	Persons Relieved	Total Expenditure	Expenditure from Rates
1913	794,227	£ 14,115,405	£ 11,907,713
1914	1,593,036	42,511,265	35,130,016
1915	1,070,715	44,478,311	6,948,651
1916	1,407,183	41,156,411	36,812,343
1917	1,211,672	41,011,151	35,168,244
1918	1,222,033	13,105,215	5,140,111
1919	627,000	£ 116,275	52,503,347
1920	570,295	5,116,122	31,072,221

dangerous illness and even for persons not settled or ordinarily resident in the co. or bor. where the case was one of urgent necessity. As regards children it is to be observed that the apprenticeship system had virtually disappeared by reason of the difficulty of apprenticing a child to a skilled trade without a premium. Children were relieved either by giving relief to their parents or through their adoption by the poor law authority with the consequence that the council had the powers of parental control. The out door relief of able bodied unemployed was taken over by the Public Assistance Board set up under the Unemployment Act of 1931 (Part II) thus relieving poor law authorities of a large body of dependants. Unemployment insurance was thereby finally restricted to short term unemployment.

*Institutional Relief under the old Poor Law*—The minister could not compel a council to provide a workhouse but if he were requested to do so by the council itself he might order the provision of such accommodation or the adaptation of an existing building to such purpose at a cost not exceeding £1000. The later poor law administration condemned the mixed workhouse and actually three different types were set up: hospitals for the sick, children's homes, and institutions for the aged and unemployed—and all these were in separate buildings or separate blocks of the same building. The poor law authority had power to send two classes namely the blind or deaf and dumb and the insane, to special estates

The number of persons relieved in 1944, 1945, and 1946 was 40,700, 532,100 and 4,400 respectively.

*Poor Law Abolition*—The National Assistance Act 1948—The Second World War strengthened the tendency to place all major insecurity burdens on the state whose outdoor relief agency remained the Assistance Board, was entrusted with the administration of new state financed schemes to relieve war distress, to pay supplementary means test pensions to old age pensioners and temporary war injury allowances for civilians. The board was then growing into a national omnibus agency for outdoor relief in cash and the gap between state and local relief was widened in 1941 by the substitution of a much less stringent family means test for the former Unemployment Assistance Board (U.A.B.) household means test. Shorn of many of its functions with an increasing transfer of its institutions and constructive services to other authorities the poor law in 1941 became a local residual relief service supplementing the new public services and filling in the gaps left by them. Its chief remaining functions were domiciliary relief of widows deserted wives and old persons not entitled to pensions, institutional relief of the chronic sick and various 'social problem' groups, and medical relief of destitute persons not entitled to National Health Insurance panel treatment.

The creation of these new income maintenance agencies profoundly modified British social life and thought. Yet

the new services were still relatively experimental; their growth was piecemeal and ill-planned and had not yet reached the final form required by modern industrial society. Britain's income-maintenance services, with the important exceptions of unemployment services and possibly of old age pensions, were backward compared with those of many other countries.

The Beveridge Report (1942) recommended that the poor law should be abolished. This recommendation was accomplished in far-reaching reforms of the National Assistance Act (1948) (*q.v.*), which concluded an epoch in Eng. hist. For most of the essentials of what became the poor law existed long before the Tudors subjected virtually the whole life of the labouring classes to a system of paternal state regulations by means of a comprehensive code contained in the poor law and the statute of artificers. In all epochs before the present century the poor law was so built into the social fabric of England that the hist. of the changing fortunes of the common people can only be imperfectly understood if the poor law is omitted from the narrative. The introduction in 1908 of non-contributory old-age pensions and in 1935 of state unemployment relief, managed by the U.A.B., made the need to nationalise what remained of local public assistance in the long run inevitable. Yet the idea was not new, for the royal commission on the poor law of 1832-31 considered seriously the creation of a national assistance service; but it required more than a century of economic and political advance to make this characteristically Benthamite reform socially and administratively practicable.

The National Assistance Act disposed of the last remnants of the old poor law system as described in the foregoing pages. Under it responsibility for giving assistance to those in financial need passed from local authorities to the state. This reform filled the last gap in the comprehensive scheme of social security (see SOCIAL INSURANCE). The Act substituted the National Assistance Board as the sole body charged with the duty of administering a single comprehensive service replacing outdoor relief, unemployment assistance, supplementary pensions, and assistance for the blind and those undergoing treatment for tuberculosis. But the duty was laid on the local authority to provide 'residential accommodation' for persons, who, by reason of age, infirmity, or other circumstances, were in need of care and attention not otherwise available to them; and the local authorities were required to submit their schemes for caring for old and infirm people to the minister of health for inspection.

Regarded as a whole, the new reforms represented a humane and sensible settlement of assistance as a national duty and fixed a sound foundation for the orderly development of the new welfare services. It made it more than ever necessary for the Assistance Board to decentralise its

work and to train its officers in the spirit of modern social service. The poor law relieving officer as such was abolished but his function remained. The board's officers became the general practitioners of public assistance. They were always to be at hand to give emergency relief at any moment. The work of the board under this new dispensation was far removed from the mere relief of 'distress,' as that term was interpreted by the poor law at the beginning of the twentieth century. See J. F. Archbold, *The Poor Law* (15th ed.), 1898; W. C. Glen, *Poor Law Orders* (11th ed.), 1898. See also *Poor Law Returns of the Ministry of Health*; Beatrice and Sidney Webb, *Local Government: Poor Law Officers' Journal*, 1930; G. Druce, *Public Assistance*, 1930; J. J. Clarke, *Public Administration, including the Poor Laws*, 1934; W. I. Jennings, *Poor Law Code*, 1937; P. Lesly (ed.), *Public Relations in Action: Case Studies*, 1947; and W. A. Robson, *Public Administration To-day*, 1948.

Poor Man's Weather-glass, see ANAGALLIS, PIMPERNEL.

**Poor Persons' Legal Aid.** *Poor Prisoners' Defence.*—The grant of free legal aid for poor prisoners is provided for by the Poor Prisoners' Defence Act, 1930, which came into force in 1931. The analogous Act of 1903 was the first piece of legislation providing free legal aid for poor persons, but it restricted the grant of aid to a person charged with a crime for which he could be tried only at the assizes or quarter sessions and, moreover, it rested with the magistrate to decide whether it was desirable to grant free legal aid, and even if granted it was not available until after the accused had been committed for trial. The Act of 1930, repealing the Act of 1903, applies both to indictable offences and to those triable summarily by a magistrate, and official lists are kept of solicitors and barristers willing to undertake the defence of poor prisoners and whose fees are paid out of local funds. In the case of an indictable offence the accused may have free legal aid if justices, on commitment for trial, or the judge of the trial court grant a defence certificate. If the person's means are insufficient, such certificate may be granted in cases where desirable, and must be granted in the case of a murder charge. In courts of summary jurisdiction, assuming insufficient means, a defence certificate may be granted if it is considered desirable to do so by reason of the gravity of the charge or of exceptional circumstances. The Act is only intended to help poor persons to prepare and conduct a defence, where they have any defence at all, so that they may be in the same position as those who can afford to pay for it; it is not intended to provide professional assistance for the purpose only of making a plea in mitigation of sentence on a guilty person.

*Civil Cases.*—Under a system for giving legal aid to poor persons in civil proceedings administered by the Law Society there are poor persons committees established throughout England and Wales to which

any one requiring this form of aid may apply for a poor persons' certificate and, if this be granted, a solicitor and counsel will be allotted to act without remuneration. The certificate can be granted if the applicant is not worth £50 (excluding wearing apparel and tools of his trade) and his usual income is not over £2 a week. In special circumstances these limits may be £100 and £4 respectively, and a special relaxation of the upper limits may be granted when the applicant was, at the time of application, serving in the forces. The committee may require the applicant to deposit a sum not exceeding £5 to cover the out-of-pocket expenses of the solicitor. Divorce proceedings under the above system may be commenced at the divorce registry in London or in any district registry in the provs. authorised for the purpose, and the trial may be in London or at the assizes at one of the many tns. at which divorce business may now be taken under the rules of the supreme court.

*Legal Aid and Advice Act (1949).*—This Act provides for a considerable expansion of the present scheme of legal advice but is not yet (1950) in operation. The new Act provides for (a) the provision of oral legal advice, and (b) legal aid in civil and criminal proceedings. Eligibility for aid will depend on the financial circumstances of the individual; generally speaking, any persons whose gross income does not exceed £700 to £750 will be within the scheme.

*Scotland.*—In every sheriffdom in Scotland there are solicitors for the poor, and in the court of sessions there are counsel and solicitors for the poor, all of whom act gratuitously. No court dues are payable in the first instance. Any class of litigation may be undertaken for poor persons. The means that preclude a person from the benefit of the Poors' Roll are not fixed, and each application depends on its own circumstances. The Legal Aid and Solicitors (Scotland) Act of 1949 follows the general lines of the Legal Aid and Advice Act for England and Wales, but with important differences.

**Popayán**, episcopal see, city, and cap. of the dept. of Cauca, Colombia, S. America, at the foot of the volcano of Puracé, 235 m. S.W. of Bogotá. It stands at an altitude of 5700 ft., and has a cathedral and univ. and beautiful old monasteries and cloisters of classic Sp. architecture. The carved pulpit of S. Francisco and the jewelled monstrances of that church and of San Agustín are noteworthy. The city was founded in 1536 and was the home of the poet Guillermo Valencia. Gold, silver, platinum, and copper are found in the neighbourhood. The chief industry is blanket-making. Pop. 39,000.

**Pope, Alexander** (1688–1744), Eng. poet and satirist, b. in the city of London, the son of a rich Rom. Catholic linen-draper. Because of his religious faith, he was educated privately. A severe illness at the age of twelve affected his health for the rest of his life and deformed his figure, about which disfigurement he was always very sensitive. He was a singularly

precocious lad, and fond of books from a very early age. While at school he was addicted to composition, and imitated his favourite authors. The exact date when he wrote his *Pastorals* cannot be stated, but they were pub. in Tonson's *Miscellany* in 1709. These poems attracted a good deal of attention, as did the anonymous *Essay on Criticism* (1711). Addison praised the *Essay* in the *Spectator*, and when Steele introduced to him the young author, he gave P. the benefit of his patronage. *The Rape of the Lock* (1712), an amusing mock-heroic poem, brought P. into further prominence. The intimacy between P. and Addison did not long endure. There were faults on both sides. Addison's patronising attitude would have irritated a man more patient than P., but P.'s sensibility was abnormal, and the breach is said to have arisen when Addison declared that Tickell's trans. of Homer was the best. P. retaliated with the famous *Atticus* passage, in which he ridiculed Addison unmercifully. He became a member of the Scribblers Club, and made friends with Swift, Gay, Congreve, and their set. In 1715 he issued the first instalment of his trans. of the *Iliad*, the last vol. of which did not appear until five years later. He leased a villa at Twickenham in 1719, and there made acquaintance with Lady Mary Wortley Montagu, with whom he afterwards had a bitter quarrel, and contracted a more lasting intimacy with Teresa and Martha Blount, to the latter of whom he was devoted. He ed. the poems of Parnell (1722) and later the works of Shakespeare (1725), which, however, was practically a failure. After this, with the assistance of Wm. Broome and Elijah Fenton, he prepared a trans. of the *Odyssey* (1725–26), from which he derived a handsome profit. P., in 1725, conceived the idea of writing a satire upon contemporary men of letters, and three years later this appeared anonymously under the title of *The Dunciad*, the archduke being Lewis Theobald, who had written a scathing attack on P.'s ed. of Shakespeare. The book created a tremendous sensation, and many retorts were made upon the author, whose veil of anonymity was too thin to disguise his identity. The satire was reissued, with additions, in the following year, but the authorship was not avowed until 1735. Of its brilliance there is no question, but it did not fulfil P.'s purpose of extinguishing the Grub Street writers, rather serving to bring them into prominence for all time, since the memory of many to whom allusion is made in the lampoon, for such it is in reality, is still kept alive by the vehicle intended for their destruction. In 1742 P. brought out a revised *Dunciad*, in which he dethroned Theobald and set up in his place the veteran actor and dramatist Colley Cibber. He pub. the *Essay on Man* (1732–34) and the *Moral Essays*, which were but a part of a contemplated series of poems, suggested by Bolingbroke, in which human nature was to be exhaustively and systematically surveyed. Among his best work was his trans. of Horace, begun in 1733. As a

man P. suffered much from excessive sensibility, and it was this unfortunate weakness that caused him to quarrel so frequently and so vigorously. His devotion to his mother is the most pleasing, as it is the most natural trait in his character. The illness which warped his body seems also to have affected his mind, and to have left in him a certain streak of dishonesty, which manifested itself again and again, most noticeably in the case of the pub. of his letters, which he printed not as they were written, but altered for his own ends. Twentieth-century biographers, however, have stressed the more pleasant side of P.'s character, and the more traditional portrait of him, drawn by the Romantics, has been somewhat modified. As a poet he occupies a high place in Eng. literature. The smoothness of his line is remarkable throughout his work, and to secure this he laboured unremittingly, though his writings lack any emotional quality and his finest passages show him as a master of rhetoric rather than as an interpreter of the spiritual. If in the Horatian satires and in the fourth book of *The Dunciad* he is, generally speaking, at his best, he is brilliant in such earlier pieces as Epistle V. (*Moral Essays*) addressed to Addison. The standard ed. of his works and correspondence is that prepared by Elwin and Courthope (1871-89), and there is an ed. of his collected poems in Everyman's Library. See lives by S. Johnson, 1781; G. Paston, 1909; E. Sitwell, 1930; G. Sherburn, 1934; N. Ault, 1919; also monograph by Sir L. Stephen, 1878.

**Pope (fish)**, see **TRUFFLE**.

**Poperinghe**, city in W. Flanders, 6 m. W. of Ypres. It has textile manuf., and grows hops, of which it is the most important market in Belgium. It was the railhead for the Ypres sector during the First World War, and therefore well known to hundreds of thousands of Brit. soldiers who fought in that sector. It was at P. that part of the Brit. 1st Corps arrived in Oct. 1914 and participated in the operations which developed into the first battle of Ypres. Pop. 12,400. See also **TOU H.**

**Popinjay** (O.F. *popinai*), obsolete synonym for 'parrot,' for which it is still used in heraldry. The word is used to-day in its transferred sense of 'coxcomb.'

**Poplar**, or **Populus**, genus of hardy deciduous trees (family Salicaceae), with broad leaves on long stalks, and drooping catkins with jagged scales. The Brit. species are: *P. alba*, the white P. or Abele, a large tree, with smooth grey bark and lobed leaves, cottony and snowy white beneath; *P. tremula*, the aspen, which has nearly round leaves, glabrous on both surfaces; *P. canescens*, the grey P., is probably a hybrid between them. *P. nigra*, the black P., and *P. fastigiata*, the tall handsome Lombardy P., are not indigenous, though common features of Brit. scenery.

**Poplar**, metropolitan bor. and bor. constituency, with an area of 2328 ac., in the E. end of London. Pop. 73,000.

**Poplar Bluff**, co. seat of Butler co.,

near Black R., in S. Missouri, U.S.A. Pop. 7500.

**Poplar Marshes**, see **DOGS, ISLE OF**.

**Poplin** (Fr. *popeline*), dress fabric, used also for upholstery, with a warp of silk and a weft of worsted which give a corded structure. Huguenot refugees introduced its manuf. into England, but it is now chiefly made in Dublin.

**Popocatepetl** (Aztec, 'smoking mountain'), dormant volcano, 45 m. S.E. of Mexico city, Mexico. It rises to a height of 17,520 ft., and its summit is covered with snow. The last serious eruption was in 1548, but minor ones occurred as late as 1802. Its crater (diameter 2700 ft.), contains exceptionally pure sulphur. Diego Cortez scaled P. in 1522, being the first ever to do so.

**Poppet Valve**, see under **VALVES, MECHANICAL**.

**Poppo**, Saint (978-1018) Flem. saint and abbot. He became a Benedictine at St. Thierry, Rheims, in 1006, and went to St. Vannes in 1008 to help in the revival of monastic discipline there. As provost of St. Vast, Arras, he became the friend and adviser of emperor St. Henry, who made him abbot of Stavelot-Malmédy in 1021. P.'s influence led to a revival in monastic fervour and discipline throughout Flanders; he is one of the greatest monastic figures of his century. See P., Ladewig. *Poppo und die Klosterreform*, 1883.

**Poppy**, or **Papaver**, genus of annual plants with white milky juice and showy red, pink, white, and yellow flowers. From the common P. (*P. rhoeas*) sev. fine garden plants have been derived. The opium P. (*P. somniferum*) bears large white flowers. Opium is derived from its unripe capsules, but the ripened seeds yield a wholesome oil, the residue being made into oil-cake for cattle feeding.

**Popski's Private Army**, independent unit of the Brit. Army formed in Oct. 1942 by Vladimir Peniakoff ('Popski'), D.S.O., M.C., who was born in Belgium of Russian parents, educated in England, fought in the Fr. Army in the First World War and settled in Egypt in 1924. In 1910 P. joined the Long Range Desert Group (q.v.) and served with it and the Libyan Arab Force (Senussi Regiment) for two years. The role of P. P. A. was reconnaissance and raiding behind the Ger. lines; it pioneered the El Hama approach along which the New Zealanders and Gurkhas made their decisive attack in March 1941. P. P. A. reached its greatest strength (120 men) when co-operating with partisans N. of the It. front. It penetrated into Austria behind Vietinghoff's retreating army group and was the first Eighth Army unit to contact the Russians in Syria. See Lt.-Col. Peniakoff, *Private Army*, 1950.

**Popular Front**, suggestion for political collaboration of Communists, Socialists, and other left-wing parties against Fascism, advanced by the Communist International in 1935. The P. F. platform provided for common resistance to Fascism and various social reforms on a democratic basis, but no adoption of

Socialism. P. F. govs. were estab. in Spain and France. The Sp. P. F. was overthrown by Gen. Franco in the civil war (see SPAIN, *History*), and the Fr. ended at the beginning of 1938. In 1937 Sir Stafford Cripps started a new campaign in favour of a P. F. which was to unite Labour, Liberals, Communists, and dissident Conservatives, but the plan was opposed by the Labour party and led to the expulsion of Sir Stafford and some of his followers, at the Southport Party Conference in April 1939. The P. F. campaign was then abandoned. For the so-called 'front populaire' formed in France under the leadership of Léon Blum, see FRANCE, *History*.

**Population.** At the death of the Emperor Augustus, the pop. of the then known world was estimated by Bodio to be 34,000,000; while, according to Mulhall, the total pop. of Europe hardly exceeded 50,000,000 before the fifteenth century. It is more than doubtful whether any reliable figures are available much before the nineteenth century, and certainly the pop. of Asia before the middle of the last century was for the most part merely conjectured. Taking the figures of Wagner, Supan, Chisholm, and others we get the following approximate census of the world:

### World Population (estimated 1940)

Europe (excluding U.S.S.R.)	380,000,000
Asia (excluding U.S.S.R.)	1,155,000,000
U.S.S.R.	193,000,000
Africa	150,000,000
N. America	144,000,000
Central America and Is.	31,000,000
S. America	101,000,000
Oceania	11,000,000
	2,165,000,000

\* Kuczynski estimated that the total pop. of the continent of Africa, shown in the *Statistical Year Book of the League of Nations* for Dec. 31, 1934, as 115,051,000, may be as low as 138,100,000 or as high as 165,300,000, and though the margin of error is large, it is not greater than that for Asia or S. America.

† No regular census of the pop. is taken in many of the S. Amer. countries, and estimates are inclined to be exaggerated and often differ widely. But from the available data it would appear that the pop. of S. America, apart from other Lat. Amer. countries, is as given above, having increased from 38,500,000 in 1905 to 107,300,000 in 1945.

The figures in the earlier table are vague, owing to the fact that the necessity

	1860	1891	1900	1930
Europe	275,806,741	377,379,000	403,360,000	475,000,000
Asia	755,000,000	820,951,000	875,000,000	1,019,000,000
Africa	200,000,000	163,953,000	170,000,000	150,000,000
America	67,896,011	121,713,000	146,000,000	210,000,000
Australia	1,115,000	3,230,000	4,240,000	6,430,000
Polynesia	1,000,000	1,420,000	1,500,000	1,500,000
Polar Regions	—	80,400	80,400	80,000
	1,301,647,782	1,473,729,400	1,600,180,400	1,862,010,000

The table at the top of the next column is an estimate of the totals at 1940. Those for China and India had long been uncertain, but according to the 1941 census the Indian pop. (excluding Burma) was nearly 390,000,000, while the total pop. for China, which was estimated by the Chinese Ministry of the Interior in 1936 at 422,700,000, exclusive of Mongolia and Tibet (5,800,000), and by the League of Nations in 1938-39 at 450,000,000, is now generally agreed to be about 456,800,000 (exclusive of Tibet). These increases on previous approximations go some distance towards explaining the difference between the world total given above for 1930 and the later total, a difference which would be too great for the probable figures of natural increase. It may be noted that the total given by the expert demographer, R. R. Kuczynski, quoting from *Wirtschaft und Statistik* (1939), is 2,139,000,000. The pop. of Europe was estimated by the same authority at 109,000,000 in 1600, 152,500,000 in 1700, 173,000,000 in 1789, and at 525,000,000 in 1934 (the last total shows that he did not accept official totals).

for an official census has in many countries been recognised only in recent years; but in the case of Europe and America they are accurate enough to give some idea of the rate of increase. According to Mulhall, Europe's pop. increased by 62 per cent between 1837 and 1891, notwithstanding that 30,000,000 of its inhab. emigrated to other lands, the bulk having gone to Eng.-speaking countries. A no less striking fact was the gravitation of the rural pop. to towns, and the consequent rapid rise of densely populated cities. These two general features continue to characterise the movement of the world's pop., and in regard to the former, the migrations in recent years, especially immediately prior to the First World War, tended more evenly to distribute the pop. of the Brit. Empire. A further effect is the levelling up of the sexes in the younger dominions. The rapid increase in pop. (until the sharp decline in the rate of increase in European and Amer. countries in the twentieth century led to a reaction in demographic speculation) long exercised the minds of economists most concurring in the view

that improvement in the conditions of life of the working classes was possible only when there existed a check on the increase of pop. The arguments used by Malthus in his *Essay on the Principle of Population as it Affects the Future Improvement of Society* (1798), to which posterity has accorded a mixed reception, were directed to show that pop. increases in a geometrical ratio, while subsistence increases only in an arithmetical ratio, and that consequently, unless there existed checks on pop., a dearth of material for subsistence would soon prevail. No legislator in the world's hist. has yet ventured to lay down artificial checks on pop. (rather has the converse been the case in both anc. and modern states, e.g. the Caducary legislation of Augustus, the Fr. Gov. bounties on large families, and the Brit. system of family allowances). Malthus, in the first ed. of his work, laid down that the positive checks of vice and misery necessarily limited pop. and seemed to say that such checks were nevertheless actual barriers to all social improvement. In the later ed. in 1803 he modified his views, and while regarding war, famine, pestilence, vice, misery, or other 'positive checks' more or less as unmitigated evils, drew special attention to the 'prudential' check on pop. In most countries both positive and prudential checks are active agents in restricting pop., but as time progresses it seems that the latter grows stronger, while war, famine, and earthquake hardly appear to be less effective than hitherto. Large numbers, for example, were exterminated in E. Europe during the Second World War.

In the twentieth century the movements of pop. have been increasingly regulated by govts. This is exemplified by the barriers raised against the settlement of Chinese and Jap. in Australia, and by similar embargoes against these races on the W. seaboard of America; the adoption of a 'quota' by the U.S.A., Canada, and other Brit. dominions, under which the number of immigrants of different nationalities is fixed; the registration of aliens with consequently greater difficulties of settling in European countries. The 'quota' system of the U.S.A., which (prior to the Second World War) favoured Germany, Great Britain, Ireland, France, and N.W. Europe, told severely against Russia, Italy, and S.E. Europe, which before 1925 found America the chief outlet for surplus pop. Such restrictions drew attention to the subject of distribution of the world's pop. Australia follows a policy of retaining a white man's land, and the development of her secondary industries tends largely to increase the pop. of her cities at the expense of the rural areas.

The most noticeable general feature of recent changes in pop. has been the great increase of city dwellers. In the U.S.A. in 1920 there were 21,000,000 persons living in cities of 250,000 inhab. against 10,500,000 in 1900, while there were 287 cities of more than 25,000 inhab. against 160 twenty years before. That this trend has been still further accom-

panied is shown by later estimates. These figures are evidence of a general movement throughout white countries which can be accounted for by (1) easier facilities of travel; (2) new trades and industries that develop best where the pop. is the most dense, and (3) improvements in agric. machinery and farming implements which make fewer employees necessary.

Before the Second World War the threatened decline in pop. in Great Britain induced considerable comment and discussion in Parliament and the press. In a memorandum which he presented to the Royal Commission on the Geographical Distribution of the Industrial Population (1939), however, the registrar general reached conclusions which seemed to differ from those of the majority of unofficial statisticians, whose views he regarded as too alarmist. Assuming that fertility remained as it was in 1938, that mortality would gradually decline according to reasonable anticipation, and that the yearly increase of immigration over emigration (as observed in 1931-37) reached vanishing point by 1951 (which appears already to be the case) he forecast total pop. in 1951 at 47,501,000, in 1961 at 47,192,000, and in 1971 at 45,980,000; but assuming a constant ann. supply of 700,000 births (the number registered in Great Britain as at the date of the memorandum), and assuming a concerted attempt to avoid the threatened decline in pop., he forecast the total pop. in 1951 at 47,835,000, in 1961 at 48,376,000, and in 1971 at 48,595,000. It was generally agreed that the pop. decline could only be prevented by raising the fertility rates far above the level of 1938, and the registrar general suggested the necessity of an immediate increase in the ann. number of births of 130,000 (*Statistical Review*, 1938). In fact Britain's pop. had reached more than 49,000,000 by 1948; the pop. is still increasing and, on present indications, should reach a maximum in about 1977, when, unless family size increases, a slow decline will begin. In 1941 a royal commission was instructed to examine the facts relating to and the causes of pop. trends in Great Britain and to make recommendations. Added by three specialist committees, statistical, economic, and biological and medical, the commission in June 1949 pub. a White Paper which concluded that Britain's fate as a world power might be sealed in some thirty years' time unless the people reverted to larger families, i.e. unless at least every fifth couple in the land had one extra child. The White Paper based many of its proposals on one fact of major significance: for some seventy years the size of the Brit. family has fallen, due to deliberate limitation, and now averages only 2.2 children to each married couple. In the opinion of the commission this is 'insufficient for replacement.' Yet only a 6 per cent. increase would be enough to ensure our pop. being stable from generation to generation (for details of the White Paper see under VITAL STATISTICS). See R. R. Kuczynski, *The*

*New Population Statistics, 1942, and Eva M. Hubback, The Population of Britain, 1948.*

**Poquelin, Jean Baptiste, see** MOLIERE.

**Porbander, tn. and seaport of P. state** on the S.W. of the Kathiawar peninsula, Bombay, India, 110 m. N.W. of Din. It has stone quarries. Pop. (state) 147,000; (tn.) 23,700.

**Porcelain** (Fr. *porcelaine*; It. *porcellana*, a cowrie-shell), name given to the finer qualities of white or china earthenware, particularly to that variety which possesses a translucent body. It is manufactured from the best china-clay, or kaolin, mixed with felspar, sand, or powdered flints. P. first became known in Europe from examples imported by travellers from China. It is said to have been made in Venice about 1470, and Italy remained the seat of manufacture until the Fr. works, particularly those at Sevres, began to produce it in large quantity early in the eighteenth century. See also LOTTERY. See N. Hudson Moor. *The Old China Book*, 1903; W. Burton, *History of Porcelain*, 1906; W. B. Honey, *Dresden China*, 1934, and *European Ceramic Art*, 1949; C. J. Thorn, *Handbook of Old Pottery and Porcelain Marks*, 1947; F. H. Garner, *English Delftware*, 1948; and A. Lucie, *French Faience*, 1948.

**Porcellanite, Agillite, or Baked Shale**, name given to highly indurated and partly fused shales found in contact with dykes and intrusive igneous masses; a result of contact metamorphism (q.v.).

**Porch, The**, refers to the *stoa poecile* (στωα ποικίλη, painted porch) in which Zeno taught, and is therefore a synonym for the Stoics and their school.

**Porcupine** (Lat. *porcus*, pig; *spina*, thorn), name given to any species of the rodent family Hystricidae. All are characterised by the possession of spines and hollow quills, smooth-soled feet, non-proboscis tails, and the grinding teeth have external and internal folds. The best-known species is *Hystrix cristata*, the common P., a native of S. Europe and N. and W. Africa. It is one of the largest of rodents, and its specific name is obtained from its crest of long hairs; the body spines are solid, and the tail bears hollow quills. There are eleven other species of *Hystrix*. The genus *Atherura* contains four species, known as brush-tail Ps. The remaining Old World P. is *Trichys lipura*. Tree Ps. belong to a distinct family and are common to the new world.

**Pores, see** SKIN.

**Porfirio Diaz, see** CIUDAD PORFIRIO DIAZ.

**Porifera, see** SPONGES.

**Pork, see** Pig.

**Porlamar, chief commercial centre of** Margarita Is., Venezuela. Pop. 10,000.

**Porlock, vil. of Somerset, England, 6 m. W. of Minehead.** It is characterised by its steep streets, especially the old main road from P. to Devon, which has a gradient of 1 in 4, and is now used for motor trials. P. Bay is an opening of the Bristol Channel, 4½ m. wide. Before the sea receded P. flourished as a market. tn. and seaport. Pop. 1400.

**Pornographic Prints and Publications, see** UNDER INDICENCY.

**Porosity.** The P. of a building material such as brick or stone is the ratio of pore space in the material to the total volume of the material. P. per cent is calculated from the apparent density  $d$  and the density of the powdered material  $s$  from the formula  $P. \text{ per cent} = \frac{s-d}{s} \times 100$ .

The saturation coefficient is the proportion of the total pore space which is filled with water under given conditions. The pores do not normally absorb water to their entire extent, absorption being governed by the degree of capillary attraction they are able to exert. A stone which has a saturation coefficient of 0.8 should be immune from the action of frost. The average percentage pore space of the chief rocks is granite 0.3 to 2.6, gabbro and basalt 0.4 to 0.5, dolomite 0.2 to 1.2, gneiss 2.5 to 4.4, marble 0.4 to 1.8, limestone 1.0 to 20.0, sandstone 1.9 to 2.0.

**Porphyrogenitus, see** CONSTANTINE VII.

**Porphyry**, name originally applied to an Egyptian rock used for ornamental purposes and known as *porfido rosso antico*. It occurs as a dyke in the granite of Jebel Jekban (mons porphyrites) in Egypt, and shows a felspathic base with plates of hornblende, magnetite, and disseminated oligoclase felspar. The porphyritic felspar shows a red tint due to the presence of a variety of epidote called 'withamite' or 'piedmontite.' The name P. is now applied by geologists to certain acid and sub-acid rocks which show porphyritic structure, not necessarily red. The green variety is found at Lambay Is., off Dublin, and in the Peloponnesus. By this is understood the occurrence of some constituent of the rock in two distinct generations, referable to different stages in the consolidation of the magma. Thus the first formed crystals are large (phenocrysts), and the ground mass, which crystallised later and is approximately of eutectic composition, is aphanitic. The phenocrysts in the Ps. are of orthoclase with occasional plagioclase crystals, giving rise to a parallel intergrowth. The ground mass is generally of felspar or the more acid types of felspar and quartz. Geologists use a descriptive prefix when specifying Ps., thus syenite P., orthoclase P., quartz P., and rhomb P. Some Ps. are given distinct names and thus there are Bostonites and Tinguatos, and some varieties of Monzonites.

**Porpoise, or Phocena**, genus of Cetacea in the family Delphinidae. They are aquatic mammals. The species are characterised by their horny tubercles on the dorsal fin and the compressed and lobed teeth, of which there are twenty-five on each half of the jaw. The young have from two to four hairs, but the adult animal is quite smooth. Ps. resemble small whales, but have more sloping heads. The general colour is black, but the under surface is greyish; the average length is from 4 to 6 ft. *P. communis*, found round Brit. coasts, inhabits the

Atlantic and Pacific, in diet is piscivorous, and in habit gregarious.

**Porrentruy**, tn. in the canton and 40 m. N.N.W. of the tn. of Bern, near the Fr. frontier; it manufs. watches. Pop. 6500.

**Porrex**, see 'GORBOUCC.'

**Porsenna**, or **Porsenna**, Lars, king of Clusium in Etruria; he marched with an army against Rome in order to restore Tarquin to the throne. He captured the Janiculum, but the whole Etruscan Army is said to have been kept at bay at the Sulpician bridge by Horatius Cocles and his two companions. The Etruscan invaders thereafter laid siege to Rome, but peace was concluded by the advice of Scævola. The defeat of the Romans was probably severe, and the myths which cluster round the event only serve to gloss over the catastrophe.

**Porson**, Richard (1759-1808), Eng. classical scholar, b. at E. Ruxton, Norfolk, the son of the par. clerk there. Thanks to the generosity of friends, he was educated at Eton, and in 1777 entered at Trinity College, Cambridge, where he had a brilliant career. He was fellow of his college in 1782-81. This position he lost by refusing to take orders. From 1790 he was prof. of Gk. at the univ. His life was a struggle till he became librarian to the London Institution. P. was one of the foremost of Gk. scholars and critics, but he left very little permanent work of his own. He ed. four plays of Euripides, viz. *Hecuba*, *Orestes*, *Phenissæ*, and *Medea*. His most widely read work was his *Letters to Archdeacon Travis* on the disputed passage, 1. John, v. 7, which is considered a masterpiece of acute reasoning. In 1817 an endowment was made in P.'s memory to provide an ann. prize to be awarded to Cambridge undergraduates for the best trans. of a passage of Eng. poetry into Gk. verse. See life by J. S. Watson, 1861, and monograph by M. L. Clarke, 1937.

**Porta**, Baccio Della, see BARTOLOMEO DI L'AGHIOLO DEL FATTORINO.

**Porta**, Giambattista della, see DELLA PORTA.

**Port Adelaide**, chief seaport of S. Australia, on the gulf of St. Vincent, 7½ m. N.W. of Adelaide. It is connected by bus and railway services with Adelaide. It has 18,000 ft. of wharves in the inner and outer harbours; there are extensive woolstores, oil installations, and timber yards, and chemical, cement, superphosphate, and other industries. Pop. 33,100.

**Portadown**, bor. of co. Armagh, N. Ireland, on the Bann, 25 m. S.W. of Belfast. P. has many industries, including the manuf. of linen, lace-making, canning, carpets, pottery, bacon curing, metal boxes, furniture, flour-mills, and boots. Pop. 16,500.

**Portage**, city and co. seat of Columbia co., Wisconsin, U.S.A., 90 m. N.N.W. of Milwaukee; manufs. hosiery, bricks, and flour. Pop. 7000.

**Portage la Prairie**, tn. in Manitoba, Canada, 56 m. W. of Winnipeg, on the Canadian Pacific Railway; has railroad shops, brick plants, hemp and threshing-machine factories, grain elevators, and flour- and lumber-mills. Pop. 7600.

**Portal of Hungerford**, Sir Charles Frederick Algernon, first Viscount (b. 1893), Brit. army officer and marshal of the I.A.F., educated at Winchester and Christ Church, Oxford. Served in the First World War (1914-18); commanded the Brit. garrison in Aden, 1934-35; instructor, Imperial Defence College, 1936-37; director of organisation in the Air Ministry, 1937-38; air member for personnel on the Air Council, 1939-40; commander-in-chief of Bomber Command, 1940; air chief marshal and chief of air staff from 1940 to 1945.

**Portal of Laverstoke**, Sir Wyndham Raymond Portal, first Viscount (1885-1949), Brit. industrialist and administrator, educated at Eton and Christ Church, Oxford. As one of the commissioners of 1934 he recommended that varied industries were needed in S. Wales, with new financial institutions to start fresh undertakings, and administered all the funds devoted to this purpose. He became regional commissioner for Wales in 1939, and later chairman of the coal production council (1940). As minister of works he became well known, especially for the P. house (prefabricated) which aroused both interest and criticism. From 1912 to 1943 he was minister of works and planning.

**Portalegre**, cap. of a dist. of the same name, prov. of Alentejo, Portugal, 95 m. N.E. of Lisbon; it has a fine cathedral, and manufs. cloth. Pop. (dist.) 186,000; (tn.) 12,300.

**Portal vein**, see CIRCULATION OF THE BLOOD.

**Portamento**, carrying on from one note to another with a very slight effect of scooping, especially in singing and string playing.

**Portaña**, Vicente Lopez y, see LOPEZ.

**Port Angeles**, tn. of U.S.A., in Washington state. The co. seat of Clallam co., it stands on the strait of San Juan de Fuca, 75 m. N.W. of Tacoma. Brewing and fish-canning is carried on. Pop. 12,100.

**Portarlinton**, mrkt. tn., Elro, on the Barrow, 10 m. W.S.W. of Dublin. Sev. families of Fr. Protestant refugees settled there in 1685. Pop. 2100.

**Port Arthur**, harbour-bay in S. Manchuria, at the S. end of the peninsula of Liaotung, at the entrance of the gulf of Pe-chih-li. The Chinese name for P. A. is Liu-Choun-Koon, the Eng. name dating from 1861, when one of the leaders of a Brit. naval surveying party was a Lt. Arthur. After the Sino-Jap. war (1894-95) P. A. was occupied by the Jap. who before their evacuation destroyed all the fortifications. Russia had been strongly opposed to the Jap. occupation, and two years later, in 1898, Russia herself obtained from the Chinese Gov. a concession in the Liaotung peninsula, including P. A., to which the Russian trans-Siberian railway was extended. Following the Boxer rising and the Russian occupation of Manchuria, Russia turned her attention to an extension of her influence in Korea. The Jap., who were already exasperated at the Russian occupation of P. A., were determined to

keep Russia out of Korea, and war was declared on Jan. 20, 1904. The Jap. landed a large army on the mainland, and besieged P. A. by land and sea (July 1904). Repeated assaults were made by the Jap. with severe losses, which were sacrificed to the need of a quick victory. At the close of the year 1904 P. A. surrendered to the Jap., with some 40,000 out of the original number of the inhab. Russian losses during the siege amounted to about 5000, and the Jap. to some 60,000. At the subsequent peace concluded at Portsmouth (1905), Russia lost P. A., which became the administrative centre of the Jap. concessions in Kwantung. In 1915 Japan obtained an extension of the lease of P. A. In Aug. 1945 Russian airborne troops landed on P. A. In 1845 a clause in the treaty between the U.S.S.R. and China laid down their joint use of P. A. as a naval base for thirty years. China was to conduct the civil administration, and Russia to be responsible for the defence.

**Port Arthur**, city of Ontario, Canada, co. tn. of Thunder Bay dist., on the N.W. coast of Lake Superior. It has the largest grain elevator in the world. Industries include sixteen elevators (total capacity 150,000,000 bushels), a ship-building plant with a large dry dock, timber companies, aerated water and wood-working plants, and pulp and paper mills. In the vicinity are deposits of iron pyrites, molybdenum, feldspar for potash, silica for glass, silver, lead, copper, zinc, gold mines, and the largest hematite iron mine in Canada. There is ample and cheap hydro-electric power. P. A. is a health resort for asthmatic persons. In 1854 the Fr. explorers, Groseilliers and Radisson, crossed the neighbourhood on their way to James Bay. In 1870 Lord Wolseley disembarked troops here from E. Canada, on the way to quell the Red Indian rebellion, and named the spot 'Prince Arthur's Landing,' after the duke of Connaught, later governor-general of Canada. It was incorporated as the tn. of P. A. in 1884, and became a city in 1906. Pop. 18,000. 2. Chief port of entry for the Sabine dist. of Texas, U.S.A. It is on the W. shore of Lake Sabine and communicates with the gulf of Mexico. It has important oil refineries. Pop. 46,000.

**Port Augusta**, seaport of S. Australia, at the head of Spencer's Gulf, Frome co., 210 m. from Adelaide. The dist. has deposits of gold, silver, copper, and coal. There is a woollen and wheat trade, and P. A. is a centre where repairs to rolling-stock are carried out. P. A. was named after Lady Augusta Young in 1852. Pop. 4,500.

**Port-au-Prince**, cap. and chief seaport of Haiti. W. Indies, opposite the is. of Gonave. It has a fine natural harbour and lies at the further end of a deep horseshoe bay, with a small is. protecting the harbour from high seas and tidal waves. The tn. is built in the form of an amphitheatre; paving and drainage have been modernised. In the lower quarter of the tn., lying at sea level, is the commercial

section; on the heights are private residences. It has the greater part of the trade of Haiti but the climate is very unhealthy. Sugar is treated in the neighbourhood and coffee is exported. Pop. 200,000.

**Port Bannatyne** (formerly Kamesburgh), vil. on the E. coast of the is. of Bute, Scotland, 2 m. N.N.W. of Rothesay. It is a holiday resort. Pop. 700.

**Port Chester**, tn. in Westchester co., New York, on Long Is. Sound, 26 m. N.E. of New York city; it is a popular summer resort, and manufs. shirts, stoves, plumbers' supplies, iron goods, etc. Pop. 23,000.

**Portcullis** (Lat. *porta*, gate, and Fr. *coulisse*, groove), strong grating of timber or iron which was constructed to slide in vertical grooves in the joints of entrance gates; it was of lt. origin. The vertical bars were generally of iron or tipped with iron.

**Port Darwin**, see DARWIN.

**Port-de-France**, see NUMÉA.

**Port de Paix**, tn. and port of Haiti, W. Indies, 100 m. N. of Port-au-Prince; it produces coffee. Pop. 15,000.

**Port Elizabeth**, seaport and second city of Cape Prov., S. Africa, on the W. shore of Algoa Bay, 18 m. S.E. of Uitenhage. It is of great commercial and industrial importance. The tn. of P. E. may be said to date from the arrival of the 1820 settlers, but as a military station it dates back to the end of the eighteenth century. Fort Frederick, which overlooks the city, was built in 1799 and named after the duke of York. Designed for a garrison of 380 men, and mounting eight 12-pounders, the fort is believed to be the oldest building of Brit. construction in Africa S. of the equator. In 1820, 3423 Brit. settlers were landed in Algoa Bay, whose sandy shores and bleak hillocks were at that time only relieved by a few huts clustering around the blockhouse of Fort Frederick. The tn. was at once laid out by order of the acting governor of the Cape, Sir Rufane Donkin, and a stone pyramid, seen on the hill near the lighthouse, was erected by him in memory of his deceased wife, Lady Elizabeth. 'One of the most perfect of human beings, who has given her name to the town below.' The geographical position of P. E. makes it at once the main export and import gateway of the Union of S. Africa. It has risen to be the leading industrial city in the country, with a magnificent harbour, which is equipped to handle any type of freight, including locomotives, double-decker buses, etc. There are some 400 industrial undertakings in the city, producing over £22,000,000 of goods annually and paying wages of over £5,000,000 per annum. It is the largest wool-exporting port in the country, and wool brokers handle the greater part of the entire S. African wool clip. It is a leading citrus export centre with special pre-cooling facilities at the docks. The city is a premier footwear manufacturing centre of S. Africa. Both the General Motor and the Ford factories are estab. in P. E. and are the largest assembly plants for motor-cars in the

country. The Firestone factory and the General Tyre and Rubber Company are two of the largest tyre firms in S Africa, while other ancillary firms to the motor industry include the manu of batteries, glass, and electric light bulbs. P E has a number of fine modern municipal buildings, and Rom Catholic and Anglican cathedrals. There is a world famous snake park and the unique Addo National Park is situated 32 m from the city. P E has greatly advanced in importance since 1949. Pop 156 300 (Euro pean 74 700).

smuggler, Wilson, P and his soldiers fired on the mob, killing six. For this P was tried and condemned to death. He petitioned for a reprieve but was executed on the gallows by a body of men in disguise who dragged him forcibly from prison. P and his wife figure in Scott's *Heart of Midlothian*.

Port Glasgow, tn on the S shore of the firth of Clyde 20 m W N W of Glasgow, Renfrewshire Scotland, made a burgh of barony in 1669. It has a world wide reputation for shipbuilding and ship repairing. Other industries include iron

Port Elizabeth Publicity Association

#### PORT ILLIZIBETH, CAPT PROVINCE

**Porter, Endymion** (1757-1849), Eng loyalist and groom of the king's bed chamber b in Gloucestershire was a devoted follower of both Charles I and Buckingham. He accompanied the king to Spain in 1623, and was employed on diplomatic missions. He took a leading part in the enterprise of Wm Courten to gain a footing in Madagascar which ended in disaster. Se. life by Dorothea Townshend 1897.

**Porter, Jane** (1776-1850), Eng novelist b at Durham she pub in 1803 her first book, *Thaddeus of Warsaw* a popular success second only to that of the better known *Scottish Chief* (1810).

**Porter, William Sydney, sr** HENRY O.

**Porter**, kind of beer of a dark brown colour and bitterish taste, brewed from malt partly charred or browned by drying at a high temp. See also under BREWERY.

**Porteus, John** (d 1736) Capt of the city guard of Edinburgh, gave his name to the 'P riots'. At the hanging of a

and brass foundries textile, rope plastic and needle manufacturing. Pop 21 000.

**Portsmouth**, seaside place in Glamorgan-shire Wales, it exports both iron and coal. Pop 10 000.

**Port Hudson**, vil on the E b of the Mississippi R in E Baton Rouge Louisiana U.S.A. famous as a Confederate strong hold in the Amer civil war Gen Gardner commanding thearrison succeeded in holding out until Vicksburg capitulated (July 4 1863). P H surrendered on July 9 1863 with its garrison of 8000.

**Port Huron**, city and co seat of St Clair co Michigan U.S.A. situated on the St Clair R about 5 m N.E. of Detroit. It manufactures machinery and engines and is engaged in shipbuilding, possessing six dry docks. It has fibre and paper plants, and automobile and aeroplane manufs. Pop 33 000.

**Portici**, tn of Campania Italy on the bay of Naples, about 41 m S.E. of

**Naples.** Part of the city is built on the site of Herculaneum. Pop. 26,000.

**Portico,** ambulatory or vestibule, at least partially open on one side, supported by columns regularly spaced. Ps. are generally attached as porches to a building, but sometimes form a separate structure.

**Portimão,** or *Villa Nova de Portimão*, seaport tn. of Portugal, 27 m. E.N.E. of Cape St. Vincent. It manufs. cork goods. Pop. 8000.

**Portioners,** in Scots law, the equivalent of the Eng. co-parceners (*q.v.*), or female heirs-at-law.

**Portions,** term used to denote the pecuniary provision made in a 'strict settlement' of real estate for the younger children of the marriage. The machinery for raising P. is to vest the property in trustees for a number of years with power to sell so much as may be necessary to produce the specified amount (*see also* HOCHPORT). In practice the tenant-in-tail usually raises the money in whatever mode is most convenient to him, and on doing so the trustees and younger children join in surrendering the term of years vested in the trustees to him. *See* LAND LAWS.

**Portishead,** holiday resort of Somerset, England, 8½ m. W.N.W. of Bristol on the Severn estuary. Pop. 4500.

**Port Jackson,** magnificent natural harbour on one of the coves of which, on the S. shore, was founded the city of Sydney, New S. Wales. It is an inlet about 1½ m. long and has an area of about 22 sq. m. The so-called Parramatta R. is really the largest arm of the harbour or inlet. P. J. was so named by Capt. Cook after Sir George Jackson, one of the secretaries to the Admiralty. Cook, however, does not seem to have discovered its potentialities, having in fact only passed near it and landed in Botany Bay, 6 m. to the S. It was the site chosen for the foundation of Sydney by Capt. Phillips, who transferred the people under his command from Botany Bay as unsuitable for settlement to near the site of the present city of Sydney (Jan. 26, 1788).

**Port Jervis,** city in Orange co., New York, U.S.A., 88 m. N.W. of the city of New York. It has railroad works and iron foundries, and manufs. gloves, glass, and silk. Pop. 10,200.

**Portland:** 1. Largest and chief commercial city of Maine, U.S.A., co. seat of Cumberland co., 150 m. N.E. of Boston, on Casco Bay, an inlet of the Atlantic Ocean. The Grand Trunk, Boston and Maine, and Maine Central Railways all unite at this city. There is a fine harbour and a regular transatlantic service, also many coastal lines. Large marble and stone quarries are in the vicinity. P. manufs. screens, canned goods, boxes, boots and shoes, paving brick, paint, and varnish, and has important fisheries. There are large shipbuilding yards. It is also a summer resort. P. was first settled in 1832, when known by the Indian name of *Machigonne*; it was burnt by the Brit. in the revolutionary war, but rebuilt a few years later. It was the cap. of Maine

from 1822 to 1832. Pop. 74,000. 2. Largest city of Oregon, U.S.A., co. seat of Multnomah co., on the Willamette R. about 40 m. from the Pacific coast. It lies on both sides of the riv., and is connected by sev. fine bridges. The busiest part of the city is on the W. side of the riv., where the streets run parallel, but the rest of the city is built on a regular plan, the streets crossing each other at right angles. P. has an extensive harbour and good commercial advantages and a large trade is carried on in lumber, grain, and other merchandise. P. was founded in 1815. There are fine views from the higher parts of the city of Mt. Rainier and

British Museum

#### PORTLAND VASE

Mt. Hood. Public buildings include the medical and law depts. of the univ. of Oregon, Columbia Univ. (Itom. Catholic), and Reed Institute. Pop. 305,000.

**Portland, Battle of,** fought in 1653 between an Eng. fleet under Blake, Deane, and Monk, and a Dutch under Van Tromp, De Ruyster, and Evetgen. It resulted in a victory for the Eng., but the losses on both sides were heavy.

**Portland Beds,** middle series, underlying the Purbeck beds and resting on the Kimmeridge Clay, of the Upper Jurassic Oolites. They attain a thickness of about 300 ft. on the Dorset coast (Portland), and contain characteristic fossils, e.g. *Ammonites (Oilesteophanus) giganteus*, *Cerithium Portlandicum*, and *Trigonia Gibbosa* are of economic importance for the Portland building stone.

**Portland Canal,** fjord on the W. side of N. America which forms the boundary between Alaska and Brit. Columbia. It is 60 m. in length, and is bordered by mts. varying from 3000 to 7000 ft. in height.

**Portland, Dukes of**, *see* BENTINCK.

**Portland, Isle of**, peninsula of the coast of Dorsetshire, England,  $4\frac{1}{2}$  m. in length, connected with the mainland by the Chesil Bank. It is known for its Boreas Institution (formerly prison), penal estab. (formerly military barracks and fortress), harbour of refuge, and building stone. It contains P. castle, built by Henry VIII. in 1520, and an anc. fortress ascribed to Wm. Rufus. Pop. 12,000.

**Portland Vase**, beautiful specimen of Gk. art, made of dark-blue glass ornamented with figures in relief in white enamel. It is  $9\frac{1}{2}$  in. high and  $7\frac{1}{2}$  in. in diameter, and has two handles. Cameos of white enamel, depicting mythological figures, are raised on its surface. It was discovered in a marble sarcophagus at Monte del Grano, near Rome, in the seventeenth century, and was placed in the Barberini Palace, but was purchased by Sir Wm. Hamilton in 1770 who sold it to the duchess of Portland for 1800 guineas. It subsequently became the property of the duke of Portland, who in 1810 lent it to the Brit. Museum, where it was broken by a maniac in 1845; it was, however, skilfully repaired. It was put up by the duke of Portland for sale at Christie's in 1929, but withdrawn at the bidding had reached 29,000 guineas. After having been on loan for 136 years, it was sold to the Brit. Museum in 1946.

**Port Lincoln**, tn. on the W. shore of Spencers Gulf, S. Australia. It is the main port for Eyre peninsula and is a popular tourist resort. Pop. 3000.

**Port Louis**, or **Isle of France**, fort. tn. and cap. of Mauritius, on the W. coast. It stands in an excellent harbour, and is the chief commercial port of the is., exporting coco-nut oil sugar and aloe fibre. Nearly all the trade of Mauritius passes through P. L. It is also a coal-station for the Brit. Navy. Pop. 69,500.

**Port Macquarie**, seaport tn. of New S. Wales, at the mouth of the R. Hastings. Pop. 1500.

**Portmadoc**, seaport tn. in Carnarvonshire, Wales, 16 mi. S.S.E. of Carnarvon. P. is a centre for excursions in N. Wales, and the adjoining Borth-y-Gest is a popular holiday place. Pop. 1200.

**Port Mahon**, cap. and prin. seaport of Minorca, on the E. coast of the is. It is a harbour, naval station, and also one of the chief places of quarantine of Spain. The chief exports are grain, livestock, and fruit. Pop. 18,000.

**Port Melbourne**, formerly called Sundridge, port of Melbourne, Australia. Pop. 13,500.

**Port Moresby**, important port of entry, in Papua. It has grown rapidly since New Guinea became an Australian mandate. There are regular steamboat services to Sydney. There is a wireless telegraph station and a supreme court. It was frequently raided by Jap. bombers in the Second World War. There are copper deposits in the vicinity. Pop. 3500. *See further under PAPUA.*

**Port Nolloth**, seaport of Cape Prov., S. Africa, 50 mi. S.E. of the Orange R.; it

exports copper and is a railway terminus. Pop. 1500.

**Porto**, dist. of Portugal, in the prov. of Entre Minho-o-Douro. It takes its name from Oporto, the chief tn. It is level near the coast, but the E. is hilly. Area 880 sq. m. Pop. 938,300.

**Porto Alegre**, city of Brazil, at the mouth of the Jacuhy, on the N.W. extension of the Patos lagoon. It is the cap. of the prov. of Rio Grande do Sul, is a bishop's see, and contains a cathedral and other important buildings. It has a private univ. The harbour has been much improved by land reclamation work. Textiles, chemicals, and food products are manufactured, and cattle, salted pork and beef, cereals, tobacco, and yerba mate are exported. Many new buildings, both commercial and residential, have been built on the reclaimed land, and P. A. is now one of the most modern cities in Brazil, with two civil airports. Ocean liners call at P. A. and there is a large riv.-trade with the agric. colonies in the N. of the prov. Pop. 321,700.

**Portobello**, seaside tn. on the S. shore of the frith of Forth in Scotland, 3 m. E. of Edinburgh. According to tradition the name was given to it by one of Adm. Vernon's seamen who was present at the taking of Porto Bello in Central America. The long stretch of sand and the excellent golf course make it a popular resort. The pop. is included in that of Edinburgh of which it forms a part for purposes of municipal administration.

**Porto Bello**, or **Portobello**, tn. in the central Amer. republic of Panama, on the isthmus of Panama, in Colon prov., on P. B. Bay. The present tn., built in 1584, occupies the site of a colony estab. by Columbus, Nombre de Dios (1502). It was sacked by Drake in 1572, by Henry Morgan in 1668, and by John Spring in 1680. It was captured more than once by the Eng., Adm. Vernon taking it in 1739. It lies at the end of an old paved road to Panama along which gold was brought for shipment. Pop. 500.

**Porto d'Anzio**, *see* ANZIO, PORTO D'.

**Porto Empedocle**, tn. in the prov. of Girgenti, Sicily, 3 m. S.S.W. of Girgenti. It exports sulphur. It was captured by the Allies in the Sicilian campaign of 1943 (*see under ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS ON*). Pop. 11,200.

**Porto Ferrajo**, or **Portoferraio**, tn. of Italy, in the prov. of Leghorn, cap. of Elba is. It is to the N. of the is. The two houses used by Napoleon in exile still exist. P. F. maintains one of the naval commands left to Italy after the Second World War. Pop. 5200.

**Port of London Authority**, body empowered under the Port of London Act, 1908, to control the docks and shipping of the Thames from the Isle of Sheppey to Teddington, where the riv. comes under the jurisdiction of the Thames Conservancy. The Act thus created a public trust to take over and administer as one unit all the docks and the whole of the tidal portion of the riv. The Act was the

outcome of the report of a royal commission appointed some years previously to inquire into the whole subject of London's port facilities. For a long time disputes had been frequent between dock proprietors and lightermen and wharfingers, who used the quays, but claimed exemption from liability to pay towards their upkeep. Competition between dock-owners, too, was not always advantageous to shippers, and there were complaints of congestion and chaos. The P. L. A. took over the docks from these companies at a capitalised value of £23,000,000. It was granted powers to impose dues on imports and, to a certain extent, on exports, but care was taken that there should be no duties on goods brought in from other countries intended for re-export, in view of London's great business as an international port and of the importance to the country's mercantile marine of developing still further the business of transhipment. The P. L. A. is responsible for the extension and upkeep of the docks, for dredging the river, and for the orderly control of traffic. It consists of twenty-eight members, ten of whom are appointed the remaining eighteen elected. The Admiralty appoint one member, the Ministry of Transport two, the L.C.C. four, the City of London Corporation two, and Trinity House one. The other eighteen members are elected by the payers of port dues and charges, wharf-owners, and the owners of river craft. The Authority have power, if they think fit, to appoint a chairman and a vice chairman who is not an appointed or elected member of the Authority. The members who are men of business and technical experience, hold office for three years and are unpaid. The P. L. A. is self-supporting and is neither subsidised by the Gov. nor by the local municipal authorities. The Authority's revenue is derived solely from dues and charges for the accommodation provided for vessels and goods and for services rendered. There are no shareholders in the usual meaning of the term. Holders of port stock receive fixed rates of interest. The P. L. A. controls 35 m. of deep-water quays, 150 m. of railway lines, and an enormous acreage of warehouses, transit sheds, and vaults. When the Authority first took over their duties in 1909 a series of comprehensive programmes for the improvement of the river and docks was taken in hand at an expenditure of approximately £20,000,000. The main improvements included the provision of adequate river facilities, the extension of the areas of the dock systems, the construction of channels and the King George V. dock, dry docks, new sheds, refrigerated warehouses, pumping installations to increase the depth of water in some of the docks, floating cranes and grain elevators, etc. A more recent and extensive programme included the complete modernisation of the Royal Victoria Dock, new quays and warehouses at other docks, electrification of berths, and the provision of improved roads, railways, and equipment. The Authority are neither importers nor

exporters of merchandise but custodians only of the goods they handle. They report upon weight, quality, and condition; sort produce to qualities and marks; open packages for inspection, and perform many other expert marketing operations on behalf of merchants. Foremost amongst the various river services which the Authority maintain must be placed the dredging service which has made and maintains the broad approach channel from the estuary into the heart of the port. There is now a good navigable channel, 1000 ft. wide with a general depth of 30 ft. at mean low water spring tides, from the estuary to Cold Harbour Point, a distance of about 35 m. Vessels of 6500 tons gross register now proceed as far as London Bridge. Vessels which draw up to 37 ft. have used King George V. Dock 40 m. from the sea. This has involved the raising and removal of 47,000,000 tons of material at a cost of £2,000,000. Other services are the Harbour Service which patrols the river to control traffic; the Wreck Diving Service, with full equipment of modern plant, and experienced divers; the Mooring Service, which has its own plant for laying and overhauling public moorings. The P. L. A. offices are at Trinity Square, London, E.C.3. Sir John Anderson was elected chairman in 1949.

Port of Spain, or Spanish Town, maritime town, of the W. Indies, cap. of Trinidad, situated on the N. of the river on the site of the old Indian vil. of Conquerable, on the shores of the gulf of Paria. It superseded San José d'Oruna (St. Joseph) in 1783 as the cap. during the Sp. tenure of Trinidad. It is one of the finest and cleanest towns in the W. Indies. The streets are well laid out and lighted by electricity, and there are electric trams on the main thoroughfares. There are two cathedrals: the Rom. Catholic cathedral, founded in 1816 but only opened in 1832, and Holy Trinity Cathedral, founded 1816 and consecrated in 1823. On the W. side of Woodford Square is the handsome gov. building, or Red House, rebuilt and enlarged in 1903. In this building are the legislative council chamber, the prin. court of justice, and the colonial secretariat. On the N. side of the square are the public library, containing over 25,000 vols., and the tn. hall, the latter an interesting example of old Sp. colonial architecture. It contains oil paintings of Abercromby, Picton, and others celebrated in the annals of Trinidad. The Royal Victoria Institute, destroyed by fire in 1920 and rebuilt in 1922, contains lecture, reading, and recreation rooms; there are a number of spacious parks. The Imperial College of Tropical Agriculture was estab. in P. of S. in 1921. The harbour of P. of S. is safe but shallow. It exports not only all the produce of the is., but also re-exports goods from Venezuela. The prin. exports are copra, rum, petroleum, sugar, asphalt, cocoa, and coco-nuts. Angostura bitters are manufactured. Pop. 107,500.

Porto Grande, or Mindello, tn. on the N.W. side of St. Vincent, Cape Verde Is.

It has an excellent harbour, and is a coaling station.

**Portogruaro**, tn. in the prov. of Venice, Italy, 27 m. S.W. of Udine. Pop. 22,200.

**Porto Leone**, see *Pizazzus*.

**Porto Maggiore**, tn. in the prov. of Ferrara, Emilia, Italy, 13 m. S.E. of Ferrara. In the Second World War the par. church was destroyed, and a Madonna by Domenico di Paris and a Pietà by Mazzoni were lost. Pop. 26,200.

**Porto Maurizio**, or *Imperia*; 1. Mountainous prov. of Italy, bounded on the S. by the Mediterranean. It has an area of 455 sq. m., and produces fruit, wine, and olives. Pop. 150,000. 2. City of Liguria, cap. of the above prov. on the Ligurian Sea, about 46 m. from Nice and 2 m. from Oneglia, with which it forms one com. It is famous for its olive oil. Pop. 28,000.

**Porto Novo**; 1. Tn. on the Coromandel coast, Madras, India, 30 m. S. of Pondicherry, and the scene of the defeat of Hyder Ali in 1781. Pop. 19,000. 2. Cap. of Duhomey, W. Africa, a Fr. possession. Pop. 27,500.

**Porto Praia**, or *Villa da Praia*, tn. on the S.E. coast of Santiago, Cape Verde Is., of which it is the cap. Pop. 28,000.

**Porto Rico**, see *P.R.*, 1000.

**Portoviejo**, tn. of Ecuador, on the R. P., 105 m. from Guayaquil and 400 m. from Quito. Hats and baskets are made and tropical produce grown. Pop. 15,000.

**Port Phillip Bay**, fine bay on the S. coast of Victoria, Australia. It is about 30 m. long. Melbourne lies at its S. end.

**Port Pirie**, seaport of S. Australia, on Spencer Gulf, 136 m. S.W. of Adelaide. Ore and wheat are exported, and there are smelting works for the Broken Hill silver-lead mines. Pop. 12,000.

**Portraiture**, art of reproducing the likeness, real, idealised, or conventional, of someone by artistic means. This is of very ant. origin, and is to be found in the ant. Assyrian, Egyptian, and Gk. civilisations, though among these it generally took the form of sculpture. Apollodorus, the Gk. painter, was the first to reproduce light and shadow in P. The painted mummy cases are some of the earliest examples of portraits in the modern sense of the word. In Pompeii, portraits in fresco have been found, and Rom. portraits from the second century A.D. were painted with coloured wax, laid on to thin pieces of wood in solid bodies of the same tint, and were cut to fit on mummy cases. Examples of this P. have survived from the tombs of Alexandria, together with a small framed portrait. Much Rom. P., as with earlier peoples, consisted of busts and statues. The portrait busts from life in Africa will stand comparison with the best classical work which they vividly recall. Giotto made the first true attempt at P. (e.g. Dante), although Cimabue before him is said to have painted St. Francis 'from nature'. Breaking away from the conventions of MS. painting, Fra Angelico in his paintings introduced figure portraits of Pope Nicholas V. and the Emperor Frederick. Gozzoli, his pupil, in *The*

*Journey of the Magi*, painted a picture composed of contemporary portraits. The art of P. is to be found in figure-painting. Hogarth, in *The Rake's Progress*, also portrayed his contemporaries. In P. proper, however, the persons are represented for their own sake, and on design and the placing of the sitter the success of the portrait depends. Two early portraits are Richard II. in Westminster Abbey, and King John II. of France, painted by Gérard d'Orléans in 1359. By the end of the fourteenth century P. was becoming a separate art in N. Europe, and was further developed by J. Van Eyck, Albrecht Dürer, and Hans Holbein (fifteenth and early sixteenth centuries). Roughly speaking the earlier painters were concerned more with the exploration of the particular shapes of the face as later topographical painters explored landscape. Their interests and business lay with the outward appearance of the man, though this statement must be modified considerably in the case of Holbein. But the later Is. Leonardo da Vinci, Raphael, Titian, Veronese, Tintoretto, brought to an already dignified sitter an atmosphere of grandeur and social magnificence. Rubens and Van Dyck were not slow to learn the lesson and their influence continued in the Eng. school through Reynolds, Gainsborough, Lawrence, and Raeburn, while Hogarth remains homely and does not put on airs. Rembrandt, who knew the painting of Rubens, and who studied Titian and Tintoretto, stands in a class apart. None, with the exception of Titian, stand near him. Rembrandt's insight into the minds and characters of his sitters, whether young or old, is beyond all others, and his means of expression is resourceful and most perfect.

The Fr. school is represented by Jean Fouquet, Clouet, Rigaud, Van Loo, Toqué, De la Tour, Rosalba Carriera, Vigée-Lebrun, David, Ingres, and Verneet, and many excellent but lesser men. Holbein was one of the first portrait painters to use the coloured crayon. He left many drawings in charcoal or chalk line, and after him the coloured crayon drawing became more complicated and led to the wonderfully polished performances of the eighteenth-century pastellists (La Tour, Liotard, Chardin). Mention must be made of the miniature painters (see *MINIATURE PAINTING*) whose skill is unsurpassed. Miniature paintings are executed in water colour applied to thin sheets of ivory, or other white substance, in minute dots of colour. The portraits would appear to be excellent likenesses. The decorative effect is lovely and jewel-like. In England N. Hilliard and I. Oliver (Elizabethan) were pre-eminent.

Modern portrait painting shows a decline. Photography has been a serious rival in the field of 'likeness' and has taken the edge off the 'side of the portrait-painter's art. Many of the conventions of portrait painting have worn thin and some fields have been exhausted by the great painters, as Rembrandt or Van Dyck. The state portrait is a thing of

the past and the technique dead. Sitters now are treated rather as still-lives (the influence of Cézanne). The best modern portrait seems to be that in which the sitter is taken unawares in his natural setting, on the lines of Legas and the early Gauguin. A fine example is the 'Victor Lecour' of Walter Sickert. The bronze portrait busts by Epstein are a great contemporary contribution. See W. Wätzoldt, *Die Kunst des Porträt*, 1908; B. Johnson, *Figure Drawing and Portraiture*, 1931; R. H. Goodall, *Guide to Successful Portraiture*, 1933; H. Murray, *Portrait Painting in Oils*, 1936; W. Hager, *Meisterbilder der Dürerzeit*, 1942; K. Scheffold, *Die Bilder der antiken Dichter, Redner und Denker*, 1943; J. Erith, *Erith on Portraiture*, 1948; and M. J. Friedländer, *Landscape, Portrait, Still-life*, 1949.

**Port Royal**, seaport tn. on the is. of Jamaica, W. Indies. It is a fort. tn. with naval dockyards.

**Port-Royal des Champs**, former Cistercian convent, 8 m. S.W. of Versailles. In the seventeenth century it became the headquarters of Jansenism (*q.v.*). In 1709 the remaining members of P.-R. were expelled and the buildings destroyed by order of Louis XV. See A. Arnauld, *Mémoires pour servir à l'histoire de Port-Royal* (ed. B. de la Bruyère), 1742; C. A. Sainte-Beuve, *Port-Royal*, 1901; H. Clark, *Strangers and Sojourners in Port-Royal*, 1932; and H. Landenbach, *Chroniques de Port-Royal*, 1946.

**Port Said**, important coaling station and tn. built on the W. bank of the entrance to the Suez canal, with a commodious harbour and discharging bawn. It has a large canal trade, and exports cigarettes, salt, cotton, and hides. Pop. 124,700.

**Portsea Island**, is. off the coast of Hampshire, England. It lies between Portsmouth harbour and Langstone harbour, two inlets of the Eng. channel; the S.W. part of the is. is occupied by the great naval station of Portsmouth, Portsea, Landport, and Southsea.

**Port Seton**, E. Lothian, see COCKENZIE.

**Port Shepstone**, port of entry situated at the mouth of the Umzimkulu R. in Natal, S. Africa. Its chief products are tea, sugar, and fruit.

**Portslade-by-Sea**, seaside tn. 4 m. from Brighton, Sussex, England. It has a polish manufacturing works and a mineral water factory, and a few light industries. Pop. 13,500.

**Portsmouth, Earls of**, are of a family called Wallop, settling in Hampshire before the Conquest. John (1690-1762) early ingratiated himself with the Hanoverians and became Baron Wallop and Viscount Lynton, 1720, and first earl of P., 1743. The fourth earl took the name Fellowes. The fifth reverted to Wallop. His son, Newton (1856-1917), was a Liberal M.P. from 1880 till he became sixth earl in 1891; he was under-secretary for war, 1905-8.

**Portsmouth and Aubigny, Louise Renée de Kéroualle, Duchess of** (1649-1734), mistress of Charles II. of England.

She was the elder daughter of Guillaume de Penancoët, sieur de Kéroualle in Brittany, and came to England in the train of the duchess of Orléans, 1670. On July 29, 1672, she bore to the king Charles 'Lennox,' afterwards first duke of Richmond. In 1673 she was made (*inter alia*) duchess of P. In 1671 the king of France made her duchess of Aubigny. She was the agent of Louis XIV., and was the only mistress of Charles who exerted any serious political influence on him.

**Portsmouth**, important city, seaport, and naval station covering Portsea Is. and extending on to the mainland of Hampshire, England, 74 m. S.W. of London. On the opposite side of the harbour is Gosport (*q.v.*). P., which was made a city in 1926, includes Landport, Portsea, Southsea, and Cosham. The harbour has a narrow entrance, but afterwards expands into a basin 1 m. by 2 m. It is spacious enough to accommodate a large part of the R.N. and to float the heaviest ship in it. The old *Victory*, Nelson's flagship, was moored in the harbour until 1920. In 1923 she underwent a thorough restoration and is now permanently berthed in the oldest dry dock in the world. A system of fortifications surrounds P., defending the chief naval arsenal of Great Britain. The forts on the Isle of Wight and Portsdown Hill and those standing in Spithead complete the perimeter. The dockyard covers an area of nearly 300 ac., has twelve docks ranging in depth from 21 to 36 feet, dry docks, building slips, a school of naval architecture, and many estabs. connected with the production of the requirements of the navy. In 1923 the torpedo school (H.M.S. *Vernon*) was transferred from old ships to new buildings on the Gun wharf. At Whale Is. (H.M.S. *Excellent*) there is a great gunnery school; on the E. of Portsea Is. are the Tipner magazine and barracks; the Eastney Royal Marine barracks lie at the E. end of Southsea, which is a popular holiday resort and watering place, with a modern pier. From the 5 m. of sea-front fine views can be obtained of the Isle of Wight and the famous Spithead roadstead, the scene of important naval reviews. The trade of P. is chiefly connected with the dockyard, the airport and its factories, the building of ships and motor boats, and varied commercial undertakings. The business of Southsea is largely devoted to the interests of the hotel and catering industry for the many thousands of tourists and holiday visitors who come annually to enjoy the amenities. In 1924 P. was made the seat of a new diocese of P. and the Isle of Wight, the old church of St. Thomas à Becket in High Street, which dates from about 1180, becoming pro-cathedral.

Among eminent sons of P. were the writers Charles Dickens, Captain Marryat, George Meredith, Sir Walter Besant; the painters W. L. Wyllie, George Cole, and his son Vicat; the engineer Sir Isambard Brunel; Jonas Hanway, the philanthropist; and John Founds, the crippled cobbler, who devoted himself to the teaching of the poor ragged children

of the neighbourhood and thereby inaugurated the Ragged Schools Union.

Richard Coeur de Lion granted P. its first charter in 1194. By the opening years of the thirteenth century P. had become a naval station of some importance, the docks, enclosed by a strong wall, accommodating the royal galleys. It was plundered by the Fr. three times in the fourteenth century. Its importance as a naval dockyard commenced about 1545. In that year the Eng. fleet assembled at P. prior to the naval engagement with the Fr. off Spithead. It was in P., in 1623, that Felton assassinated the duke of Buckingham. In 1662 the marriage of Charles II. with Catherine of Braganza took place at P. The registers of the cathedral of St. Thomas record the marriage, which, however, was celebrated at the nearby Domus Dei or chapel of the garrison, now temporarily used in place of the ruined church of St. Thomas à Becket. Adm. Byng was executed here in 1757, and, in 1782, the *Royal George* went down with Adm. Kempenfelt and nearly 1000 men. In Sept. 1805 Nelson and his fleet departed from P. for Trafalgar. In June 1918 F.-M. Lord Montgomery unveiled a memorial of the departure of the D-Day invasion force. The memorial consists of a block of stone similar to the road blocks along the Brit. highways in the war. It stands in the garden facing Southsea beach, overlooking the waters through which the D-Day armada sailed on June 6, 1944.

P. was frequently raided by Ger. bombers in the Second World War, being a very important military target. It was one of the tns. to receive the first and last bombs from the Gers., the first raid being in July 1940 and the last raid in May 1944 just before the attack on England by guided missiles replaced the use of bombing planes. Altogether, P. had sixty-seven air raids. Many of them were quite severe, but the major attacks took place in Aug. 1940, and Jan. 10 and March 10, 1941. P. was a city of some 70,000 buildings, and 65,000 of them suffered some kind of air raid damage, many of them on more than one occasion. No fewer than 6650 buildings were totally destroyed. Amongst the buildings destroyed was the splendid guildhall, which was gutted by fire in 1911, and a number of buildings in the historic High Street. P. had a serious housing problem before the Second World War. In 1943 the city council decided to reduce the city's pop. within its present boundaries from 216,000 to 150,000 and to develop a new tn. at Leigh Park. In 1949 some 1250 houses were under construction, but disagreement between city and co. led the Ministry of Tn. and Country Planning to advise them to commission a consultant to review the problems of the whole area around P., including Gosport, Havant, and Fareham. The task fell to Mr. Max Lock, whose outline plan for the P. dist. recommends abandonment of the P. city's projected new tn. at Leigh Park, while accepting a great part of the city plan's other features. The Max Lock plan also

holds that the city can comfortably accommodate 196,000 people. A prominent feature of the plan is the finding of new sites by expanding partially developed places into complete small tns.: Lee-on-Solent would be enlarged from 4000 to 11,300 people, and Fareham from 16,000 to 28,000; while the straggling suburbs of Waterlooville, Purbrook, and Widley, which have 9000 people, would grow into a tn. of 33,350. Pop. 218,300.

**Portsmouth:** 1. Seaport city of Virginia, U.S.A., on Elizabeth R., in Norfolk co., opposite the city of Norfolk. It has sev. manufs., and near by is the U.S.A. naval shipbuilding yard. P. has paper, cotton, and hosiery mills, oil refineries, fertiliser factories, smelting and chemical works. Pop. 50,700. 2. City and cap. of Scioto co., Ohio U.S.A., situated at the confluence of the Scioto with the Ohio, 110 m. E.S.E. of Cincinnati. It is a centre of the iron and steel industries, and makes shoes, furniture, and stoves. Pop. 40,500. 3. City and cap. of Rockingham co., New Hampshire, U.S.A., and a seaport on the Atlantic, 50 m. N. of Boston. The treaty of peace terminating the Russo-Jap. war was negotiated here in 1905. Its greatest prosperity existed before the decline of the W. India and China trade, carried in sailing ships. It possesses outstanding examples of eighteenth-century Amer. architecture. There is a U.S.A. navy yard. The navy yard of P. is on two is. (Fernald's and Savery's) opposite the tn., but is included in the tn. of Kittery, Maine. The prin. industry is the manuf. of footwear. Pop. 14,800.

**Port Sudan,** seaport of Egypt, on the Red Sea, 40 m. N. of Suakin. The harbour was opened in 1909 by the khedive. It exports cotton, gums, salt, and ivory. Salt pans here supply the whole needs of the country. There is railway communication to Berber on the Nile. Pop. 25,000.

**Port Sunlight,** model vil., 3 m. S.S.E. of Birkenhead, Cheshire, England, founded in 1888 by W. H. Lever (later the first Viscount Leverhulme) to house the employees of his soapworks. The P. S. soap factory is now the largest of its kind in the world. The vil. contains some 550 houses and flats and includes a church, schools, hotel, theatre, vil. halls, and shops. It is also the home of the Lady Lever Art Gallery, built by the founder of P. S. in memory of his wife.

**Port Talbot,** small port in Glamorgan-shire, Wales, 7 m. E.S.E. of Swansea. It has a good coasting trade and a fine dock. There are coal mines and copper works. Pop. 41,000.

**Port Tampa,** seaport of Florida, U.S.A., in Hillsborough co., on the peninsula separating Old Tampa Bay from Hillsborough Bay. It is the deep-water port for Tampa (q.v.), 9 m. N.E. There are oil and coal bunkers, and the chief exports are phosphate and lumber. Pop. 1200.

**Port Townsend,** co. seat of Jefferson co., Washington, U.S.A., on Puget Sound, 40 m. N.N.W. of Seattle. It is a port of entry and customs station, and has

considerable trade in lumber, agric. produce, and fish. There are boiler works, foundries, and pickling and canning works. Pop. 4,700.

**Portugal**, republic of W. Europe, occupying one-fifth of the Iberian peninsula. It is bounded on the N. and E. by Spain, and on the W. and S. by the Atlantic Ocean. In shape it is a parallelogram, its greatest length being 362 m., and its breadth varying between 80 and 140 m. The total area is 35,401 sq. m., which includes the areas (1236 sq. m.) of the Azores and Madeira Is., recognised as an integral part of the republic. P. is divided into eleven provs.: Algarve, Alto Alentejo, Baixo Alentejo, Beira Alta, Beira Baixa, Beira Litoral, Douro Litoral, Estremadura, Minho, Ribatejo, and Trás-os-Montes e Alto Douro. It has a seaboard of nearly 500 m. The coast is low, flat, and unbroken, the only important promontories being capes Mondego, Carvoeiro, Roca, Espichel, Santa Maria, and St. Vincent. The prin. mts. are continuations of Sp. ranges. The mts. of Galicia are continued S. into the Transmontane system (Peneda, 4723 ft.; Marão, 4642 ft., etc.), lying between the Rrs. Minho and Douro in the N. of Portugal. Between the Douro and the Tagus there extend two ranges, the N., including Montemuro (1534 ft.), and the S., the Sierra da Estrella (6540 ft.), a W. continuation of the Sp. Sierra Guadarrama system. S. of the Tagus and between it and the Guadiana are many isolated mt. masses, among the most lofty peaks being Fôla (2962 ft.) and Ossa (2128 ft.). Much of the scenery is extremely beautiful. The rivs. already mentioned have their sources in Spain, and flow through P. to the Atlantic. The Mondego, the longest wholly Portuguese riv., rises in the Sierra da Estrella, and has a length of 130 m. Smaller rivs. are the Vouga, Sado, Lima, Cavado, and Mira. The rainfall is heavy, especially in the N., and the climate temperate and equable, except in the valleys, where the summer is excessively hot, and malaria and fever prevail on account of the swamps and the salt marshes. The geology, fauna, and flora of the country differ little from those of Spain (q.v.). Lisbon is the cap., having a pop. of 709,200; Oporto, the second city, has a pop. of 262,300. Other mcs. are Funchal, 51,900; Coimbra, 35,100; Setúbal, 35,000; Braga, 29,900; and Évora, 21,900. The total pop. of P. is 8,312,200 (including the Azores and Madeira).

**Constitution and Justice.**—Until 1910 P. had a hereditary monarchical form of gov. In that year, after a short revolution, a republic was estab. Its constitution provided for a bi-cameral legislature under a president elected for four years. In 1933, this was superseded by a new constitution, adopted by plebiscite. This provided for an authoritarian republic on a corporative basis. The president is elected for seven years by direct vote of the electors and is assisted by a privy council. There is a single-chamber legislature of ninety members elected for four years, but in practice the candidates are

almost exclusively nominated by the gov. party. There is also a corporative chamber composed of representatives of commercial corporations and local authorities, whose chief function is to advise on legislation. Portuguese constitutional law is hostile to liberal principles. Article 8 of the constitution, however, defines under a score of heads the rights of the Portuguese citizen, some of which are liberal in tendency. Half of them deal with the citizen's ordinary rights before the law (e.g. no arrests without charge; the right to be defended in court, etc.). The rest are the right to good name and reputation; liberty of religious beliefs and practices; freedom in the choice of work or profession, and freedom of association. The liberty of expressing opinions and holding meetings is, however, liable to control by an amendment of the constitution. The gov. maintains a strict hold on any movement which, in its view, is inimical to the national interest or the foundations of the 'New State'. The family, rather than the individual, is the unit of which the state is composed; next comes the guild or corporation. The corporations are not only trade and industrial organisations, but also bodies engaged in science, literature, etc. (*see also* CORPORATIVE STATE). Within the corporation, employers and employed form a single guild. The representatives of the corporations form the corporative chamber. All Bills and motions, projected treaties and conventions, must be submitted to the corporative chamber before being discussed and voted on in the assembly. The ministers are appointed by the president of the republic. They need not be members either of the corporative chamber or of the assembly; if they are, they may not sit in their respective chambers during their term of office. The gov. exercises legislative authority to a considerable extent when the assembly is not in session. It depends on the confidence of the president, and its retention of office does not depend on the fate suffered by its Bills or on any vote of the assembly.

P. is divided into 154 *comarcas* for judicial purposes. In each *comarca* there is a lower court; in the *comarca* of Lisbon there are nineteen, and twelve in that of Oporto. There are three courts of appeal. The Supreme Court has its seat at Lisbon.

**Communications.**—The state owns all of the 2216 m. of railway lines. There were in 1917 16,000 m. of roads and over 6650 of telegraph lines. The merchant marine numbers about 950 vessels with a combined tonnage of 314,000. Air services from Lisbon connect P. with all parts of the world.

**Defence.**—The army is maintained by conscription, every Portuguese male between twenty and forty-eight being liable for service. The period of general training is twenty-eight years, the first six of these being with the active units. Pre-military training is entrusted to the Portuguese Youth Movement. Continental P. is divided into four areas for military purposes, these being Lisbon,

Coimbra, Oporto, and Lvoia. There are sixteen infantry regiments besides artillery, ordinary and mechanised cavalry, etc. Equipment and training are generally most modern. The navy consists primarily of six sloops, five destroyers, six submarines and four gunboats. Many of the Portuguese naval vessels are of Brit manufacture. A naval air force was established in the First World War. During the Second World War it consisted of about fifty machines.

**Production.** P is a fertile country except in the most mountainous areas and more than 60 per cent of the pop is

Portuguese Travel Agency

#### CASTLE OF LOUÇA (FOURTEENTH CENTURY)

A medieval stronghold on a hill overlooking a valley  
fifty miles from C

engaged in agriculture. Methods, however, are frequently primitive though the Salazar Gov. has done much to encourage the adoption of modern machinery and about 5 per cent of the land fit for cultivation has not yet been developed. Of cultivated land 84 per cent of the land is cultivated for cereals, pasture, etc., 26 per cent for timber, 6 per cent for fruit trees and 5 per cent for vineyards. Vines are widely grown and wine is the most important product. Other products are maize, rice, wheat, tomatoes, olives, figs, onions and oranges. The forests yield principally pine, oak, chestnut, and cork. Cork is a prime export, since P produces more of it than all the other countries of the world combined. The production of resin and turpentine derives from P's forest production. P possesses great mineral wealth including anthracite, coal, copper, iron, lead, sulphur, tin, wolfram and

many manganese, iron pyrites, slate, and basalt. But the mines are not worked to capacity because of the shortage of electric power. Lisbon and Oporto are the prime industrial towns, the chief manufactures of the country being soap, flour, tobacco, cork, olive oil, cement, textiles, gold and silver filigree and food canning. *Cesulejos*, or porcelain tiles, are made. This ancient industry is a Moorish inheritance, and the tiles are widely used in both the exterior and interior decoration of buildings of all kinds. There are porcelain factories at Sagres, Vista Alegre, Gaya and Coimbra. The mining industry at Scabul is very important. Lisbon is the centre of the shipbuilding trade. The heavy wine trade necessitates large cooperages. The chief exports are sandalines and other preserved fish, wine, cork, fruit, vegetables, timber, cotton, olive oil, wolfram, resin, iron and tin ore and pyrites. In 1947 Portuguese exports were valued at £306,941,000 and imports in the same year at £146,214,000, a surplus of £160,727,000. In 1948 Great Britain imported Portuguese goods to the value of £5,307,070. Portuguese imports of Brit goods totalled £25,536,183.

**Religion.** — Roman Catholicism is the state religion. There are 650,000 Catholics in Braga and Lvoia. Other religious creeds are tolerated. The Church suffered most at the period when it was identified with the unpopular monarchy and aristocracy. A bitter anticlericalism characterised the Liberal political movement of the nineteenth century which culminated in the revolution of 1910 and the establishment of the republic. The Church was disestablished and its property sequestered, yet the new order did not bring the expected national regeneration and economic prosperity. Since 1924 there has been a reaction against anticlericalism. The (Salazar) Salazar regime is frankly Christian in character and its public association with the Church appears popular. The separation of Church and State was maintained in the 1933 constitution. The Concordat with the Holy See signed in 1940 restored buildings and property to the dioceses and parishes. Religious marriages were to be civilly recognised and divorce of parties married by the Church forbidden. The Catholic Shrine of Our Lady of Fatima is in P.

**Education.** — Primary education is free and compulsory for children between seven and fifteen. In 1947 there were 10,248 primary schools with 533,400 pupils and 43 secondary schools divided into *liceus* and technical colleges. There has been compulsory primary education in theory since 1911 but it is not enforced adequately, and the numbers of schools and teachers are also inadequate. In 1947 49 per cent of the pop over seven years of age was illiterate. Secondary education (although limited to a high standard) the number of pupils at secondary schools in 1947 was about 20,000. 2,000 attended private schools. There are three univs. with various faculties at Coimbra, Lisbon and Oporto.

There are training colleges for teachers in the most important tns., commercial schools, a military and naval college, eccles. seminaries, and colleges for music and art. There were 8600 univ. students in 1947. A technical univ. was founded at Lisbon in 1930: it had nearly 3000 students in 1947.

**Colonies.**—The prin. dependences and colonies of P. are, in *Asia*: Goa, Macao, Timor; and in *Africa*: Cape Verde Is.; Principe and St. Thomas Is., Guinea, Angola, and Mozambique. The Portuguese empire is the oldest colonial empire in the world. It has an area of over 800,000 sq. m., and a pop. of nearly 11,000,000. Goa (*q.v.*), in India, became a Portuguese possession in the sixteenth century, a result of the wave of missionary and trading enthusiasm then sweeping P. It has an area of 1400 sq. m. and a pop. of 624,000. The largest Portuguese colonies are Angola (*q.v.*) with 485,000 sq. m. and 3,000,000 inhab. and Mozambique (*q.v.*) with 297,731 sq. m. and about 5,085,600 inhab. These two African dependencies with their harbours, which are regularly used by Brit. shipping, have been developed extensively since 1928. Every effort has been made to utilise their mineral and agric. resources, and communications have been greatly improved. They have important railways which give access to Lobito Bay, Beira, Lourenço Marques, Mafeking, and Komati Port.

**History.**—The early hist. of P. practically coincides with that of the whole of the Iberian peninsula. The sway of Carthage (third century B.C.) gave place to that of Rome. Lusitania, comprising that part of P. which lies S. of the Tagus, was formed into a Rom. prov. during the Augustan period, and the country prospered under Rom. rule. From the fourth to the eighth century it was overrun by hordes of Alani, Suevi, Visigoths, Saracens, and Arabs in succession, and it was not until the twelfth century that a kingdom was estab. Ferdinand of Castile and his son Alfonso VI. won back the ter. forming the country of P. from the Moors. Alfonso Henrique, grandson of the latter count, maintained throughout his lifetime a state of continual warfare on the Galician frontier. In 1143 he obtained for P. the status of an independent kingdom. In 1147 he captured Santarem and Lisbon from the Moors and made the latter his cap. He was succeeded by Sancho I. (1185–1211), who was engaged during the earlier part of his reign in war with the Moors and with Alfonso IX. of León, and later, by his encouragement of local self-government, won for himself the title of *O Porador* (founder of cities). He opposed the claims of Innocent III., but in 1210 submitted to papal authority. Alfonso II., the Fat (1211–1223), is notable as the first king to summon the Portuguese cortes. Sancho II. (1223–48) drove the Moors from Alentejo, and won many successes in Algarve. He was forced to abdicate in favour of his brother, Alfonso III. (1248–79), who proclaimed himself rei (king). He extended his kingdom to Algarve, and strengthened

it by marrying the daughter of Alfonso X. of León and Castile. Thus the kingdom of P. reached its present European boundaries.

Diniz (1297–1325) devoted himself to the constitutional and social reconstruction of his kingdom. He encouraged agriculture, industrial arts, commerce, and maritime enterprise, and was a patron of learning, founding the univ. of Coimbra in 1290. He negotiated a commercial treaty with England (1294) and formed a royal navy. Alfonso IV. (1325–57) was chiefly occupied in wars with the Castilians and Moslems, while his successor, Pedro I., the Cruel (1357–1367), endeavoured to lessen the tyranny of the nobility and clergy. The claim of Ferdinand (1367–85) to the throne of Castile was contested by Henry of Trastámara. Ferdinand allied himself with the Aragonese and Moors and with England. On his death the Burgundian line came to an end, and the cortes asserted its right to elect the new king, choosing John I. (1385–1433), an illegitimate brother of Ferdinand, and the first of the house of Aviz. In 1385 the united Portuguese and Eng. forces defeated the Castilians at Aljubarrota. The Anglo-Portuguese alliance was confirmed by the treaty of Windsor (1386); and John cemented the friendship between the two countries by marrying in 1387 Philippa, daughter of John of Gaunt. During his reign the period of expansion overseas and of geographical enterprise began with the capture of Ceuta on the N. coast of Africa, in 1415, by his son Prince Henry the Navigator (*d.* 1460). In the fifteenth and sixteenth centuries there was a period of discoveries which made P. at one time the greatest maritime country in the world. Prince Henry and his captains explored the Atlantic and the W. coast of Africa. They doubled Cape Bojador (1433), and discovered Madeira and the Azores (1442), Senegal (1445), and Cape Verde (1446). The first consignment of slaves was brought to Lisbon in 1481. The Cape of Good Hope was doubled by Bartholomew Diaz in 1486, and Vasco da Gama reached India in 1497. In 1500 King Emanuel (Manuel) assumed the title of 'Lord of the conquest, navigation, and commerce of India, Ethiopia, Arabia, and Persia,' and in the same year, Portuguese settlements were made in Brazil and on the W. coast of India. Gaspar and Miguel Corte-Real reached Greenland in 1500, and fresh colonies were made in E. and N. Africa. Albuquerque conquered Goa (1510) and Malacca (1511); the Portuguese dominion in the Malay Archipelago was founded (1512–14), and commercial relations were entered upon with China (1517) and Japan (1512).

At this time P. was at the height of her power. Her commercial enterprise knew no limits, and Lisbon was recognised as the great centre of oriental traffic. Her fall was due to the persecution and later expulsion of the Jews, who contributed greatly to the wealth of the country, and to the introduction of the Inquisition

(1536) and of the Jesuits (1540). In 1578 the country suffered an overwhelming disaster in the defeat and death of the young King Sebastian, grandson of John III. (1521-27), at Alcazar-al-Kebir. Sebastian was succeeded by his uncle, the senile Cardinal Henry, last of the Aviz dynasty. Among the many claimants to the crown was Philip II. of Spain, who in the confusion and disaffection marched boldly into the country and had himself crowned king. From 1581 to 1640 P. remained under the Sp. suzerainty, thus becoming involved in the wars in the Netherlands and Germany. England and Holland seized the Portuguese possessions in S. America and the Malay Archipelago. After sev. insurrections, P. regained her independence, and John, duke of Braganza, a descendant of Emanuel I., was crowned John IV. in 1640. England recognised the Braganza dynasty when Charles II. married Catherine of Braganza in 1661. This confirmed the friendly relations between the two countries, which dated back to a treaty of 1373. The country became involved in a colonial war with Holland, and a more serious conflict with Spain. In the reign of Alfonso VI. (1656-83), son of John IV., the Sp. were defeated at Elvas (1659), Ciudad Rodrigo (1664), and Montes Claros (1665), and the war concluded with the treaty of Lisbon (1668). The Anglo-Portuguese alliance was renewed by the treaty of Methuen (1703), and P. became involved in the war of the Sp. Succession. P. had lost all her important colonies except Brazil, and was no longer one of the chief powers in Europe. Pombal, a minister of Joseph (1750-77), did his utmost to restore the kingdom to its former position by strengthening the monarchy and encouraging colonial development. He expelled the Jesuits (1759), organised education, and carried out reforms in the defence of the country. On the accession of the mad Queen Maria I., he was deprived of office (1777), and P. relapsed to its former condition. In 1792 Maria's son, John, was appointed regent. In the European war which broke out at the end of the century Dom John obtained substantial aid from Great Britain against Spain and France, but in 1807 left P. for Rio de Janeiro. His act was followed by the Fr. occupation of P. and the crowning of Joseph Bonaparte at Madrid, resulting in the Peninsular war (q.v.), which continued till 1811. In 1816, on the death of Maria I., John VI. succeeded to the throne, but remained in Brazil, appointing Marshal Beresford as his viceroy. The discontent which this caused among his subjects resulted in a revolution (1820) and the estab. of a democratic form of government. John hastened back to Lisbon, and promised to obey the 'constitution of 1822.' Meanwhile Brazil had obtained complete independence, with Dom Pedro I. (q.v.) as constitutional emperor. On the death of John VI. (1826) Pedro, who was now Pedro IV. of P., estab. the basis of the constitution which remained in force until 1910,

and then, returning to Brazil, abdicated in favour of his seven-year-old daughter, Maria da Gloria, who ruled with her uncle Miguel as regent. The latter headed a reactionary movement, and with the aid of the nobility, military, and clergy, proclaimed himself king in 1828. With the help of Brit. troops, Pedro re-estab. his daughter, reintroducing the constitution of 1826. But the emperor died the same year, and a period of misrule and confusion followed, the government being alternately in the hands of the Septembrists and Carlists. The constitutional party owed much of its victory, in 1834, to Eng. support and protection. Maria's son, Pedro V. (1833-61), was succeeded by his brother Luiz I. (1861-89).

Towards the end of the nineteenth century P. realised, a little too late, the value of her African possessions, and was obliged to cede some of her ter. in E. and W. Africa, giving up her claim to Nyasaland in 1889. In that year Carlos I. ascended the throne, and was assassinated with the crown prince in 1908. His second son, Manuel II., was de throne in Oct. 1910, and the republic was proclaimed on Oct. 5. The Provisional Gov. was under the presidency of Dr. Braga, who in Aug. 1911 was succeeded by Dr. Manuel de Arriaga, the first president of the constitutional republic. A royalist counter-revolution under Pablo Couceiro (Sept. 1911) was suppressed and also an extremist 'Red' revolution in Jan. 1912. The 'Reds' and the Royalists were not represented in the first Congress; the strongest party were the Democrats, into which Alfonso Costa had transformed the fighting revolutionary force, the Carbonario. After three ineffective coalition Cabinets, Costa became in Jan. 1913 a relled dictator, who, however, respected parl. forms. In Feb. 1914 he was succeeded by Bernardino Machado, whose policy was conciliatory. In the First World War royalist P. sympathised with Germany, and the Republicans with the Allies. On Dec. 9, 1914, the pro-ally Premier, Machado, was succeeded by Azevedo Coutinho. The non-interventionist president, Arriaga, allowed the Gers. to engineer a neutralist *coup d'état* (Jan. 1915) which unde Gen. Phelinto de Castro a dictator, but in May he was overthrown. Dr. Braga became provisional president, being succeeded in Aug. by Dr. Machado. In Nov. Costa returned to power, and his allowing the Allies the benefit of interned shipping caused Germany to declare war, March 9, 1916. P. had been traditionally allied to England for five centuries. P.'s chief theatre of war was E. Africa, while Gen. Termagnum commanded the Portuguese Expeditionary Force in France. A war Cabinet was formed by Dr. Almeida, including Costa, who formed his own Cabinet in April 1917, but a Lisbon insurrection in Dec. drove both Costa and president Machado out of office. Brachamps became provisional president and Major Paes, leader of the revolutionaries, Premier, later (May 10, 1918) being elected president, but was assassinated

In Dec. 1910, Bernardino de Sá formed a ministry with Silva Antunes as provisional president. In Jan. 1919, Conceição Estab. a Royalist Gov. at Oporto but was suppressed. In Aug. Dr. Almeida was elected president. During 1920 there were nine successive cabinets and a revolution in Oct. 1921. In 1923 Almeida's presidency terminated and Teixeira Gomes succeeded him. He attempted reconciliation in politics but financially P's bankruptcy threatened also her colonial possessions. On Dec. 11, 1925, the venerable Dr. Machado was

re-elected president in 1935, 1942 and 1949 but Salazar was in fact the prime force in P. During the Second World War P. remained neutral but in 1943 under the treaty of 1873 he granted Britain facilities to set up air and naval bases in the Azores. Britain handed back these bases in June 1946. Salazar's benevolent dictatorship has been apparently popular and responsible in character. The assembly set up under the constitution of 1933 provided a form of safety valve but with the excesses of the later monarchy and of the

Portuguese Tra el Agency

OPO110

THE LEBEIRA QUAY AND THE DOURO BRIDGE OVER THE DOURO

again elected president but in July 1926 his powers were transferred to Gen. Gomes da Costa who had engineered a successful revolution until his air by Gen. Carmona who then became a military dictator. On March 25, 1928, he was elected president. The finance minister, Dr. Salazar, abolished nominal and treaties of commerce were signed with Estonia and Finland and of arbitration with the U.S.A. (1929). A new ministry came in on Jan. 20, 1930 with Gen. Oliveira as premier and President Carmona continued his mild dictatorship despite protests against it which led to revolt and revolution in Madeira and the is. of the Azores (April 1931).

In 1932 Salazar became Prime Minister. Between Sept. 1944 and Feb. 1947 he also held the post of foreign minister

republic till in his mind Salazar had not been prepared to entrust any substantial measure of power to an elected body and that of the assembly is very limited. It has been able to criticize candidly however and has frequently done so on points of detail. In 1949 Portugal participated in the N. Atlantic Treaty. Public opinion seemed to welcome the change but not as a significant change but merely as a logical continuation of a policy pursued for many years. The presidential elections of 1949 during which censorship of the press was considerably relaxed, passed off peacefully a striking contrast to elections held at the beginning of the twentieth century. The opposition candidate, Gen. de Matos, eventually withdrew his nomination. The opposition gave no sign that they could sustain a peaceful parliament regime, and

the opposition presidential candidate, though a respected statesman of liberal traditions, offered little constructive criticism of the gov. and had no programme of his own. Consequently, it was impossible to gauge either the extent of the opposition, or the basic causes underlying it. Subsequent assembly debates suggested that these included discontent with gov. policy on educational and agrarian matters and on the Angola administration.

P. has remained a poor country with a low standard of living. The Salazar Gov. recognised that without greater industrialisation little can be done to raise the general standard of living, and put forward an ambitious scheme of public works and plans to develop power schemes. A series of hydro-electric works connected with dams on the Rts. Cavado and Zezere were begun with the same object, to be completed in the early 1950s. The electrification of all the railways is under consideration, and a number of new deep-water docks planned for the port of Lisbon. One of the many new roads contemplated or under construction involves the building of a large bridge over the R. Tagus at Vila Franca do Xira.

**Language and Literature.**—Portuguese, a branch of the Roman branch of languages, has grown out of Lat. dialects spoken in the prov. of Lusitania at the time of the Rom. occupation, and through the influence of the Saracen invaders an Arabic element was later introduced. Portuguese is strictly connected with Gallego, the dialect of the old kingdom of Galicia. With the growth of national pride in P., the language became more differentiated from the other Romance tongues of the peninsula. Portuguese is spoken by about 8,000,000 people in P., by about 44,000,000 in Brazil, by about 10,000,000 in the Portuguese colonies of Africa, about 1,000,000 in Asia, and about 1,500,000 in Oceania, apart from the 'pidgin' Portuguese varieties in Africa, India, and S.E. Asia. Gallego is spoken by about 3,000,000 people in N.W. Spain. The reign of Alfonso III. saw the production of many troubadour songs, the oldest collection being the *Cancioneiro da Ajuda*. The royal patronage of bards was continued by his son, King Diniz (1279-1325), himself the author of numerous trovas and pastorals. The early court poetry is preserved in the *Cancioneiro Geral* (1516), compiled by Garcia de Resende (1470-1536). Throughout the fourteenth and fifteenth centuries many prose chronicles, lives of saints, and genealogical registers were written, and the legends of Arthur, Merlin, Amadis of Gaul, and other heroes of chivalry, legends which permeated the literature of W. Europe, early penetrated into P. Portuguese drama went through the natural stages of religious play, morality, farce, and comedy. The founder was Gil Vicente (1470-1536), who gathered round him many disciples, including Alfonso Alvarez, Antonio Ribeiro, Antonio Prestes, and Balthazar Dias. Antonio de Ferreira (1528-69), author of *Inez de Castro*, was a superb writer of tragedy. The old Provençal traditions of

poetry gave place to the classic influence which spread from Italy through Spain. Sá de Miranda (c. 1485-1558), poet and dramatist and founder of the classic schools, was strongly influenced by contemporary It. literature. His *Comedias* (1550), written in collaboration with Antonio de Ferreira, became, like his poems, popular in Lisbon. The new classic poetry did not, however, grip the people at large, and was confined in its popularity to court circles.

But with the growth of maritime and commercial prosperity, new life was fused into the literature of P., and the patriotism of the people found expression in Camoens's *The Lusads* (1572), a great national epic. The epic form became popular, and Camoens had many imitators, among whom may be mentioned Peroira de Castro (1571-1632), Sousa de Macedo, Sá de Meneses (d. 1661), and Garcia de Mascarenhas. During the years of Sp. rule (1581-1640) the national spirit received an overwhelming blow which necessarily affected the literary output. For a time even Portuguese was abandoned in favour of Sp. In the seventeenth century, however, some good histories were written, notably by Brandão (d. 1637) and de Meneses (1673-1743). In the early eighteenth century Fr. influence prevailed with most Portuguese poets, but the general standard of taste was raised by the two poets, F. M. do Nascimento (1731-1819) and Manoel du Bocage (1767-1805), who endeavoured to purify and enrich the language and to preserve the early national traditions. The early nineteenth century witnessed a spirit of revolt against the outworn forms, and a general revival of letters. The chief exponents of the Romantic movement in P. were J. B. Gomes (d. 1831), J. A. de Macedo (d. 1831), N. T. da Almeida (d. 1811). Of the nineteenth century and modern poets the most notable are A. de Castilho (1800-1875), J. de Almeida Garrett, the dramatist (1799-1854), J. de Barros, Palmirim, Magalhães, and Soares de Passos; among the historians are Hierculano (1810-79), Varnhagen, P. da Silva, Luz Soriano, and Oliveira Martins. The novelists of the nineteenth century are represented by Rebelo da Silva and Eça de Queiroz (d. 1900), and of the twentieth century by Emanuel Ribeiro and Raul Brandão. The political conflicts of the first three decades of the twentieth century caused some decline in Portuguese literary standards, the poet Eugénio de Castro (b. 1869) being an exception to this rule. But after 1930 a modern school of literary artists grew up, combining some features of Fr. and Amer. literature with a basis of intense nationalism, and retaining the essentially Portuguese preoccupation with the spiritual. This school includes Fernando Pessoa, Camillo Pessanha, José Régio, Almada Negreiros, Gaspar Simões, and Maria Archer.

**Art.**—There are some Rom. remains in P., notably at Évora, where there are impressive ruins of a temple to Diana. Truly Portuguese art, however, dates from a later period. One of the finest

examples is the Romano-Gothic cathedral at Evora (1185-1204). Numerous religious buildings in Lisbon, Coimbra, and Oporto illustrate the development of Portuguese Gothic, the purity of line being particularly notable. Portuguese art of the late fifteenth and early sixteenth centuries was much influenced by Moslem and Burgundian styles. Under these influences, there evolved an artistic pattern differing considerably from the styles generally prevalent outside the Iberian peninsula at the same period. The master craftsman of Manueline style was João de Castilho, and fine examples of his work can be seen in Evora, Elvas, Coimbra, and Cintra. The combination of Burgundian lavishness of detail and Moslem simplicity of architectural forms, grafted on a basis of late European Gothic, results in buildings which are both exquisitely decorated and yet fundamentally simple, having a sometimes almost ethereal quality. Though Portuguese baroque is of a high standard, it never attained the quality of Manueline, and later Portuguese art was generally inferior. In the twentieth century, official government encouragement has been given to native artists and architects, and many of the characteristics of the Manueline style have been incorporated into modern buildings.

**Music.**—P. is noted for its folk music, though it was not until the nineteenth century that musicians began to incorporate folk-themes into their work. This folk-music shows Moorish and troubadour influences. Portuguese music otherwise tended to be modelled on Sp. forms. Among composers inspired by their native music may be mentioned Luiz Freitas Branco, Viana da Motta, and Rui Coelho.

**Portuguese East Africa**, see MOZAMBIQUE.

**Portuguesa**, state of W. central Venezuela, N. of Zamora, named after the riv. of the same name. It is an agric. state, sugar, coffee, maize, and cocon being the chief products. Guayare is the cap. Pop. 87,200.

**Portuguese Guinea**, colony of Portugal, on the coast of Senegambian, W. Africa, comprising the Bisagos Is., in the Atlantic. It has an area of 11,300 sq. m. Balamã is the cap.; Bissau is the chief port. The chief exports are ivory, palm oil nuts, rubber, rice, and wax. Pop. 351,000.

**Portuguese India**, three dependencies of Goa (q.v.), on the Malabar coast; Damão, on the coast 100 m. N. of Bombay; and Diu (q.v.), a small is., about 130 m. W. of Damão. Goa, or Pungim, is the cap. There are manganese deposits near Mormugão. Fish, salt, coco-nuts, and copra are exported. Area 1537 sq. m. Pop. 625,000.

PORTUGUESE MAN-OF-WAR

**Portuguese Man-of-War**, name given to the species of *Physalia*, a genus of Hydrozoa, or jelly fish, remarkable on account of their brilliant colours, size, and the severity of the pain its members are capable of inflicting on the human skin. Portuguese West Africa, see ANGOLA.

**Portus Plendum**, see under SANTANDER.  
**Port Wine**, dark-red, full-bodied wine made in Portugal and exported from the tn. of Oporto, from which it takes its name. The grapes from which P. W. is made do not belong to any one variety, but the distinctiveness of the wine depends upon the climate and soil of the dist. and the methods of cultivation and vinification. The P. W. dist. is the Alto Douro, a region along the R. Douro, about 40 m. long and 10 m. wide. The dist. is very mountainous, and the soil, kept in place by stone-walled terraces, consists mainly of clay-schist and granitic material. The climate is extreme, hot summers alternating with cold winters, accompanied by heavy rains. For the most part the vines are allowed to grow quite close to the ground. The grapes are carried away in baskets, their stalks are removed, and the fruit trodden in large stone vessels for more than twenty-four hours. Fermentation is allowed to proceed to a certain extent in the stone vessels, the skins being trodden after an interval to procure the characteristic dark colour. The wine is then removed to vats and about 10 per cent of its volume of good brandy added. In the winter the wine is racked and more brandy added; another racking takes place in the spring, and the wine is stored in casks for export. The restricting of fermentation by the addition of brandy causes a large percentage of sugar (7 to 15 per cent) to remain in the wine, while there is usually from 18 to 22 per cent of alcohol. The development of the P. W. trade has been effected by means of Brit. capital, and for many years Great Britain received the greater part of the exported product.

**Port Winston Churchill**, name given to Arramanches, Normandy, where allied troops landed on June 6, 1944.

**Porvoo**, see BONGA.

**Posadas**, tn. of Argentine, cap. of the Misiones dist., on the Alto Paraná R., 700 m. from Buenos Aires. Yerba maté and tobacco are grown in the vicinity. Near by are the ruins of the old Jesuit missions, from which the prov. of Misiones derived its name. Pop. 40,000.

**Poseidon**, in Gk. mythology, god of the sea and son of Chronos and Rhea. He was identified by the Romans with their god Neptune. P. married Amphitrite, and had sway over the sea, the winds, and earthquakes, his symbol of power being a trident. His palace was at the bottom of the sea, near Aegæ in Kubera, where he kept his chariot and his stud of horses. He built the walls of Troy, but, not being rewarded for his work, he showed implacable hatred towards the Trojans. He contended with Athens for Attica, and conspired against the sovereignty of Zeus.

**Poseldonium** (c. 135-51 B.C.), Stoic philosopher, b. at Apamea in Syria. He was a pupil of Panætius. He travelled considerably, visiting Rome in 86 B.C., and was the teacher and friend of Cicero.

**Posen**, see POZNAN.

**Posilipo**, volcanic mt. to the N.W. of Naples, penetrated by the tunnel called

Grotto of P. (755 yds. long) connecting Naples with P. (anc. Puteoli), supposed to have been built during the Augustan period, and by the Grotto of Sejanus (990 yds.), built by M. Cocceius Nerva in 37 B.C. at the command of Agrippa. In the vineyards near its entrance is the alleged tomb of Virgil.

**Positive Rays** were first discovered in 1886 by Goldstein during experiments with discharge tubes containing rarefied gases. He noticed that luminous streaks passed through holes in the cathode in the tube, and he named these streaks *Kanalstrahlen*. J. J. Thomson revealed the nature of these streaks, and finding them to consist of positively charged particles, he renamed them P. R. Thomson used a discharge tube with a perforated cathode, and the rays were made to pass through an electric field and a magnetic field successively. The fact that the rays were deflected in these fields proved that they consisted of charged particles; the direction of the deflection proved that the charges were positive, and measurements of the deflections produced by the electric and magnetic fields enabled Thomson to compute the ratio of the charge to the mass of the particle. He thus estab. the fact that the particles were ionised atoms, i.e. atoms minus one or more electrons, and as the electronic charge was known he was able to determine the mass of the atom in question. Subsequent experiments with an improved form of Thomson tube by Aston led to the important discovery that most chemical elements really consisted of a mixture of simpler elements. The simpler elements had identical chemical properties, and were named *isotopes*, but their atomic weights were different. Chlorine, for example, consists of two isotopes having atomic weights 35 and 37 respectively. Any sample of chlorine is made up from a mixture containing these isotopes in proportions that never vary, and the atomic weight of chlorine determined by chemical means is found to be 35.5. Aston's result has explained many anomalies in the periodic classification of the elements, and it has confirmed the hypothesis that all atoms are built up of the same bricks—electrons and protons. See J. Aston, *Isotopes* (2nd ed.), 1921. See also ISOTOPIES.

**Positivism**, philosophical system which restricts itself to the data of experience, rejecting all *a priori* and metaphysical speculation. In the seventeenth century Hume confined himself to the sphere of observation. He considered causal relations as merely what experience has led man to expect. While not denying absolute reality he declared it outside the scope of his perfect system. The true founder of P., however, was Auguste Comte (q.v.), who owed much to Saint-Simon. P. starts from the assumption that knowledge is based solely on the methods and discoveries of physical science, and attempts the revaluation of social and moral values in the light of the exact sciences. Comte adopted a 'religion of humanity' akin to Nietzsche's idea of Superman, and proposed to dethrone the

gods of existing religious beliefs and raise the welfare of mankind as the object of worship. There exists a positivist church with ritual and organisation which has been aptly described by Huxley as Catholicism without Christianity. See A. Comte, *General View of Positivism* (trans.), 1908; G. Delermine, *J. Comte et son œuvre, le positivisme*, 1909; and H. Gouhier, *Jeunesse d'A. Comte et la formation du positivisme*, 1933-36.

**Positivism, Logical**, school of philosophy arising out of the work of Bertrand Russell. Its fundamental propositions, briefly stated, are three in number. Firstly, the meaning of any statement about the everyday world is the method by which its truth is verified through sensations; thus 'this is a picture' means that sensations of colour, hardness, coldness, etc., are being produced. Secondly, and following from the first, there is no meaning in theological or metaphysical statements, because these are *not* made about the world which is experienced by the senses. There can be no meaning in statements about the nature of God, because His existence cannot be verified by sense experience. Thirdly, and again following from the first, propositions concerning aesthetics or ethics e.g. that 'stealing is wrong' or that 'Keats's poetry is beautiful,' contain only the expression of a subjective emotion and do not say anything about the objects they purport to discuss, since 'poetry,' 'beauty,' 'evil,' etc., are not experienced by the senses. Though a movement of great influence, the doctrine has a profoundly destructive effect, since, if its propositions be granted, no theory about the nature of the universe can be offered. See A. J. Ayer, *Language, Truth, and Logic*, 1936, 1946, and C. E. M. Joad, *A Critique of Logical Positivism*, 1950.

**Posology** (*ποσος*, how much, *λογος*, science) science of quantity. The term was used by Jeremy Bentham in his system of classification of sciences. The science of the body, somatology, was divided by him into P., the science of quantity (i.e. mathematics), and potology, the science of quality. The modern use of the term P. is now confined to medicine, particularly homeopathy, where it means theory of dose. In the decimal system, the pure substance or pure tincture is denoted by  $\phi$ . To make the first decimal dilution ten grains of the substance are mixed with ninety grains of sugar of milk, or ten drops of the mother tincture with ninety drops of alcohol. The second decimal dilution, or 2X potency, is made by mixing ten parts of the first dilution with ninety parts of sugar of milk or alcohol, and so on. A centesimal system is also worked, the ratio of successive potencies being 1:100. Both systems of P. are associated with various branches of homeopathy.

**Posse Comitatus** (power of the co.). 'Raising the P. C.' is an ancient common law power inherent in any justice of the peace or sheriff to take of the co. any number of persons he deems necessary to accompany him in the pursuit, arrest, and imprisonment of traitors, felons, and

breakers of the peace. According to Blackstone everyone over fifteen years of age and under the grade of a peer is bound under pain of fine and imprisonment to obey the order. The power is never exercised at the present day.

**Possession**. It is safe to say that the whole field of legal theory contains no conception that has given rise to such difficulties as that of P. These difficulties are not merely academic, for the legal consequences of the acquisition and loss of P. are of great practical importance. Corporeal P., i.e. the P. of a material object, is defined by Salmond as the continuing exercise of a claim to the exclusive use of it. The subjective element consists in the intention (*animus possidendi*) to appropriate to oneself the exclusive use of the thing; the physical or objective, in the external facts which effectively realise or embody the intention. This realisation is derived as a rule from one or more of the following sources: (1) The physical power of the possessor; (2) the personal presence of the possessor; (3) sequecy; (4) custom; (5) respect for rightful claim, and (6) the manifestation, by entry, apprehension, and actual use, of the *animus domini* (intention to own). Incorporeal P., if it can be said to amount to P. at all, is the P. of any non-material object, e.g. a right to light or any other easement (*q.v.*) (see also INCORPORA, HEREDITAMENT; PRESCRIPTION). Physically, as no mere claim to exclusive use can be effective, it is essential in the case of incorporeal P. that the possessor exercise his P. by continuous use and enjoyment. On the whole, the authorities concur in calling corporeal P. the P. of a thing, incorporeal the P. of a right. In both civil and criminal law it is often of vital importance to distinguish P. from ownership, e.g. to differentiate larceny (*q.v.*) from false pretences (*q.v.*). Inhering's statement of the relation between P. and ownership may be adopted, viz. 'Possession is the objective realisation of ownership,' i.e. P. is in fact what ownership (Rom. *dominium*) is in right, or, in other words, 'Possession is the *de facto* exercise of a claim: ownership is the *de jure* recognition of one' (Salmond). A number of important consequences flow from P., e.g. it is evidence of ownership, and the possessor can put all other claimants to proof of their alleged titles (i.e. it is the proverbial nine points of the law); long P. in certain circumstances gives a complete title even as against the true owner (see PRESCRIPTION; LIMITATIONS, STATUTES OF); ownership may be transferred by mere transfer of P., e.g. in the case of certain negotiable instruments; a possessor having no title may often confer a good title on another, e.g. if a thief pays another man for goods with stolen coin. It may be noted that a widely accepted theory of P. is that of the celebrated jurist Savigny, to the effect that the essence of corporeal P. is the physical power of exclusion; but that, while at the commencement of P. present or actual physical power of using a thing oneself is requisite, mere ability to reproduce such

power at will is sufficient for the retention of P. once acquired. Salmon asks, 'What physical power of preventing trespass does a man acquire by making an entry upon an estate which may be some square miles in extent?' It is clear that in a civilised community physical force is only an alternative element in P., and that by no means the most important. The whole theory, indeed, has been attacked by Savigny's equally celebrated opponent, Ihering, in *Grund des Besitzes*. A great deal of gratuitous difficulty arises from confusing the physical power of the individual and the active or dormant physical force of the state, the one element being important in some cases, while in others, e.g. P. of land, the force of the state is the real guarantee of occupancy.

**Possession, Demoniac, see DEMON-  
OLOGY.**

**Posset**, hot drink of curdled milk, usually taken at bed time, to cure a cold or cough. The milk is boiled and curdled by the addition of some acid, such as wine, ale, sherry, vinegar, or lemon juice, and sweetened with treacle.

**Postage Stamp Collecting, see PHIL-  
ATELY.**

**Postage Stamp**, adhesive labels applied to letters, parcels, etc., handed to the post office for transit, and placed on the sev. packages, as a receipt for money prepaid for their carriage. Prior to the introduction of the penny post, as represented by the first adhesive P. S., the 1d. black and 2d. blue of 1840, Brit. postal rates depended on the distance a letter was carried, together with very stringent rules as to contents and weight. While a letter posted in London to a London address cost 2d., the fee rose by progressive stages, so that if it were carried for 20 m. it amounted to 6d. To take advantage of this rate a letter had to consist of only one sheet; if two sheets were used the rate was doubled, and if the letter weighed as much as 2 oz. the fee was seven times the minimum. These exorbitant charges greatly curtailed correspondence, and Rowland Hill believed that if the rate were lowered to a uniform charge of one penny for a letter of reasonable weight and the service reorganised (made possible by the coming of the railways) the increase in the use of the post would be so enormous as to justify fully such a drastic innovation. In 1837 he wrote a pamphlet entitled *Post Office Reform: its Importance and Practicability*, and gradually, with the help of James Chalmers, who submitted specimen stamps to him in 1838, persuaded the gov., who sponsored the necessary legislation. A public competition was held to decide the design of the proposed stamps, but though sev. thousand entries were received and four prizes awarded, yet the actual design settled upon, which was the joint work of Rowland Hill, Charles and Frederick Heath, Wm. Wyon, and Henry Corbould, was not one of those submitted. The profile of Queen Victoria, which forms the centre of the stamps, was taken from

a medallion of Wyon's struck in 1837 and resketched by Corbould.

The first adhesive P. S. ever to be issued in any country (originally they were called 'labels' and the gum 'cement'), 1d. black and 2d. blue, were put on sale on May 6, 1840, and despite much opposition and ridicule fulfilled, within a few years, Hill's greatest expectations. These two stamps, which for seven years were the only ones available in Great Britain (similarly, the first Federal stamps issued in the U.S.A., the 5 cents and 10 cents of 1817, sufficed America for four years), were line-engraved by Frederick Heath and printed by the firm of Perkins, Bacon, & Petch on paper, watermarked with a small crown, made by the firm of Stacey Wise. The 1s. stamp of 1847 was issued to meet the postal rate to the U.S.A. and some of the outlying colonies, being also the rate fixed for inland registration; the 10d. stamp of 1848 to meet the postal rate to France and some of the nearer colonies; the 6d. stamp of 1854 to meet the postal rate to Belgium and some other European countries. Soon afterwards postal rates for abroad began to fall; the 1d. stamp of 1855 represented the revised rate to France, the 3d. stamp of 1862 the revised rate to Belgium and Switzerland, the 9d. stamp of 1862 the revised rate to India, Australia, and Brazil. At one time or another Great Britain has issued stamps of the following values: 3d., 1d., 14d., 2d., 2½d., 3d., 4d., 4½d., 5d., 6d., 7d., 8d., 9d., 10d., 11d., 1s., 2s., 2s. 6d., 5s., 10s., £1, and £5. All these stamps were produced to fulfil specific needs, particularly as, for many years past, stamps have been valid for revenue as well as postal purposes. At one period, though this custom has long since been given up, current stamps were over-printed with the names and for the use of certain gov. depts.: Inland Revenue, Office of Works, Army, Admiralty, Board of Education, Gov. Parcels, and Royal Household. The first official stamp of this nature was a variant of the original black 1d. in the top corners of which the initials 'V R' replaced the Maltese cross of the normal stamp. This official stamp, however, though printed, was never put into service. The first 1d. stamp was printed from twelve different plates and the 2d. stamp from two different plates. In 1811 the colour of the 1d. stamp was changed to red, many new plates being added, and in the same year the 2d. stamp had a white line drawn on the design above and below the head and was reprinted in a different type of ink. One new plate was added.

The reason for both these changes was the fear that unscrupulous persons would delete the postmark (for years the post office experimented, earnestly but inconclusively, with a cancellation ink that could not be re-used) and thus be able to use stamps a second time. The black of the 1d. had made postmarks difficult to distinguish, while the ink used in the printing of the first 2d., unlike the ink used in the printing of the second, was not fugitive and thus did not reveal the

effects of erasure. Another method of defrauding the post office was to cut off the upper and lower portions of two stamps where the postmark did not show and to join these halves together so as to form an apparently unused stamp. This was met in 1858 by fitting the check letters on the stamps, which had hitherto filled only the two bottom corners, into all four corners: thus 'A B—B A.' As these check letters ran almost through

may be said with assurance that the danger has been largely eliminated. Only one Brit. stamp, the 1s. of 1872, has been forged for the purpose of defrauding the post office. This stamp was used mainly in the London Stock Exchange for brokers sending telegrams to their clients, and it was a clerk in the telegraph office there who perpetrated the forgery, which was not discovered till 1898, when he was already dead.

#### POSTAGE STAMPS: SOME FIRST ISSUES

1. 1840 *Great Britain*. The 1d. and 2d. of 1840 were the first two postage stamps ever issued.
2. 1843 *Brazil*. The first country to follow Great Britain's lead and issue postage stamps. The issue of 1843 consisted of three values: 30 reis, 60 reis, and 90 reis.
3. 1843 *Zurich*. This is a local stamp issued by the Swiss canton. The issue consisted of two stamps: 4 rappen and 6 rappen. Later in the same year Geneva also issued a stamp.
4. 1847 *United States of America*. These are the first two Federal postage stamps issued, though several cities had issued local stamps as early as 1845.

*By courtesy of Frank Godden Ltd.*

the alphabet, each stamp on the sheet of 240 exhibiting a different combination, the chance of two stamps being found with the same check letters was remote. Many other efforts were made, both in Britain and elsewhere, to counteract possible attempts at cheating, and in the sixties and seventies of the nineteenth century the U.S.A. even imposed a 'grill,' a mark like a hairrow, upon its stamps, in order to break up the ink of the postmark and render its removal impossible. But since the introduction of chalk-surfaced paper at the end of the nineteenth century, tampering with stamps has become much more hazardous, and though post offices never relax their vigilance, it

Up till 1854, when Henry Archer's many years of experimenting with a perforating machine were finally successful, and his machine was adopted by the post office, stamps were issued imperforate and had to be cut from the sheet as required. This was a laborious process, and next to the invention of adhesive P. S., it is probable that Archer's invention has done more to popularise the use of the post than anything else. The lead given by Great Britain in inaugurating adhesive P. S. was followed within a few years. The following countries, up to 1850, took advantage of the new system: 1843: Brazil (July); 1847: U.S.A. (Aug.); (from 1845 some cities in the

U.S.A. had issued local stamps), Mauritius (Sept.); 1849: Franco (Jan.), Belgium (July), Bavaria (Nov.); 1850: New S. Wales (Jan.), Spain (Jan.), Victoria (Jan.), Switzerland (April) (two of the Swiss cantons had issued local stamps in 1843 and one in 1845), Austria (June), Brit. Guiana (July), Saxony (July), Prussia (Nov.), Schleswig-Holstein (Nov.), Hanover (Dec.). By 1849 there was no state of any importance that had not its postal system and its P. S. The effect of the two world wars has been to create numerous new stamp-issuing states, but in the course of the P. S. more than one hundred years of existence many states that once issued stamps have ceased to function as separate entities.

The actual printing of stamps has undergone many changes and modifications. Some early stamps were hand-set, some (including three Brit. stamps) were embossed; many have been line-engraved and many have been lithographed. But the most general systems in vogue in later times have been surface printing, recess printing, and photogravure printing from cylinders. This last, especially, makes for combined speed, cheapness, and accuracy, but the stamps produced, though excellent examples of mass workmanship, cannot compare in beauty or dignity with the original line-engraved stamps printed on steel. The most famous firms of Brit. printers of stamps have been Perkins, Bacon & Petch, De la Rue, Waterlow, Nissen & Parker, Bradbury, Wilkinson & Company, Harrison and Sons, and Somerset House, where the post office printed certain issues.

In the production of the world's P. S. many different kinds of paper have been used, though by far the commonest are 'wove' and 'laid,' which may briefly be differentiated by the fact that wove paper has no lines in it, and laid paper has lines, although there are countless varieties of both. Many types of watermark have also been used, and though watermarking every paper is not a universal rule, every Brit. stamp, with the exception of the 1s. of 1847 and the 10d. of 1848, has been printed on watermarked paper, of which over twenty varieties have been employed. Again, many sizes of gauge and types of perforation have been tried and even various qualities of gum, though it should be mentioned that, just as early stamps were imperforate, some early stamps were ungummed. Monocoloured stamps are usually, though not invariably, printed from a single plate; but when the centre of a stamp has a different colour from the surrounding frame it has to be printed from two plates, and it sometimes happens that one of them gets reversed. As for the shape of stamps, although there have been many divergences from the normal, such as the triangular shape of the early Cape of Good Hope stamps and the large size of some Brit. commemorative stamps, the fact remains that the size and shape of the very first P. S. set a fashion which has survived to this day.

As international postage increased in

volume, many problems arose. A letter posted in one country, which had to pass through one or more other countries before reaching the country of destination, was subject to postal dues in any countries through which it passed. This led to a complicated system of international book-keeping and caused much inconvenience. However, this and other difficulties were smoothed out by the creation of the Universal Postal Union in 1874. A reciprocal arrangement was come to whereby only the country in which a letter was posted charged a fee for its carriage. Thus every country benefited roughly as much as it lost and the labour of keeping accounts was abolished. One of the early innovations agreed to by the Universal Postal Union, which, from 1875, held triennial meetings, was that low face-value stamps of approximately the same value should, in every member country, be printed in the same colour, thus facilitating the work of post offices throughout the world. This arrangement lasted for many years, but with the collapse of currencies and the fluctuating rates of exchange it became somewhat modified. Owing to rising costs and need for revenue, the basic penny rate for inland letters in Britain which had existed unaltered from 1840 to 1918 was finally abandoned. In the latter year it was increased to 1½d., raised to 2d., in 1920, lowered again to 1½d. in 1922, and in 1940 raised to 2½d., where it now (1950) stands. See also PHILATELY. See It. P. Croom-Johnson, *Postage Stamp Collecting*, 1923; It. Lowe (ed.), *Empire Postage Stamps*, 1937; chapters in L. N. and W. Williams, *Philately*, 1939; J. Easton, *British Postage Stamp Design*, 1943, and *Postage Stamps in the Making*, 1949; and R. Curle, *Stamp collecting: a New Handbook*, 1946.

**Postern**, or Sallyport, small gate in a medieval castle defended by a portcullis. It was used for the entrance and exit of secret messengers, or sorties.

**Posters.** A roll of twenty-three prehistoric P., alleged by Egyptologists to date back to the period of Dynasty VI, was found among the sarcophagi of the ruined pyramids of Sakkarah, Egypt. But the pictorial poster is essentially modern, and is but little older than the middle of the nineteenth century. Jules Chéret is generally regarded as the father of pictorial P., the idea of which was quickly adopted in Great Britain and America. But Eng. pictorial P. prior to 1871 exhibited hardly any of the artistic merit that characterised the Fr. P. of Gavarni, though brave attempts were made by Godfrey Durand in a poster announcing the then newly pub. *Graphic*, and Walter Crane in a poster advertising a make of lead pencils. In 1871 Fred Walker designed his celebrated poster (now in the Tate Gallery) to advertise Wilkie Collins's dramatized version of *The Woman in White*, which was being produced at the Olympic Theatre in that year. Since that time many R.A.s and other notable artists have entered this particular field of activity, and it is hardly necessary to mention the coup of

T. J. Barratt, who secured the beautiful picture of 'Bubbles' by Sir John Millais to advertise Pears' soap. Aubrey Beardsley introduced the curious flat poster, uniform in colour and setting the fashion in oriental lack of perspective. After him came the Dudley Hardy school of designs—bold in outline, arresting in subject-matter; while among other later artists of note in poster painting are Fred Hassall with his comic P., Hilda Cowham with her felicitous adaptation of child-studies, E. McKnight Kauffer, who produces striking landscapes in three or four boldly handled colours, and A. R. Thompson, whose *Street Markets* (1949) has pointed to a school of future P. in which boldness of outline is not incompatible with a wealth of detail.

The London Co. Council have passed a by-law prohibiting the exhibition of any pictorial poster where such poster may disfigure a highway, landscape, place of natural beauty, or public pleasure-ground. Bill-posting generally has become so important a factor in the business life of the nation that there exist societies like the London Billposters' Protection Association and the Billposting Contractors for the protection and advancement of the general interests of the bill-posting trade. The first-named society exercises through its censorship committee a healthy supervision over P. generally, though that body and the London Co. Council do not always concur in what is desirable and what is not. An attack on advertisement by P. was made in 1913 by the Bill for the Regulation of Advertising, which proposed unsuccessfully to empower every local authority to prescribe the shape and colour of P. in its own area. In the period between the outbreak of the First World War and the introduction of conscription successful use of P. was made for recruiting purposes, the 'Kitchener poster' being famous. After the armistice the newspaper advertisement columns were filled at a quicker rate than the poster hoarding, and it seemed for a time as if the advertiser had less faith in the value of this medium. But by 1930 good hoardings were at a premium, the chief competitors for space appearing to be the cinematograph theatres and breweries. A successful poster campaign was that of the Empire Marketing Board (*q.v.*), the purpose of which was to induce people in Britain to purchase empire goods. Among advances in poster art after 1920 the P. displayed by the main-line railway companies have been outstanding, while those of the Underground Railway won recognition not so much on account of some outstanding specimens of artistic merit as for boldness and originality displayed in the use of small space, and some commercial firms have produced outstandingly impressive or comic P., such as *Shell-Mex* and *Guinness*. During the Second World War the art of P. was brought almost to a standstill, except for those issued by the gov., because of the paper shortage. After the end of the Second World War the reappearance

on a large scale of commercial P. has shown that the artistic consciousness which was being developed in poster art before 1939 has not been lost. In 1949 an exhibition of London Transport P. was held at the Victoria and Albert Museum, London. See also ADVERTISING. See C. Hatt, *Pictorial Posters*, 1895; and E. McKnight Kauffer, *The Art of the Poster*, 1921, *Studio Special Number: Posters and Publicity*, 1926, and *Commercial Art Annual: Posters and Publicity*, 1927.

**Post-Impressionism**, movement in painting which followed on Impressionism. P.-I. was a return to the classical and architectural in painting, and the movement started in France towards the end of the nineteenth century with the paintings of Cézanne and Seurat. Architectural form is the criterion of P.-I., while other points in Post-Impressionist technique are a perception of formal relations revealed in painting and the ability of the painter, if necessary, to dispense with representational details and to break away from the camera vision.

P.-I. as a whole is not naturalistic painting, and Cézanne, its greatest exponent, introduced perspective into his work by the use of tone and colour. Van Gogh, Gauguin, and Renoir followed the movement to a certain extent, but each possessed individual qualities of painting that prevented them from being true Post-Impressionists. Cézanne, Matisse, and Picasso afterwards carried the movement further. P.-I. did not reach England until 1910, when the first exhibition was held in London. The Eng. painters Paul Nash and Duncan Grant may be termed Post-Impressionist painters. P.-I. declined with the development of Cubism.

**Postliminium** (Rom. law, *post*, after; *limen*, threshold), term adopted in modern international law from the *jus postliminii* of Rom. law to indicate the fact that *ter.*, individuals, and property, after having come in time of war under the power of an enemy, return either during the war or on its termination under the power of their original nation. This may happen by reason of evacuation of *ter.* by the enemy, reconquest by the former owner, reconquest by a third nation followed by restoration to the former owner, or restoration by the terms of a treaty of peace. Strictly the title of P. is unnecessary to describe an obvious state of facts, and, indeed, the real difficulty in P. cases is to determine the validity or otherwise of acts done in relation to reversioned property during its ownership by an enemy. Again, other liabilities may arise, *e.g.* if a ship has been captured and is recaptured, P. reverts the ship only in the original owner, subject to the obligation to pay salvage. Most modern international lawyers restrict P. to *ter.* and ships, and apply the principle of P. to movables only if they be promptly recaptured.

**Post Mills**, see under WINDMILLS.

**Post-mortem Examination**. When a coroner issues a summons to a medical practitioner to attend and give evidence as to how a deceased person met his death, he may, either in the summons or at any

time down to the end of the inquest, direct the practitioner to make a P. E. of the body of the deceased either with or without an analysis of the contents of the stomach or intestines. Frequently the practitioner who attended the deceased at his death is called upon to make the examination, but if evidence is given at the inquest to the effect that the death was caused by the improper or negligent treatment of a practitioner, that practitioner may not be permitted to perform or assist the P. E. By the Coroners Act, 1887, a coroner's jury, if not satisfied by the evidence brought before it, may require the coroner to summon some other medical practitioner named by it, and to direct the practitioner so summoned to make a P. E., whether an examination has been previously made or not. A P. E. is necessary only where it appears either to the coroner or the jury that it will explain the cause of death. See CORONER.

**Post-nuptial Settlement**, see SETTLEMENT.

**Post-obit Bond**, bond given to secure the repayment of a loan on the death of some specified person from whom the borrower has expectations.

**Post Office**. It is often said that in England prior to the seventeenth century nothing is heard of a P. O., and in the modern sense of that term as denoting a gov. dept. possessing a monopoly as to carriage of letters, the statement is true. But correspondence between subjects, as distinct from communications between states, must have existed from the earliest times, and the only difficulty, if any, is to determine the precise mode of transmission before the state couriers both in England and in other countries were permitted to carry such correspondence along with public dispatches. The Close and Mesne Rolls, the wardrobe accounts of the kings of England, royal proclamations, and other records afford ample evidence of a regular if rudimentary postal system for royal correspondence. The expenses of the estab. of *nuncii* entrusted with the conveyance of letters formed a large item in the charges of the royal household as early as the middle of the thirteenth century, and these payments, which will be found enrolled on the Close and Mesne Rolls, may be traced in an almost unbroken series through the records of reigns subsequent to that of King John. The method of transmission was by relays of men and horses maintained under the superintendence of some gov. official. Herodotus describes a similar means of communication in vogue with the ancients. Persians, and it can hardly be doubted that the Rom. practice of transmission by *tabellarii* (from the *tabella*, or waxen tablets, on which the *epistolæ* were inscribed), as described by Festus and by St. Jerome, was closely analogous. Whatever the precise manner of evolution, however, it is clear that by 1548 the transmission of the private correspondence of the subject by post-horses had become a common practice, for a statute of that year fixed a penny a m. as the rate of hire. Camden mentions Thomas Randolph as

the chief postmaster of England in 1581, but this office would seem to have existed at least as early as the reign of Henry VIII. What the duties were is not clear, as the earliest recitals of the duties and privileges appertaining to the office occur in the reign of James I., which monarch, according to the letters patent of Charles I., constituted an office called the office of postmaster of England 'for foreign parts being out of his dominions.' James I., however, went further than this, for according to Kennedy's *Annals of Aberdeen*, he introduced improvements in the postal system upon the lines suggested by the methods in vogue in various Scottish towns. From all accounts it seems that we owe the amelioration of the service as it existed in the early part of the seventeenth century to the necessity for a better means of communication between England and Scotland, a conjecture borne out by sev. proclamations, especially one of 1635, which was made 'for settling of the letter-office of England and Scotland.' That proclamation recites 'that there hath been no certain or constant intercourse between the kingdoms of England and Scotland,' and commands 'Thomas Witherings, Esq., his Majesty's postmaster of England for foreign parts, to settle a running post or two, to run night and day between Edinburgh and Scotland and the City of London, to go thither and come back in six days'; and directions are given for the management of the correspondence between post-towns on the line of the road and other named towns, and similarly in Ireland.

In 1649 the Common Council of London endeavoured to inaugurate a separate P. O., but was thwarted by a resolution of the Commons, which declared the office of postmaster to be in the sole power and disposal of Parliament. Throughout the earlier part of the Stuart period constant attempts were made by private individuals to break the royal monopoly, but they were one and all unsuccessful. The only class of persons, indeed, that ever seems to have been favoured with the right to send its own letters by its own service was the mercantile community, but except as to the Company of Merchant Adventurers the privilege was speedily revoked. During the Commonwealth the postal service was farmed out by the Commons at a rent of £10,000 a year to one John Manley (later, for £21,500 annually, to the duke of York), apparently as the easiest way out of the difficulty arising from the fact that the earlier Stuarts had granted sev. patents to different individuals, with the result that conflicting and concurrent claims were put forward. The latter half of the seventeenth century saw considerable advances in the estab. of a P. O., advances which were probably hastened by the public-spirited agitation for reform by John Hill, a Yorkshire attorney who, considering the gov. monopoly to farmers to be an infringement of the liberty of the subject, organised a postal service at half the gov. farmers' rates, and nearly lost his life for his audacity. The gov. intended at all costs to keep the monopoly because

it was a source of revenue and because it enabled them by a system of espionage to control the political agitator at home and abroad. The gov. still possesses limited powers of espionage, but its unfettered liberty in that respect was curtailed as a result of the indignation roused by the opening of the letters of the celebrated refugee Mazzini.

In 1656 an Act was passed to establish one general P. O., and one officer, to be styled the postmaster-general of England and comptroller of the P. O. This officer was to have the horsing of all 'through' posts and persons 'riding in posts'.

escorts and so constructed as to nullify as far as possible the attentions of the omnipresent highwayman, and the development of the packet system, especially through the advances made in steam navigation.

Rowland Hill, arguing from the unprogressive rate of revenue from the postal service, and the fact that the charge of postage altogether exceeded the actual cost of receipt, delivery, and transit, advocated, in his pamphlet *Post Office Reform*, the estab. of a uniform penny postage throughout the kingdom, as the only alternative to the impossibility of

Postmaster General

THE ROYAL MAIL COACH, LONDON TO GLASGOW 1840

Engraving by F. W. Hoppam after a painting by J. L. Henning Senior

Prices for letters, whether Eng., Scottish, Irish, or foreign, and for post-horses, were fixed. All other persons whatsoever were forbidden to 'set up or employ any foot, posts, horse-posts, or packet boats'. In 1683 a metropolitan penny post was instituted by the celebrated Wm. Dockwra, who carried and insured letters and parcels up to £10 in value and a pound in weight for one penny. He naturally excited the fury of the farmers by his enterprise and involved himself in litigation, the ultimate consequence of which was that his penny post became a part of the General Post Office (G. P. O.), and he himself, as a solatium, was appointed comptroller of the London office. The prin. reforms from that time down to the measures of Sir Rowland Hill were the invention by Allen of the cross-road postal system, Palmer's mail-coaches, these latter being accompanied by armed

collecting what he estimated to be the average cost of postage of a single letter, namely, something less than one tenth of a penny. His proposals met with ridicule from more or less interested quarters, but public agitation called for the appointment of a select committee of inquiry into the whole economical aspect of P. O. charges. The result was the Act of 1839, which enabled the Treasury to establish a uniform penny rate for the whole of the United Kingdom, the scale of weight being 1d. per half ounce, or 2d. per ounce, all fractions of an ounce above the first being reckoned as an ounce. Postage stamps (q.v.) were introduced in place of the old method of payment in advance, shortly afterwards. The success of Hill's scheme, in the teeth of prejudice both inside the P. O. and in gov. circles, is sufficiently proved by the fact that the number of letters carried rose from 1,585,973 for the

week ending Nov. 24, 1839, immediately prior to the scheme being put into execution, to 6,849,196 for the week ending Feb. 21, 1840, and the net revenue in the space of twenty years yearly reached the figure it stood at in 1838, namely £1,676,522, and in 1930 at nearly £27,000,000. This rise in net revenue was certainly not striking for the first thirty years, but it is to be remembered that the old charges were in the highest degree exorbitant (9d. a letter being an average charge for transmission outside London), and further, that the profits of the P. O. were burdened with the payment of certain large pensions. Since Hill's time the most notable features of the hist. of the P. O. have been the estab. of the parcel post (aimed at the excessive charges of railway companies), the institution of the P. O. savings bank, the transfer to the state of the telegraph and telephone services, the introduction of post cards and letter cards, the extension of the penny post throughout the Brit. dominions (though originating as a measure to increase revenue during the First World War this rate gave place to 1½d., rising to 2½d. during the Second World War).

**STAFF AND ORGANISATION.**—The ministerial head of the P. O. is the postmaster-general, who is responsible to Parliament for the conduct of the affairs of his dept.; his chief adviser is the director-general, who is the permanent head of the dept. The headquarters of the P. O. are in the city of London on a site long associated with P. O. work. Under the director-general the work of the administration is divided into four main depts.: (1) The personnel dept., which deals with matters affecting staff and accommodation. (2) The postal services dept., where policy relating to home and overseas mail services is decided. (3) The telecommunications depts. (inland and overseas) for the settlement of matters relating to telephone, telegraph, and wireless. (4) The public relations dept., acting as liaison between the P. O. and the general public. These depts. are staffed mainly by what are known as the Treasury classes (the general civil service clerical, executive, and administrative grades) but there are in addition many specialist P. O. grades. With their separate headquarters in London are the main depts. which control the working of the services within their respective spheres. These are the accountant-general's dept., the engineering dept., the P. O. savings dept., and the supplies, contracts, factories, and solicitor's depts. To organise control effectively throughout the country and to provide local contact with P. O. administration, the country is divided into ten self-contained regions. Within a region all P. O. services are gathered under the control of the regional director, except that in London the postal and telecommunications sides are separated into two functional regions. Within the regional organisation the two main sides of the work—the telecommunications side and the postal side—are split up into smaller

geographical units under the control of telephone managers and head postmasters.

**INLAND CORRESPONDENCE.**—The principal features of the inland correspondence system are as follows:

**Parcel Post.**—The rates of postage on parcels are from 9d. for a parcel not exceeding 3 lb. in weight to 1s. 4d. for a parcel not exceeding 15 lb. (maximum) in weight. (The rates of postage for parcels to the Irish Republic are: not over 2 lb., 9d.; not over 5 lb., 1s.; not over 8 lb., 1s. 3d.; not over 11 lb. (maximum), 1s. 6d. The greatest length allowed is 3 ft. 6 in., and the greatest length and girth combined 6 ft. It is illegal to send by post any packet consisting of any indecent or obscene matter, any explosive or dangerous substance, any sharp instrument not properly protected, any deleterious or noxious substance, any article which may be a source of damage to other postal packets, and (except with the permission of the postmaster-general) any living creature. Prohibited articles, if detected, are liable to detention and the sender to prosecution. Perishables may only be sent by parcel post, and must be marked 'perishable'; they should be packed so as to prevent injury to other postal packets by contact.

**Poste Restante.**—This facility is provided solely for the convenience of travellers and it may not be used in the same tn. for more than three months. The words 'To be called for' or 'Poste restante' should appear in the address of such correspondence. When dispatched from abroad the limit of retention is one month; if posted in the United Kingdom a fortnight. Letters addressed to a P. O. at a seaport tn. for a person on board a ship expected at that port are kept two months. At the expiry of these periods postal packages are treated as undeliverable.

**Registration.**—Both letters and parcels can be registered, the ordinary fee, in addition to the postage, ranging from 4d. to 2s., with compensation of from £5 to £100. The packet should be marked in the bottom left-hand corner with the word 'Registered,' and if a higher fee than 4d. is paid, this should be shown, viz. 'Registered 5d.' Nothing intended for registration and marked 'Registered' must be dropped into a letter box, or it will be compulsorily registered. Correspondence can be registered at any time during the ordinary hours of business. The sender may arrange, for a fee of 3d. at the office of posting, for an advice of its delivery to be sent to him. Packets containing coin or jewellery, if posted otherwise than in accordance with the regulations, are compulsorily registered at a fee of 4d.

**Cash on Delivery Service.**—Packets or parcels up to the value of £40 may be posted at a money order P. O., when the value of the contents will be collected and remitted to the sender. When the value does not exceed £10, delivery is made by the postman in the ordinary way. When above that amount, the addressee is informed of its arrival at the P. O., and delivery is made upon receipt of payment.

The fees, which in addition to postage must be prepaid, are: value not exceeding 10s., 4d.; £1, 6d.; £2, 8d.

**Express Delivery Service.**—The three express delivery services are: (1) by special messenger all the way; (2) by special messenger after transmission by post; and (3) by special delivery in advance of the ordinary mail at the request of the addressee. The rate for the first service is 6d. for every mile or part of a mile, together with the cost of any necessary special conveyance in addition to the mileage fee. Money and jewellery may be conveyed under this service at the sender's risk without being registered. Packets for this service must be boldly and legibly marked 'Express' above the address in the left-hand corner of the cover and must be handed in at a P. O. The charge for the second service is normally 6d. in addition to the full ordinary postage, but where a special conveyance is indicated by the sender or is otherwise necessary, the actual cost is charged, or if that is not known, 1s. per mile. Packets for this service must be legibly marked 'Express' above the address on the left-hand side of the cover, and in the case of a letter the cover must also be marked with a broad blue or black perpendicular line from top to bottom, both on the front and back. The postage and charges should be prepaid by means of stamps affixed to the letter or parcel. The fee for the third service is the full express fee of 6d. a mile as for one packet, and a further fixed charge of 1d. for every ten or less number of additional packets beyond the first.

**Railway Letters.**—Under agreement with the P. O., Brit. Railways accept and convey letters by the next available train or ship, either to be called for at the station of address or to be transferred there to the post by railway officials. The following fees are payable, in addition to the normal postal charges: weight not over 2 oz., 5d.; over 2 oz. and not over 4 oz., 9d.; over 4 oz. and not over 1 lb., 1s. 2d.. Railway letters should be tendered by the sender to a railway servant in the parcel booking office or, if that office is closed, in the passenger booking office.

**Air Mail Services.** First-class mail (letters, letter packets, air letters, and postcards) and second-class mail (printed papers, commercial papers, samples, literature for the blind, and, in the case of those countries which accept them, small packets) may be sent by air mail to civilian addresses in many overseas countries; parcels may be sent by air to most destinations in Europe. Full particulars of these services and of the appropriate air postage rates are given in the air mail leaflet. This leaflet may be obtained at any P. O., or a standing order may be placed with the local head postmaster for new eds. of the leaflet to be supplied by post free of charge as and when pub.

**TELEGRAPHS AND TELEPHONES: Telegrams.**—Inland telegram service extends over Great Britain, N. Ireland, the Channel Is., and the Isle of Man, and

between these places and the Irish Republic. The charge is 1s. for nine words or less and 1d. a word thereafter, except in the case of telegrams to the Irish Republic when the minimum charge is 1s. 6d. for twelve words. The charge covers delivery within a tn., postal area, or within 3 m. of the telegraph office nearest the address, whichever is the greater. In the Irish Republic free delivery is restricted to addresses within 1 m. of the delivery office. The charge for delivery at any address beyond the limits of free delivery is at the rate of 6d. for each mile or fraction of a mile. Except as regards telegrams to destinations in the Irish Republic the charge is payable by the sender. Replies may be prepaid up to forty-five words (up to forty-eight words to addresses in the Irish Republic) and the reply-paid form is valid for twelve months, after which time the sender may recover the amount of the prepayment on production of the form.

**Wireless Telegraphy.**—The Marconi Company applied in 1910 for licences for eighteen wireless stations at various points in the Brit. Empire, the gov. to have a right to purchase at the end of twenty years. This offer was rejected by the gov. and the P. O. then proposed an agreement with the Marconi Company for a state-owned chain of stations (see parl. paper, July 19, 1912) in England, Egypt, S. Africa, India, Singapore, and the E. Africa Protectorate. The complete installation of these stations was, under this proposed agreement, to be the absolute property of the gov. But this proposed empire wireless chain did not materialise owing to the development of the short-wave directional system, commonly known as the Beam system. For this service the Marconi Company built a transmitting station at Bodmin and a receiving station at Bridgwater for communicating with S. Africa and Canada, and a transmitting station at Totnes near Grimsby, for communicating with India and Australia. When the stations were completed they were taken over and worked by the P. O. until 1929, when they were leased to Imperial and International Communications Ltd., who now carry on these services. The corresponding stations are at Cape Town, Halifax, Bombay, and Melbourne. P. O. coastal wireless stations provide short-range and world-wide radio-telegraph services with ships at sea. The standard rate of charge for a radiotelegram is 1s. a word.

**Acceptance and Delivery of Telegrams by Telephone.**—Telephone subscribers may telephone messages for onward transmission as telegrams to a telegraph office, and the public, generally, are at liberty to dictate telegrams from any telephone call office. Telephone subscribers can generally arrange with the P. O. to have their telegrams delivered by telephone instead of by messenger.

**Night Telegraph Letter Service.**—This service is at present (1930) suspended.

**Telephones.**—The whole of the local telephone system formerly owned and

worked by the National Telephone Company was in 1912 transferred to the P. O., which now controls the trunk and local telephone service throughout the United Kingdom (except in Kingston upon Hull where the local telephone service is controlled by the city corporation). The fees for calls of 3 min. duration within the Brit. telephone system are as follows: from midnight to 6.30 p.m. (call office and coin box lines midnight to 5.30 p.m.) and 9.30 to midnight, 15-20 m., 10d.; 25 m., 1s. 2d.; 35 m., 1s. 6d.; 50 m., 1s. 10d.; 75 m., 2s. 3d.; 125 m., 3s.; over 125 m., 3s. 9d. Between 6.30 p.m. and 9.30 p.m. (call offices and subscribers' coin box lines 5.30 p.m.-9.30 p.m.) a lower scale of charges operates. Calls may be made to specified persons for a small additional charge which is the same whatever the distance or duration of the call. Telephone communication is obtainable (1950) with all countries in Europe, except Albania, and by radio-telephone with most of the other countries of the world, coasting and short-voyage ships, and certain ocean liners.

The development of wireless telephony commenced with the opening in Jan. 1927 of a wireless telephone service between the United Kingdom and the U.S.A. There are now sev. transmitting and receiving stations in the United Kingdom and the service is carried out by both long- and short-wave circuits.

It is interesting to note that the land-line services with the Continent are linked up with the services carried out by wireless through the P. O. wireless stations. Thus, for instance, a subscriber in Oslo wishing to speak to a subscriber in Bombay would be linked up by land line to London, then by wireless from Rugby to Poona, and then by land to Bombay.

**TRANSMISSION OF MONEY BY POST: Money Orders.**—The money order service is intended primarily for the transmission of small sums throughout Great Britain (including the Channel Is. and the Isle of Man), N. Ireland, the Irish Republic, and to certain places abroad.

**Inland Money Orders.** A money order for payment in Great Britain and N. Ireland may be obtained for any amount not exceeding £50, but for an order payable in the Irish Republic (which is also included in the inland service) the limit is £40. Fractions of a penny are not allowed. The intending purchaser is supplied with a requisition form on which, in addition to his own name and address, he should enter the surname and, if known, at least the initial of one Christian name of the payee, and the name of the office of payment if payment is required at a P. O. If payment is required through a bank, this must be indicated. When issued, the money order, with a counterfoil attached, is handed to the remitter so that the order may be sent to the payee and the counterfoil retained for reference purposes. If the order is to be paid at a P. O., an advice, containing information as to the amount of the order and as to the names of the payee and remitter, is forwarded by the issuing postmaster to the

office of payment and before payment is effected the payee must sign the order in accordance with the name given in the advice and must furnish the name of the remitter correctly.

**Inland Telegraph Money Orders.**—An inland money order may be transmitted to the payee by telegraph and this facility is available at most money order P. Os. from which telegrams are dispatched. A form of requisition must be completed by the purchaser as for an ordinary inland money order and, in addition, the words 'By Telegraph' and the address of the payee must be entered. A certificate of issue is handed to the purchaser as a record of the transaction. Money orders are not negotiable, and after an order has been paid the P. O. is not liable to meet any further claim in respect of it.

**Overseas Money Orders (Ordinary and Telegraph).**—These are available to certain places only. For most parts of the Brit. Commonwealth the service is free from restrictions and the maximum amount of an order is £10. For Canada and most foreign countries the service is subject to strict Treasury control, and can only be used for certain purposes, and is subject to a maximum of £10. Permission to send to any of these countries has to be obtained from the accountant-general's dept. (G.P.O.) on a declaration form obtainable at any money order P. O. before an order can be purchased. A requisition form for an overseas money order must be completed in the same way as for an inland order but, in addition, the full address of the payee must be stated. If the order is to be sent by telegraph the words 'By Telegraph' should be written across the requisition form. Telegraph orders payable overseas may not be crossed for payment through a bank, and this also applies to ordinary orders payable in foreign countries and in some Brit. Commonwealth countries. A certificate of issue is handed to the purchaser for retention as a receipt, and payment is arranged by means of a document prepared in the country of payment.

**Stoppage of Payment (inland and overseas order).**—Payment of an ordinary money order may be stopped. A fee of 4d. is charged for this service, application for which should be made, preferably on the form provided for the purpose and obtainable at any money order P. O.

**Postal Orders.**—Postal orders provide a convenient means of transmitting small sums of money through the post. For sums up to £1 7s. 10d. the sending of postal orders is a cheaper method of transmission than the use of money orders. Postal orders may be purchased at, and are payable at, most P. Os. throughout Great Britain, N. Ireland, the Channel Is., and the Isle of Man. They may be sent without restriction to most parts of the Brit. Commonwealth and to the Brit. trusteeship and to Eire and Iraq. They are not payable at P. Os. in Australia and may not be sent to Canada nor to most foreign countries.

They may also be sent under the same conditions as to civilians to persons in his majesty's forces, his majesty's and merchant ships. Postal orders are issued for 6d. and by sixpenny steps up to 5s., and for 6s., 7s., 7s. 6d., 8s., and thence by one-shilling steps up to 21s. Their value may be increased by affixing postage stamps, not exceeding two in number, and up to the value of 5d. on denominations up to 4s. 6d. and 11d. on denominations above 4s. 6d. The sender of a postal order must enter thereon in ink the name of the person to whom the amount is to be paid and is recommended also to fill in the name of the office at which it is to be paid. Postal orders may be crossed for payment through a bank. A counterfoil is provided on every postal order, for retention by the purchaser. Postal orders, unlike bank-notes, do not represent value in themselves and are not negotiable. Only the rightful owner may cash a postal order; and if the sender has filled in the name of the payee, the owner may take legal action to recover the amount from any person who negotiates it. When a postal order has been paid, the P. O. is not liable if any further claim is made for payment. As a general rule postal orders are valid for a period of six months from the last day of the month of issue.

**POST OFFICE SAVINGS BANK, see under SAVINGS BANK.**

**NATIONAL SAVINGS CERTIFICATES** are sold at most P. Os., and offer a means of investing small sums in a gov. security bearing a high rate of interest free of income tax. See further under **NATIONAL SAVINGS CERTIFICATES**.

**GOVERNMENT ANNUITIES AND LIFE INSURANCES.**—Immediate annuities from £1 up to £300 may be purchased through the agency of the P. O. savings bank on the life of any person over five years of age. Husband and wife may each purchase an annuity for £300. Annuities are payable by equal quarterly instalments on Jan. 5, April 5, July 5, and Oct. 10. On the death of an annuitant a single payment equal to one-fourth part of the annuity is made to the representative, if claimed within two years.

**THE POST OFFICE AND THE CRIMINAL LAW.**—The law as to larceny or other offences in relation to the P. O. is to be found for the most part in the Post Office Act, 1908, as amended by the Post Office (Amendment) Act, 1935. A P. O. official who steals or destroys a letter is liable to imprisonment for seven years, and if the letter contains any chattel, money, or valuable security, to imprisonment for life. Larceny of a letter, or of any chattel, money, or valuable security out of a letter in course of transmission by post, is punishable with imprisonment for life. Fraudulent retention, or secretion by any person of letters found or delivered by mistake, is also heavily punished, whilst the opening of other people's letters is punishable by a fine of £60 or six months' imprisonment. P. O. officials who wilfully or negligently omit or delay to deliver or improperly divulge

the purport of any telegraph message are liable to a heavy fine. Disclosure or interception by P. O. officials of any message entrusted to them may involve twelve months' imprisonment. Obstruction or molestation by any person of an officer of the P. O. whilst in the execution of his duty is punishable with a fine of £10 or one month's imprisonment or to both such fine and imprisonment. The transmission by telephone of any grossly offensive or indecent message may entail a fine of £10 or imprisonment for one month or both such fine and imprisonment. A person who sends a message by telephone which he knows to be false for the purpose of causing annoyance, inconvenience, or needless anxiety to any other person, or who persistently makes telephone calls without reasonable cause for any of the purposes above mentioned, is also liable to a fine of £10 or one month's imprisonment or both such fine and imprisonment.

**FOREIGN POSTAL SYSTEMS: The United States.**—The hist. of the Amer. P. O. shows a parallel deficiency of revenue to that of England on the occasion of the reforms of 1884 on the introduction of the two cents (1d.) universal postage. The feature of the Amer. postal system for seventy years had been the development of the railway mail service, which by reason of the vast extent of the country and the great mileage of railroads rapidly reached a pitch of excellence which has never been excelled. But after the First World War the U.S. postal service began the development of air mail services. At first the P. O. Dept. ran its own planes. Now all the work is done by contract with aeroplane companies and has developed into the greatest air service in the world, linking up all the great cities in the U.S.A. The fee is 6 cents an ounce or fraction thereof up to 8 oz. In the U.S.A. all mail matter is divided into four classes. *First-class matter* includes letters, postal cards, post cards, and anything sealed against inspection. Rate is 3 cents an ounce for each ounce or fraction of an ounce. *Second-class matter* includes all printed newspapers and periodicals that have been entered as second-class matter. Rate to publishers 1 cent a pound or fractional part thereof, to others 1 cent for each 2 oz. or fraction thereof. *Third-class matter* includes pamphlets, printed books, engravings, circulars, not exceeding 8 oz. Rate 2 cents for the first 2 oz., 1 cent each additional ounce, with cheaper rates for books. *Fourth-class matter*: Previous to the Parcel Post Act, which came into effect in Jan. 1913, there was no distinct parcel post in the U.S.A. Until then parcels were sent by post as fourth-class matter. The Act of 1913 provided that fourth-class matter should embrace all matter not included in the first three classes and not exceeding 11 lb. in weight, nor 72 in. in length and girth combined. The limits are now 70 lb. and 100 in. New rates for parcel post are shown in the table.

Franking, which was greatly abused, was abolished in 1873, but the P. O.

carries official matter under penalty labels or envelopes (that is, containing a notice of the penalty incurred by improper use). This privilege is extended to congressmen and gov. officials. Before 1862 carriers were remunerated by collecting 1 to 2 cents for delivery. The free delivery was first authorised by law in 1863, and in 1901 866 cities and tns. were included in this scheme; since 1896 it has included rural pop. also. Immediate delivery by special messenger was instituted in 1885. In 1864 the money order system was estab. There is a registry system in force increasing according to the value of the packet registered. There is a postal savings system in which deposits from individuals are accepted from \$1 upwards, and no one can have more than \$2500 to his credit. In 1947 \$3,392,773,461 were thus on deposit. Saving certificates are issued. The stamp system for amounts less than \$1 is in force. Interest at 2 per cent. In 1948 there were in the U.S.A. 41,695 P. Os., the total revenue in 1946 was \$1,224,572,173, and the expenditure \$1,353,653,679.

was then taken up by Dr. von Stephan, head of the Prussian postal service. His draft treaty establishing a General Postal Union was laid before the first congress, at Berne in 1874, and was put into force, as the 'convention' in 1875. Under it, for postal purposes, international frontiers are regarded as non-existent, and there is an unrestricted right to use the services of any other country, with an obligation to pay. The convention prescribes international postage rates and rules for the make-up of mail, deals with the mutual settlement of accounts, and, with sev. subsidiary agreements, embraces all aspects of the international postal service. Congresses are held at five-yearly intervals to revise the convention and agreements, the congress being the main legislative body of the union. The latter is now one of the specialised agencies of the United Nations. All countries, except a few unimportant ters., are now party to the convention.

**France.**—To France belongs the honour of having originated, through the celebrated Pierre d'Alméra, not only the system of transmission of money by post, but the registration of letters. As in England, so in France, the P. O. revenue and administration during the seventeenth century were farmed out, and similarly that system led to intolerable abuse and corruption. In regard to the inauguration of a system of insuring articles of declared value, the issue of postal notes payable to bearer, and the introduction of postage stamps, France generally lagged from ten to twenty years behind England.

**Germany.**—The outstanding name in the hist. of the Prussian P. O. is that of Dr. von Stephan, who was also the dominating figure in the organisation of the International Postal Union of Bern. As in England the Prussian system grew out of a purely gov. service, stimulated by the private letter and parcel post of a commercial guild.

**UNIVERSAL POSTAL UNION.**—The impetus given to international correspondence by the Industrial Revolution demanded a simplification of rates, weights, etc. On the initiative of Montgomery Blair, postmaster-general of the U.S.A., a preparatory conference was held in Paris in 1863, and the idea of reform

**Potassium.** Symbol K, atomic number 19, atomic weight 39.10. It was first isolated by Davy in 1807 by the electrolysis of melted caustic potash, and occurs in the form of silicates in rocks such as felspar, e.g. orthoclase is  $KAlSi_3O_8$  and mica. Through weathering action these rocks are broken up and the P. salts pass into the soil, from which they are taken up by plants. P. is an essential constituent of plant food; when plants are burned the P. is left in the form of the carbonate, and this was formerly the chief commercial source of P. compounds. Part of the P. salts find their way into seas, lakes, and mineral springs. When inland seas evaporate, the more insoluble salts, e.g. common salt, are first deposited, and then the more soluble salts, chiefly those of P. and magnesium. In this way the Stassfurt deposits which, with the

deposits in Alsace now constitute the chief source of P., were formed; the more important compounds being carnallite ( $KCl \cdot MgCl_2 \cdot 6H_2O$ ), kainite ( $MgSO_4 \cdot KCl \cdot 3H_2O$ ), sylvine ( $KCl$ ). When Davy obtained the metal by electrolysis of caustic potash, globules of metal appeared on the negative wire. It was prepared at one time by heating P. carbonate with finely divided carbon:  $K_2CO_3 + 2C = 2K + 3CO$ . The vapour of the metal tends to combine with carbon monoxide to form an explosive compound,  $P. carbonyl$ ,  $K_2(CO)_4$ , and the yield is thus reduced. This method was replaced by the Castner process, in which caustic potash was heated in iron crucibles with carbide of iron. The resulting P. was distilled off and collected. Both these methods gave place to the modern electrolytic method in which fused P. chloride is electrolysed. P. is a soft silvery-white metal, melts at  $62^\circ$ , boils at  $757^\circ$ , and has a sp. gr. of 0.875. P. and its compounds give a violet tint to the Bunsen flame. P. oxidises in moist air, and combines with the halogens more vigorously than sodium does. It reacts with water so vigorously that the evolved hydrogen catches fire and burns with a lavender flame. On account of its reaction on water and air it must be kept in sealed tins or in naphtha, which does not contain oxygen and is incapable of dissolving a sufficient amount of oxygen from the air to permit much oxidation of the P. P. forms a liquid alloy with sodium.

**POTASSIUM COMPOUNDS:** *Potassium hydride*, a white crystalline solid, is formed when hydrogen is passed over P. heated to  $360^\circ C$ . It acts upon water, forming caustic potash and hydrogen. *Potassium monoxide* ( $K_2O$ ), a yellow solid, is obtained by heating potassium nitrate with P. *Potassium tetroxide* ( $K_4O_6$ ), formed when the metal burns in oxygen, is a yellow powder which is decomposed by water, forming P. hydroxide, hydrogen peroxide, and oxygen.

*Potassium hydroxide*, obtained (a) by acting on water with P., (b) by boiling P. carbonate with milk of lime, (c) by electrolysis of aqueous P. chloride, using special precautions (see SODIUM). It is a white amorphous substance which melts at  $360^\circ$ , and absorbs moisture from the air. It is used to absorb gases, e.g. carbon dioxide. It readily dissolves in alcohol, and the alcoholic solution is often used in organic chem. where water would cause decomposition. It is used in making soap. *Potassium chloride*, obtained from carnallite, is used in the preparation of other compounds and as a manure. *Potassium bromide*, a white solid, crystallises in cubes, and is useful in medicine in cases of nervous disease, and as a hypnotic, and also in photography for preparing silver bromide. *Potassium iodide* occurs in cubic crystals, useful in medicine and photography. *Potassium chlorate* is now largely obtained by electrolysis of a hot solution of P. chloride. It is useful as an oxidising agent, e.g. in the

preparation of the dye aniline black, in fireworks, and in making matches, and is also used in medicine. *Potassium carbonate* is a white salt, extremely soluble in water. It is largely used in the manuf. of other P. compounds. *Potassium bicarbonate* is a white crystalline solid which decomposes when heated, evolving steam and carbon dioxide, and leaving normal P. carbonate. It is used in medicine, e.g. in dyspepsia and gout. *Potassium nitrate* occurs naturally in rich soils. It is a white crystalline solid. It is largely used in the preparation of gunpowder, and in medicine (e.g. for asthma, when porous paper is soaked in the solution, dried, and ignited, and the fumes inhaled), and as a food preservative. *Potassium cyanide* crystallises in cubes extremely soluble in water. It is highly poisonous. It is a reducing agent, and is therefore useful in blowpipe analysis, e.g.:

It is useful in electroplating. Large amounts of the cyanide are used in extracting gold from its ores, particularly in the Transvaal colony.

**Potassium Antimonyl Tartrate**, see TARTARIC ACID.

**Potassium Chlorate**, see POTASSIUM.

**Potassium Hydrogen Tartrate**, see CREAM OF TARTAR.

**Potassium Nitrate**, see POTASSIUM.

**Potato**, or *Solanum tuberosum*, plant (family Solanaceae), the underground tuberous stems of which constitute the most important vegetable crop in Britain.

POTATO

A, Seed vessel. B, Seed tuber.

It was introduced from America into Britain in the sixteenth century by Sir Walter Raleigh, but had been brought a little earlier to Italy and Spain. For nearly 200 years it was not recognised as a valuable food product, and it is only since the middle of the nineteenth century that attempts have been made to improve the quality and cropping powers of the tubers.

Great numbers of new varieties, obtained by sowing the seed from the berries obtained by cross-fertilisation of the flowers, have been introduced from time to time, and the best appear gradually to decline in value, becoming less productive and more susceptible to disease. Varieties are classified as early, maincrop, and late. In ordinary practice the crop is grown from tubers, the eyes of which are buds that can develop into new plants. Much superior crops are obtained by sprouting the 'seed' tubers in shallow wooden trays where they are exposed to light and air, and thoroughly *greened*. Tubers so prepared can be left to be planted until weather and soil are in a suitable condition, and not only mature earlier but produce considerably heavier and healthier crops. Ps. do best in a warm and comparatively dry climate, with a deep sandy loam and porous sub-soil. From 12 to 18 wt. of sets are required per acre. The early varieties are planted in Feb. and March; drawing the earth up to the rows is an important protection against frosts. The main crop and late varieties after lifting are stored in straw-covered clamps or pits. The two worst diseases of Ps. are those known as the P. disease (*Phytophthora infestans*) and P. scab. The use of healthy seed and proper rotation of crops is the best preventive. The value of spraying the foliage with Bordeaux Mixture, composed of copper sulphate and lime, has been repeatedly demonstrated, and this practice by growers is steadily on the increase. In 1816 and 1817 Ireland was subjected to extreme famine owing to the failure of the P. crop. Since the Second World War Brit. scientists have made various experiments in an attempt to produce a blight-resisting P. See W. G. Burton, *The Potato*, 1918, and R. N. Salaman, *The History and Social Influence of the Potato*, 1949.

**Potato Beetle**, see COLORADO BEETLE.

**Potato Spirit**, see FUSSEL OIL.

**Potchefstroom, or Mool River Dorp**, tn. in the S. of Transvaal prov., S. Africa, on the Mool R., 91 m. S.S.W. of Pretoria. It is in the centre of an agric. and gold-mining area and is a popular health resort. It is the oldest tn. in the Transvaal, and was founded by *Vortrekkers* crossing the Vaal in 1838, and named after their leader, Potgieter. The first shots against Brit. troops were fired at P. in 1881, and during the S. African war, 1899-1902, P. was occupied by both sides on sev. occasions. There is an agric. college and a univ. college which was incorporated as a constituent college of the univ. of S. Africa in 1921. Pop. 25,600.

**Potemkin, Gregory Alexandrovich** (1739-91), favourite of Catherine II. of Russia. P. came of a poor Polish family. He began life as an obscure officer in the army, but succeeded in attracting Catherine by his presence and his wit. In a short time he had risen to be chamberlain at the court. He became the open favourite of the queen, incurring the hostility of Count Orloff, who was her former favourite. But P. overcame all

opposition, and soon became the most powerful person at the Russian court. His successes in the war against the Turks served to increase his ambitions and authority so much that he began to aim at becoming emperor of Constantinople. In the subsequent intrigues and machinations between the queen and himself he was worsted, and died soon afterwards, possibly by poison. P. had great qualities as a statesman and as a general. See life by G. Solovey Tchik, 1948, also study by D. B. Wyndham Lewis in *Four Favourites*, 1948.

**Potential**, see ELECTRICITY.

**Potentilla**, genus of herbs and shrubs (family Rosaceae) with pinnate or palmate leaves, and generally yellow or white flowers, followed by an eteio of achenes. Among the numerous Brit. species are *P. fragariastrum*, the barren strawberry; *P. silvestris*, common tormentil; and *P. anserina*, silver weed or goose grass. Sev. species are grown in gardens.

**Potentiometer**, see ELECTRICITY, *Electrostatics*.

**Potenza**, tn. of Italy, cap. of the prov. of the same name, 34 m. E. of Salerno. It has a Doric cathedral and is the seat of a bishop. It suffered severely from earthquake in 1857, and the cathedral suffered heavy damage in the Second World War. Pop. 25,100.

**Pot-holes, or Giant's Kettles**, cavities varying in diameter and depth, formed most commonly by glacier streams, which pour down a crevasse in a 'moulin' or swirling eddy, whose force drives the pebbles, gravel, and other detritus, which are borne along in the torrent against the rock surfaces. These become worn and abraded, the hollows being sometimes basin- and sometimes pipe-shaped. The largest pot-hole in the Gletscher Garten, Lucerne, measures 30 ft. deep and 26 ft. across.

**Poti**, seaport in the Georgian S.S.R., 55 m. W. of Kutais, on the Black Sea, at the mouth of the Rion. The small and open harbour has been extended and improved; corn, manganese, palm wood, and grain are exported. Pop. 10,000.

**Potomac**, riv. of the E. U.S.A., rising in two branches in the Alleghany Mts., and flowing as the boundary between Maryland and Virginia in a winding S.E. course, to full into Chesapeake Bay. Its chief tribs. are the Shenandoah and the Monocacy. At Washington, 125 m. from its mouth, the riv. becomes tidal and navigable. Length 360 m.

**Potosi**: 1. S.W. dept. of Bolivia, bounded by Chile on the W. and Argentina on the S.; it has silver, gold, tin, and copper mines; bismuth, zinc, and lead are also important. Area 45,867 sq. m. Pop. (estimated 1947) 768,800. (2) Tn., cap. of the above prov., on the Cerro de P. (altitude 13,325 ft.), 50 m. S.W. of Sucre. It is gradually falling into decay but has a univ., a fine granite cathedral, and mint. The silver mines, discovered in 1546, and now nearly abandoned, were the cause of its early prosperity. Gold is still mined and zinc and bismuth are profitable. Pop. 45,000.

Pototan, tn. in the prov. of Iivilo, is. of Panay, Philippine Is. Pop. 43,000.

Potsdam, former cap. of Brandenburg, Prussia, situated on an is. formed by the Havel and the Spree, 16 m. W.S.W. of Berlin. Before the Second World War it was a finely built tn., with wide streets and handsome garden squares. It was a city of palaces, the prin. being the Royal Palace (seventeenth century), the Sans Souci, the Charlottenhof, the Marble Palace, Friedrichskron, and Babelsberg. Many of these were damaged in the Second World War, but the Sans Souci, built by Frederick the Great, escaped. P. was the second royal residence of Prussia, and one of the notable features is the noble Brandenburg Gate, which is built on the lines of Trajan's triumphal arch at Rome. The garrison church contains the tomb of Frederick the Great, and the Friedenskirche the mausoleum of the Emperor Frederick III. and his Eng. consort. The prin. occupations of the inhab. are the manuf. of chemicals, sugar, silk, woollens, cottons, etc., while horticulture is extensively engaged in. P. is not an anct. tn., dating only from the time of the Great Elector, before which it was merely a small fishing hamlet. In 1805 the Fr. sacked the tn. and bore away many relics. After 1945 P. came within the Russian zone of Germany. Pop. 136,000.

Potsdam Agreement, agreement arising out of the three-power conference held at Potsdam, July 16-Aug. 1, 1945, between Winston Churchill and Clement Attlee for Great Britain, President Truman for the U.S.A., and Marshal Stalin for the U.S.S.R., together with various ministers and chiefs of staff of these countries. The conference was called to determine the future of Germany after the unconditional surrender of May 7, 1945. Certain frontier changes had already taken place, particularly in relation to Poland's new boundaries (see *POLAND, History*). The P. A. provided that (1) a committee of foreign ministers of the U.S.A., U.S.S.R., Britain, France, and China should be estab. to frame peace treaties with Germany's allies, to be submitted to the United Nations; (2) the commanders-in-chief of France, Britain, the U.S.A., and U.S.S.R. should exercise supreme authority in their respective Ger. zones, on instructions from their govts., and also jointly, as members of the control council in affairs concerning the whole of Germany; (3) the Allies should disarm and demilitarize Germany and prevent the future use of Ger. industry for war purposes. Nazism should be entirely destroyed and the Ger. people made aware of their defeat, and re-educated on democratic lines. For the present no central Ger. Gov. should be estab. but Germany should be treated as one economic unit; (4) it was agreed that Königsberg should be transferred to the U.S.S.R., and special provisions were made concerning reparations due to the U.S.S.R. The Oder-Neisse line was made the provisional Polish W. frontier, its final confirmation to await the peace

conference; (5) war criminals should be brought to trial, and any transfer of Gers. from Poland, Hungary, and Czechoslovakia should be humanely carried out. For further developments after the P. A. see *GERMANY, History*.

Potter, Beatrix (Mrs. William Heelis) (1866-1943), Brit. authoress of tales for children. She passed a lonely Victorian childhood in Bolton Gardens, S. Kensington. In the N. she lived a secluded life preferring to remain unknown and to conceal her art behind the everyday character of a Lakeland farmer. Her struggles for independence and an unhappy love affair marked her life until her happy marriage. She will be remembered as the authoress of *Peter Rabbit* (1902) and other nursery masterpieces. Among the best are: *Squirrel Nuts* (1903); *Benjamin Bunny* (1904); *Mrs. Tiggy-winkle* (1905); *Miss Moppet* (1906); *Jemima Puddle-Duck* (1908); *Ginger and Pickles* (1909); and *Pigling Bland* (1913). In her small and special sphere she conveyed truth through fantasy, enlarging the reader's perception of life by poetic means. Of the story books which appeared after her marriage only one, *Johnny Town-Mouse* (1918) can be compared in style or creative effort with her earlier work. The others, including *The Fairy Caravan* (1929); *Sister Anne* (1932); and *Wag-by-Wall* (1914) are less happy experiments addressed to her Amer. public. See Margaret Lane, *The Tale of Beatrix Potter*, 1946.

Potter, Paul (1625-54), Dutch animal painter, b. at Enkhuizen. Some of his best pictures are: 'The Young Bull,' 'The Dairy Farm,' 'The Herdsman,' 'Orpheus,' 'Equestrian Portrait of Tull,' and 'Landscape with Cattle' (at Munich). See W. von Bode, *Meister der holländischen und ulandischen Malerschulen*, 1921.

Potteries, The. Dist. of N. Staffordshire. It is the centre of earthenware and china manufs., and comprises Hanley, Stoke-on-Trent, Burslem, Longton, Tunstall, and Fenton. These, together with other smaller neighbouring dists., were made into the co. bor. of Stoke-upon-Trent in 1910.

Pottery, term applied to all objects made out of clay and baked. It is derived from the Fr. *poterie*, which in its turn originates in the Lat. word *potum*, a drinking vessel. The Gk. word for earthenware is *keramos*, whence the term ceramics, applied to the study of P. In general, with perhaps some insistence on the artistic point of view. All P., whether earthenware, stoneware, or porcelain, is made from a clay paste which can be fashioned while in a plastic state into more or less elaborate shapes, and afterwards converted into a hard and durable material by the application of heat. Early potters were content to pick out the coarse material from the local clay and to work up the rest with water into a fairly homogeneous mass. The discovery of clays of particularly fine natural texture occasioned a demand for that material, and potters all over the world now obtain their clay from a few

favoured dists. The clay best esteemed for fine P. is that known as china-clay or kaolin, and is mostly found in Cornwall, Devon, and Dorset. Various other substances are mixed with the clay to form the body of the P.; sand or felspar is added in the coarser varieties, while calcined flints, fine chalk, or calcined ox-bones are used to form the material out of which the finest examples of white P., or porcelain, are made. Porcelain owes its origin and development to China, and was in the past usually produced under royal patronage. The greatest invention in the hist. of P. is that of the potter's wheel, a contrivance which consists essentially of a disk or table revolving horizontally. The clay is thrown on the centre of the wheel and fashioned by the hand of the potter, aided by a few simple tools, into any symmetrical shape about the axis of the wheel. The clay is then commonly put aside to dry to a more tenacious consistency, and is then more accurately worked by steel tools in a lathe, while unsymmetrical appendages, such as handles and spouts, can be separately moulded and attached to the main body. The articles are then placed in coarse earthenware vessels called *saggars* and piled up in the kiln to be baked. This is often performed in two or more stages; the P. is turned out first in a state called blawit-ware, in which any decorated pattern may be printed or painted; the colour is permanently attached by another firing. In order to lend a lustre to the porous surface, the articles are covered with a composition known as a glaze, of which the prin. ingredient is white lead. This substance is converted into a hard, transparent, and lustrous film by an additional firing process. Great scientific progress has been made in recent years in the manuf. of electrical porcelain in N. Staffordshire and elsewhere. A feature is made of the production of super-insulators for high-tension work. There has also been introduced a system of potter's drying stoves designed to enable the electrical porcelain clay to be dried more uniformly and more quickly than is normally necessary in the case of domestic P. Further, the pieces are sometimes so large that they have to be specially railed into the stove to obviate strains which might arise through vibration. Gas-fired ovens have been erected for the adequate and safe firing of the larger constructions.

**HISTORY OF THE ART OF POTTERY.**—P. was one of the elements in the Neolithic revolution which started somewhere in the E. Mediterranean between Iran and Egypt. The earliest forms were bag-shaped pots and shouldered bowls based on vessels of animal skins. The decoration is very simple; the base of the pot is rounded and there are often lugs for carrying. Sev. varieties of P. are known in the Bronze Age, but all are local products. With the introduction of the hand turn-table or the wheel in the Early Iron Age, P. making became a true industry in Britain.

*Egypt, Mesopotamia, etc.*—The art of

the potter proceeded on parallel lines in Egypt and the Near and Middle E. Bricks made of sun-dried clay, with an admixture of straw, were commonly made at an early period. In Egypt these were unglazed, but in Assyria glazed bricks were used for decorative courses in the most important buildings. Clay tablets and cylinders were used for inscriptions, etc., and these were baked in order to preserve them. The finest art of the Egyptian potters is exemplified in their glazed decorated ware. In the earliest period vases, bowls, etc., were made unglazed, a red colour was obtained by means of a wash of red clay, and black ware was obtained by restricting access of air in baking clay containing iron. Vitreous glazes containing copper were afterwards used, and, although sev. colours were obtained, the finest examples are contained in the turquoise blue glazed ware of the twelfth to eighteenth dynasties. In Ptolemaic times the glaze becomes less opaque, and beautiful effects were obtained by overlaying the old glaze with the new translucent material.

*Crete.*—In Crete valuable discoveries of P. were made at the beginning of the twentieth century. Early Minoan ware consisted chiefly of pots made from coarse grey clay. This ware was hand-polished and decorated with incised lines, as was also P. from the Antiporas Is., 2500 B.C. A ripple design is also found on Neolithic ware from Crete, all of which dates from before 3000 B.C. In the Bronze Age, the Minoan period at Cnossos, terra-cotta coloured clay was used and was probably baked. This ware was painted dull black and, later, was decorated with white patterns in imitation of the design on Neolithic ware. In the middle Minoan period that followed, the potter's wheel introduced from Egypt was probably first used. Patterns of curves and spirals formed the decoration and were either in light colours upon a black background (polychrome) or were a dark design on the original clay (monochrome). Later Minoan period produced eggshell vases and a relief design was introduced. Large storage jars, 'pithoi,' similar to those in use to-day, were made first at this time, and a change in favour of monochrome rather than polychrome took place. A durable black varnish was discovered which was not a glaze but probably a forerunner of that used in Attic black figure vases. Later Minoan P. was all monochrome, with brown black glaze on buff clay slip, and was polished by hand. Design became naturalistic, plants, flowers, fish, and shells being represented. A quick deterioration followed. P. became stiff in shape and the decorations were conventionalised until they finally disappeared altogether. Cretan P. was used for many purposes, including cups, kettles, ornaments, and cupboards.

*Greece.*—P. in Greece appears to have developed independently of any Egyptian or Assyrian influence until a late period. The Gks. even credited themselves with the exclusive invention of the potter's

wheel. The most typical form of Gk. P. is the vase, manifold as regards shape and probable uses, but possessing the common features of foot, body, and neck. They were used as measures, as indicated by the use of the term *amphora*, and as storeplaces for food, toilet preparations, and the like; they were given as prizes in athletic contests, and some had a purely sacramental or religious function, as is evidenced by their constant occurrence in tombs in every part of the Mediterranean coast. The earliest decorations were obtained by inscribing geometrical and floral patterns by means of a pointed instrument. Strictly speaking the Gks. used no glaze; but a black varnish of uncertain composition is characteristic of all the best decorated work. The black coat was painted on in the form of animals, human figures, etc., and the material consolidated by another firing. Later it was customary to exhibit the figures in red, the background being filled in with the black pigment. Numerous examples of these vases, called Etruscan ware from their plentiful occurrence in Etruria, have been preserved. From the fourth century B.C. Gk. P. becomes over-ornamented and florid; the drawing is careless, and the subject-matter shows signs of decadence in the Gk. spirit.

*Rome.*—From an artistic point of view, Rom. pottery is inferior to Gk. There is earthenware, used for domestic purposes, and the bright red glazed ware produced in Italy, S., central, and E. Gaul which found its way to almost every Rom. prov. It is traditionally known as Samian ware, and from its wide distribution its chronology is useful to the archaeologist. The forms show great variety, and nearly all are borrowed from metal-shapes. Decoration is usually moulded, applied, or stamped; but barbotine, painting, incision, rouletting, and marbling are also used. The coarse domestic P. was widely manufactured throughout the empire, and many potters' kilns have been found. Often a local potting tradition combines with the prov. Rom. to provide a fabric of merit.

*Asiatic Pottery.*—It is to China that we owe sev. of the distinctive features of artistic P. The development of ceramics seems to have followed the same lines as elsewhere in the early stages, though the Chinese appear to have been the first to discover that powdered felspathic rock mixed with lime could give a high glaze. When porcelain was first produced is not known. Chinese potters favoured high temp. firing, which resulted in a highly vitrified stoneware. The discovery of the properties of kaolin appears to have led to the production of the thin translucent ware known as porcelain about A.D. 1000. Owing to the high temp. of firing, the Chinese were restricted to such colours as cobalt blue and a blood-red copper pigment in their decorative schemes. Afterwards other colours were painted after the blue and red had been fixed and the ware fired again at a lower temp. The influence of Chinese porcelain cannot be over-esti-

mated. It was felt first by the potters of Asiatic countries, and afterwards inspired European craftsmen to fruitless endeavour. *Persia* had received the heritage of the Assyrian skill in glaze, and, like the Chinese, aimed at a dead-white stone-ware. From the twelfth to the sixteenth century Persian P. shows fine examples of brilliantly coloured patterns on a white ground. P. (among other things) from the excavations at Nishāpūr, Persia, in the Metropolitan Museum's Iranian expedition of 1938-40 show that Nishāpūr was an important centre of early Islamic art in evolving the Saljuk style. The P. found included a ninth-century polychrome glazed bowl, a green P. bottle in the shape of a fish, a red, black, and white tenth-century glazed bowl, a green P. bottle, and a carved P. lantern carved before firing, all from Teppēh Madraseh. *Turkish* P. of the same period is characterised by a white body of sandy texture; strong colours are used, and a thick transparent glaze. The general effect was to make the colours run somewhat, presenting a crowded effect of brilliant yet harmonious colour. The luxurious impression is often heightened by the use of gold leaf. The early P. of Japan was earthenware, and such pieces are valued very highly in that country. The Jap. claim to have learnt the art of P. from the Koreans, but many Jap. potters studied their trade in China. The Jap. potter, Kato Shiroz (Yemon, learnt from China, and in Seto in 1223 made 'harefur' cups for tea-drinking, a custom also imported from China. Later tea-bowls of porcelain, used in the numberless tea-drinkings, formed the greater part of Jap. P. Among Jap. P. we find *kakiyemon* ware of creamy white paste with moulded forms and sparsely scattered decoration. *Imari* or old Japan is chiefly blue and white P. *Orochi* or *nabeshina* ware has a blue comb-like pattern round the base of cups and bowls. *Kishiu* ware and *Kutani* are other forms of old Jap. porcelain, while there is a great deal of kaolinic stone-ware.

*European Pottery.*—After the decline of the Rom. Empire P. in Europe degenerated. The greatest advance in medieval times came with the introduction of tin-enamel from the Moslem invaders of the S. of Europe. The white enamel consisted of silicates of lead and potash combined with oxide of tin. Articles made of buff-coloured clay were dipped in this wash and attained an opaque, white colour. The knowledge of this process spread from the is. under Moorish occupation to Italy, and the name *Majolica* is given to it. Ware of this period to denote its connection with the is. of Majorca. Sometimes the pattern was scratched through to the underlying red clay, and a beautiful metallic lustre was lent to the surface after glazing owing to the presence of the tin. Fine painted examples of tin-enamelled ware were produced at Faenza, whence the name 'faience' for glazed painted stone ware in general. From the sixteenth century

the centre of the industry was transferred to France, where brilliantly decorated enamel-ware was produced at Rouen. About 1600 the production of enamel-ware was initiated in Holland at Delft. The best kind of Dutch P. was in the form of earthenware, although the potters of Delft attempted to imitate the surface of Chinese porcelain and sometimes termed their ware porcelain. An important section of Dutch P. was the manuf. of tiles which were used for wall decoration. The valley of the Rhine was the seat of the production of a hard white stone-ware, glazed by throwing salt into the kiln. In England the Rhine valley ware was imitated at Fulham and in N. Staffordshire, while Lambeth, Bristol, and Liverpool produced delft with decorations, mostly of cobalt-blue. England also produced stone-ware which was white throughout, and this characteristically Brit. variety of P. underwent marvellous development in the hands of Josiah Wedgwood. The attempts at copying Chinese porcelain were first distinctly successful in Germany, and a factory estab. by Bottger at Meißen was the precursor of many others. Highly vitrified stone-ware had been produced in France at St. Cloud, and greater success attended the work of the royal factory at Sevres, estab. in 1756. The process was, however, very laborious and expensive, and the artistic value of most varieties of Sevres porcelain has been greatly overrated. In Denmark the art of P. has always been remarkable for its wonderfully correct shape, and to-day also for its perfect glaze. In England factories for the manuf. of porcelain on continental lines were estab. at Chelsea in 1750 and at Worcester in 1751. At Bow (1744) the use of bone-ash led to excellent results, and the factory at Plymouth (1768) produced a fine hard, white ware made from Cornish clay. The factory was removed to Bristol in 1770, and the characteristic porcelain became widely known. During the Napoleonic wars the industry in England developed on somewhat utilitarian lines and there was a tendency to forgo artistic considerations. Of recent years there has been a revival in the direction of P. of real decorative value, to which the work of the Rookwood factory has undoubtedly contributed. See A. Jacquemart, *Histoire de la céramique*, 1873; A. Brongniart, *Traité des arts céramiques*, 1884; L. M. Solon, *The Art of the Old English Potter*, 1885; W. Pottstown, bor. of Pennsylvania, U.S.A., in Montgomery co. on the Schuylkill R., 18 m. E.N.E. of Reading. There are iron and bridge works, boiler shops, etc. Pop. 21,200.

Pottsville, city of Pennsylvania, U.S.A., co. seat of Schuylkill co., at the junction of the Norwegian and Schuylkill Rs., 18 m. N.E. of Harrisburg. It is the centre of an anthracite coal dist., and there are manufs. of iron and steel goods and textile and silk mills. Pop. 24,500.

Pouched Mouse, or Kangaroo-rat, names applied to species of *Dipodomys*, a genus of rodents in the family Heteromyidae. There are in all twelve species of these jerboa-like creatures all belonging to N. America. They are burrowing animals, with long hind limbs and tails, and cheek-pouches. *D. merriami* and *D. philippii* are well-known species.

Poudré Weather, see under SNOW.

Poughkeepsie, city and co. seat of Dutchess co., New York, U.S.A., on the Hudson R. It is a manufacturing centre of considerable importance, and is noted for its educational institutions, Vassar College being one of the most famous women's colleges in America. P. regatta is celebrated. Pop. 41,000.

Pouishnoff, Leff (b. 1891), Russian pianist and naturalised Brit. subject, educated at the Petrograd conservatoire where he gained a first-class diploma. He was also awarded the gold medal and the Rubinstein prize. He made his first appearance in Uman in 1896, and appeared also in Petrograd in 1910 and in London in 1921.

Poulenc, François (b. 1899), Fr. composer, b. in Paris, chiefly known as a composer of sonatas for wind instruments: a sonata for two clarinets, a sonata for clarinet and bassoon, and a sonata for trumpet, horn, and trombone, besides a concerto for harp-ichord. He was a member of the group of Fr. composers led by Honegger (q.v.) and known as 'Les Six.' He has also composed a ballet, *Les Biches*, produced by Diaghilev (1925), and a one-act *comédie bouffe* entitled *Le Gendarme incompis* (1920). His works show the influence of the eccentricities of the whimsical composer Erik Satie (1866-1925), and the extravagance of his friend, the poet Jean Cocteau (q.v.). Other works include *Le Bistrot d'Apollinaire* (1919), *Poemes de Ronsard* (1925), *Trio* (1926), *Aubade* (for orchestra, 1929), a *marche militaire*, and sev. piano pieces.

Poulson, see POLESSEN LACEY.

Poultice (from the Lat. *puls*, pottage), application to some part of the body with the object of promoting counter-irritation in the case of inflamed tissues or organs, of relieving pain generally, of accelerating suppuration, or of stimulating or soothing the skin.

Poultry and Poultry Keeping. The keeping of poultry for the production of eggs and flesh dates from a remote period of civilisation. A theory shared by Darwin

was that all the domesticated breeds of poultry were derived from *Gallus bankiva*, a bird which inhabits N. India, Burma, Malay Peninsula, and the Malayan Archipelago, and though he admitted the lack of good evidence of the theory, he drew attention to the well-known tendency of many of the breeds, now widely different in external characteristics from *Gallus bankiva*, to revert to its type. Probably it occupied centuries of careful selection and breeding to produce a strain of birds capable of continued laying; but it is a remarkable fact that since breeding has been undertaken on modern scientific lines the average egg production has increased more rapidly in a half-century than in those many previous centuries. The ordinary fowl's yield of about 150 eggs in twelve months results in a profit after all charges are paid. To increase such an average yield for a large flock is to enhance the profits more rapidly than the expenses. Of the many factors which contribute towards profit on poultry, strain is the most important, for egg production is undoubtedly a Mendelian or inherited characteristic. Only the best layers, past their first moult, or, at least, in their second year, should be used in the breeding pen, and the male bird should come of a large egg-laying strain.

**THE DOMESTIC FOWL. Breeds.**—The most popular layers are Leghorns, Anconas, Light Sussex, and Rhode Is. Red, the last-named being a favourite. Two good cross-breeds are the Legbar, a cross between a Brown Leghorn and a Canadian Barred Rock, and a variety which is a cross between a Leghorn and a Rhode Is. Red.

**Rearing.**—When chicks are hatched out naturally by the broody hen (see below), the hen and her chicks should be housed in a fold with a portable run attached. When day-olds are purchased from a reliable breeder and no broody hen is available the chicks are reared in an artificial brooder, which has vents for the fumes of the oil lamp, and slides which are shut in with curtains through which the chicks can pass to and from the lamp. The temp. in the hover should be regulated according to the state of the chicks. If chicks are found to be always packed together more warmth is needed, if found standing around looking rather sleepy, less heat is required. Chicks are usually ready to be taken away from the brooder after five to seven weeks and moved to a larger house with a run. The next stage is when the pullets reach the point of lay period (five to seven months). Female poultry stock are advertised as (1) pullets (birds up to twelve months old); (2) yearlings (twelve to twenty-four months); and (3) hens (over twenty-four months).

**Feeding.**—Before 1939 a layer's food allowance normally consisted of 2 oz. of corn and 2½ oz. of layers' mash daily; thus six pullets needed nearly 12 lb. of food a week. The corn was given for one meal and the mash for another, usually the final meal before roosting; fresh greenstuff at midday and clean

water always are normal provisions. During the Second World War a rationing system was introduced in Great Britain, under which poultry keepers with twelve birds or less received a ration of 'balancer' meal made up of bran, dan, maize meal, meat and bone meal, ground oats, and wheatings; this is fed either morning or evening, or both, mixed with finely chopped household scraps. A plentiful supply of crushed oyster shell should always be available. This contains lime, and is essential to the welfare of the fowls and for the formation of the shells of eggs.

**Accommodation.**—Fowls with a free range, if active foragers, exercise themselves sufficiently, but those in confinement should be induced to exercise by the provision of a scratching shed. This is a shed with a well-lit floor and one side open to the S., but protected from driving rain by adjustable canvas screens. The floor, which preferably should be of rammed earth, is covered with a layer, 6 in. or more deep, of litter such as dry leaves, chopped straw, or peat-moss, and in this corn is buried, so that the fowls have to scratch for it. Devices exist for scattering the corn automatically at intervals, so as to economise labour. The house may be completed as a day and night house by being provided with perches at the back and wide boards, 9 in. below, to prevent the litter being soiled, and the necessary nest-boxes, one to every four birds, arranged with their entrances facing the wall, a raised shelf bearing a self-filling drinking vessel, and a spacious flat box containing fine dust, in which the birds can take their dust bath to keep down insects, complete the equipment of a type of house which is in favour with many successful poultry keepers and farmers. For sleeping accommodation only, almost any structure, if well-ventilated yet not draughty, can be utilised, provided it allows a minimum of 10 cub. ft. per bird of air space and is frequently lime-washed and disinfected. Innumerable failures in poultry keeping are due to foul ground; this is the case even on farms where, though the fowls have an unlimited range, they frequent one corner of a field near the homestead, the grain food being always thrown down there. Chicks and young birds must develop on clean, fresh ground. The confined runs of tens must be cleaned out daily, all objectionable matter being removed. Under the most cleanly conditions not more than six medium-sized fowls ought to be kept in a dry covered-in run 6 ft. by 12 ft. Once in six months the top inch of the rammed earth floor should be removed and used as manure, and every two years the run dug up. Grass is a valuable poultry food, and fowls are commonly kept on grass runs, but as it quickly becomes foul, the grass should be regularly mown and the runs vacated and rested every three months.

**Laying Battery.**—Under this system layers are confined in a cage of some 18 in. by 14 in. Although this is considered to be cruel by many poultry keepers the birds lay extremely well, and it also

enables the poultry keepers to note the bad layers. The cages are constructed so that the egg rolls gently down the sloping wire tray on which the bird stands to the egg rack in front. It is essential that the droppings boards or trays should be cleaned daily.

**Broody Hens.**—If the hen is required for 'sitting,' the setting of eggs (usually thirteen under large birds and nine or eleven under light strains) should be placed in proper nesting boxes in a quiet corner, and the hen fed once daily. The bird should come off the nest for 20 min. voluntarily each day, and care must be taken not to disturb it after it has been sitting for nineteen days. If the hen is not required to sit it should be placed in a small coop with a barred front and bottom, situated in full sight of the other birds, and fed well; as it is unable to sit comfortably the hen soon recovers from its broodiness.

**Artificial Incubating.**—There are many makes of incubators. The incubator must be placed in a well-ventilated position where there is no draught, and the heating apparatus regulated to maintain a steady temp. of 102° to 104° (see further under INCUBATION AND INCUBATORS).

**Common Diseases.**—The symptoms of abortion are the dropping of eggs, often shell-less. The affected bird should be isolated, with a nest in a corner, and given soft food with a little bicarbonate of soda in water. **Bumblefoot** is a growth under the ball of the foot, and must be treated by a veterinary surgeon. **Consumption** is a wasting disease and can rarely be cured, but cod-liver oil in meal and one or two quinine capsules sometimes overcome the tendency if treatment is commenced early. **Cramp** is usually caused by exposure to damp, saturated runs, etc. The legs should be plunged fairly frequently in a warm mustard bath and the bird kept in a dry warm house until improvement is obvious; the legs may also be rubbed with an embrocation. **Gapes** is caused by worms in the windpipe, and is frequently fatal. Camphor should be placed in water provided for the fowls, and for individual treatment a small quill feather should be stripped, moistened with turpentine, forced down the trachea (windpipe), and withdrawn with the worms attached. The symptoms of **rheumatism** are a swelling of the joints; treatment, as for cramp. **Roup** (q.v.) is a common contagious disease characterised by a thick discharge from the eyes and nostrils. Birds attacked should be placed in a warm, dry enclosure. The head should be cleaned with a disinfectant; the drinking water and soft food treated with proprietary preparations.

**Table Poultry.**—For this purpose white-skinned, big-breasted, quick-maturing birds are essential. At six months such birds are placed in a small pen and fed for two or three weeks from a trough containing a mixture of balancer meal, ample fat scraps, and potatoes. They are starved for 24 hrs. before killing. Cockerels not required for breeding pur-

poses are reserved for the table. Hens culled (i.e. thrown out) because their laying days are over are sold as boiling fowls.

**Killing and Plucking.**—In the case of chicks the bird is placed with its neck against the edge of a table or door; pressure by thumb-nail on the other side will sever the neckbone and cause instantaneous death. Cockerels and hens are taken by the legs, hanging head down, and gripped behind the head (back of head to palm of hand) with first and second fingers. The head is bent back firmly to part the neckbone just below the head and the bird plucked directly after killing. If the plucking be delayed the bird should be plunged into hot water, when the feathers will come away more easily.

**Auto-sexing.**—Experiments undertaken at research stations have enabled the sex to be determined by the plumage of the sex in the case of the Welbar, Legbar, Cambar, etc. (see also under SEX DETERMINATION).

**DUCKS.**—Of the many breeds of ducks (q.v.) the two which are most popular with domestic keepers are the Aylesbury, unsurpassed for table purposes, and Khaki Campbells, which are excellent layers and also good table birds. Ducks are hardy and can be kept profitably without a pond. If a duck-pond is constructed the sides should slope easily down to the water, the water being changed frequently. In a well-ventilated shed, with the floor well covered with straw in which the birds may lay their eggs, the ducks will lay almost daily.

**GESE.**—These are not popular with the domestic poultry keeper, largely because the goose is not a satisfactory 'sitter,' and then only four or five goose eggs can be hatched under one hen; goose meat, because of its richness, is not liked by many, and a good area of grassland is needed to keep them in good condition. The well-known breeds are Embden, Toulouse, and Roman; a cross between the Embden and Toulouse makes the best table bird (see also GOOSE).

**TURKEYS.**—These are really farm birds, and as such are not generally suited to the domestic poultry keeper (see under TURKEY).

**GUINEA-FOWL.**—Guinea-fowl (q.v.) are popular both for their eggs and flesh, but they do not thrive in close confinement and require a large range if they are to remain healthy. As a result, domestic poultry keepers do not often keep them.

See E. T. Brown, *The Poultry-keeper's Text-book*, 1948; C. E. Lee, *Profitable Poultry Management*, 1948; H.M.S.O., *Scientific Principles of Poultry Feeding*, 1948; 'Poultry World,' *Practical Poultry Keeping*, 1948, *Geese*, 1948, and *Ducks*, 1949; and G. R. Scott, *Secrets of Successful Poultry-keeping*, 1948.

**Pound, Sir (Alfred) Dudley (Pickman) Rogers** (1877-1943), Brit. admiral, son of Alfred John P. and Elizabeth Pickman Rogers of Boston, U.S.A. He entered the *Britannia* as a naval cadet, 1891; midshipman, 1893; sub-lieutenant, 1896;

lieutenant, 1898. In 1899 he specialised in torpedoes, all his seetime as a torpedo lieutenant being passed in flagships. On his promotion to captain in Dec. 1914 he was appointed naval assistant to the First Sea Lord (Adm. Fisher). In Oct. 1915, as captain, he took command of the flagship *Colossus*, the leader of the 5th Div. of the battle fleet in the battle of Jutland. From 1917 to 1919 he was director of operations (home) at the Admiralty, and from May 1925 to Jan. 1927 he was chief of staff to Adm. Sir Roger Keyes, commander-in-chief, Mediterranean, being promoted rear-admiral during that period. In 1927 he was made assistant chief of the naval staff, with a seat on the Board of Admiralty. Two years later he hoisted his flag on the *Hood* in command of the battle cruiser squadron, being made vice-admiral during the period of his command. From 1932 to 1933 he was Second Sea Lord and chief of naval personnel at the Admiralty. From June 1939 until his death he was First Sea Lord and chief of the naval staff. A capable officer and fine seaman, no other service chief of staff had held office continuously in time of war for so long a period. His outstanding services were recognized by the award of the O.M. in Sept. 1943.

**Pound, Ezra Loomis** (b. 1885), Amer. poet, oriental and medieval scholar, b. in Hailley, Idaho. He was educated at Pennsylvania Univ. and settled in Europe in 1907, travelling widely in England, Italy, and France. P. was one of the founders of the Imagist school of poetry, and probably not only the best of them, but also the most scholarly. His knowledge of medieval literature is profound. His early books—*Exultations* (1909), *Personae* (1910), and *Lustra* (1918)—show the results of his studies. Not only does he give in free verse lovely rhythmic inventions of his own, but also masterly trans. from the Provencal songs of the troubadours. He has trans. many works of the Chinese, Lat., It., and Fr. poets. Some of his own poems are hauntingly beautiful, and full of experiments, while at other times he is a savage satirist. Among his prose writings are *Indiscretions* (1923) and *Imaginary Letters* (1930). P. broadcast from Italy during the Second World War, and was later accused of treason by the U.S. Gov. In 1946 he was declared mentally unsound and was confined in an asylum. In 1948 he was awarded the Bollingen prize for his *Pisan Cantos*, written while he was in the asylum. While there he also trans. the odes of Confucius. See T. S. Eliot, *Ezra Pound, His Metric and Poetry*, 1917, and A. S. Amund, *The Poetry of Ezra Pound*, 1937.

**Pound** (Saxon *pyrdan*, to confine), enclosure in which cattle or other beasts are confined when taken trespassing or going at large contrary to the law. See pound breach under BREACH.

**Pound**, unit of weight. The Eng. unit of weight is the P. avoirdupois of 7000 grains divided into sixteen ounces. It was made the legal unit of weight in 1855. The P. troy consists of 5760 grains, and

is used for gold and silver, platinum, and precious stones; also in dispensing medicines.

**Poundal**, in dynamics, unit of force in the foot-pound second system, is that force which, if acting for one second, will produce in one pound a velocity of one foot per second.

**Pounds, John** (1766–1839), Brit. philanthropist, b. in Portsmouth. Being crippled for life by an accident in 1781, he became a shoemaker and set up business for himself in 1803. In 1818 he began to teach poor children, and from that time became famous as a teacher and friend of the poorest, being the originator of ragged schools (*q.v.*). After his death schools were estab. as memorials of his achievement.

**Poushkin**, see PUSHKIN.

**Poussin, Nicholas** (c. 1594–1665), Fr. painter, b. at Les Andelys, Normandy. He studied under Quentin Vrai of Amiens and Ferdinand Elle, a Fleming, and in 1624 went to Rome, where he studied the works of Raphael. He has been called the 'Raphael of France.' He excelled as a painter of hist. and landscapes. The noble construction of his designs may be better seen in engravings than in the originals, where often the colour has changed in parts. Among his chief pictures are the 'Triumphs of Flora,' a 'Bacchanal,' 'Massacre of the Innocents,' the 'Last Supper,' the 'Labour of Hercules,' the 'Triumph of Truth,' and the 'Holy Family.' See studies by P. Desjardins, 1903, and W. Friedländer, 1911.

**Pout**, see BIE.

**Powan**, see CORLIGON(S).

**Powder Metallurgy**, see under METAL-LURGY.

**Power.** A P. is an authority reserved by or limited (*see* LIMITATION) to a person to dispose, either wholly or partially, of real or personal property either for his own benefit or for that of others. The word thus specialised is highly technical, and the idea underlying it must not be confused with the dominion exercisable by a man over his own property by virtue of ownership. Usage has sanctioned a classification of P.s. into (1) Common law P.s., i.e. either bare authorities by one person to another to do an act for him, or P.s. coupled with an interest. Examples: A P. of attorney (*q.v.*); a declaration in a will by a testator that the executors may sell the land, by virtue of which P. the executors can pass the legal estate to the purchaser. (2) Equitable P.s., or those which affect the equitable as opposed to the legal interest or estate in property (*see* EQUITY); the commonest example is the ordinary P. of appointment among children in a marriage settlement (*see* LAND LAWS), where personality (*see* PERSONAL PROPERTY) is vested in trustees. A 'general P. of appointment' is one whereby the donee of the P. can appoint whom he will as owner of a particular fund or other property; a 'special P.' is one whereby he can only appoint some or all of a specified class of persons (usually children or other issue to be provided for in a marriage settlement). (3) P.s. oper-

ating under the Statute of Uses, or Ps. of revoking or declaring future uses vested in some person named for that purpose in the deed by which the uses to be affected by the operation of the P. are created. The commonest instances of the exercise of this cumbersome device for getting over the technical difficulties of common law conveying rules are the Ps. of sale and jointuring (see JOINTURE) in a marriage settlement.

**Power**, see AIR ENGINE; GAS ENGINES; GEARING; HORSE-POWER; MECHANICS; TUBES (PNEUMATIC).

**Power of Attorney**, authority by one person, called the donor, to another, called the donee, under which the latter becomes authorised to act as the agent of the former. It is by no means essential that a P. of A. should be given by any formal instrument, but in practice the authority is always embodied in a deed poll of indenture. Where the authorisation is to act for the donor in all matters, or in all matters relating to a particular business, it is called a *general P. of A.*; where the donee is only authorised to do some specified act the P. of A. is called a *special power*. Ps. of A. are construed strictly, and give such author'y only as is conferred expressly, or is by implication clearly necessary for the due execution of the powers expressly conferred. The stamp duty on a P. of A. to a person to vote as proxy is 1d.; on a P. of A. for any purpose not specifically described in the Stamp Act, 1891, 10s.; but proxies given by creditors or contributors in bankruptcy and winding-up proceedings are exempt.

**Power Stations**, see ELECTRICAL POWER GENERATION.

**Powieke, Sir Frederick Maurice** (b. 1879), Eng. historian, b. at Alnwick, and educated at Owens College, Manchester, and at Balliol College, Oxford. He was a fellow of Merton College from 1908 to 1915, and was made an honorary fellow of Merton in 1922 and of Balliol in 1939. After holding chairs of hist. at Queen's College, Belfast, and at Manchester Univ. he was regius prof. of modern hist. at Oxford from 1928 to 1947. He was president of the Royal Historical Society from 1933 to 1937. In 1946 he was knighted. A brilliant medievalist, P.'s influence at Oxford did much to maintain and increase the keen interest in medieval hist. for which that univ. is famous. He stressed the importance of spiritual values in hist., and, while encouraging the new emphasis on economic factors, helped to ensure that they did not, at Oxford, flourish to the exclusion of the spiritual. His *Henry III. and the Lord Edward* (1947) was an outstanding monumental study of a period of Eng. hist. which had not previously been thoroughly explored in Eng. Among his other publs. are *The Loss of Normandy* (1913); *Aired of Rucantr* (1922); *Stephen Langton* (1928); *Christian Life in the Middle Ages* (1933); and *The Reformation in England* (1941).

**Powis, Earls and Marquesses of**, descended from the first earl (second 'Her-

bert' creation) of Pembroke, whose son Sir Edward Herbert in 1587 purchased P. Castle, Welshpool, from Edward Grey, feudal lord. Sir Edward's son Wm. became Baron P., 1629. Wm.'s grandson, third baron, was made earl 1674, marquess 1687. His honours became extinct on the death of the third marquess, 1747-48. A descendant of a younger brother of Sir Edward was made earl, 1748; his honours became extinct on the death, 1801, of his son, whose sister had married Edward, second baron Clive (1754-1839)—who was in 1804 created earl of P., and whose son and successor took the surname Herbert. When the last-named earl's son and successor died, 1891, the earldom passed to his nephew George Charles, styled third earl, b. 1862, a son of Lt.-Gen. Sir Percy Egerton Herbert.

**Powlett, or Pawlett, Charles**, see BOLTON, DUKE OF.

**Poyning, Sir Edward** (1459-1521), Eng. statesman b. in Southwark. He led the rising in Kent in 1483. He fled to the Continent, but returned with Richmond, afterwards Henry VII., in 1485. He subsequently became lord-deputy of Ireland (1491). In this capacity he convoked a Parliament which passed 'Poyning's Law' (1495), enacting that no law could be valid in Ireland until it received the sanction of the Eng. king and council. P. defeated Perkin Warbeck and crushed the Yorkist cause in Ireland.

**Poynter, Sir Edward John** (1836-1919), Eng. painter, b. in Paris. He studied art at Rome under Leigh, 1854; in England under Dobson, 1854-56; and in Paris under Gleyre, 1856-59. He was shade prof. of art at Univ. College, London, 1871-75; became an R.A. in 1876; and director of the art dept. at S. Kensington and prin. of the National Art Training Schools there, resigning in 1881. P. succeeded Burton as director of the National Gallery, 1894-1903, he made the Tate Gallery a dept. of it. He ed. the *Illustrated Catalogue of the National Gallery* (1889-1900). From Millais' death (1896) he was president of the Royal Academy. He was knighted in 1896 and created a baronet, 1902. He became a G.C.V.O. in 1918. P. designed the cartoons for the mosaic panels of 'St. George' and 'St. David' in Westminster Palace (1870), and of 'Apelles' and 'Phidias' in the Victoria and Albert Museum. His pictures include 'Israel in Egypt' (1867) and 'Atalanta's Race' (1876). He pub. *Ten Lectures on Art* (1879).

**Poynting, John Henry** (1852-1911), Eng. physicist, b. at Moulton, near Manchester, educated at Owens College and Trinity College, Cambridge. Formulated P.'s theorem in 1884, proving that the flow of energy could be expressed by a formula in terms of the magnetic and electrical forces—a point.

**Požarevac** (Ser. Passarowitz), tn. of Serbia, Yugoslavia, 37 mi. from Belgrade. It was the scene of the peace of Passarowitz (1718) between Charles VI. and Venice on the one side, and Turkey on the other. Pop. 16,100.

**Poznan** (Ger. *Posen*): 1. Prov. of Poland. It is situated in the N. Ger. plain, and is watered by the Warthe (Warta), Proсна, Obra, and Netze. Agriculture is the prin. industry, and great attention is paid to stock-raising. The chief manufs. are machinery, tobacco, beet-sugar, bricks, cloth, and leather. Lignite and salt are mined. The most notable tns. are P. and Bydgoszcz (Bromberg). It belonged to Prussia from the time of the partitions of Poland in the eighteenth century until 1918, when most of P. was returned to Poland. The remainder was transferred to Poland in 1915. Area 11,947 sq. m. Pop. 2,115,000. 2. Cap. of the above, situated at the confluence of the Warthe and Cybina, a fortress of the first class, and an archiepiscopal see (since A.D. 1000). The most interesting buildings are the Gothic cathedral with its 'Golden Chapel,' old tn. hall, and Raczynski palace. The tn. has important manufs., distilleries, flour mills etc. A univ. was founded in 1903. Pop. 297,000. See W. Maas, *Die Entstehung der Posener Kulturlandschaft*, 1927.

**Pozoblanco**, tn. of Spain in the prov. of Cordova, situated in a rich lead-mining dist. There are noted cattle fairs, and manufs. of leather and woollen. Pop. 19,800.

**Pozsony**, see BRATISLAVA.

**Practice**, in arithmetic, name given to a rule or method which shortens the operation of compound multiplication, e.g. find the price of 85,764 articles at £3 15s. each:

£ 85,764 is the cost at £1

257,292	"	"	3	
42,882	"	"	10s. (4 of £1)	
21,441	"	"	5s. (4 of 10s.)	
<u>321,615</u>	"	"	<u>3 15s.</u>	

**Practice and Procedure** (in law), see ACTION; CRIMINAL LAW; EVIDENCE; INJUNCTION; INTERLOCUTORY PROCEEDINGS; PLEADINGS; PROCESS (in law); PROOF; SPECIFIC PERFORMANCE; SUMMONS; WRIT.

**Practitioner**, see MEDICAL PRACTITIONER.

**Prado**, Museo del, state gallery of Madrid. It houses the most important Sp. art collection, over sixty of the works of Velazquez being there. Raphael, Titian, Rubens, and Goya are also well represented. There are paintings by Correggio, Giorgione, and El Greco, and a large Flem. collection. See also NATIONAL GALLERIES, European Galleries of Paintings. See *The Prado Treasure House of the Royal Spanish Collections*, 1940.

**Præd**, Winthrop Mackworth (1802-39), Eng. poet b. in London, and educated at Eton and at Trinity College, Cambridge, where he became noted for his Gk. and Eng. verse. He was called to the Bar in 1829, and later took up political life. He was one of the prime movers in establishing a national system of education. His poems are marked by grace, wit, and delicacy of style and finish. An author-

ised ed. of his poems, with a memoir, appeared by D. Coleridge in 1861.

**Præfect**, name of various Rom. magistrates. The original *præfectus urbi* or *custos urbis*, created by Romulus and chosen from among the senators, only exercised his functions in the king's absence, when he could convoke the Senate or hold the Comitia. Under Augustus he had beneath him the *miles stationarii*, and kept peace and order in the city. Officers who controlled or superintended some particular dept. were also called *præfecti*.

**Præfloration**, see ESTIVATION.

**Præmonstratensians**, see PREMONSTRATENSIANS.

**Præmunire**, name of a medieval writ taking its title from the opening words *Præmunire facias* (cause to be forewarned). The name came to be applied to the offences prosecuted by such a writ and to the penalties incurred. In this way the name P. came to be given to sev. Eng. laws passed in the later Middle Ages for the purpose of restricting papal authority in England. The first of these statutes of P. was passed in 1353, but that which is usually known as the statute of P. was a law passed in 1392, forbidding the obtaining of bulls from Rome. After the Reformation many further types of offence were made subject to the penalties of P., e.g. such penalties were attached to the Habeas Corpus Act of 1679.

**Præneste**, see PALESTRINA.

**Præsepe**, beautiful star cluster, commonly known as the Beehive, in the constellation of Cancer. It is just visible to the naked eye, and a small telescope or a pair of binoculars will show the individual stars. Next to the Pleiades it is the most conspicuous of the star-clusters.

**Præsidium Julium**, see SANTAREM.

**Prasodymium**, see DIDYMIUM.

**Prætor** (*prætor*, one who goes before), originally a title designating the Rom. consular leader of the army (Gk. *ἀρχηγός*). After 366 B.C. it was applied to the annually elected curule magistrate, who administered justice and was subordinate to the consuls. The office was thrown open to the plebeians by 337. By 246 there were two Pn. (*urbanus* and *peregrinus*), the number later increasing to eighteen under Nerva. There were eight, sixteen, and twelve under Sulla, Julius Cæsar, and Augustus respectively. They were attended by lictors. Under the empire one of their chief functions was the management of the games. Prov. governors were of prætorian rank. In later times the word came to mean mayor or chief magistrate, the It. *podestà*. See Labatut, *Histoire de la Préture*, 1868, and Mommsen, *Römische Staatsrecht* (II.), 1887.

**Prætorian Guard**, or **Prætoriani**, imperial bodyguard in anc. Rome instituted by Augustus (3 B.C.), consisting of nine (later ten) cohorts of about 1000 men each, horse and foot, commanded by a tribune. They had higher rank and pay than the legions, and their term of service was sixteen years. They came to possess an

almost acknowledged right to choose the new emperor. These cohorts which were stationed in Rome were collected into the famous 'praetorian camp' in Tiberius's reign. Constantine finally suppressed them (A.D. 312). The name *praetoria cohors* had been applied earlier under the republic to select troops attendant on the praetor or general of the army. See also ROMAN ARMY.

**Pragmatic Sanction** (Gk. *πράγμα*, business), solemn ordinance or imperial rescript. The term *pragmatica sanctio* was used in late Rom. law, and continued to be used in the legal phraseology of the Middle Ages and of modern Europe, particularly of a decree that defined the powers of a sovereign. The most important decrees in European hist. which have been so named are that of Bourges, in which Charles VII. defined the pope's power within the Fr. dominions (1437); of Charles VI. of Germany, in which he settled his succession on Maria Theresa (1713); of Naples, when that kingdom was made over by Charles III. of Spain to his third son (1759). The term P. S. has since the rise of modern constitutional govts. become little more than historic.

**Pragmatism, or Humanism**, is almost entirely a product of modern thought. It was first clearly defined by Peirce, but only during later years did it become recognised as a distinct system of philosophy—a development due mainly to Profs. James (Harvard) and Dewey (Columbia). P. may be defined as the philosophy of the expedient; it refuses to recognise as ultimate the ordinary and accepted truths of metaphysics, and confines itself wholly to those truths which are definitely correlated to the actual facts of existence. Since the relation of such truths with facts is liable to constant growth and change, truth thus becomes an intellectual expedient just as right is a moral expedient. One must avoid the error, however, of regarding P. as a form of Positivism (q.v.) in spite of the superficial similarity in many respects. P. contends that truth *happens* to an idea by force of circumstance, and that ideas are true only when they can be 'assimilated, validated, corroborated, and verified.' Thus the expression of truth is limited to broadly realistic lines, and the vague idealistic suggestions of certain schools of metaphysics discarded as intrinsically false. See W. James, *Pragmatism*, 1907, and *The Meaning of Truth*, 1909; and Schiller's works on Humanism, 1903, 1907.

**Prague** (Czech, *Praha*), cap. of Bohemia and of the republic of Czechoslovakia, and one of the most ant. cities of Europe, is built partly in a valley and partly on the inclines of various hills, through which the R. Vltava or Moldau cleaves its rugged course. It is a picturesque tn., containing many buildings of great architectural beauty, abounds in palaces and towers, and has sev. handsome bridges spanning the riv., which separates the old tn. from the new. Old P. is predominantly Gothic in style, but its baroque buildings, chiefly palaces, are some of the finest examples

of baroque in Europe. Among its chief buildings are the Royal Palace (fourteenth century), the cathedral of St. Vitus (1484), containing the reliquary of St. Wenceslas, the Nostic Palace, the Waldstein Palace, the palace of Count Clam-Gallas, the Czernin Palace on the Hradschin Hill, the Kinsky Palace, and many others. Its churches and monasteries are very numerous, the first in importance being the Tyn (Hussite) Church (fourteenth and fifteenth centuries), in the market-place of the old tn., which contains the tomb of Tycho Brahe (q.v.). Another fine church is that of St. Nicholas, erected in the seventeenth century. The most ant. monastery is that of Mt. Zion or Strahor, founded in 1142 during the reign of Vladislav I.; others are the Capuchin and the Emaus monasteries. One of the two old tn. halls, which had a famous clock (1381-1480), was one of the few old buildings in Prague which was destroyed in the Second World War. There is a univ., with 18,900 students in 1947, founded in the fourteenth century, of which John Huss was rector in 1402; there is an observatory attached to it. There are numerous parks and theatres, and a stadium. Modern P. is a commercial centre of great importance. According to tradition P. was founded in the eighth century by Libusa, the youngest daughter of Krok or Crocus, the earliest sovereign of Bohemia. It became a Ger. settlement early in the twelfth century, and a large Ger. element remained in P. until after the First World War. It suffered severely at the hands of the Hussites in 1421, and the battle of White Mt. (1620), during the Thirty Years war, was fought outside its gates. The Swedes gained possession of the tn. in 1648, and it was taken by the Fr. in 1741 and by the Prussians in 1744, who also besieged it in 1757. In the war of 1866 it was again occupied by the Prussians and the treaty of peace was signed here. In Oct. 1918 the declaration of national independence was made in P. It was occupied by the Gers. in March 1939 and liberated by Amer. and Russian troops, aided by a rising by Czech partisans within the city, on May 10, 1945. On May 26, 1942, Reinhard Heydrich, deputy protector of Czechoslovakia, was assassinated in the suburbs of P. In Feb. 1948 the *coup d'état* which placed Czechoslovakia under Communist control took place in P. P. is a Rom. Catholic archbishopric. It is the most important junction of the Czechoslovakian railways. P. manufs. machinery, textile and leather goods, and paper, and has brewer., iron foundries, and chemical works. Pop. 924,000. See A. Exax and F. Hlavas, *Prag in Bildern*, 1928; C. Holland, *Czechoslovakia: the Land and its People*, 1931; and O. Schuorcr, *Prag Kultur Kunst. Geschichte*, 1939.

**Praha**, see PRAGUE.

**Prahlín Island**, see under SEYCHELLES.

**Praia**, cap. of the Cape Verde Is., on the S. coast of Santiago Is. It exports grain, coffee, and medicinal products. Cinchona is grown in the vicinity. Pop. 6000.

**Prairie** (Lat. *pratium*, meadow) vast tract of land usually level in character, covered with grass but devoid of trees, in temperate regions. Such areas of land are common in the U.S.A. and in the P. provs. of Canada. Some P.s. are great wheat growing areas. In other parts stock raising is the chief occupation.

Ind in G. ernment

DR. RAJENDRA PRASAD

**Prairie-dog**, or **Prairie Marmot**, term applied to any of the four species of rodents in the squirrel family Scuridae and genus *Cynomys*. They are burrowing animals, averaging about a foot in length and have the curious habit of dwelling in friendship with the ground owl and rattlesnake. All are found exclusively in N. America.

**Prairie-hen**, or *Impanachus americanus*, galliform bird of the family Phasianidae and subfamily Tetraoninae to which belong the grouse and partridges, the term is also applied to *Tetrao cupido*, a reddish brown bird which is a near ally of *T. americanus*. Both species are natives of N. America.

**Prairie State**, see ILLINOIS.

**Prairie Wolf**, see COYOTE.

**Prakrits**, Indian, see under INDO-EUROPEAN LANGUAGES.

**Pralltriller**, musical ornament which when placed over a note indicates that this note should be struck twice in rapid succession with a note a degree higher or lower in between, according to the sign ♯/W in the former case ♯/W in the latter.

**Prambanan**, see BRAMBANAN.

**Prasad, Rajendra** (b. 1884), Indian nationalist political leader, b. in a vil. in the Suran dist., Bihar. He became a member of the All India Congress Committee in 1912, and practised law in the Patna high court in 1920. He gave up his practice and joined the non-cooperation movement supporting Gandhi in the Champaran agrarian agitation. P. became a member of the working committee of the All India Congress in 1922, and was president of the Congress 1934. He was chairman of the Constituent Assembly, and his firm yet conciliatory handling of its debates during the years 1946-49 endeared him to the back benchers and it was to them mainly that he owed his election (uncontested) as first president of the republic of India (proclaimed on Jan. 26, 1950). Prior to the proclamation India was a dominion whose governor general was Dr. Rajagopalachari. The latter declined to stand for election as president.

**Prase**, lark green chalcidony. The name is also given to quartz of the same colour.

**Praseodymium**, metallic chemical element symbol Pr atomic weight 140.9 atomic number 59 discovered in 1835 by Auer von Welsbach. It belongs to the group of rare earth metals and occurs in monazite and similar minerals. P. is a scarce element and its compounds are difficult to purify.

**Prato**, tn. in the prov. of Florence, Italy, 11 m. N.W. of the city of Florence. It is enclosed by walls and has a citadel, and the prin. edifices are the twelfth-century cathedral, the interior of which is decorated with beautiful frescoes and reliefs, the fifteenth century Madonna delle Grazie church and a tn. hall with picture gallery and public library. There are manuf. of textiles, straw wine flasks, machinery etc. and there are serpentine quarries in the near neighbourhood. During the Second World War there was severe street fighting in P. between Sept. 6 and 10, 1944, between Ger. and Amer. troops. The cathedral was slightly damaged, the loggia of the cloister was destroyed. The church of St. Bartolomeo and the house of Filippo Lippi were also demolished. Pop. 76,600. See M. R. Gabrielli, *Guida di Prato* 1927.

**Pratt, Charles**, see (AMERICAN), LAROF.

**Prawn**, term applied to the shrimp like decapod crustaceans in the family Palaemonidae but especially to *Palaemon* (or *Leander*) *seratus* which furnishes the edible P. It is from 3 to 4 in. long, has a long serrated rostrum of a pale red colour, and is often found near rocks on Brit. shores. In America the name is applied to scv. shell fish but in particular to *Penaeus esculentus* and *P. brasiliensis*. See CRUSTACEA.

**Praxiteles** (fl. c. 364-330 B.C.), Gk. sculptor. His chief works have perished, including the 'Aphrodite' of Cnidus (for which Phryne was probably his model). This was ranked in antiquity next to the 'Zeus' of Pheidias at Elis. It was destroyed by fire in A.D. 475, but a copy exists in the Vatican. Other works were

a 'Satyr,' 'Eros of Theopias,' and 'Apollo Sauroctonos.' His 'Hermes' was found in the Heraeum at Olympia (1877). The Basis from Mantinea, representing the contest of Apollo and Marsyas, is also ascribed to him. See Pliny, *Ist. Nat.*, xxxiv. and xxxvii.; C. O. Müller, *Archäologie der Kunst*, 1835; A. Furtwängler, *Masterpieces of Greek Sculpture* (Selliers's trans.), 1895; W. Klein, *Praxiteles*, 1898; and study in *Plo Arte* by K. Schefold, 1915.

**Prayer** (Lat. *precari*, to implore, entreat), in religion, in the broadest sense of the word, signifies the lifting up of the heart towards God, or some spiritual being believed to have power of intercession with God. P. is therefore essentially an act of religion and is found wherever there is belief in a personal divinity or divinities. P. in primitive religions is devoted almost entirely to the securing of temporal benefits, such as health, good crops, success in war, and, in connection with these, the blessing and the curse. Religions of high culture, however, understand P. in a much wider sense. For them it includes not only petitions but also acts of adoration; love, thanksgiving, and atonement. The teaching of Jesus Christ emphasised the essentially spiritual nature of P., and gave the 'Our Father' as a model for all his followers. Types of P. may be classified as public or private, oral or mental. Christian public P. includes the liturgy, the Divine Office recited by monks, cathedral choirs, and others in common, and other forms of divine service. Private P. may be oral or mental. Oral, of course, implies sufficient attention and intention to make it a human act. But mental P., *par excellence*, consists in meditation on some religious tenth leading up to wordless intercourse with God. This meditation may be superseded by affective P. in which the preparatory work of the intellect is reduced to a minimum. Affective P. in turn may be superseded by the P. of Quiet, in which the whole soul rests in contemplation of God. This contemplative P. has many degrees and many names. See (Protestant authors) J. E. Liddon, *Some Elements of Religion*, 1872; Clarke, *Christian Doctrine of Prayer*, 1874; Newman Hall, *Prayer: its Reasonableness and Efficacy*, 1875; L. D. Weathered, *Healing through Prayer*, 1946; H. T. Hughes, *Prophetic Prayer*, 1947; and V. L. Johnstone, *Learning to Pray with the Church*, 1949. (Catholic authors) St. John of the Cross, *Spiritual Works* (trans. by Allison Peers, 1913); Ludovic de Herse, *The Science of Prayer* (trans. 1925); J. Grou, *How to Pray* (trans. 1901); and P. Boylan, *Difficulties in Mental Prayer*, 1915.

**Prayer Beads**, see ROSARY.

**Prayer, Book of Common**, authorised service book of the Church of England. The B. of C. P. and administration of the Sacraments, and other rites and ceremonies of the Church, according to the use of the Church of England, is adequately described in its title. The purpose of its compilation is clearly explained in the

preliminary dissertation 'Concerning the Service of the Church' which first appeared in the book of 1549, and which has remained at the head of the P. Book ever since that date. The preface gives the following reasons why a new B. of C. P. was required: (1) that the Lessons and Psalms might be better arranged, that the number of feast days might be reduced, and that legendary matter might be removed; (2) that Eng. might be substituted for Lat.; (3) that one uniform use might be set up instead of the variety of uses that had before obtained. In the early Eng. Church there was no rigid uniformity in the service-books. Printing was not in use, and different reforms were made along different lines in various parts of the country. There was always, however, a distinct trend in the direction of uniformity, and in time, as certain cathedral churches and monastic houses rose into greater prominence, they began to be copied in the dioc., all round them. The P. Book speaks of the uses of Salisbury, Hereford, Bangor, York, and Lincoln, but it is important to remember that the first of these was more important and widespread than all the others put together. It formed, indeed, the basis of the revised P. Book. Successive stages in the progress of this revision, as the Reformation went on, may be given shortly as follows, in order of date; 1541, a Litany in Eng. pub.; 1548, 'The Order of the Communion' pub., an Eng. form of Communion in both kinds to be inserted in the Lat. service; 1549, the first P. Book of Edward VI., containing the order for Morning and Evening Prayer, etc., on the plan of the present P. Book; 1552, the second P. Book of Edward VI. was issued but only remained in use for about eight months. On the accession of Mary the Lat. services were restored. In 1559, the year after the accession of Elizabeth, a revised P. Book was issued, modifying some of the statements of the 1552 book in favour of a more Catholic interpretation. The 1552 book had been compiled while the influence of the foreign reformers was most strong, and it was this version which came closest to the ideas of continental Protestantism. Elizabeth's P. Book was, in all essentials, the P. Book as it exists to-day. The preface proclaimed that the policy of the Church of England was 'to keep the mean between the two extremes.' It seems certain that the moderation of the Elizabethan B. of C. P. was a prime factor in winning the majority of the Eng. who had been known as devout Catholics, away from Rome. On the other hand, its deliberate ambiguity on certain fundamental issues probably ultimately endangered the Elizabethan settlement, and has led to there being, almost continuously from 1559, two opposing sections in the Church of England, each arguing its own interpretation of the disputed passages. The Elizabethan compromise was never universally accepted. The ornaments rubric was set aside from the first: the use of the surplice could only be enforced with difficulty. In spite of such concessions,

the Puritan party became increasingly hostile. The hist. of Elizabeth's reign is, to a considerable degree, the hist. of a relentless conflict between Puritanism and churchmanship, with the Prayer Book as the chief battleground. As a result the Prayer Book became one of the issues over which the Civil war was fought. In 1645 it was suppressed by Parliament, and its use was made a penal offence. In 1660, however, it was restored, and at a last revision some six hundred minor alterations were made, including the addition of the last part of the Catechism, dealing with the Sacraments, the separation of the Catechism from the Confirmation service, the use of the word 'priest' rather than 'minister' in sev. places, and the addition of 'the commemoration of the departed' in the Prayer for the Church Militant. But it was still the book of 1552 rather than that of 1549.

After the beginning of the nineteenth century agitation to revise the B. of C. P. received an impetus due mostly to the conviction that the social and mental development of the civilised world had created a need for a Prayer Book that should be more closely in touch with the people, and which would be able more intimately to enter into their ordinary lives. The agitation was not confined to any particular country, but arose in England, Scotland, Ireland, America, S. Africa, and Canada. The bitter arguments between High and Low Church parties in the preceding century had also suggested that sev. disputed sections of the B. of C. P. should be more clearly defined. In England deliberations took place by a specially appointed convocation between 1906 and 1920, and final proposals drawn up by the Church Assembly were considered by the Houses of Clergy and Laity. They were handed to the bishops for final revision. In 1927 the proposed alterations were placed before Convocation. They included the omission of certain rubrics concerning Holy Communion, Public Baptism, Confirmation, and the Solemnisation of Matrimony. The Ordinal of 1662 was replaced by that of 1927, and many occasional prayers were added, while portions of the Psalms were allowed to be omitted. The revision was, in fact, a move much nearer the B. of C. P. of 1549. Most support came from the Anglo-Catholics, and the book was passed by the House of Lords. But the House of Commons definitely rejected it, and the bishops drew up an amended list of changes, thereby alienating many former supporters among the Anglo-Catholics. But the Church Assembly approved the amended ed., and it was once more brought before Parliament, only to be rejected again. Since then the use of many passages in the rejected version has been sanctioned by some bishops. Special services in commemoration of the fourth centenary of the first Eng. Prayer Book were held in 1949. Although there are divs. of opinions even among Anglicans on some of the liturgical aspects of the B. of C. P. in its present form, it is universally agreed that the beauty of its

language is outstanding, and has exercised an incalculable influence upon Eng. thought and writing during the past four centuries, far beyond the confines of Anglicanism (*q.v.*). See F. Procter and W. H. Frere, *New History of the Book of Common Prayer*, 1901, and *Report of Convocation*, 1927; C. S. Phillips, *The Background of the Prayer Book*, 1938; M. M. Knappner, *Tudor Puritanism*, 1939; W. K. Lowther Clarke, *The Prayerbook of 1928 Reconsidered*, 1943; and F. Moyle, *The Book of Uncommon Prayer*, 1949.

**Praying Mantis**, see under MANTIS.

**Preaching** (Lat. *prædicare*, to proclaim), public proclamation of some religious belief, delivered with the object of exhorting or converting. It has played a vital part in the hist. of Christianity, but is used in other religions. The O.T. prophets were preachers: in the N.T. John the Baptist preached the coming of the Messiah and summoned men to repentance. Christ Himself delivered many sermons, the most famous being the Sermon on the Mount. Examples of apostolic P. are preserved in the report of St. Peter's sermon on the day of Pentecost (Acts ii. 14 ff.) and that of St. Paul on Mars Hill (Acts xvii. 22 ff.). The proclamation of the Gospel remains the chief element of P., but in an organised Christian community, the exposition of the truth, and the illustration of its bearing on character and conduct, became increasingly important. Some of the fathers of the Church preached a great deal, but by St. Jerome's time it had become customary to read the written discourses or 'homilies' of the holy fathers in the regular meetings of the Church which had no competent preacher. Later the Venerable Bede's works were frequently used thus. The missionaries from the Scottish and Irish monasteries who carried Christianity all over Europe were a group of preachers. Of medieval Fr. sermons, those of Maurice de Sully (*d.* 1196) provide the first authentic examples of homilies in the vernacular. In Germany, in the mid-thirteenth century, P. became an agency of great power in the life of the country, the preachers being prin. founders of Ger. prose style. Among the most noted were Berthold von Regensburg, the Franciscan (*q.v.*), and Meister Eckhart (*q.v.*). In England the stress laid upon P. by the mendicant orders can be gauged by the architectural developments of the time, with the emphasis on a large nave, capable of holding a big congregation. Wycliffe (*q.v.*) realised the power of P. and emphasised its importance. During the Reformation Luther, Knox, and Latimer made full use of the impassioned personal appeal to establish their doctrines. Protestants, especially nonconformists, made the sermon an essential part of their services. The Catholic counter-Reformation realised the value of P., and the Jesuits laid stress on it in their training. One of the greatest Fr. preachers was Bossuet (*q.v.*) whose sermon on the extent and limits of papal authorities (1681) is a masterpiece of Fr. prose. P. was a leading feature of the Eng. religious

revival of the eighteenth century. John Wesley's (q.v.) oratory was colloquial, terse, and homely, and George Whitfield (q.v.) was able, by a combination of fervour, dramatic action, and homely pathos, to hold the attention of an outdoor audience for long periods. In the nineteenth century famous preachers included Edward Irving (q.v.), J. H. Newman (q.v.), H. P. Liddon (q.v.), C. H. Spurgeon (q.v.), and Joseph Parker (q.v.). During the twentieth century the sermon became generally much shorter, lasting only about a quarter of an hour, as compared with the three-hour sermons of previous centuries. The broadcast sermon became important after 1920: by it preachers like H. R. ('Dick') Sheppard (q.v.), and W. H. Elliot became known to thousands outside their own par. Other prominent contemporary preachers include L. D. Weatherhead, W. E. R. Sangster, and R. A. Knox (q.v.). See G. R. Owst, *Preaching in Medieval England*, 1926; D. B. Knox, *Handbook for Speakers and Preachers*, 1936; F. A. Tatford, *The Art of Preaching*, 1936; E. Vuast, *Lacordaire et les conférences de Notre Dame*, 1937; H. G. Pfander, *The Popular Sermon of the Medieval Friar* (2 vols.), 1937; and T. H. Hughes, *The Psychology of Preaching and Pastoral Work*, 1939.

**Preaching Friars**, see under DOMINIO, ST. Prebend, term formerly denoting the food, clothing, etc., of a secular priest or canon regular, or the endowment from which this was provided, as distinct from the income of a benefice. Later it was applied to the endowment possessed by a cathedral or collegiate church for the support of a canon residentiary, who was in consequence known as a prebendary. To-day the P. is generally an honorary office, and the prebendary is then not a member of the cathedral chapter, and does not receive a stipend.

**Pre-Cambrian**, term for all rocks older than the Cambrian. The oldest of all are also called Archean or Laurentian. Lying below the Cambrian beds containing *Olenellus trilobites* they comprise igneous and sedimentary rocks, mostly highly metamorphosed, exposed over one-fifth of the present land surface, including nearly 2,000,000 sq. mi. in Canada and large areas in the N.W. of Scotland. Both Cambrian and P.-C. rocks, however, are classified among other rocks of the Primary or Palaeozoic period.

**Precedence** depends partly upon letters patent and statute and partly upon ancient custom. In England questions of P. are generally referred to those officers of the council of the earl-marshal of England to whom is assigned the arrangement of public processions on state ceremonial occasions. In Scotland matters of P. are regulated by the officers of the Lyon Court (see LYON KING-AT-ARMS). In strict constitutional law the sovereign has, as complementary to the prerogative right to create new titles or dignities, the right to confer any P. he pleases (see *Coke's Institutes*, vol. iv.). But apparently he may not create a peerage with a right of P. inconsistent with the Act of

1540, which regulates the P. of all the nobility and great officers of state. He may, however, create baronets with P. before knights baronets, knights of the Bath, and knights bachelors, and grant both rank and P. before even the great officers of state and any peer of the realm to a foreign prince marrying into the royal family (see Halsbury's *Laws of England*).

The official table of P. will be found in such reference books as *Burke's Peerage* and *Dod's Peerage*. The sovereign is at the head, followed by the Prince of Wales and other sons, brothers, uncles, and nephews of the sovereign, and ambass. Then come the archbishop of Canterbury, lord high chancellor, archbishop of York, Prime Minister, lord president of the council, Speaker of the House of Commons, lord privy seal (if of baronial rank), lord great chamberlain, earl marshal, lord steward of the household, lord chamberlain, and master of the horse (these last five, if dukes). Next follow dukes, marquesses, earls, viscounts, bishops, secretaries of state (if barons), barons, certain officers of the household, secretaries of state not barons, knights of the Garter, privy councillors, chancellor of the exchequer, chancellor of the duchy of Lancaster, lord chief justice, master of the rolls, lords justices of appeal, lords of appeal, puisne judges, baronets, members of orders of knighthood, co. court judges, companions, members, and officers of various orders, gentlemen entitled to bear arms. Sons of peers, baronets, knights, etc., rank in a manner decided by that of the father, a duke's eldest son, for example, taking 1<sup>st</sup> after a marquess, and the eldest son of a marquess after an earl.

In the U.S.A. the order of P. is as follows: Sovereign or president of a foreign state, the President, the vice-president (in the absence of the President), ambass., chief justice of the U.S.A., the vice-president (when President present), the Speaker of the House of Representatives in Congress, associate justices of the supreme court, the secretary of state, the secretary of the treasury, foreign ministers plenipotentiary, the secretary of war, the attorney-general, the postmaster-general, the secretary of the navy, the secretary of the interior, the secretary of agriculture, the secretary of commerce, the secretary of labour, senators, the House of representatives, the chief of staff of the army and the chief of naval operations, general of the army (five stars), fleet admiral (five stars), general (four stars), admiral (four stars), governors of states, etc. Rank is always official, i.e. Mr. Smith who is 'His Excellency the Ambassador' ranks above a prince or duke who is officially a secretary of embassy.

**Precedents**, in law, judicial decisions whether interlocutory (see INTERLOCUTORY PROCEEDINGS) or final, which serve, as a rule, for the determination of analogous or similar cases, are called P. P. have the force of law (*Bentham's Judge-made Law*), and no court will reverse a previous judgment of a court of equal, or co-ordinate, *a fortiori* of superior, authority. Thus the decisions of the House of

Lords are binding on all other courts, those of the court of appeal on that and all other courts below the House of Lords, and those of the various divs. of the high court on those divs. (see ROYAL COURTS OF JUSTICE) and all courts of inferior jurisdiction. The decisions of co. court judges and of the judges of the tribunals of the U.S.A. may be and often are cited in the Eng. courts, but are, as Prof. Salmon styles them, of *persuasive* but not *authoritative* efficacy (see also LAW REPORTS).

**Precentor**, dignitary in an Anglican cathedral, originally the leading singer in the choir, but also in charge of the vocal church music and superior to the organist. His seat is opposite that of the dean (who takes the *Decani* side) on the *Cantoris* side of the chancel. In some churches in Scotland, where the organ or other musical instrument is not employed, the P. is the leader of psalmody.

**Preceptory**, see TEMPLARS.

**Precession**. A westward movement of the equinoxes on the ecliptic so that they advance to meet the stars and the sun on its ann. return. Observations of the brighter stars over many years led Hipparchus about 125 B.C. to the conclusion that the latns. of the stars were fixed but the longns. increased. Although he did not know the reasons for this phenomenon, he was able to measure its effect with a fair degree of accuracy. The longns. of the stars increase by 50".2 annually and as a consequence the sidereal year (the time required for the sun to move round the ecliptic) is greater than the tropical year (the interval between two successive passages of the sun through the first point of Aries). The difference between the two years is 20 min. 23 sec. Owing to P. the signs of the zodiac do not now agree with the constellations, and the first point of Aries is in the constellation of Pisces. The cause of P. is the pull of the sun and moon, the moon in particular, on the equatorial bulge of the earth. The tendency of the pull (actually a couple) is to make the equator coincide with the ecliptic, but the spinning of the earth prevents this and the phenomenon of P. takes place, a good illustration of which is seen in a spinning top when its axis is not vertical. Its head moves round comparatively slowly in a circle so that its axis describes a cone whose vertex is its point. The axis of the top can be taken to represent the earth's axis and the horizon the ecliptic, but as the tendency of gravitation is to pull the axis of the top towards the horizon while the attraction of the sun and moon tends to pull the earth's axis perpendicular to the plane of the ecliptic, the P. in the latter case is in a direction opposite to that in the former, assuming that the earth and the top spin in the same direction. The changes in the longns. of the stars imply changes also in their right ascensions and declinations which are always used by astronomers in defining their positions. The poles of the equator perform a movement round the poles of the ecliptic in about 26,000 years, just as the axis of the top performs a

movement round a vertical line through its point, but the motion is not absolutely uniform nor do the poles of the equator move exactly in circles. This is due to certain fluctuations in the disturbing couples of the earth, and in consequence the earth's poles describe wavy curves, a phenomenon known as nutation (*q.v.*). This is often seen in a spinning top, the head 'noddling' to and from the vertical so that it describes a wavy curve. The pole star (*q.v.*), which is less than 1° at present from the point in the heavens to which the earth's axis is directed, was not always the pole star, nor will it be so in the future, P. causing different stars to occupy this position. See also VEGA.

**Precious Stones**, see GEM.

**Precipitate Ointment**, one of two ointments containing mercury compounds. Red precipitate is red oxide of mercury (HgO); while white precipitate is mercuric ammonium chloride (NH<sub>4</sub>HgCl). Both are used locally for skin affections.

**Precipitation**. If one of the products of the chemical reaction between substances in solution is insoluble, that product is thrown out of solution, i.e. it is precipitated. The substance thrown out of solution is termed a precipitate and the action is termed P. The characteristic precipitate formed by substances affords methods of qualitative and quantitative analysis.

**Predestination**, divine provision and preparation of benefits by which those who are freed from sin and its consequences are most certainly saved. This is St. Augustine's definition (*De Dono Perscr.*, cap. 14). The doctrine of P. is explicitly contained in the Bible in such passages as Eph. i. 4-6, 11, and especially in Rom. viii. 29 f., and is accepted in some form or other by all the chief Christian churches. But the existence of human free-will is a fact of everyday experience and hence there has been a series of controversies throughout the hist. of the Christian Church, designed to reconcile this paradox. The difficulty is to reconcile the divine provision and the certainty of the prepared benefits with the freedom of the human will. Pelagius taught that man was justified on account of his foreseen merits, and against him Augustine attributed justification to a divine decree antecedent to man's merits. Following generally on the lines of Augustine Aquinas is found against Duns Scotus, the Jansenists against the Jesuits, the Calvinists against the Arminians, Whitefield against Wesley. For the hist. of patristic opinion see Potavius (*De Leo*, ix., x.). Of late stress has usually been laid more on the free-will of man than on God's P. See CALVINISM. See J. Forbes, *Predestination and Free-will*, 1878; J. B. Mozley, *Augustinian Doctrine of Predestination*, 1883; *Dictionary of Theological Catholicism*, XII (pp. 2809-3022), 1948.

**Predicables**, term in scholastic logic, used in connection with the scheme of classification borrowed from Porphyry. There are five P., viz. genus, species, difference (*differentia*), property (*proprium*),

and accident. The first two name the greater and lesser classes of things, a genus comprehending sev. species. The difference distinguishes various members of the same genus; the property is a distinction that is not ultimate; while the accident is any peculiarity not connected with the nature of the species. *See also* UNIVERSAL.

**Predictor**, device for discovering automatically the future position of a moving object. The prin. use is in the sighting of anti-aircraft guns. The target is held in the optical part of the P., consisting of a height finder and a range finder. The factors of height, speed, and drift are automatically calculated and the results interpreted in the training of the guns and the setting of fuses, the whole process being controlled by the P. operator.

**Pre-emption, or Purveyance**, anct. royal prerogative by virtue of which the king enjoyed the right to purchase provisions and necessaries for the royal household at a fair price, in preference to every competitor, and without the consent of the owner. Payment was generally made in exchequer tallies, the amount being deducted from the next taxes paid in by the delinquent vendors. Naturally a system liable to such abuses was the subject of frequent petitions and numerous statutes. The prerogative was not finally surrendered until 1660, when the king gave up his rights in consideration of a fixed composition. Parliament agreeing to settle on the crown the hereditary excise on all beer and ale sold in the kingdom, together with a proportionate sum for certain other liquors.

**Pre-existence**, doctrine that man's soul had an existence apart before it became united to the body. It is eastern in origin, and in the E. it is generally associated with the doctrine of the transmigration of souls. Thus it is held by the Buddhists, and formed part of the Pythagorean system. Plato also upheld it, unless we may regard his language on the subject as purely symbolical. Philo Judæus also taught the doctrine of the P. of the soul, and from him it was adopted by Origen. It was condemned at the Council of Constantinople, and two main views of the origin of the soul were then open to acceptance. The belief in P. is countenanced by such names as those of Kant, Schelling, the younger Fichte, Lessing, Schopenhauer, and Jean Reynaud. The idea has been poetically treated by Tennyson in his *Passion of the Past* and by Wordsworth in his *Intimations of Immortality*.

**Prefect**, in France, political functionary in some respects analogous to the sheriff in England, but vested with far greater powers. The P. possesses extensive powers of municipal regulation. This office, estab. in 1800, was modified under the constitution of 1946.

**Preference and Preferential Trade**, *see* TARIFF REFORM.

**Preference Share**, *see* under COMPANY AND COMPANY LAW, *Capital*.

**Frontal Leucotomy**, *see* under INSANITY, *Treatment*.

**Pregl, Fritz** (1869-1930), Austrian chemist, b. at Laibach. From 1913 he was prof. at Graz. He worked out the methods of microanalysis of organic matter, for which he received the Nobel prize for chem. in 1923.

**Pregnancy**, period of intra-uterine development of the fertilised ovum. The time varies with different species of animals, and in human beings the average duration is from 274 to 280 days. Amenorrhœa is one of the first symptoms to be observed in P. Irregular hæmorrhages frequently occur in pregnant women, but there is no well-authenticated instance of menstruation continuing during P. Great care must be taken by the physician to distinguish between the amenorrhœa of P. and that dependent on anemia, some debilitating disease such as phthisis, or on some pelvic disorder. Morning sickness is a fairly common symptom. It usually appears in the second month, and rarely lasts more than three months. Frequency of micturition, accompanied by some pain and discomfort, may occur in the early part of P., but disappears in the third month, when the uterus rises into the abdomen. Quickening occurs between the sixteenth and eighteenth weeks. The use of the word quickening is due to an anct. theory that at that time the fœtus came to life. It is the first consciousness, on the part of the mother, of the foetal movements, and is accompanied at times by nausea and faintness. The later symptoms of P. are chiefly those of increased abdominal pressure—such as oedema of the feet, varicose veins, cramp, palpitations, and dyspœa. The signs of P. are of two kinds, presumptive and positive. The positive signs are the foetal movements and the foetal heart. These cannot be obtained before the sixth month. The foetal heart can be heard by the unaided ear, or by means of a wooden stethoscope. The rate of the foetal heart varies with the sex, age, and size of the fœtus. The pulse of the abdominal aorta may be mistaken for the foetal heart-beat unless care is taken to make sure that the beat heard does not synchronise with the maternal pulse. Breast changes occur in the eighth week. At this stage they consist of a nodular hypertrophy of the gland with some tenderness. Occasionally a little clear serum may be expressed from the nipple. By the sixteenth week the presence of secretion can generally be made out, and the pigmentation is increased. Later on a secondary areola appears, and often also Montgomery's tubercles. The enlarged uterus is not palpable abdominally until the thirteenth week. From this time until the end of the eighth month it rises steadily higher at a rate of rather less than half an inch a week until the eighth month. During the last two or three weeks the presenting part descends into the pelvic b. n. so that the uterus appears smaller. Hegar's sign is of great use in diagnosis during the second and third months of P. In the later months, ballottement—the uterine soufflé—and the funic souffle are additional points, the

most useful being, of course, the foetal heart sounds and foetal movements already mentioned. It should be remembered that although P. is a physiological condition, in some ways it approaches a pathological one, so that the pregnant woman, for her own sake, and for the sake of her child, should pay special attention to her health. The chief essentials for her well being are a quiet life, generous diet, fresh air, and plenty of gentle exercise. Violent exercise, worry, and excitement should be avoided.

Prehistory is generally defined as the story of events and conditions before written or recorded hist. The scientific study of the wide range of remains and monuments of the prehistoric period is known as archaeology. It should be noted, however, that the boundary between P. and hist. is often difficult to determine. In Britain, for instance, the earliest cultures of the Palæolithic (the

Old Stone Age) are dated very approximately 550,000 years B.C., while the dividing line between P. and hist. is usually placed at the Claudian Conquest in A.D. 43. On a strict interpretation, the Maoris of New Zealand were still in the Stone Age when Capt. James Cook visited the is. just after the middle of the eighteenth century, and a further indication of the nature of the difficulties involved in fixing the boundary of P. is shown by the fact that the Minoan civilisation of Crete, which used a form of writing, is always considered as prehistoric. The study of P. can also throw light on early hist. which is not well documented. The invasion of the Belgæ into Britain in the Early Iron Age, for example, is quite well known from reliable literary sources, but the archaeologist, in his investigation of the remains of the field systems introduced by these peoples, has been able to demonstrate their new method of agriculture based on the

use of the heavy wheeled plough which man has not been interested in the remains of his predecessors, but in opened up the fertile clay lands of the riv. valleys. Britain sev. factors have had a profound influence on the study of P. and the

There has perhaps been no time when

development of archaeology. The Industrial Revolution, with its great extension of urb. life, was responsible for an era of discovery which has scarcely been surpassed; the followers of the Romantic movement, in Britain as on the Continent, looked upon the mouldering skull, the auct. potsherds, and the dolmens with an excited pleasure, to which they were able to add a neo-Celtic appreciation of the Druids and, on frequent occasion, an attempt at antiquarian exploration. The third factor, and the one of greatest significance, was the acceptance of Darwin's theory of evolution and its application to the study of human origins.

Side by side with these main influences were others, among which should be noted the pioneer topographical work of John Aubrey (1626-97), and other antiquarian topographers exemplified by Wm. Stukeley (1687-1765); the formation of co. archaeological societies in the early part of the nineteenth century; the pub. of a classification of Dan. antiquities (1844) in accordance with the succession of stone, bronze, and iron, first formulated by Lucretius; and more particularly the discoveries (1845) at Abbeville in the Somme valley of humanly worked flints, together with an elephant's tusk in a geological deposit of the Pleistocene Age, which until then had been regarded as of an incredibly remote age. In recent years there has been a phenomenal increase in the volume of data available to prehistorians. The field of study is consequently wider. While in Britain certain geographical areas (e.g. Wessex and Sussex) and certain cultural periods (e.g. the Early Iron Age) tend to be prominent by reason of the proclivities of noted and estab. workers, it should not be overlooked that in considering the greater field, the prehistorian's study is on a wide scale; no longer does the Palaeolithic mean W. Europe; for example, but E. Europe, Africa, and Asia in addition.

In his study of the remains of early man the prehistorian considers and interprets age, material, function, and social environment. The quest for food and dwelling, the conditions of commerce, trade, labour, and communications, the way of worship, the presence of peace or war, and finally the burial and disposal of the dead, all come within his view. Discovery is the first concern, and then interpretation, and the two processes meet in excavation, the examination of a site by modern scientific method. The very great advance in our knowledge of P. made in recent years is largely the result of improved excavation technique. No longer is brilliant excavation confined to Egypt and the Near E. The Viking ships at Oseberg and Ladby, the Neolithic vil. at Kôin-Lindenthal, near Cologne, the pallsade barrows of the Early Bronze Age in Holland, and Maiden Castle and the Sutton Hoo ship-burial, both in Britain, are evidence enough of a faultless technique in Europe.

The chronology of P. is both relative and absolute.

The framework provided by the three

successive technological ages of stone, bronze, and iron is a beginning of ordered arrangement; it is borne out in stratified deposits, that is, for example, in the successive undisturbed layers of human occupation in a cave or a dwelling-site, and stratigraphy thus determines that the oldest relics come from the lowest layer. The chronology furnished by stratigraphy is relative; it does not determine the duration of the various periods, and it does not, in general, prove that a period in one area is contemporary with that in another. A cross-bearing is sometimes possible upon the historic civilisations, and the early historic periods of Babylonia, Egypt, and Crete are so used, but the reservation that the beginning of the Dynastic period can only be dated to c. 3100 B.C. is enough to show the limits of the system. Typology, and the study of progressive evolution or degeneration, is applied by the prehistorian to pottery form and decoration, to weapons, and to trinkets, and by its use, with certain well-known reservations, a relative chronological sequence can be obtained. Outstanding examples of the use of typology are Abercromby's identification (in 1901) of the Beaker Folk of the Bronze Age and their continental home by a study of their characteristic sepulchral pottery, and Collingwood's systematic chronology (in 1930) of Rom. brooches.

Absolute chronology is provided by geology and by changes in climate which have taken place over a considerable part of the surface of the earth. Analyses of pollen from the peat bogs of Britain, Scandinavia, the Alps, and other parts of central Europe have reflected the hist. of forest and vegetation in the epoch known to geologists as Recent. There are three main phases known in one terminology as Pre-Boreal, Boreal, and Atlantic, and in others by a system of numbers. So accurate is the process of pollen analysis that the layers of peat-bogs can be divided into intervals of a century. In Britain it has been used with striking results in the Cambridge fens. In the Pleistocene epoch a time-scale is provided by the Glacial Periods, the Interglacial Periods between them, and by Pluvials, periods of heavy rain, which fell in some regions now dry, such as Rhodesia and Persia. The question is complicated, and recent studies of solar radiation, although most valuable, have not lessened the difficulties. Geochronology is not yet fully developed as a science, although the work of de Geer in Sweden as long ago as 1885 made possible the counting of the exact number of years occupied by the withdrawal of an ice-sheet. It remains to mention dendrochronology, the new science of determination of date by observation of the ann. growth-rings of trees. Its use to the prehistorian in dating the timber-work of buildings of all periods cannot be overestimated. The use of vivianite as dating material, once loudly proclaimed, is now abandoned.

The tables on pp. 632 and 633, after Childe and Zeuner in *Progress and Archaeology*, set out a chronology of P.: (1) The earlier

archaeological stages with their probable geological equivalents and estimated duration in years; and (2) later archaeological and historical periods.

See also MEGALITH; STONE AGE; SURVEYING AND LEVELLING, *Aerial Photography*.

Clark, *Archaeology and Society*, 1939; C. F. C. Hawkes, *The Prehistoric Foundations of Europe*, 1940; and *Proceedings of the Prehistoric Society* (in progress). A most valuable pub. is M. C. Burkitt and V. G. Childe, 'Chronological Table of Prehistory' in *Antiquity*, June 1932.

Pre-Islamic Inscriptions, see ORKHON INSCRIPTIONS.

Prelate, in church law, name given to the higher dignitaries of the church, such as archbishops, bishops, abbots, and certain members of the papal court.

Prelude, in music, introductory piece played before a church service or a musical performance, or forming the first movement of a suite or other sectional work; also one paired with a fugue, to which it forms an introduction. From the nineteenth century onward it is sometimes a separate concert work, especially for piano (Chopin, etc.) or orchestra; and from Wagner onwards the orchestral introduction to an opera where it does not take the form of a detached overture and leads straight into the first act.

Premature Labour, see ABORTION.

Premier, see PRIME MINISTER.

Premium: 1. In insurance a periodical sum paid by the insured or assured in order to secure the payment to him or his representatives by the insurer or assurer of a sum by way of indemnity for loss or damage to goods, or a stated sum at death, according to the kind of policy (see also INSURANCE). 2. In stock or share dealing the excess in the value of any securities over the price of issue. 3. A bonus or sum given for the loan of money over and above the interest. 4. A P. bond is one carrying with it the chance of winning a money prize. Such a bond is in the nature of a lottery, the prizes being given to holders of certain numbers drawn.

Premonstratensians, order founded by St. Norbert about 1120, which receives its name from Prémontré in the diocese of Laon, France, where the first monastery was founded. Its rule was that of St. Augustine, and the discipline was very severe. The order spread rapidly throughout Europe, and for sev. centuries was a serious rival to the Cistercian order. At the time of the Reformation there were in England thirty-five houses of the order, of which two were nunneries, but there is now only one, at Storrington, Sussex. There is a large Premonstratensian abbey in Belgium.

Pre-Raphaelite Brotherhood, primarily a group of three painters, W. Holman Hunt, D. G. Rossetti, and J. E. Millais,

whose aims constituted a reaction against current art traditions and proclaimed the 'return to nature.' This reaction was in some ways akin to Fr. Impressionism (see IMPRESSIONISM); it revolted against the 'grand style' and the arrogant allegory of the Romantics, and discarded the technical device of working on a dark brown ground with a composition of 80 per cent shadow. To a certain extent, therefore, it was foreshadowed in the canvases of Constable, Turner, and Bonington. Hunt, Millais, and Rossetti identified themselves with the artistic ideals of simplicity and sincerity which they had found in the works of Raphael's precursors, and estab. the fellowship called the P.-R. B.; one of their chief ambitions being to restore decorative art. Shortly after its inception the P.-R. B. increased from three to eight members. Thomas Woolner, sculptor and poet, who later forsook practical art and became a collector and connoisseur, was the first addition. James Collinson and W. H. Deverell, two not outstanding painters, followed. The remaining two were men of letters, Wm. Rossetti, brother of the painter and a poet of ability, and F. G. Stephens. To them the P.-R. B. was much indebted for their critical defence in the columns of the *Athenæum* and *Spectator*. See P. Bates, *Pre-Raphaelite Painters*, 1897; D. G. Rossetti, *Pre-Raphaelite Letters and Diaries*, 1900; W. H. Hunt, *Pre-Raphaelism and the Pre-Raphaelite Brotherhood*, 1905; and W. Gaunt, *The Pre-Raphaelite Tragedy*, 1942.

Prerogative Court, The P. C. of the archbishop of Canterbury was an old eccles. court which, prior to 1857, had gradually acquired practically all the contentious business in testamentary causes, previously falling within the jurisdiction of the local eccles. courts. In 1857 its jurisdiction was transferred to the Probate Court (q.v.).

Prerogative Royal, see CROWN.

Prerogative Writs, processes issued, not as of mere course, but in pursuance of the Crown's extraordinary powers of rendering assistance to the subject on proper cause shown. These writs are: certiorari (q.v.), habeas corpus (q.v.), mandamus (q.v.), procedendo (which issues when the judge of an inferior court (q.v.) neglects to give judgment; a concurrent and more usual remedy is the mandamus), prohibition (q.v.), and quo warranto (q.v.). Proceedings for the issue of P. W. are begun by motion in a divisional court.

Presbyonia, see under OPHTHALMOLOGY.

Presbyterianism, form of church government, in which the leading part is taken by presbyters or elders. It stands, therefore, somewhat midway between the two systems of Episcopacy and Congregationalism. In the former, authority rests with the bishop in the latter with the individual congregations. In P. authority rests with a succession of councils, each consisting of ministers and elders. Presbyterians themselves claim that P. is identical with or akin to the order of apostolic times. The present system owes its estab.

to the Fr. reformer Calvin. This took place at Geneva, and the system spread widely, though in somewhat modified forms. It is important to notice that P. primarily denotes a form of church government, so that under this title come many bodies differing in their confessions of faith. Generally speaking all the Presbyterian bodies are Calvinistic. The Presbyterian Church has but one spiritual order, that of Presbyters, though the Presbyters are divided into ministers and elders. The minister occupies the chief position in each congregation, dispenses the sacraments, and conducts the services of the church. There are sev. elders to each church, and though ordained by the Presbyters, they are actually laymen. They assist the minister in matters of discipline, and they may be described as the ruling elders, while the ministers may be described as the 'teaching elders.' The deacons are not concerned with spiritual matters, but have charge of the money for the poor, and in some cases have the general financial control of the church. The Presbyterian constitution is as follows: Each church or par. is under the care of the Kirk Session, which consists of the minister and elders of the particular church. This is the lowest of a series of courts of judicature, and controls the discipline of the congregation which it represents. The minister is the moderator *ex officio*, and without the presence of the minister or a deputy appointed by him no meeting can be held. The Kirk Session has no control over the minister, who is responsible to the Presbytery alone; hence his independence is assured. Above the Kirk Session is the Presbytery, which consists of all the ministers in a given dist., and one elder from each par. The moderator is elected from among the ministers. This court is held at regularly fixed intervals, but may be called at other times. It has the supervision of the entire dist. from which its members are drawn, and forms a court of appeal from the Kirk Session. The Synod, which normally meets twice a year, represents a number of Presbyteries in the same way as the Presbytery represents a number of congregations. Above it, and forming the final court of appeal, comes the General Assembly, which meets annually, and represents the whole church by means of ministers and elders sent from each Presbytery. It supervises all the work of the church, conducts missionary enterprises, and generally superintends the interests of the whole body. A moderator is chosen at each Assembly, and each year the place and time for the next Assembly are agreed upon. There is a difference of opinion among Presbyterians on the question of church estab. The dominant personality of many of the early leaders often tended towards a theocracy. The majority of modern Presbyterians, however, favour a cessation of the union between the state and the church. The spiritual independence of the church has been a fundamental tenet of P. from the beginning. In Scotland, since the union of 1929, it is now acknowledged by the

State. The doctrines of P. are Calvinistic and evangelical, and the large number of doctrinal confessions which the various churches have produced show almost entire agreement. The Eng. and Scottish churches accept the Westminster Confession, and the Larger and Shorter Catechisms. The N. church has also the Scottish Confession of 1580. Other confessions are the First Helvetic, Geneva, Gallican, Frisian, Belgian, Dutch, Hungarian, and Bohemian. The worship proceeds, broadly speaking, on the lines of the *Directory of Public Worship*. Most churches have now official books of order for the guidance of ministers; there are, however, no compulsory forms. The chief countries in which P. has taken a firm root are Scotland, Switzerland, England, France, Ireland, the Netherlands, and the U.S.A. (For Scotland, see SCOTLAND, CHURCH OF.) The Swiss and Fr. churches were formed exactly on the model of Calvin. The Presbyterian Church in England traces its origin to the Puritan nonconformists. During the eighteenth century these declined rapidly in numbers, and many of them became Unitarians. A revival came in the last century, largely through Scottish influence, and the association between the Eng. Presbyterians and the Church of Scotland became very close. Ireland has also very closely followed the Scottish model. In modern P. the ecumenical spirit is increasingly strong; it has made possible in the United Church of S. India a combination of episcopacy with Presbyterian essentials. P. in the U.S.A. may be said to have begun about 1610, the first Presbytery being that of Philadelphia in 1704. It now forms a most flourishing body, and in 1949 its total number was given as 3,349,073 in all the various branches, including the Negro churches. See T. M. Lindsay, *History of the Reformation*, 1907-8; J. Moffat, *The Presbyterian Churches*, 1928; C. L. Warr, *The Presbyterian Tradition*, 1933; and J. L. Ainslie, *The Doctrine of Ministerial Order in the Reformed Churches of the 16th and 17th Centuries*, 1940.

**Presbytery**, in eccles. architecture the sanctuary, or that part of the choir of the church in which the high altar is placed. The name is sometimes extended to the whole choir. Also house of R.C. priest.

**Prescott**: 1. Par. and former mkt. tn. of Lancashire, England, 3½ m. W.S.W. of St. Helens; it has manufs. of electric cables, plastic, and sheet-metal plating. There are printing works and coal-mines. Pop. 11,300. 2. Or Prescott, tn. and port of entry, Ontario, Canada, on the St. Lawrence R., 49 m. S.E. of Ottawa. There are marine works. Pop. 3200.

**Prescott**, William Hickling (1796-1859), Amer. historian, b. at Salem, Massachusetts, educated at Harvard Univ. In early life he lost the use of one eye and the other became almost useless, but with the aid of readers and secretaries he prepared his book of *The History of Ferdinand and Isabella* during 1827-38. This was followed by *The Conquest of Mexico* (1843); *The Conquest of Peru* (1847); and *History of Philip II.* (3 vols., 1859; unfinished),

His works, though charged with historical inaccuracies, have become recognised as Eng. classics

**Prescott**, city and co seat of Yavapai co., Arizona, U.S.A. It has gold, silver, and copper mining. Pop. 3200

**Prescription**, in law, broadly speaking, is that right given partly by common law (*qv*) and partly by the Prescription Act of 1832, by which a person claims to be entitled as *owner*, to easements or profit *a prendre* over or from the lands of another (see INCORPORIAL HEREDITAMENTS and LAND LAWS) on the sole ground of long *uses*. By the common law a man who could not show an express grant (see GRANT) might successfully show either (1) that he and his ancestors had from time immemorial (the time of legal memory is the accession of Richard I.) had undisputed enjoyment either of a right *in gross* (i.e. not dependent on any estate in land held by him or his predecessors), or (2) that he and his predecessors in title as owners of certain lands had from time immemorial had some easement over or profit *a prendre* (*qv* and see COMMON, RIGHT OF) from certain other lands. Later this excessive rigour of proof was mitigated by allowing evidence of uninterrupted user for upwards of twenty years to stand as conclusive proof of immemorial user unless rebutted by proof that the enjoyment had in fact begun within the time of legal memory. This remains the law of P. as to (1) but as to (2) the owner of the *dominant* tenement may prove his title to a right over the other or *servient* tenement either as above or under the Prescription Act, which Act has greatly shortened the requisite periods of uninterrupted enjoyment. Under this Act thirty years give a *prima facie* right, sixty years an indefeasible right to a profit *a prendre* (subject in the latter case to the effect of some agreement incompatible with the claim); twenty and forty years are the respective periods for easements (*qv*), and an indefeasible right to light is conferred after twenty years (see LIGHT, ANCIENT). The periods are calculated backwards from the date of any action brought against the prescribing owner, and no act is to be deemed an interruption unless acquiesced in for one year after the party interrupted shall have had notice of it.

**Presentation**, formal act by which the patron of a vacant living presents to the bishop for institution the clerk whom he has chosen to fill the same. It is regulated to some extent by the Benefices Act of 1898. When the appointment to a benefice lies in the hands of the bishop himself, he is said to 'collate' and not to present to it.

**Presentation at Court**, see COURT PRESENTATION AT

**Preserved Foods** Food preservation aims at retaining the colour, flavour, aroma, and texture of fresh produce for an indefinite period so that it may be consumed outside its natural growing season and in parts of the world where the fresh produce is not available. The causes of deterioration in fresh produce are chemical and biological changes which

proceed sometimes quite slowly, sometimes with great rapidity. The biological changes are in general more pronounced than chemical changes and are the result of infection and growth of micro-organisms, i.e. bacteria and moulds. The means by which growth and development of these micro-organisms is arrested or prevented constitutes the science and practice of food preservation. In drying or dehydration the water which is essential for growth of bacteria and moulds is removed. The process is accompanied by a considerable reduction in bulk. Salting and pickling are adopted as a means of curing or preserving both animal and vegetable products and rely on the retarding effect of salt and acid on the growth of harmful micro-organisms. A further commonly employed method of preservation involves the addition of chemical preservatives such as borates, benzoates, and sulphur dioxide commonly used, for example, in sausages and fruit drinks. The use of chemicals harmful to the consumer is closely regulated by the Food and Drugs Act. A high concentration of sugar acts as a deterrent to bacterial and mould growth, and is an important aid to the keeping properties of jam and confectionery. Canning relies on the destruction by heat of micro-organisms which would otherwise cause spoilage. Most frequently but not exclusively, it involves sealing the material to be preserved in a glass or metal container prior to the application of heat. Almost any type of perishable food may be preserved by this means.

**Francis Appert**, in the early part of the nineteenth century was the first to apply the preserving process by sterilisation, that is, by placing the food in bottles or cans and after hermetically sealing the containers, subjecting them to heat for a specified time. Much progress, however, has been made since those days both as regards the containers used and the scientific control of the canning process. For example the tops and bottoms of most cans used nowadays are hermetically sealed without the use of solder.

As canned foods are cooked when sealed in the tin they retain a large proportion of the vitamin and other nutritive constituents of the corresponding uncooked foods and for this reason are extensively used on ships and for voyages of exploration where fresh produce is not available. To obtain the full nutritive value from canned fruits and vegetables, both the solid and liquid portions of the contents of the can should be used.

Freezing with which may be included chilling, has made rapid strides in recent years as a means of food preservation. Refrigerated ships now transport food in bulk all over the world while quick frozen foods in small packages provide a convenient means of internal distribution of food which by this method more nearly retains its original characteristics than by any other means of preservation. Condensed milk is either whole or skimmed milk evaporated to about one third of its bulk. There are two varieties

sweetened and unsweetened. It is preserved in cans, which after hermetical sealing are submitted to a high temp. to ensure sterilisation. Under the Food and Drugs Act, condensed milk, other than that labelled 'skimmed' milk, must conform to certain regulations as to minimum milk fat content. Powdered milk, which has become popular in recent years, is made either from entire milk or skimmed milk. It is often used for sick people unable to take fresh milk, and is largely used also in making certain manufactured foods.

**Preserving.** If not carefully treated many fruits will decompose rapidly when attacked by bacteria, moulds, or yeasts, and the problem of their preservation is how to protect them from these. Winter pears and apples, however, may be stored to bring them to perfection. A fruit-room should be cool and shady, but at the same time dry and airy, and sunshine should be avoided. The fruit should be gathered before it is ripe, handled carefully, and laid out separately on slatted trays or wrapped in paper to prevent contact with other fruit. Periodically the fruit should be examined, and any showing signs of decay removed.

The three prin. methods of P. fruit and vegetables are (1) dehydration or drying, i.e. the evaporation of almost all water, this being one of the earliest known methods; (2) sterilisation, or the killing by heat, low temps., or freezing of harmful germs or bacteria; and (3) the addition of chemical agents such as sugar, salt, vinegar, or sulphur.

**DEHYDRATION OR DRYING.**—This is achieved either naturally or artificially, i.e. in the open air by the sun and wind, or in ovens or hot cupboards. In Australia, California, and parts of France, the Near and Middle E., and other dry and warm countries, apricots, currants, dates, figs, peaches, pears, raisins, sultanas, etc., can be dried naturally; but the moist climate of the Brit. Isles is usually unsuited for this method, and the oven, hot cupboard, or warm room is substituted. As in all methods of P. fruit and vegetables should be freshly gathered, quite sound and ripe, but not over-ripe, and washed free from dust and grit. Apples should be peeled and cored, and cut into rings. Soaking in cold salted water (one teaspoonful to a pint) will preserve the colour and prevent browning. Pears may be treated in a similar way, but sliced lengthwise after being cored; plums and apricots should be stoned and halved. Apple rings may be threaded on sticks, and other fruit laid on muslin-covered trays. Oven temp. should be from 120° F. to 150° F., with the door left slightly open. Heat should be gradual, i.e. low at first to prevent outside hardening, bursting, or swelling of the fruit. The drying may be done intermittently over two or three days, or, if continuous, about 6 hrs. should be sufficient. The fruit or vegetables (protected from dust) should be left in a warm room to finish off the drying, and then tested by pressing sev. pieces together in the hand. These should feel pliable and springy, but

not brittle, and no moisture should be seen. Before using dried fruit it should be soaked in water for 24 to 48 hrs., and boiled slowly until quite tender, when sugar may be added. Vegetables, such as broad beans, string beans, mushrooms, marrow, etc., may be dried in the oven, but root vegetables, such as carrots, turnips, swedes, etc., are better stored in clamps or sand. Herbs, such as parsley, mint, sage, and thyme, should be gathered before flowering, and when quite dry. These need only 1 hr. in the oven at about 120° F.; or they may be hung in muslin bags in a warm room, or placed above a stove for 3 to 4 hrs. Parsley may be dried in a hot oven for a few minutes only, which will preserve the colour. The dried leaves should be crisp, and may then be crushed and stored in air-tight tins, or if put into bottles they should be stored away from strong light.

**STERILISATION.**—P. by heat may be done in jars or bottles, or by the home-canning method. The art of bottling fruit has long been practised, and is still a popular and inexpensive method. Simple apparatus, such as ordinary jam jars with special or home-made air-tight caps or lids, may be used quite successfully, but special bottling jars, complete with glass cap and metal screw bands, can be bought. All utensils, jars, bottles, caps, etc., should be scrupulously clean and free from defects. Fruit should be fresh, clean, and ripe, except gooseberries, which should be green and under-ripe; over-ripe or unsound fruit should be discarded. The two familiar methods of bottling are by the water method and the oven method. For the first it is recommended that a special steriliser be used, i.e. a pan with a false bottom and a lid with a hole in which the thermometer is placed. An ordinary deep pan or fish kettle may be used, but it is essential to have an extra bottom to place inside the pan; this may be a double piece of cardboard, a folded cloth, or newspaper. It is important to have a bottling thermometer to obtain the correct temp., for sterilising yet P. valuable vitamins, and also to keep the flavour and colour of the fruit. The water method is better than the oven method, because it is easier to control the temp. For the water method the fruit is packed into bottles, and cold water or cold syrup (made from ½ lb. to 1 lb. of sugar, or golden syrup, boiled in 1 pint of water; peaches require the maximum amount of sugar) should be poured over the fruit to the neck of the bottles; and rubber rings and clip lids or glass tops with screw bands are then fitted on the containers. Other air-tight seals may be obtained by using paraffin wax, mutton fat, porpoise skin, or layers of grease paper dipped in white of egg or milk. After being screwed down bands should be undone slightly (a half turn is sufficient) to allow air to escape during heating. The filled and capped bottles are put into the steriliser, which is then filled with cold water up to the top of the bottles; the steriliser or pan is then put over a low heat, allowing the temp. to rise gradually (about 1½ hrs.), to 165–175° F.

The recommended temp. should be held for 10 to 30 min., according to the requirement of the contents. The hands should be adjusted securely on the removal of the bottles from the steriliser.

In the oven or dry method bottles are packed with fruit, without any liquid, capped loosely, and put into a low oven (about 240-250° F.) for 40 to 60 min. While the jars are in the oven, boiling water or syrup should be made ready; jars or bottles should be removed from oven, singly, filled quickly with the boiling liquid, and sealed instantly. When the bottles are quite cool (allowance of at least 12 hrs.) they should be tested by removing the screw bands or spring clips, and lifting the bottles by their lids, so proving the vacuum. If any lids are loose the fault must, if possible, be detected and sterilisation repeated. Any fruit, whole, sliced, or pulped, may be bottled. Good results are obtained in the P. of apples, apricots, black-currents, cherries, damsons, gooseberries, peaches (skins should be removed by plunging the fruit in boiling water for 1 min., and then into cold water), pears (preferably ripe, but if unripe they must first be stewed before packing into bottles), plums, and rhubarb young. Tomatoes should be firm and just under-ripe, and skinned like peaches; packed whole, quartered; or pulped (see below, *Pulping*). The water method is recommended for tomatoes, as a temp. of only 190° F., raised in 1½ hrs., is needed, and held for 20 to 30 min. Tomatoes should not be brought into contact with any copper utensils.

Acid fruit is easier to sterilise than vegetables, and for various reasons the P. of the latter at home is not recommended. It can be done, however, but special experience and equipment are necessary. Vegetables contain heat-resistant bacteria and lack the acid necessary to kill bacteria. The high temp. needed to sterilise vegetables requires a pressure cooker (see *PRESSURE COOKERY*), which is a necessary part of the equipment, and great care is needed in carrying out the process. The addition of small quantities of an acid, such as vinegar or lemon juice, to a non-acid vegetable or meat does not change the acidity of the food enough to permit processing in the boiling water bath. This can be done only if enough acid is added to pickle the food (see *Bulletin No. 1782, Home Canning of Fruits, Vegetables, and Meats*, issued by the U.S. Dept. of Agriculture).

*Pulping* is another way of storing fruit and tomatoes. Preparation is the same as for bottling, but cooking is first done in a saucepan with a little water (sugar may be added to the fruit and salt to the tomatoes). The boiling pulp is poured into previously heated bottles and sealed immediately, but to ensure complete sterilisation the bottles must be put into a steriliser or pan of hot water, and held at boiling point for a few minutes.

*Home Canning* needs special equipment, i.e. a seaming machine, steriliser, and cans. Fruit or vegetables should be prepared as for bottling, and packed into cans within

one-eighth of an in. from top. In the case of fruits the covering liquid should be boiling syrup, and for vegetables, boiling salted water. The loose lid is placed on the can, sealed immediately, and then placed in a pan of boiling water. The water must be reboiled quickly, and held at boiling-point for 10 to 45 min., according to the contents of the tins. The cans should be quickly cooled to blood heat by standing them in running cold water. As previously stated, vegetables need higher temps. to sterilise than fruits, and a pressure cooker should be used. Meat, game, poultry, and fish can be canned, but they present special problems which must be carefully considered.

**CHEMICAL AGENTS.**—Sugar is used in large quantities in the making of jam (q.v.), and also for crystallising fruit. Salt when used in sufficient amount preserves food, yet does not affect its nutritional value. Runner beans, sliced, or Fr. beans whole, may be successfully preserved, if packed in jars with the addition of alternate layers of salt (1 lb. to 3 lb. beans). The packed jars should be closely covered; and when the beans are required for use they should be well washed to remove the salt before cooking. Vinegar is used as a preservative in the making of chutneys, pickles, sauces, etc. Sulphur has been used for many years to preserve fruit, and can now be obtained in the form of fruit P. tablets. This method is useful for P. temporarily large quantities of fruit. The tablets should be dissolved in cold or slightly warmed water, which is poured into jars packed with prepared raw fruit, and then made air-tight. Red fruit becomes discoloured in the solution, but regains some of its original colour when boiled. The sulphur method may be used for blackberries, black-currents, cherries (sweet), gooseberries, pears, tomatoes, or vegetables. Before using fruit preserved in this way it is important that the sulphur dioxide should be driven off by boiling the fruit in an open pan for at least 10 min. Sugar may be added afterwards, when the fruit will be ready for use in pies or puddings, or may be made into jam.

**FRUIT SYRUPS.**—The fruit should be fully ripe and freed from grit by washing through a colander; large fruit should be pulled to pieces. It should be placed in an aluminium or thick enamel saucepan, with a little water if necessary. A wooden spoon is used to crush the fruit against the sides of the pan, which is heated until the juice has been extracted over moderate heat; this may take from 10 to 20 min. The pulp is then strained through a fine sieve, and finally through a jelly bag. Sugar, from ½ lb. to 1 lb. per pint, is added after the straining. A final clearing through one layer of butter muslin is necessary to get rid of any solids left by the sugar. The syrup should be bottled as soon as possible, all corks being boiled for 15 min. before use. A space of at least 2 in. must be left between the top of the syrup and the cork, which is then tied with string or wire. It is necessary to be

assured that the corks are quite airtight.

**Eggs.**—These may be preserved in several ways, but should be new-laid if possible, less than seven days old, and clean and free from cracks. They may be smeared with lard or oil, and buried separately in bran, and the process repeated after every six or eight weeks. In the water-glass or silicate of soda method the eggs are immersed in a liquid solution in stone pots, pitchers, or jars. As the eggs must be completely covered by the liquid any evaporation should be made up periodically. A further method is dipping the eggs into a proprietary sealing liquid and storing them dry (preferably with separating divs.) in baskets or boxes; the eggs preserved in this way will keep up to twelve months. Eggs, hard-boiled and shelled, may be pickled in vinegar.

Commercial P. of food is described in the article **PRESERVED FOODS**.

See also **WINES, HOME-MADE**.

See C. GRADGE, *Bottling and Preserving*, 1931; Mrs. Arthur Webb, *Preserving*, 1947; and Ministry of Agriculture and Fisheries, *Domestic Preservation of Fruit and Vegetables* (Bulletin 21), and Good Housekeeping pub.

**President**, one who 'presides' over or directs. In classical Lat., *præses* was the title of governor of provs., and in England, in the seventeenth century, P. was used for the king's 'lieutenant,' who had extensive powers delegated to him. In the final constitution of the U.S.A. the head of the Federal Gov. was called P. This is the most common meaning of the word, the head by election of a modern republic, such as the U.S.A., France, S. Amer. states, Switzerland, etc. The P. of the U.S.A. has more power than any similar official elsewhere. The Amer. P. is commander-in-chief of the U.S. Army, Navy, and Air Force. The title is given to the heads (or sometimes in Great Britain to the second in importance) of colleges and univs., to the person presiding over the meetings of learned societies and conferences, and in Great Britain to some ministers of the Crown and judges.

**President of the Council**, Lord, in Great Britain one of the great officers of state, who presides over meetings of the privy council, but has few other duties. Since 1880 the office has been a political one, held by a member of the party in power, who is usually a leading member of the Cabinet free to undertake duties of a general nature.

**Prešov**, tn. in Slovakia, Czechoslovakia, N. of Kaschau. It is important for machine and chemical works. Pop. 27,800.

**Press Association**, The, founded 1868, largest Brit. home news agency and also a part-owner, with London and Commonwealth newspapers, of Reuters, the leading Brit. world news agency. The P. A. is owned by the prin. newspapers of the United Kingdom (outside London) and Eire. It provides London and prov. newspapers, by means chiefly of its own private telegraph system over wires leased from the post office, with a complete

service of home news, including general, parl., courts, and all branches of sport, and newspapers outside London with the overseas news service of Reuters. The P. A. special reporting service supplies special reports of events of local interest to daily, weekly, and trade newspapers, and also to periodicals. In addition the P. A. serves London and prov. newspapers with a daily photograph service, including photographs by wire to prov. newspapers when required. In conjunction with the Exchange Telegraph Company the P. A. supplies over its private telegraph system or by telephone or tape machine services, reports of cases heard at the royal courts of justice, stock exchange and commercial news, racing results and betting, and football and cricket scores. The head office is at 85 Fleet Street, London, E.C.4.

**Press Club**, London, leading P. C. of the Brit. Empire. It was founded in 1882 with George Augustus Sala as its first president, its membership in 1950 numbered 1600, comprising tn., country, overseas, associate, life, and honorary members. President, Col. J. J. Astor of *The Times*; manager-secretary, Mr. A. Lazenby. Membership is strictly journalistic.

The club was estab. by parl. journalists in the days when the House of Commons often sat far into the night, and transport to suburban dormitories was inadequate to bridge the gap between the last night and early morning trains. It changed from one home to another, making its last move from Wine Office Court to Salisbury Square in 1914. Since then its activities have greatly expanded. On the social side they include a widely varied series of functions, outstanding among which is the ann. Derby lunch founded by Edgar Wallace when chairman of the club (1923-24). It has a well-stocked reference library, with a strong section on the hist., technique, and personalities of journalism, and notable collections of the Brit. press from its foundations in the early seventeenth century to the wartime press of 1939-45, with a Book of Honour in memory of the journalists and press photographers throughout the empire who lost their lives in the two world wars. Address: 7 St. Bride's House, Salisbury Square, Fleet Street, E.C.4.

**Press-forging**, see under **METALLURGY** (**FABRICATION OF METALS**).

**Press, Freedom of**, the. In the language of constitutional law, this phrase implies hardly more than that the P., no less than the individual, enjoys full liberty of discussion, subject only to the ordinary law of libel. Strictly the trend of modern legislation is to exempt journalists from the maximum of liability incurred by other persons, provided that what was inserted in the P. was inserted without spite and in good faith. This higher measure of liberty is a direct reversal of the state of things during the heyday of the Star Chamber when public opinion, the only true champion of popular liberties, was incapable of expressing itself in its most effective manner, through

the medium of the P. Among historians it is almost an axiom that the F. of the P., far from being estab. by any formal pronouncement, was the indirect and accidental result of the refusal of the Commons, in 1695, to re-enact the Licensing Act of 1663 (*see CENSORSHIP OF THE DRAMA; NEWSPAPERS*). This result is no doubt eminently in harmony with the practical, if unscientific, methods of the Brit. law-giver; but it is inconceivable that the Commons, with the memory of *Histriomastix* in their minds, and the lines of the *Areopagitica* before their eyes, were not perfectly well aware of the probable consequences of their action. *See also JOURNALISM*.

**Pressburg, or Presburg, see BRATISLAVA.**

**Pressgang**, name given to the detachment of officers and men commissioned to execute warrants for the impressment of men to serve in the Brit. Navy. They generally consisted of a captain, two lieutenants, and a body of picked men. A rendezvous was chosen, and volunteers were enlisted, deserters arrested, whilst all able-bodied men were liable to be pressed. By an Act of 1835 the period of compulsory service for men impressed for the navy was limited to five years. The employment of the P., though in abeyance, is still legal.

**Pressure and Pressure Gauges, see HYDROSTATICS; GAS AND GASES.**

**Pressure, Centre of, see CENTRE.**

**Pressure Cookery.** Pressure cooking is a method used for accelerating the process of cooking with water, by means of apparatus or utensils which produce pressures greater than atmospheric. By this means, cooking is carried out at temps. greater than the ordinary boiling point of water. At normal atmospheric pressure at sea level, water boils at 212° F., whereas if the pressure is doubled (*i.e.* increased by about 15 lb. per sq. inch) it will boil at 250° F. It is this higher temp. which accelerates the cooking process, so that, for example, a stew will require about 25 min. in a pressure cooker at 15 lb. per sq. inch compared with four or five times as long in an ordinary saucepan. Because of the shorter time involved, fuel consumption is reduced.

The forerunner of the modern simple pressure saucepan, as well as of the larger digesters still in use for processing meat bones, was the digester invented by the Frenchman Papin in 1679. The principle still most commonly used is the same, whereby the pressure of steam generated in the cooker is regulated by a valve which allows the steam to escape when it has reached the predetermined pressure. Most pressure cookers have, in addition to the release valve, a further safety device which releases the pressure if, for some reason, the release valve does not function.

The pressure attained in most models is 15 lb. per sq. inch, but some of the newer models have devices, usually a series of weights on the valve, by which more than one pressure can be used. The common values of pressures used, and their equivalent temps. are: 5 lb. (228°),

10 lb. (240°), 15 lb. (250°), 20 lb. (259°), 30 lb. (277°). These different pressures make it possible to choose those which give temps. most suitable for different types of food, so that frozen foods can be cooked at lower temps., vegetables at intermediate temps., and meat and soups at higher temps.

The pressures mentioned will only give the appropriate temps. if the atmospheric pressure is that normally found at sea level. At high altitudes, the atmospheric pressure is appreciably lower so that water boils ordinarily at a lower temp. For example, at 8000 ft., water boils at about 200° F. Ordinary cooking is therefore appreciably slower at these altitudes than at sea level. With a pressure cooker, however, higher temps. can be achieved and the effect of high altitude overcome.

It has been suggested that the nutritive value of foods would be adversely affected by the higher temps. attained in pressure cooking. As against this, however, the shorter time of the cooking process, the fact that the air in the cooker is displaced by steam, and the smaller quantity of water used, might be expected to decrease the loss of nutrients, such as vitamins which are easily oxidised in air, or vitamins and mineral salts which dissolve in the cooking water. Recently these theoretical views have been tested by experiments in which the effects on the nutrients of various foods have been determined when they are cooked by a pressure cooker or by other means. The results show that the effects of pressure cooking on food generally are either very much the same as, or slightly better than, those found with other good methods of cooking when these are used in ways which are most calculated to conserve nutrients. These experiments have been relatively few and concerned only with some of the nutrients; more work will have to be done before the complete effects of pressure cooking on all the nutrients are known. Experiments made on guinea-pigs by the Swiss Board of Health in Berne have shown that food which is overcooked in a high-pressure steamer loses its value. The *British Medical Journal* of April 2, 1949, observes that 'So far as can be judged from the limited evidence available, pressure cooking does not cause any greater loss of vitamins than good ordinary cooking. . . . Total immersion of the vegetables in an open saucepan invariably caused much greater losses. . . . But if misuse of the pressure cooker gradually accustoms the taste to very soft potatoes, and brown pulpy vegetables, then the risk of malnutrition is a real one.'

Since pressure cooking is so much quicker than ordinary cooking, it is necessary to time the process more carefully, especially with foods like vegetables which only take a few min. Too long cooking, even for a minute or two, will destroy the attractiveness and palatability of such foods and cause loss of nutrients. However, the directions supplied with most cookers, together with a little experience of their use, will enable the user to judge the necessary times of

cooking with reasonable accuracy. See C. K. Sutherland, F. G. Halliday, and W. F. Hinman, *Food Research*, 1947; Good Housekeeping Institute, *Pressure Cookery*, 1949; and Gweneth M. Chappell and Audrey M. Hamilton, 'Effect of Pressure Cooking on Vitamin O Content in Vegetables,' *British Medical Journal*, April 2, 1949.

**Prestatyn**, urb. dist. of Flintshire, Wales, on the coast, 205 m. from London. It is a holiday resort with a fine background of mt. scenery. Pop. 8700.

**Presteigne**, co. tn. of Radnorshire, Wales, an urb. dist. and mrkt. tn., on the R. Lugg, 157 m. from London on the W. Region railway. The riv. attracts many visitors for trout and grayling fishing. There is a shirehall where assizes and quarter sessions are held. Pop. 1200.

**Prester John**, probably mythical character, supposed in the Middle Ages to rule over a vast domain in the interior of Asia. Efforts were made by the popes to communicate with him. According to popular belief he was a Christian priest as well as king. The report may have originated with the Nestorian missionaries of Mesopotamia, who penetrated into Persia, India, and Tartary. Some have identified P. J. with the Grand Lama of Tibet, others with Toghrul Wang-Khan, chief of the Keraites, and still others with the Abyssinian king of Habbesh, or the founder of the empire of the Khara-Khital. A kinsman who took the same name is said to have been slain by Jenghiz Khan. The Portuguese quest for P. J. began in 1415 after the conquest of Ceuta. But the European legend of a P. J. fabulously rich and powerful, had vanished when the Portuguese, with great loss of life, saved Abyssinia from Moslem domination. See F. K. T. Zarucke, *Der Priester Johannes*, 1876-79; Sir H. Yule, *Cathay and the Way Thither*, 1866; and E. Saecan, *Portugal in Quest of Prester John*, 1943.

**Preston**, co. and municipal bor. and seaport in Lancashire, England, on the Ribble, 21 m. S.S.E. of Lancaster, with which it is connected by canal. It is the administrative centre for the co. Buildings include the Harris public building, museum, and institute, founded in 1882, the modern municipal building, the tn. hall and guild hall, seriously damaged by fire in 1947, and the public hall. P. Grammar School was founded in the fourteenth century, and there are sev. other schools, and a technical college. P. has a number of hospitals and sev. public parks, including Avenham, Miller, Ribbleson, Haslam, and Ashton. The churches in P., sev. of which are Rom. Catholic, are all modern. The prin. Rom. Catholic church, dedicated to St. Wilfrid, dates from 1793, but in 1879 it was almost entirely rebuilt. The steeple was designed by Hansom, who invented the hansom cab.

The name P. may be a corruption of *Prebsta-tūn* (Priest's Town), so called because of the number of religious houses once there. A large number of the citizens are Rom. Catholics. P. is referred to

in Domesday Book. Henry II. granted it a royal charter in 1179: this was followed by others granting various privileges including the right to have a fair. This fair still exists, but is no longer associated with trade or burgess rights; known as the P. Guild, it takes place every twenty years, first being recorded in 1328. There was fighting in and around the tn. during the Civil war, Cromwell defeating the Royalists there in 1648. P. later became a Jacobite centre. In 1715 the Old Pretender was proclaimed in P. market square; the Jacobite force later surrendered at P. Derwentwater and Kenmore were executed there. In 1745 Prince Charles Edward Stuart visited P. With the rise of industrialism the mansions of the nobility in P. disappeared, among them the mansion of the earls of Derby and that of the duke of Hamilton. P. was represented in Parliament as early as 1295 and possibly earlier. The first temperance newspaper was founded in P. Francis Thompson, the poet, was b. there.

The manuf. of cotton, especially of fine yarns, is the staple industry. Court-auds introduced a new industry, the production of viscous rayon yarn, in 1939. Electrical engineering is second in importance. There are steel and iron foundries, and other engineering manufs. include textile machinery, marine boilers, artesian pumps, and printing machinery. Other activities are wood-pulp, motor spirit, china clay, and coal distribution. Motor and rubber goods are made in Leyland, near P. Maritime trade has greatly increased since the construction of the large docks, and the deepening of the riv., begun in 1884. P. corporation is the responsible authority for the port of P. An airport was estab. jointly by the P. and Blackburn corporations in 1939 at Salmsbury, 4 m. from P. Pop. 111,400.

**Preston**, tn. near Galt and 28 m. N.N.W. of Hamilton, on the Grand R., in Waterloo co., Ontario, Canada. It is a health resort, with mineral springs, and has woollen mills, furniture factories, and machine shops. Pop. 6700.

**Prestonpans**, seaside tn. of East Lothian, Scotland, 9 m. E. of Edinburgh, celebrated for the victory of Prince Charles Edward over the royal troops under Sir John Cope, 1745. Fire-bricks, tiles, soap, etc., are manufactured, and there are coal-mines and a brewery. Pop. 2700.

**Prestressed Concrete**, see under REINFORCED CONCRETE.

**Prestwich**, Sir Joseph (1812-96), Eng. geologist, acquired a taste for geology during his scientific studies at Univ. College, London. He was appointed to the chair of geology at Oxford in 1874. In 1886 and 1888 he pub. his admirable handbook of *Geology*. He was knighted in 1896.

**Prestwich**, municipal bor. of Lancashire, England, 44 m. N.N.W. of Manchester; it has cotton manufs., but is mainly residential. Pop. (estimated) 30,000.

**Prestwick**, burgh of Ayrshire, Scotland, on the frith of Clyde, some 2 m. from Ayr. It is one of the most popular and widely

known holiday resorts in the S.W. of Scotland. For long known as an excellent golfing centre, it has four 18-hole courses, including the famous old P. championship course. The name of P. became even more widely known during the Second World War because of the adjoining airport. After the Second World War there was considerable discussion on the question of the retention of the airport, but eventually the minister of civil aviation adopted a scheme for providing P. airport with a second runway, 7000 ft. long, to the S. of the present runway; new terminal buildings are to be constructed in the angle of the intersection of the runways. The cost of these developments was estimated at £5,000,000 but their final adoption awaited the decision of the gov. in power in 1953, before which year the work could not be started. The tn. itself is a delightful resort, offering all seaside amenities and pleasures. The esplanade is 1½ m., and there are over 2 m. of broad, sandy beach. P.'s bathing lake, with accommodation for 1200 bathers and 3000 spectators, is one of the largest and best equipped in the country. Pop. 10,000.

**Presumption.** In the law of evidence Ps. are inferences from facts already proved or admitted. They are commonly classified into (a) *Juris et de jure* or Ps. absolute and irrefutable; e.g. that an infant under seven years of age is incapable of committing a felony. (b) *Juris* or Ps. which hold good only unless and until rebutted; e.g. that a child between seven and fourteen years is incapable of committing a felony, but the proof of its mischievous discretion will destroy the P.; and (c) *Facti* or *homini*, which, however, are mere arguments from probabilities and almost synonymous with circumstantial evidence (q.v. under EVIDENCE). In civil actions there are a number of Ps. of law as to documents, resting upon the authority of decided cases, which greatly facilitate proof; e.g. that alterations and interlineations appearing on the face of a will, in the absence of all evidence relating to them, were made after the execution of the will.

**Pretender.** see STUART, CHARLES EDWARD; STUART, JAMES FRANCIS EDWARD.

**Pretoria**, cap. of Transvaal prov., and administrative cap. of the Union of S. Africa, 35 m. N. of Johannesburg, situated on both banks of the R. Aapjes, at the foot of the Magaliesburg Mts. It is an important railway junction, being on the direct line with both Johannesburg and Durban. Sir Herbert Baker built the Union Building and the railway station. The Union Building houses the Premier, ministers and their staffs, agric., mining, commercial, and financial specialists, and the heads of the civil service. In the Raadzaal, at present occupied by the gov. of the Transvaal, took place the debates which preceded the S. African war of 1899. There are sev. churches, the Anglican cathedral of St. Alban's being the most notable. The tn. has a state library of 80,000 vols., sev. museums, and is the seat of the federal univ. of S. Africa. P. univ. was founded

in 1930. There are many schools and a technical college. Onderstepoort, noted for veterinary research, is 10 m. N. of the city. The Radcliffe Observatory was transferred to P. from Oxford, England. There are numerous parks and zoological and botanical gardens; in Oct.-Nov. the jacaranda blossom is a striking feature. Paul Kruger is buried in P. Winston Churchill was a prisoner there in 1899. P. was founded in 1855 by Marthinus Pretorius (q.v.), son of Andries Pretorius, victor of Blood R., after whom it was named. In 1860 it superseded Potchefstroom as the cap. of the Transvaal. In 1900 P. surrendered to Lord Roberts, the Union being constituted nine years later, when P. became its cap. There are iron and steel, cement, pottery, brick, and leather industries, and printing works. Pop. 117,000 (European) 92,600 (non-European). See A. Macmillan, *Environments of the Golden City and Pretoria*, 1934; G. S. Preller, *Old Pretoria*, 1938; M. Nathan, *Paul Kruger: his Life and Times*, 1941; and H. V. Morton, *In Search of South Africa*, 1948.

**Pretorius**, Andries Wilhelmus Jacobus (1799-1853), Dutch settler in S. Africa and soldier. A leader of the great Boer trek in 1838, into what is now Natal. Early a rival of Hendrik Potgieter who led his voortrekkers (q.v.) much further N. With a small force of farmers P. defeated Dingaan's army of 30,000 imps at the famous battle of Blood R. (Dec. 16, 1838) and so broke the power of the Zulu. This led to the setting up of a republic of Natal, with P. as first president of the first Volksraad of Natal and chief commandant of its forces. This move alarmed Sir George Napier, the Cape governor, who sent troops to Durban and annexed Natal, the Boers realising the hopelessness of resistance. Offers of farms were made to the Boers, but a considerable number of them recrossed the Drakensberg under the leadership of P. and set up new republics between the Orange and Vaal Rrs. But on Feb. 3, 1848, the governor, Sir Harry Smith, proclaimed the annexation of the entire region between those rivers as far E. as the Drakensbergs. Recalcitrant Boers, led by P., were defeated at Roomplaat (Aug. 28, 1848) and P. fled across the Vaal with a price upon his head; yet within six years after that battle the policy of Smith and Lord Grey (colonial secretary from 1846) had collapsed and freedom had been granted to all Boers beyond the Orange. P. early quarrelled with his rival Potgieter, who in 1838 founded Potchefstroom (named after him), oldest tn. of the Transvaal, whence parties of burghers left to settle further inland and prepared to set up their own separate gov. Civil war seemed certain, but ultimately P. succeeded in subjecting all the dists. in the Transvaal to one gov. without loss of life. The city of Pretoria, founded by his son, Marthinus Wessels (q.v.), was named in his honour. A man of integrity and prestige, a Bible reader and preacher, and a commandant who left nothing to chance, P. was pre-eminently fitted to lead the Boer farmers.

Pretorius, Marthinus Wessels (1819-1901), Boer commandant-general and political leader, son of Andries P., whom he succeeded as leader of military forces in 1853 and as President of the Transvaal in 1864. With Field-cornet Paul Kruger in 1854 he led the Boer punitive force against the chieftain Makapaan—who had massacred Boer women and children while their menfolk were absent hunting—drove Makapaan and his men into a cave, and there disposed of them. P. tried to go further than his father and marched with a commando to bring the Orange Free State under his rule; but in this he did not at first succeed, and, at the Vaal R. matters were settled amicably. Between 1857 and 1869 he was thrice elected president of the new S. African republic. As President of the Orange Free State (1859-63) he made every effort to reconcile the Free Staters to amalgamation with the Transvaal. He also tried, unsuccessfully, to annex Bechuanaland and Delagoa Bay. Following the first Brit. annexation of the Free State (1877) P., together with other rebel Boer leaders, joined the insurgent movement, but in 1880 the independence of the Free State was recognised. He was one of the leaders in the Free State until the election of Paul Kruger in 1883.

Preussisch-Eylau, tn. of Poland in the former Ger. prov. of E. Prussia, 23 m. S.S.E. of Kaliningrad (Königsberg). A famous battle was fought here on Feb. 7-8, 1807, between the Fr., under Napoleon, and the Russians and Prussians. Pop. 4300.

Prevention of Crime Acts. The Prevention of Crime Act, 1871, provides for the arrest and punishment of convicts out on licence under the Penal Servitude Acts. It enables a court of summary jurisdiction to forfeit the licence if it appears that the holder is getting a dishonest livelihood. In any case, holders had to notify their place of abode to the police within forty-eight hours of their arrival in any place. This provision is abolished by the Criminal Justice Act, 1948. Instead, certain categories of offenders with at least two previous convictions, after release from prison can be placed under the supervision of a named society or individual. Further, a court of summary jurisdiction can award imprisonment, not exceeding one year, to persons who have on former occasions been twice convicted of crime, and who within seven years from their last conviction are guilty of certain offences or, rather, conduct which leads to the inference that they are again contemplating crime; e.g. they may be so imprisoned: (1) if they refuse to give their names and addresses, or give false ones; (2) if found in any place under such circumstances that the court is satisfied that they are about to commit a crime, and in any case if it appears that they are getting a dishonest livelihood; and (3) if found in any premises or grounds without being able to give a satisfactory account of themselves. The police have power under this Act to search for stolen property in premises which, within the last twelve months,

have been in the occupation of persons convicted of receiving stolen property or harbouring thieves, or are, in fact, occupied by persons who have been convicted of crimes involving fraud and dishonesty. The Home Office is empowered under this Act to make regulations for photographing prisoners, and due provision is made in the Act for the keeping of a register of prisoners by the Scotland Yard authorities for purposes of identification (*see also* FINGER PRINTS). By the Prevention of Crime Act, 1908, a prisoner who pleads or is found guilty of an indictable crime involving a sentence of penal servitude may, in certain circumstances (*see* CRIMINAL LAW), be charged as an 'habitual criminal.' If found guilty on such further charge, the court could add to his sentence for the specific crime a sentence of 'preventive detention' for any period of from five to ten years. Persons undergoing preventive detention are confined in prisons set apart by the Home Office for that purpose, and subjected to such disciplinary and reformatory influences, and employed on such work as may be best fitted to make them able and willing to earn an honest livelihood on discharge. Under the Criminal Justice Act 1914, preventive detention can only be ordered for persons over thirty years of age with at least three previous convictions on indictment. It does not now involve an additional sentence, but a single sentence of from five to fourteen years. The Act also provides for the reformation of young offenders (not less than sixteen nor more than twenty-one years of age), convicted of an offence involving imprisonment, by enabling the court to pass sentence of detention in a Borstal institution for a term of not less than one year or over three years; the minimum of one year was raised to two years under the Criminal Justice Administration Act 1914, and under the Criminal Justice Act, 1948, the sentence must always be for three years. It is further provided by the Act of 1914 that the young offender shall be under supervision until the end of one year after the conclusion of the full period of detention (i.e. with a three-year sentence until the conclusion of the fourth year from the date of sentence). In the event of unsatisfactory behaviour during the period of supervision he may be recalled to a Borstal institution. Further provision is made for the reformation of young people by the Children and Young Persons Act, 1933, which provides that in dealing with a child or young person the court shall have regard to his welfare by removing him from undesirable surroundings and providing for his education and training. A court may not order a child under the age of ten years to be sent to an approved school (*q.v.*) unless for any reason, including the want of a fit person of his own religious persuasion who is willing to undertake the care of him, the court is satisfied that he cannot suitably be dealt with otherwise. The Children and Young Persons Act, 1938, extends the powers of the courts of summary jurisdiction as to

the making of orders for the protection, custody, supervision, and care of children and young persons, and for their temporary detention. A juvenile court's power to revoke an order committing a child or young person to the care of a fit person includes also power to substitute an order placing him for a period not exceeding three years under the supervision of a probation officer or some other person approved by the court.

**Prevention of Cruelty to Animals, see ANIMALS, CRUELTY TO.**

**Prevention of Cruelty to Children, see CHILDREN, SOCIETIES FOR PREVENTION OF CRUELTY TO; CHILDREN ACT, 1908.**

**Preventive Medicine** is that branch of medicine which aims at the avoiding of disease by application of the principles of hygiene (*q.v.*), both personal and public. Personal hygiene promotes the health of the individual, so that he will be better fitted to withstand infection and less liable to acquire disease; it ranges from the pre-natal care of the foetus and the mother to the science of geriatrics, or the health of old age, which is now being increasingly studied. Personal hygiene includes the cleanliness of the body which is so essential, especially in the tropics, for the avoidance of skin infections and external parasites (such as lice and fleas which are themselves able to transmit disease); care of the teeth and mouth, and of the hair, is also important. Public hygiene, or public health, is controlled by appropriate Acts of Parliament, administered by the Ministry of Health and by local authorities; it is concerned with such matters as the provision of adequate water supplies and the proper disposal of sewage, the safeguarding of food and especially milk, superintendence of buildings, and so on. Many infectious diseases, as, for instance, measles, smallpox, scarlet fever, typhoid, puerperal fever, and diphtheria, must by law be notified to the local medical officer of health, so that steps can be taken to prevent their spread. The numerous occupational diseases are also controlled by legislation. Under the National Health Act of 1946 medical attention and hospital treatment is available to all inhab. of Great Britain. P. M. is of particular importance in tropical dists., where diseases such as malaria, yellow fever, and sandfly fever, with insect vectors, and others caused by intestinal parasites, are rife and could be controlled, or even prevented entirely, by the application of adequate preventive measures. **See also CHILD; DIET; FOODS AND FEEDING; HYGIENE; PUBLIC HEALTH; SANITATION; SEWAGE; VENERAL DISEASE; WATER.** **See J. R. Currie and A. G. Mearns, *Manual of Public Health Hygiene*, 1948, and W. M. Frazer and C. O. Stallybrass, *Text-book of Public Health* (12th ed.), 1948.**

**Preventive Service, see COASTGUARD.**  
**Preveze, tn. and dopt. of Epirus, Greece,** at the entrance to the gulf of Arta, 49 m. W. of Fanina; exports cheese, butter, wool, olives, and oil. Pop. (tn.) 8800, (dopt.) 77,400.

**Prévost, Eugène Marcel (1862-1941).**

Fr. novelist and playwright, *b.* in Paris. His first successful novel was *Le Scorpion*, 1887. Others included *Chonchelle*, 1888; *Lettres de femmes*, 1892; *Les Demi-Vierges*, 1891 (produced on the stage, 1895); *Monsieur et Madame Moloch*, 1906. *La Plus Faible* had a popular run at the Comédie Française, 1904. P. was admitted to the Academy in 1909. His later works include *Mon cher Tommy*, 1920; *L'Art d'apprendre*, 1922; *Sa maîtresse et moi*, 1925; *L'Homme vierge*, 1929. **See P. Valéry and H. Bordeaux, *Marcel Prévost et ses contemporains*, 1943.**

**Prevost D'Exilles, Antoine François (1697-1763),** Fr. writer, *b.* at Hesdin in Artois, and generally known as the Abbé P. He was brought up by the Jesuits, but abandoned monastic life for military life, then re-entered a monastery, and finally left France for Holland and London. In 1734 he returned to Paris as chaplain to the prince de Conti. He wrote many novels, mostly long and diffuse stories of love and adventure. He is famous chiefly as the author of *Manon Lescaut* (1731), his one masterpiece, pub. as part of the *Mémoires d'un homme de qualité*, the first part of which appeared in 1728. Other works of note are *Fils naturel de Cromwell* (1732), and *Histoire générale des royaumes* (1745-70). As the translator of Richardson's *Pamela* and *Clarissa Harlowe* P. exercised a considerable influence on the literature of his day. **See life by H. Harriette, 1896, and E. Lasserre, *Manon Lescaut et l'abbé Prévost*, 1930.**

**Prevost, Jean (1901-44),** Fr. writer, *b.* at Goderville. His work belongs to the school of Alain; he analysed the life of the senses with clarity and vision. He was killed in the resistance movement during the Second World War. His pub. include *Dix-huitième Année* (1927); *Epicuriens français* (1931); *Le Sel sur la plaie* (1935); and *Ursone* (1939).

**Preysing, Konrad von (b. 1880),** count of Lichtenegg-Mons, and Ger. cardinal from 1946, *b.* at Kronwinkl. After a diplomatic career, he became a priest in 1912, being made bishop of Eichstätt in 1932, and of Berlin in 1935. With Cardinals Faulhaber and von Galen (*q.v.*) he was one of the chief leaders in the Ger. Catholic resistance to the dictatorship.

**Priamus, or Priam (Ἰκ. Πριάμος),** king of Troy at the time of the Trojan war, was the son of Laomedon. Being an old man he took no active part in the famous conflict between the Gks. and the Trojans. He took refuge at the altar of Zeus when the Gks. entered Troy, and having witnessed the death of his son Polites, hurled his spear at his pursuer Pyrrhus, by whom he was forthwith killed. He was the husband of Hecuba, by whom he was the father of Hector, Paris, Deiphobus, Polites, Polydorus, Troilus, Crenaeus, Polyxena, and Cassandra.

**Pribilof or P. bylov Islands,** volcanic is. in Bering Strait, Alaska, U.S.A., the centre of important seal fisheries. The total area of the group is 170 sq. m., the largest is. being St. Paul and St. George. **Pfibor, see FREIBURG.**

**Pfibram**, tn. in Bohemia, 33 m. S.W. of Prague. It has the most important silver and lead mines in Czechoslovakia (worked since 1330). Near P. is the Hellig Berg, a much frequented shrine. Pop. 10,500.

**Price**, Harry (1881-1948), Eng. psychic investigator, b. in London. He founded and equipped (1925) the first laboratory in Britain for the scientific investigation of abnormal happenings, publishing the results of his researches in Britain and abroad in numerous books, among the best known being *Pollergeist over England* (1945) and *The End of Borley Rectory* (1946); he investigated the claims of the prin. mediums and visited scores of haunted houses in Britain and sev. European countries. He formed a library of over 20,000 vols. on ghosts, magic, and allied subjects, which he presented to the univ. of London. See his autobiography, *Search for Truth* (1942), and P. Tabori, *Harry Price—Companion of the Unseen*, 1950.

**Price**, Lillian Nancy Baugh (b. 1880), Brit. actress, b. at Rochmount, Kinver. She was educated at Malvern and first appeared on the stage in 1899 at Birmingham. She is most famous as a character actress, especially in such roles as Mrs. Alving, in *The Ghosts*, and Adeline in *Whiteoaks*. She has also appeared in films. In 1930 she founded the People's National Theatre. She pub. her memoirs, *Shadows on the Hill*, in 1936 and has also written *Fagabond's Way*, *The Wonder of Wings*, and *Where the Skies Unfold*.

**Price**. P. is value in exchange in terms of money. The P. of an article is the sum of money paid for it. A wage is the P. of labour; and a rent is the P. of the use of land. To say that Ps. have risen is to say that the value of money has fallen. A general rise in P. indicates a rise in the quantity of money. According to the original Quantity Theory of Money, if the quantity of money is increased Ps. increase proportionately. Such a crude statement needs adjustments to relate it closely to fact. Money must be taken in the modern sense to include not only bank-notes but bank-money (demand deposits); and allowance must be made for expectation as well as for money substitutes and arrangements which economise the use of money. An increase in the volume of trade will require a more or less proportionate increase in the amount of money. Again, an increase in the 'demand' for money (the desire to hold money) will reduce its velocity and be equivalent to a reduction in quantity. Decreases will have opposite effects. With these qualifications the quantity theory may be looked to, not for mathematically accurate results, but for a useful indication of tendencies. If all Ps. double, relative values are undisturbed. Thus, although there may be a general rise in Ps., there can be no general rise in values. Under conditions of perfect competition there can be only one P. for identical articles at any one time in the same market. This P. equates, or tends to equate, the quantity offered and the quantity

demanded. The Normal P., on the other hand, is that which tends to persist over a lengthy period. The normal P. tends, under conditions of perfect competition, to equal the marginal costs of production (including normal profit), supply being increased by a rise in P. and restricted by a fall. While increase in P. will tend to increase supplies the increase in supply may, in turn, either tend to reduce P. (in conditions of increasing returns) or to increase P. (in conditions of decreasing returns). Demand, on the other hand, may be relatively elastic or inelastic: an elastic demand will respond markedly to a rise or fall in P.; an inelastic demand will persist substantially in spite of P. variations. P. thus plays a great part in regulating economic activity and adjusting it to the needs of mankind—or at least to the requirements of purchasers.

It is sometimes denied that the quantity of money is the great determinant of the P. level and maintained that the contrary is true—that the level of Ps. determines the amount of money. This counter-argument is valid only while the authorities are content to furnish whatever money is required by the volume of trade and the level of Ps. If the level of Ps. tends upwards owing, for example, to wage pressure, the gov. may meet (potential) inflation by monetary or non-monetary measures. Non-monetary measures could take the form, as in 1949, of an attempt to restrict wage increases; while monetary measures mean a deflationary reduction of bank-money by restricting loans (and selling securities). Deflation was a gold standard feature, involving unemployment. (See MONEY.)

The condition of perfect competition tends to be unattainable in these days of P.-fixing and monopoly; and with 'imperfect competition' there is no presumption that P. will no more than equal marginal costs of production. The monopolist can either fix his P. or alternatively fix his output; he cannot do both at the same time. The public like fixed-P. branded goods, and the question of manufacturers enforcing retail Ps. has recently been studied by the Resale P. Maintenance Committee, whose report was pub. in March 1949. The committee 'are satisfied that the elimination of price competition over the greater part of the distributive trades is not consistent with... maximum efficiency and economy...' and have been concerned to mitigate the harmful effects of resale P. maintenance as now in operation, and guarantee a substantial degree of flexibility in distribution. Their recommendations make a big distinction between the use of sanctions by an individual producer and by associations. They recommend continued liberty for the individual producer to apply sanctions in support of his fixed P., but recommend at the same time that it should be made illegal for associations of traders to apply such sanctions. The committee favours the double P.; one for 'cash and carry', and another for delivered goods. In the U.S.A. the self-service has made great progress, and accounts for a high

proportion of retail trade. Monopolistic practices are not confined within national boundaries. The control of diamond P. is world-wide; and both tin and rubber have been subject to international restriction (of production or of export) schemes, and, in the case of tin, to the creation of a 'buffer stock' in the hands of the international body, for the purpose of steadying the market in an unforeseen emergency.

In order to measure the value of money at different periods it is necessary to make a P. index—to record the P. of a large number of commodities (and services), and to 'weight' them in accordance with the quantities considered to be appropriate to the purpose. Comprehensive indexes are a comparatively modern device and regard is had to wages or a basic commodity such as wheat to get an idea of the value of money in pre-index times. (Gold P. are often quoted as representing real values as against 'paper' values; and where gold P. have themselves kept stable this is often convenient; but a criterion is necessary by which to determine whether gold itself has kept stable.) Even the best indexes have their limitations, however, and it is important to bear this in mind when using the best available index to give the relative values of money at different times. The Ministry of Labour Cost-of-Living Index measured P. changes from July 1911 in a working-class budget of 1904-14. It had risen to 56 per cent (above 1914) in 1938 and to 103 per cent in June 1947, when it was discontinued. Pending the estab. of a new basis for a permanent index, it has been replaced by an Interim Index of Retail P. based on the 1937-38 pattern of working-class expenditure (but not purporting to show the rise in the cost of living since 1937-38). Wholesale P. indexes, while often more comprehensive, are in theory clearly inadequate to measure the value of money since the consumer pays retail P.; nevertheless they have manifest advantages, and similar discrepancies at different dates tend to cancel out. The cost of living index reflects inadequately the change in the value of money not only because the typical 1904-14 budget is not the typical budget of 1947, but because so many of its components were subsidised during the Second World War and after.

While the value of money is the reciprocal of the general P. level, the P. of money is the rate of interest. The P. of money may move quite differently to general P. After the Second World War general P. rose, but the P. of money fell. A 'cheap money' policy had made the Second World War a '3% war' as against the 5 per cent paid on long-term loans in the First World War. Short-term rates were also much reduced. 'cheap money' policy having reduced bank rate to its present low level of 2 per cent in 1932. At that time of industrial depression the 'weight of money' pressed down the rate of interest: to-day controls serve to keep money cheap. The post-war fall in the P. of money marked a reinforcement of cheap money policy with

heavy cuts in the rates for Treasury bills and Treasury deposit receipts; but long-term rates have risen appreciably since. By driving down the rate of interest a cheap money policy drives up the P. of stocks and shares; and so presents the holders with large capital gains.

A rate of exchange provides two P., e.g. the P. of £s in francs and the P. of francs in £s.

St. Thomas Aquinas favoured the 'just price,' the P. which gave labour no more than its accustomed standard of life, and throughout the Middle Ages P. were under control, not only by Church and State, but by the gilda. The Black Death in the fourteenth century played a notable part in breaking up the estab. P. for labour; and P. for both goods and labour rose rapidly in response to the currency debasement of Henry VIII. and the influx of gold and silver from the Americas.

The following figures give some idea of the course of Eng. P. from the Middle Ages onwards

	Agric. Labourer's Wage	Wheat per Quarter
1261-1350	2½d per day *	5s 9½d.
1351-1400	3½d per day *	6s 1½d.
1401-1510	1d per day	5s 1½d.
1511-1542	6½d per day	13s 10½d.
1583-1612	4s 10d per week	36s 1d
1613-1702	6s 4½d per week	41s 1½d.

Price Level Policy, see under MONEY.

**Prichard, Harold Arthur** (1871-1948), Eng. philosopher. Educated at Clifton and New College, Oxford, he was a fellow of Hertford College, Oxford (1895-98); fellow and later tutor of Trinity College (1898-1924), and White's prof. of moral philosophy at Oxford from 1922 to 1937. His most important work was done in the spheres of moral philosophy and the theory of knowledge. He was one of the founders of realism, and in moral philosophy the leader of the intuitionist school or 'Oxford Moralists.'

**Pricking at the Belt**, see FAST AND LOOSE.

**Prickly Heat**, or *Miliaria Populosa*, skin disease common in tropical and sub-tropical lands. It is characterised by inflammation of the sweat-glands, leading to the formation of small red papules, and accompanied by a prickling or tingling sensation. It usually follows an excessive flow of perspiration; it is unaffected by any treatment.

**Prickly Pear**, see OPUNTIA.

**Pride, Thomas** (d. 1658), Eng. soldier; he entered the parl. army in 1644 and distinguished himself at Naseby. In 1648, to prevent an agreement with the king, P. stopped nearly a hundred members from taking their seats in Parliament, an act which is known as 'Pride's Purg.' He was a commissioner at the trial of the king and signed the death warrant.

**Priene**, anct. city of Ionia, Asia Minor, some 6 m. N. of the Meander. Excavations conducted by the Eng. society of Dilettanti (1765 and 1868) and by the Ger., Th. Wiegand (d. 1899), confirmed the traditional prosperity of the city in the fourth and third centuries B.C. See M. Schede, *Die Ruinen von Priene*, 1934.

**Priest**, shortened form of presbyter (Gk. *πρεσβυτερος*, an elder), minister of public worship, to whom it belongs especially to perform the sacrificial rites pertaining thereto. It seems evident that, in the primitive stages of society, these duties belonged to the head of the family. A later development made the head of the clan the natural representative in religious matters, and this stage can be seen in the biblical accounts of the patriarchal age. As the organisation of society became more defined, the priestly office was in many cases associated with the king. In other religions, such as those of Egypt and India, the Ps. form a separate caste. The Jewish priesthood, inaugurated by the Mosaic law, was elaborately developed, and there is a parallel between the Jewish and Christian systems. The Christian hierarchy was not fully developed until post-apostolic times. In it the priesthood forms the second grade of the sacred ministry, exercising many, but not all, of the functions of the higher grade of the episcopate. To the P. belong especially the functions of offering sacrifice, ministering the sacraments, of blessing, and of preaching. See APOSTOLIC SUCCESSION; HOLY ORDERS; and articles on the various religions.

**Priesthood**, see under PRIEST.

**Priestley, John Boynton** (b. 1894), Eng. author; b. at Bradford, Yorkshire, and

educated at Bradford and Trinity Hall, Cambridge. He served during the First World War. After leaving Cambridge P. became a reader for John Lane and estab. contacts with the *London Mercury*. He wrote *George Meredith* (1926) and *Thomas Love Peacock* (1927) for the English Men of Letters series, but his chief interest lay in creative, rather than critical literature. In 1918 he pub. *The Chapman of Rhymes; Brief Diversions* followed in 1922. His early novels included *Adam in Moonshine* (1927); *The Good Companions* (1929); and *Angel Pavement* (1930). *The Good Companions* was a phenomenal success, being a rollicking story rather reminiscent of the Dickens manner of narration and in the picaresque tradition of Fielding. *Angel Pavement*, a sombre story of middle-class life, was also extremely successful, and has been declared by some critics to be his best work; others have preferred *Bright Day* (1948) pointing out that this combines many sides of P.'s literary talent. Other novels include *They Walk in the City* (1936); *Let the People Sing* (1939); *Black-out in Greley* (1942); *Three Men in New Suits* (1945); and *Jenny Villiers* (1947). P. has also written for the theatre. *Dangerous Corner*, a character-study, was produced in 1932. *Time and the Convoys*, and *I have been here before* (1937) are usually considered his greatest contribution to the Eng. theatre. They are time-studies, which, while owing something to the theories of J. W. Dunne and Ouspensky, show exceptional imaginative capacities and sympathy. P.'s later plays dealt mainly with social subjects. *They Came to a City* (1943) was a symbolic drama; *The Linden Tree* (1947) showed P.'s ability to draw sympathetic characters of the political sides to which he was opposed; *To-morrow will be Better* (1948) was a plea for international co-operation through United Nations Organisation. During the Second World War P. broadcast a famous series of 'Postscripts' after the 9 p.m. Sunday news which admirably portrayed the character, opinions, and aspirations of Englishmen at war. His ability to make a broadcast into a personal 'fireside chat' has made him also an excellent writer of autobiographical studies. *Delight* (1949), notes on the things which have delighted him most in life, is a good example of this type of writing.

**Priestley, Joseph** (1733-1804), Eng. chemist and divine, b. at Fieldhead, near Leeds, and educated at Wetherby, then entered a dissenting academy. In 1755 he became a dissenting minister at Needham Market, and at Nantwich in 1758. In 1761 he became a teacher in Warrington. He met Franklin in London, and pub. *History and Present State of Electricity* (1767); LL.D. Edinburgh (1764), F.R.S. (1766). He was literary companion to Lord Shelburne (1773); and was in Paris with him (1774). P. became a minister in Birmingham (1780-91); it was here the mob burnt his house, books, MSS., and scientific instruments. Being left £10,000 and £200 annuity by his brother-in-law, he

settled in Pennsylvania (1794). He commenced chem with carbon dioxide of fermentation in brewery; discovered oxygen from mercuric oxide, etc. He carried out further researches on nitric oxide, hydrochloric acid, sulphur dioxide, ammonia, air, carbon monoxide, and silicon fluoride, examined effect of different gases on the respiration of animals and plants, applied carbon dioxide to aerated water, greatly improved the pneumatic trough. *P's Works* were ed. by J. F. Rutt 1817-1832. See the lives by F. E. Thorpe, 1906,

JOSEPH PRIESTLEY

Engraving from a picture by Gilbert Stewart

A. Holt, 1931, and D. McKie 1949. See also H. Pearson *Darwin and his Circle* and *Doctor Darwin*, 1930 and Sir P. Hartog, *Joseph Priestley and his Place in the History of Science* 1931.

**Prignano**, Bartolommeo, see **URBAN**, Urban VI.

**Prilep**, tn of Macedonia, Yugoslavia. Pop. 25,800.

**Primage**, small sum of money over and above the freight charges paid to the master of a ship for his care of the goods. *P'* which was known as 'hat money' is now included in the freight and retained by the shipowner.

**Primary Colours**, see **SPECTRUM**.

**Primate** in the Rom. Church the bishops of certain sees which anciently had attached to them the positive of vicar of the holy see. They have however no primatial jurisdiction. In the Church of England, the title belongs only to the two archbishops: the archbishop of York bears the title of *P' of England*, while the archbishop of Canterbury is *P' of All England*.

**Primates**, term invented by Linnaeus to define the first order of the class Mammalia. By Huxley and other authori-

ties, man is included, though there are some who place him in an order apart. *P.* include all the apes, monkeys, and marmosets, as well as the lemurs, which bear a closer resemblance to monkeys than to any other animals, and are, therefore, agreed to belong to the order, though ranked apart as the sub order Lemuroidea, on account of their lower organisation and inferior intelligence. The order is characterised throughout by milk and adult dentitions. As a rule, both fore and hind limbs bear five digits each, the thumb being usually but not invariably, present, and, except in man, the large toe is opposable to the other toes, with the same exception, *P.* are mainly arboreal in habit and are confined to warm climates.

**Prime**, in the Rom. Catholic and Gk. Churches is an office said in the first hour after sunrise following matins and lauds.

**Prime Minister**, or **Premier**. The *P' M* or *Premier*, although the *de facto* head of the Cabinet and the most important personage in the kingdom is an official unknown to the law but in 1805 Edward VII. recognised the existence of the position and gave the *P' M* a definite precedence, next after the archbishop of York. Estab. usage, however not only clearly defines his powers and privileges and his relations with the Crown (see under **CABINET**) but usually combines with the first that of first lord of the Treasury, foreign minister, or some other important Cabinet office together with a privy councillorship. Walpole is generally assumed by historians to have been the first *P' M* but he was not asked by the king to form a ministry or to choose his colleagues the two duties which are the constitutional authorisation for a *P' M's* assumption of office but he entered the Cabinet at the behest of George I. and gradually thereafter by his dominant personality acquired the leadership though apparently it was his very assumption of premiership that led to his fall. The office exists in some of the self-governing colonies but though nominally there is a *P' M* and always in other continental countries some leading minister, whether called *P' M* or not, such minister does not possess the same executive power and does not depend to the same extent on the retention of a parliamentary majority (see **PARLIAMENTARY GOVERNMENT**) as the *Eng P' M*.

**Prime Number**, number which is indivisible without a remainder, save by itself and unity.

**Primitive Land Tenure**, see **LAND TENURE**.

**Primitive Methodism** was founded in 1801 by Wm. Clowes of Burslem and Hugh Bourne of Stoke on Trent. Its form of service differed from Wesleyan Methodism (*q.v.*) in its inclusion of singing and revivalist exhortations. The name Primitive Methodist was adopted in 1812 and, as is usual where persecution is bitter, the cause finally surmounted the many obstacles placed before it and by 1852 the movement was well organised, not only in Great Britain, but as far afield as Australia, New Zealand, and S.

Africa, and the U.S.A. To-day in the U.S.A. there are about a hundred Primitive Methodist churches with a membership of 12,000, while in Canada membership totals over 8000, with 100 effective churches. In London at the centre of Whitechapel, Thomas Jackson began a remarkable work of social service in the eighties of last century, particularly his 'Home for Friendless and Orphan Lads.' Primitive Methodists were reunited with the parent body in 1932 as part of the Methodist Church. *See also* METHODISM.

**Primitive or Early Norse Language, see under NORSE LANGUAGES.**

**Primitive Painting**, general term used to denote the art of the early formative years of modern European painting, beginning in Italy at the end of the twelfth century, and ending in Italy during the fifteenth century and in N. Europe some decades later. Evolving from fresco-painting, P. P. shows a concentration on line, flat colour-blocks, and decorative rather than strictly accurate composition, being aimed primarily at illustrating some teaching of the Church. While they had freed themselves from the stylised, artificial pattern-painting which had gone before, the primitive painters often distorted and drew out of proportion, owing to their lack of anatomical knowledge and failure to master perspective. P. P., however, was never really static: it was developing all the time towards the styles of Raphael, da Vinci, and the Van Eycks. The later paintings of the primitive school frequently show a mastery of perspective and a tendency to 'solidify' by some use of shading. A comparison between the work of Cimabue, Giotto, and Fra Lippo Lippi will illustrate the breadth of development which took place within P. P.

**Primo de Rivera y Orbaneja, Marqués de Estella, Miguel** (1870-1930), Sp. statesman, b. at Jerez de la Frontera, and educated at Madrid Military Academy. He campaigned in Morocco, 1893, and in 1895, in Cuba. He was in the Philippines, 1897. After more fighting in Morocco, became governor of Cadiz, 1915, but was deprived of that post for an imprudent speech, 1916. In 1922 P. was appointed military governor of Barcelona. During the summer of 1923, he organised military revolution. His resignation was demanded; but the king, refusing to sign the Prime Minister Alhucemas's plan for suppressing the revolt, sent for P. (who had already on Sept. 13, issued a manifesto demanding dismissal of the Cabinet), and made him president of a military directorate, suspending the constitution indefinitely. P. formed the Unión Patriótica in imitation of Fascism. His greatest achievement was the solution of the Moroccan affair. He conducted the retreat that ended successfully in Dec. 1924, and was followed by the victories of 1926. In 1925 he dissolved the directorate, and became Premier of a gov. into which he had introduced a civilian element. The only result of this was that he began to be unpopular with the army. His action in consulting army and naval officers as to whether he should resign

caused the king to insist on his immediate resignation, Jan. 28, 1930.

**Primogeniture**, state of being the first-born child of the same parents; in King, law the term has become more specialised and denotes the right (abrogated in 1925) by which, on intestacy of the father, the eldest son or his issue succeeded to the real estate to the absolute exclusion of the younger sons and daughters (*see also* HEIR; INTERSTATE; PORTIONS; SUCCESSION). For the various forms of P. in anct. legal systems reference should be made to Maine's *Ancient Law* (chapter vi.), where it is pointed out that in some anct. systems it was not always the eldest son or his issue who took up the succession, but sometimes the next brother succeeded in priority to all grandsons, especially when the succession was not to civil but to political power; and again, in polygamous societies the form of P. always tended to vary. There is no trace of the normal form of P. among the Romans, and it seems certain that it is feudal in its origin, and was the customary manner by which the huge military benefices of the Carolingian Empire were held by subfeudatories.

**Primorska**, prov. of Yugoslavia. Cap. Split (Spalato). Area 7580 sq. m. Pop. 900,000. *See also* ASPALATHOS.

**Primrose, Archibald Philip, see** ROSEBURY, EARL OF.

**Primrose** (*Primula*), genus of herbaceous plants (family Primulaceæ). The common P. (*P. vulgaris*) is one of the most cherished Brit. flowers; a number of varieties of it are grown in gardens. *P. veris* is the cowslip. The hybrid between P. and cowslip is often wrongly known as the oxlip; the true oxlip is *P. elatior*, a rare species found in the E. cos. of England. *P. farinosa* is the beautiful bird's-eye P. found growing on limestone, the leaves are mealy on the lower surface (thence *farinosa*). A number of species of the genus are valuable garden and greenhouse plants, the interest in which is increased by the ease with which they are cross-fertilised. The auricula (*P. auricula*, dimin. of Lat. *auris*, an ear, referring to the shape of the leaves), Chinese P. (*P. sinensis*), and *P. obconica* are among the more important species from which many valuable hybrids have been derived.

**Primrose League**, Brit. organisation for spreading Conservative principles. It was instituted in 1883 by Lord Randolph Churchill, Sir H. D. Wolff, Col. F. Burnaby, Sir J. Gorst, and others, and is so called because the primrose was said to be the earl of Beaconsfield's favourite flower. Its objects are 'the maintenance of religion, of the estates of the realm, and of the imperial ascendancy of Great Britain.' The badge consists of the letters P. L. surrounded by primroses, and the seal is three primroses. It has a membership of between two and three millions. **Primulaceæ**, family of herbaceous plants which include some of the most popular wild and garden flowers. *Hottonia* (water violet), *Primula* (primrose, g.r.), *Cyclamen* (swallowtail, g.r.), *Lysimachia* (loosestrife), and *Anagallis*

(pimpernel, *q.v.*) are among the more important genera, which occur chiefly in the cooler parts of the N. hemisphere.

**Prince** (Lat. *principes*, chief), epithet applied originally to the *principes senatus* at Rome, later adopted by the emperors from Augustus onwards. Hence it came to be used for one of the highest rank or holding the highest place and authority, and may mean the sovereign or ruler of the state. It more usually implies the son of a king or emperor, the issue of a royal family, or the head of a principality or small state. A territorial title is often attached, thus in England, the eldest son of the reigning sovereign is always P. of Wales. Germany distinguished between the sovereign 'Prinz' and the 'Fürst,' merely one of a princely family. In Italy, as in anct. France, P's. rank next to dukes.

**Prince Albert**, tn. of Saskatchewan, Canada, on the N. Saskatchewan R., and the Canadian Pacific Railway, 100 m. N.E. of Battleford. The water-power of the Laclois Falls has been developed since 1911. Lumber, grain, fish, and cattle are produced, and there are creameries, meat-packing plants, tanneries, bottling works, grain elevators and mills, and wood-working plants. Pop. 14,500.

**Prince Albert's Regiment**, see SOMERSET LIGHT INFANTRY.

**Prince Charles Spaniel**, see under SPANIEL.

**Prince Edward Island** (formerly *Isle St. Jean* till about 1799), smallest but most densely populated prov. of the dominion of Canada, in the gulf of St. Lawrence, separated from Nova Scotia and New Brunswick (S. and W.) by Northumberland Strait. It is 140 m. in length and varies from 4 m. to 34 m. in width, and has an area of 2184 sq. m. It has deep bays dividing the is. into three natural peninsulas, almost corresponding to the three cos., King's, Queen's, and Prince's. It has a climate tempered by the surrounding waters of the gulf and yet free from the rigours of Atlantic storms. Its rich red soil and red sandstone formations make up a distinctive and even topography, no point in the is. attaining a greater altitude than 500 ft. above sea level. The surface is gently undulating, and the soil fertile, producing fine crops of oats and potatoes. Wheat, barley, and other cereals are also grown; cheese factories and creameries were first estab. in 1892; and cattle are reared. Forest land still covers nearly a third of the is. Fisheries are important, especially the lobster and oyster fisheries. The total value of the fisheries in 1947 was about \$2,897,281. The waters adjoining P. E. I. comprise by far the most valuable section of the fishing grounds of America. The prov. is noted for its relative predominance in the fox-farming (silver-black foxes in captivity) industry (the value of pelts sold in 1947-18 was estimated at 2549,362), its lobster canneries, and its production of oats and potatoes. There are good oyster beds in Richmond Bay and elsewhere. The farmland occupied is about 1,970,000 ac. Field crops in

1947 covered nearly 485,000 ac. (oats, 122,000; wheat, 5000; barley, 10,000; mixed grains, 65,000; potatoes, 43,000; roots, 12,000; hay and clover, 226,000). The trade of P. E. I. is chiefly with the other provs. of Canada, but fox pelts are shipped to the U.S.A. and European markets. Three ferries operate between P. E. I. and the mainland. There has been daily steamship communication since 1917. There are dominion experimental farms and stations at Charlottetown and Summerside Fox Ranch. Chief manufs. or industries: butter and cheese, fish-curing and packing, flour and grist mills, printing and publishing, castings and forgings, bread and bakery products, sawmills, electric light and power. Education is free and non-sectarian and compulsory between seven and thirteen. There is a Rom. Catholic univ. not under gov. control. Prince of Wales College is head of the prov. schools system. Responsible government was estab. in P. E. I. in 1851. Four members are sent to the Senate, four to the House of Commons of the Dominion Parliament. The is. has its own lieutenant-governor, and an executive council, and legislative assembly of thirty members elected by the people. Discovered by Cartier in 1534, the is. was first settled by the Fr., who held it for many years as a fishing station. The Eng. took it from them in 1745 but subsequently restored it; they seized it again however, during the Seven Years war (1763) and compelled the greater part of the Fr. inhab. to leave, and from that time it has remained Brit. It was admitted to the dominion in 1873. The chief tns. are Charlottetown (with Royalty, 14,800) and Summerside (5000), the former being the seat of a Rom. Catholic bishopric. A line of railway crosses the is., belonging to the dominion gov. Its length, with branches, is 286 m. A railway connects Belfast and Murray Harbour (50 m.), and one of the longest bridges in Canada spans the Hillsboro R. There are railways to Montserrat and Vernon R. Bridge. Pop. 95,000. See G. Sutherland, *History of Prince Edward Island*, 1861; D. Campbell, *History of Prince Edward Island*, 1875; D. C. Harvey, *The French Regime in Prince Edward Island*, 1926; and J. B. Pollard, *Historical Sketch of Prince Edward Island*.

**Prince Edward Island**, small is., in the S. Indian Ocean, 1400 m. S.E. of S. Africa. It was annexed by the S. African Gov. in Dec. 1947, the chief purpose of the annexation being the estab. of an air base as a link in Commonwealth communications in the S. hemisphere. At the same time an Australian expedition landed on Heard Is., over 2000 m. S.S.E. of P. E. I., for a similar purpose.

**Prince of Wales (title)**, see WALES, PRINCE OF.

**Prince of Wales**, Brit. battleship, see under PACIFIC CAMPAIGNS OF FAR EASTERN FRONT IN SECOND WORLD WAR.

**Prince of Wales Island**: 1. See PENANG. 2. Is. situated in Low Archipelago of Pacific, in 15° 18' S. and 147° 23'

W. 3. Is. in the Alexander Archipelago of Alaska.

**Prince of Wales's Own, see** YORKSHIRE REGIMENT, WEST.

**Prince of Wales's Theatre**, theatre in Coventry Street, London. The original building, known as the Prince's Theatre, was built in 1883 and opened the following year. The opening programme consisted of two plays, Sydney Grundy's *In Honour Bound*, and W. S. Gilbert's *The Palace of Truth*, the cast including Kyrie Bellew and Herbert Beerbohm-Tree. In 1937 the old theatre was demolished, and Gracie Fields laid the foundation stone of the new building. Since 1942 productions have included *No Orchids for Miss Blundish*, *Diamond Lil*, and *Harvey*.

**Prince of Wales's Volunteers** (South Lancashire Regiment), formed in 1712 as the 40th Foot and served in Nova Scotia in the war of the Austrian Succession, a war which embraced three continents. The regiment's battle honours, prior to the First World War, include St. Louis, 1778, Monte Video, all the great battles of the Peninsular war, Waterloo, Kandahar, 1842, Ghazal, 1842, Kabul, 1842, Sevastopol, Lucknow, and Relief of Ladysmith. At Waterloo the 40th was in reserve, but subjected to so heavy an artillery fire that three companies were cut to pieces. In 1881, under the reorganisation scheme, the 40th and 82nd Foot were amalgamated as the 1st and 2nd battalion of the P. of W. V. In the First World War the various battalions, regular and territorial, fought in Gallipoli, Egypt, and on the W. front. In the Second World War the regiment was in Madagascar (g.v.). Regular and other battalions took part in the early fighting in Normandy in 1944, winning especial distinction in a charge across a riv. to the W. of Caen. See the hist. of the regiment by Lt.-Col. F. E. Whetton, 1928.

**Prince Rupert**, seaport in. at the W. terminus of the Grand Trunk Pacific Railway, on Kulen Is., Port Essington estuary, Brit. Columbia, Canada. Founded in 1869, it has since developed rapidly and has fisheries and fish canneries, and ships' halibut, minerals, lumber, and grain. Pop. 6700.

**Prince's Theatre**, theatre in Shaftesbury Avenue, London. It was opened by S. F. Melville, who had built up a reputation in pantomime production at the Lyceum, in Dec. 1911. It was intended at that time to fill the need for a large theatre for melodrama and popular drama. Among its most successful productions have been *White Cargo*, *Bits and Pieces*, *Funny Face*, *Shepherd's Pie*, *Magic Carpet*, and numerous ballets.

**Princes' Islands**, group of nine Is. in the E. of the Sea of Marmora, the two largest being Prinkipo and Khalki. They are about 13 m. S. of Constantinople, and are celebrated for their beauty and fine climate.

**Princeton**: 1. Bor. of Mercer co., New Jersey, U.S.A., 10 m. N.E. of Trenton. The univ. of P. owes its existence to a college founded at Elizabethtown in 1746,

and moved to P. in 1756. It was then called the College of New Jersey. In 1980 it had 2000 students; in 1948 13,200. There is also a Presbyterian seminary, founded in 1812, the Rockefeller Institute for Scientific Research, and other educational institutions. Washington defeated the Eng. here in 1777. Pop. 7700. See Hageman, *History of Princeton and its Institutions*, 1870. 2. Cap. of Gibson co., Indiana, U.S.A., 27 m. N. of Evansville. An important grain and cattle market, it has also manufs. of glass, lumber, etc. Pop. 7800.

**Principal, see** AGENT; GUARANTEE. **Pringle, Thomas** (1789-1834), Scottish poet, b. at Blaiklaw, Teviotdale, and educated at Edinburgh Univ. His *Autumnal Excursion* (1816), contributed to Hogg's *Poetic Mirror*, won him Walter Scott's friendship. With Lockhart, Wilson, and others he helped found the *Edinburgh Monthly Magazine* (1817), later *Blackwood's Magazine*, editing it for some months with J. Cleghorn. Emigrating to the Cape (1820) he formed the Glen-Lyndon settlement, and ed. the *South African Journal*. Returning to England (1826), he pub. his experiences in *Narrative of a Residence in S. Africa*, contained, with the fine poems 'The Emigrants' and 'Afur in the Desert', in his *African Sketches* (1834). His earlier poems, *Ephemerides*, appeared in 1828. See ed. with life by J. Conder, 1835, and L. Ritchie, 1838.

**Pringle-Pattison, Andrew Seth** (1856-1931), Scottish philosopher, b. in Edinburgh; educated in Edinburgh and Germany. He was prof. of logic, metaphysics, and rhetoric at Cardiff, 1883; at St. Andrews, 1887; at Edinburgh 1891-1919. He was Gifford lecturer at Aberdeen Univ., 1911-13, and Hilbert lecturer, 1921. He was Gifford lecturer, univ. of Edinburgh, 1921-23. His works include *The Development from Kant to Hegel* (1882); *Essays in Philosophical Criticism* (with Haldane) (1883); *Irregularity and Personality* (1887); *Scottish Philosophy* (new ed., 1890); *Two Lectures on Theism* (1897); *Man's Place in the Cosmos* (new ed., 1902); *The Philosophical Radicals and other Essays* (1907); *The Idea of God in the Light of Recent Philosophy* (1917); *The Idea of Immortality* (1922); and *Studies in the Philosophy of Religion* (1930).

**Pringles**, tn. of Argentina, in Buenos Aires prov., 300 m. from Buenos Aires, and 135 m. N. of Bahía Blanca. It is the centre of a thriving agric. dist. Pop. 13,000.

**Printing** may be described as the art of taking copies by pressure from the inked surface of engraved blocks or movable type; or from incised lines on metal plates, as in engravings and etchings; from depressions, as in photogravure, or from the smooth surface of stone so treated as to reject the ink except where required (lithography).

**HISTORICAL**.—Although we know that P. from movable type was practised in China in the thirteenth century and in Korea in the fourteenth, and that block

P. was in use there and in Japan some centuries earlier, yet it was not till the middle of the fifteenth century that any press was set up in Europe. In the E. from the multiplicity of the characters required, the use of type soon went out, and the Chinese reverted to block books. One hundred and forty years after movable type had been introduced in the W., it returned to China, where it had originated over 550 years before. The first book printed by Europeans in China was printed in 1590: *De missione Legatorum Japonensium ad Romanam Civitatem*. The earliest undoubted date for any European woodcut block is 1423, and although there is no certain evidence for the existence of block books with both text and illustrations out in wood before 1460, it seems most probable that the desire for some text to accompany the pictures would early lead to this method. As to who was the inventor of P. from movable type in Europe, opinions are divided, and the controversy has gone on with more or less acrimony for nearly four hundred years whether Johann Gutenberg (q.v.) of Mainz should have the honour or Lauronz Janszoon, surnamed Coster (q.v.) of Haarlem. Neither, as no appears on any P. turned out at their respective presses, nor do any of the associates of either mention him as a printer or the inventor of P. In the *Cologne Chronicle*, 1499, it is said, on the authority of Ulrich Zel, a printer of Cologne, that 'this right worthy art was invented first of all in Germany at Mainz on the Rhine,' and proceeds: 'This happened in the year of our Lord 1440, and from that time on until 1450 the art and what belongs to it was being investigated, and in the year of our Lord 1450 . . . men began to print, and the first book that was printed was the Bible in Latin [the Lat. Massarin Bible].'

'Although the art was invented at Mainz as regards the manner in which it is now commonly used, yet the first prefiguration was invented in Holland from the *Donatuses* which were printed there before that time.' The chronicler continues: 'The first inventor of printing was a burgher of Mainz, and was born at Strasburg, and called Yunker Johann Gutenberg.' Junius Hadrianus in his *Balania*, printed in 1588, states of Lauronz Coster of Haarlem, that in 1440 he first cut letters from the bark of trees and printed them for the amusement of children, and afterwards used lead and tin, that a workman in his employ stole the letters and went to Mainz, and in 1441 set up a press there, and in 1442 printed the *Doctrinale* of A. Gallus and the *Tractatus* of Hispanus. From these two sources the controversy arose, and there is a considerable literature on the subject, notably A. van der Linde's *The Ooster Legend* (1871), Gutenberg (1878), and *Geschichte der Erfindung der Buchdruckerkunst* (1882); and Heesels's *Gutenberg: was he the inventor of Printing?* (1882), and *Haarlem the Birthplace of Printing, not Mainz* (1887). The controversy continues, but the greatest weight of evidence at present is for Gutenberg as being the first in Europe to make a practi-

cal business of P. from movable types. A form of P. press was already known, so was the necessary stiff ink; paper was available, so that Gutenberg's contribution was largely in devising a practical method of casting large numbers of identical types in a reasonable length of time. No date or name of printer appeared on any book until 1457, when the names of Furt and Schoeffer, who had been associated with Gutenberg, appeared on the famous and beautiful *Psalter*. This magnificent vol. has initials printed in red and blue, and the craftsmanship is of a very high standard.

Cologne had some noted printers, and here the title-page was first used and leaves began to be numbered and the 'signature' added to the first page of the sheets. Here, too, Caxton made his first acquaintance with the press from some printer whose name has not come down to us. Printed musical notes appeared in 1473 in Gerson's *Collectorium*. In Italy the first printers were two Gers., Sweynheym and Pannartz, who in 1461 started a press in Subiaco; before the end of the fifteenth century there were thirty Ger. printers there out of a total of forty; at Venice, too, the name occurs of John of Speler in 1469. Naples and Milan, Florence and Ferrara all had presses before 1500. It was Italy that first broke away from the Gothic form of letter that had been used by the Ger and Dutch printers. One of the finest printers was Nicolas Jenson whose noble roman type was the inspiration of Wm. Morris's 'Golden' type, of the 'Doves Press' type, and of Bruce Rogers's 'Centaur' type. Venice produced in the fifteenth century nearly half of the books printed in Italy, and Italy with its many presses had a larger output by far than Germany, and produced finer work. The first printers in France, too, were Ger. craftsmen, Friberger, Goring, and Crantz, who were brought to Paris in 1470 for the press at the Sorbonne, and in 1473 started their own press. In 1499 Aldus Manutius produced the *Dream of Polyphilus*, regarded by many authorities as one of the finest illustrated books ever produced. The types used by Aldus were excellent and a revival of one of them, now called 'Bembo,' is one of the best types for books in use to-day. Aldus was the first printer to use sloping or what is now known as italic type. In the Netherlands, Utrecht, and Alost produced the earliest dated work which we know, and that as late as 1473.

The first Eng. printed book to bear a date was the *Dices or Sayings of the Philosophers* issued by Wm. Caxton from his press at Westminster, Nov. 18, 1477, although, as he had been settled there for over a year, it is probable that it was not the first work printed there. During his first three years at Westminster Caxton printed 17 books, and in the fifteen years of his life that the press was carried on by him no fewer than 100, including new eds. His first use of signatures and of spaced-out lines was in 1479, and of woodcut blocks in 1481. At Caxton's death in 1491 the business

came into the hands of Wynkyn de Worde (q.v.), who had been his foreman, and was carried on at Westminster till 1500, when he removed to Fleet Street, during which time almost all his dated books were reprints of those issued by Caxton. In all, his output during this period was no less than 100 vols. Oxford was not long behind Westminster in starting P.; there is a book supposed to be from the press of Theodoric Rood which bears date 1468, but this date is an error for 1478, caused by the dropping out of an X. In 1480 another printer, John Lettoun, set up a press in London, and was joined a few years later by Wm. de Machlinia, who continued the business by himself at two addresses—'By Flete-bridge' and in Holborn. There is no direct record of the fact, but very strong evidence in support of the belief, that the business of Machlinia was taken over by Richard Pynson, who was the finest printer in England before the end of the fifteenth century, his first dated book being issued in 1492. The only other London printers of this period to be mentioned are Julian Notary and Jean Barbier, who were working together from 1498 to 1500. The term *Incunabula* (q.v.) is applied to books which were printed before 1500.

From 1500 onwards it must suffice to mention a few of the printers who have done most for the advancement of the craft (see separate articles). Aldus has already been named, and after him Johann Froben of Basle (d. 1527) may be mentioned for the decorations and literary quality of his output. Paris now comes to the front with Henri Estienne, and later his son Robert, Simon Colines, and Geoffroi Tory. In Lyons there were Etienne Dolet (commenced P. 1538), Sebastian Gryphus (commenced P. 1528), and Jean de Tournes (1504-64). In Antwerp from 1570 onwards Christopher Plantin was turning out a vast quantity of books, some of them most costly productions, such as his Polyglot Bible (1569-73). Very little can be said for the quality of Eng. P. in the sixteenth century, though in 1559 the work from the press of John Day entitled him to be classed amongst the fine printers. Scotland had its first press in Edinburgh, and in 1507 James IV. licensed Walter Chepman and Andrew Myllar to print; and the first printer in Ireland of whom there is any reliable account was Humphrey Powell, who was printing in Holborn in 1548-49, and set up in Dublin in 1550. At Oxford, where there had been no press at work since about 1476, Walter Burley was printing in 1517, and his latest book is dated 1519, and no other printer is known there for seventy years. The earliest Cambridge date is 1521 on a book printed by John Siterch (a trans. of Lucian), it is sixty years before another Cambridge imprint is found. There were printers in Tavistock in 1525; in Bristol, 1546; Ipswich, 1547; Canterbury, 1549; Norwich, 1566; and in addition to this there were sev. secret presses in various parts of the country. The seventeenth

century was a period of stagnation, if not retrogression, in the quality of P. both on the Continent and in England especially. The large family of the Elzevirs in various tns. in Holland stand out prominently, however; their business was founded by Louis in 1583, and the latest printer of the name was Abraham, who died in 1712; the most famous of the Elzevirs was Bonaventura, who commenced P. in 1608 and died in 1652. The books bearing their imprint number over 1600 (see ELZEVIUS). In England during this period the name of Robert Barker should be mentioned as the printer of the so-called authorised version of the Bible, 1611, and those of Wm. and Isaac Jaggard

A PRINTING PRESS: SEVENTEENTH CENTURY

An illustration from a page of *Spiegel van het menschelyk bedryf*, by Jan and Caspar Luiken, Amsterdam, 1694.

for the folio Shakespeare of 1623. Richard Norton in 1610 issued a very fine ed. of the works of St. Chrysostom. The first press in the Amer. colonies was at Harvard College, Cambridge, the Rev. Joseph Glover having given to the college a fount of type. This remained the only press till 1680, when another press and another printer, Marmaduke Johnson, were sent out from England to print a Bible in the Indian tongue, upon which book the two printers worked together, and completed it in 1683. Boston was the next to have a press, in 1675, and the colony of Pennsylvania followed in 1685, but presses set up in Virginia in 1682 and in Maryland in 1689 were at once suppressed. P. in New York began in 1693. Up to the end of this century the Eng. printers had been their own typefounders in most cases, though sometimes procuring matrices and sometimes type from the Dutch. Dr. Fell, at the Oxford Univ. Press, estab. a type foundry in 1667 and helped to produce some of the finest P. in England.

Fell types have been revived for occasional books in this century, notably for the Nonesuch Press.

Wm. Caslon, the greatest of Eng. typefounders of the eighteenth century, cut some beautiful types in 1718, and it is probable that the type used by John Baskett (the royal printer at Oxford) in the Bible of that date, commonly known as the 'Vinegar' Bible, was from his foundry. Other printers in London in the eighteenth century were Samuel Richardson (*q.v.*), the novelist and bookseller, who started in 1706; Henry Woodfall and Thomas Bensley, who commenced business in 1783. After 1744 Robert and Andrew Foulis of Glasgow issued some beautiful books, and John Baskerville (*q.v.*)—a writing master of Birmingham—who became univ. printer at Cambridge (1760–70) is recognised as the finest typographer of his time (he began printing in 1750) in this country at least. A revival of his type is in regular use by book printers to-day. On the Continent the two outstanding names are those of the Didots (*q.v.*) of Paris and Giovanni Battista Bodoni (*q.v.*) of Parma. There were a number of private presses started in England in the eighteenth century, the most prominent among them being that of Horace Walpole at Strawberry Hill. The prin. features to be recorded of P. in the nineteenth century are the substitution of iron for wood in the P. press, and, in common with other manufs., the introduction of machinery and steam and other power and of type-setting machines; these, however, are treated of in the technical portion of this article. Of the printers, Bulmer, Bensley, and John Nichols were all three producing important works. The line of the king's printers was continued from 1770 by the ancestors of the Byres of Eyre & Spottiswoode. Edmund Evans was the printer of Kate Greenaway's famous children's books, and also the work of Randolph Caldecott, both of which owe much to the printer for the beauty of their illustrations.

Improvements in decoration and in display of title-pages is associated with the work of Ch. Whittingham the younger, and of the new designs of types and decorated pages produced by Wm. Morris (*q.v.*) at the Kelmscott Press, and his influence upon others of the private presses for which beautiful types have been designed. Notable among these is the Doves Press whose austere typography was in such contrast to Wm. Morris's decorative exuberance. After the First World War many fine private presses had an influence on general publishing and book printing, conspicuously the Golden Cockerell Press under Robert Gibbings, who employed Eric Gill to design types and illustrations. The Nonesuch Press (*q.v.*), founded by Francis Meynell, proved that elegant and beautiful books could be produced on modern machines in modern types at moderate prices. Previously, the private presses had used hand presses and the prices were out of reach of all but the rich. Some of the loving care, the good taste, the inventiveness that used

to be lavished on collectors pieces is now going into everyday productions though more often by the publisher's initiative than by the printer's.

**PRACTICAL WORK.**—**Typography**, or P. from a raised surface, is by far the most used of the three methods specified in the definition of P. and includes not only P. from movable type, but all relief P., *e.g.* stereotypes (*q.v.*), or type-metal casts produced from moulds of plaster or slong of whole pages of type or other matter; electrotypes, or copper shells backed with metal, produced from electrical deposit upon moulds of plastic or wax taken from type, woodcuts, line or half-tone blocks; or directly from any one of these three kinds of blocks. Typefounding is described under TYPE and TYPEFOUNDING; electrotyping under METALLURGY; line and half-tone blocks under PROCESS WORK; and woodcuts under WOOD ENGRAVING.

**COMPOSITION.**—Composition by hand only is here considered, that by machine is treated in a separate article—**TYPE-CASTING AND TYPE-SETTING MACHINES**. In practice, only small jobbing work is hand-set to-day. All continuous reading matter of any length is always set on a machine which may cast types singly ('Monotype') or in lines ('Linotype', 'Intertype'). Experiments are being made with photographic type-setting machines for use with the photographic reproduction processes. Each character must, of course, have its own place, and for this purpose each font needs two cases, or trays, divided by partitions into separate boxes, one for each character. These cases lie on the top of the composing frame at about breast height, sloping upwards towards the back. These are the cases for immediate use, and beneath there is a rack to hold five pairs of cases. The upper case contains all the capitals, small capitals, figures, and accented letters. The lower case, because of the varying frequency of occurrence of the different letters, and the greater aggregate of them used, has boxes of varying size. (From this arrangement are derived two phrases in the printer's terminology: 'Upper case' refers to capitals, and 'lower case' to small letters.) There are four different sizes: the largest, of which there is only one, is for e, which is six times the size of the boxes in the upper case; then there are fourteen two-thirds its size, eleven one-third, and twenty-six one-sixth. This case contains all the small letters excepting accented ones, and the punctuation marks, quadrats, and spaces, double letters like ff, fl, fi, and &, and the boxes are so arranged that the larger and more frequently used ones are together in the middle of the case. Type is set by a compositor who takes each letter and space in turn out of its box and places it in a small adjustable tray, known as a composing stick. The ordinary stick used in book and jobbing work is of metal, with the left end adjustable by a screw or spring fastening, so that the measures may be altered to the length of line to be set. In beginning a paragraph an em quadrat,

or space the size of the letter M, is first placed in the stick to the extreme left and held by the thumb to form the indentation, then the types, letter by letter, of the first word are taken from their boxes and placed in the stick as they are picked up. As each word is set a space is put in (except, of course, at the end of a line), generally a thick or three to em, and when the last word that the line will hold has been set, if that does not fill out the line and the next word cannot be divided, the line will require justification, that is, the space between the words altered to accommodate the word in question. If the work is not to be set solid, that is, each line of type close up to the one above it, a thin strip of lead is inserted between the lines. In emptying the stick the compositor uses a lead which was placed in the stick before the first line was set, and, turning the stick end for end so that the last line set is nearest to him and the setting-rule outside that, grasps the ends of the matter between the lead and rule with first fingers and thumbs of his two hands and steadies the type at the sides and back with his other fingers, and so carries it to the galley, which is a flat tray with three raised sides made sometimes of wood, but mostly of metal; in this and on a special press a galley proof is generally pulled for first reading. In the case of long books or books which have special problems of layout or are likely to be heavily corrected, the editor, author, or publisher may require to see proofs at this stage (for marking of proofs see *PROOF-READING*).

The type, corrected, is now made up in page form, with headlines and page numbers added. When the number of pages that will complete one sheet are ready they need to be imposed, or arranged in such relation to one another that when printed the sheets may fold with the pages appearing in their correct order. This having been done, the whole requires the insertion of furniture (wooden or metal strips) between and around the pages and to form the margins. It is then locked up in a chase or iron frame with bars across it to give security to the forme, as the chase with the assembled pages is called. When the furniture is in position the type is held firm inside the chase by means of wedges known as quoins. Before the quoins are tightened the planer is used to ensure for the type an even surface, which it would not have if some letters were not standing on their feet but sticking to the next letters. The planer is a block of wood about 1 in. thick, and about 6 in. by 8 in., which is placed on the face of the type and gently struck with a mallet. A first page proof is now pulled and the corrections made. After printing, the type may be returned to the composing room for distribution, i.e. return to the cases, if it is desired to preserve it.

The practice of bookwork applies also to jobbing and news work, and where there is any difference it will now be mentioned. The term 'jobbing work' is applied chiefly to cards, circulars, invoices, hand-

bills, and other small work, as well as to posters, and to a very large extent consists of displayed work. The differences between the operations of the newspaper office and those which have been described are that a much larger proportion of the composition is done by mechanical means (see *TYPE-CASTING AND TYPE-SETTING MACHINES*), and there is very little distribution in that, the type being melted down and the metal used again; and the fact that when the ordinary movable type is used it is not printed from direct, but stereotyped plates are made, either flat or, more frequently, cast in semicircular form, for attachment to the type cylinders of rotary presses (see *STEREOTYPING*).

**PRESS AND MACHINE WORK.**—For the best part of 400 years after the invention of P. in Europe the same style of wooden press was in use, with only minor improvements, and these chiefly in Holland. It was a screw press, made entirely of wood, except that the bed upon which the forme lay was of stone, contained in the carriage or 'coffin.' It was only in the first decade of the nineteenth century that the first iron press was invented by Earl Stanhope; in this the chief improvement, beyond the fact of its being of iron and therefore more rigid and less clumsy, was the use of levers in place of the screw. The same structural form, however, still persists, which may be described as a vertical frame, standing on four feet and supporting a platen made to rise and fall at will by the use of a horizontal bar. Horizontal runners or ribs are fixed to the bottom of this frame, supported at the other end by one leg, with a carriage travelling upon them, forming the bed of the press, and bearing upon it the forme, which is drawn out for inking, and placing the sheet and returned beneath the platen to receive the impression. The movement of the carriage is effected by a winch arrangement. The platen, which is supported on a strong spring contained in a box at the head of the press, is forced down by a piece of steel, called a chill, being brought to a vertical from a sloping position by means of a lever actuated by the pulling over of the handle bar, the recoil of the spring carrying back the platen to its former position on the return of the handle bar. Two adjuncts of the press have yet to be described: the tympan and frisket. The former is fixed with detachable hinges to the carriage at the end farthest from the platen when the carriage is run out, and consists of two iron frames each covered with parchment stretched tightly, one being made to fit within the other, so that they are flush in thickness, the larger one being of the same size as the bed of the press. The two frames are fastened together by hooks on the larger one, with studs on the smaller, and the parchment on both is on the lower side, between which a few sheets of paper are interposed for the purpose of equalizing and taking off the hardness of the impression. When the tympan is fixed to the carriage as described and turned upon its hinges, it is

upon the inner side that the paper to be printed is laid. The frisket serves to hold the paper in its place when the tympan is lowered on to the forme, and to prevent any ink that may have got on to the furniture or chase from reaching the paper, it consists of an iron frame slightly smaller than the outer frame of the tympan, to which it is attached in the same way as that is to the carriage. A sheet of strong paper is pasted on to the frisket in the same way as the parchment is to the tympan and this paper is cut away in those places where it would fall upon the type a framework of paper being thus left to support and protect the margins of the sheet to be printed

making the impression equal for the whole forme, and this is effected for the most part by varying the number of thicknesses of paper within the tympan. The basic reason for inequality of impression in type is (a) inequality of surface of the bed of the printing machine and (b) the variation in pressure received by characters with a printing surface which is small (e.g. a full point) and those with a large surface (e.g. the letter *m*). The Litoluzy method of printing reduces make ready by employing type cast with minute differences in height, e.g. *m* has a shorter shank than the full point. Overlaying applies to woodcuts, line, or tone blocks, and is on the same principle as making

THE COMPOSITOR AND THE  
PRINTER

Left The compositor is preparing a small form for jobbing work. Right The printer is running the first sheet (Quad Demy) run from a flat bed machine after completion of make ready

Ink tables are mostly made of iron and fixed to the floor. They are of two sorts: one has a cylinder with crank handle to give out the ink from a receptacle behind it, with the other a brayer, a wooden implement in the form of a short broad cylinder with an upright handle at the top is used to rub out the ink as needed. Inking balls with a handle at the top were used in the old days for beating the ink upon the type but at the present day rollers are used. They are made of a composition which includes glue and tallow and are cast or moulded around a wooden spindle and revolve in an iron frame with upright handles or a single handle in the case of short ones. (For ink see under Ink.) Nowadays these hand presses are only used for making proofs, but in the past two men generally worked together at a press, one rolling and one pulling, and about 250 impressions in the hour was the usual speed. This is after making ready, and overlaying, which are processes that have to be described here, though the same operations occur with machine P. Making ready, on both press and machine, is bringing up the type to an absolute level, or more accurately,

ready a type forme, but is much finer work and its object is the reverse, namely to give a heavier impression on some parts of the block than on others. Half tone blocks do not require the same amount of overlaying as woodcuts, as a finer gradation of tone is natural to them nor must the overlays be so thick or so hard a paper.

The smaller platen machines are sometimes worked by treadle, the larger machines either platen, cylinder or rotary are power driven. It is intended here to give a general idea of the principles on which they are constructed. P machines may be divided into three classes: platen machines in which both the P surface and the impression surface is flat, cylinder machines in which the P surface is flat and the impression surface cylindrical, and rotary in which both surfaces are cylindrical. The principle of the smaller platen machines is as follows: they have a vertical coffin facing the operator, upon which the forme is fixed by clamps on a special chase. The platen, when the sheet is laid on, is nearly horizontal and immediately in front of the operator, being supported by

two arms, by which in working it is carried down to face the forme; its position whilst travelling gradually assumes the vertical, and on arriving at this position the impression takes place. The impression is regulated by one or more screws, or, in some makes, wedges, at the back of the platen. As the platen returns to position for laying on after each impression, the inking rollers travel downwards across the inking table and over the forme, returning as the platen again approaches the forme. The making ready is upon the same principle as in the hand-press; and this holds good with machines of the various sorts. With the class of machine above described a lad can lay on and take off 1000 per hour with a treadle machine, or more with power.

The first P. machine was a cylinder machine invented by Wm. Nicholson in

THE PRINCIPLE OF LETTERPRESS OR RELIEF PRINTING (left) COMPARED WITH LITHOGRAPHIC (SURFACE OR PLANOGRAPHIC) PRINTING (right)

A block is shown for the purpose of illustration: the principle applies equally to a line of type.

1790, and about twenty years later this was improved upon by Koenig for *The Times*. Cylinder machines may be classified as follows: flat-bed machines and rotary. Of the flat-bed machines the simplest form is that with one cylinder, which prints only one side of the paper. In this form the cylinder is placed across the machine about midway of its length, with the ink duct and ink-distributing arrangement at one end, and the inking rollers, between these and the cylinder and close to the latter, the other end being occupied by the laying-on board. Beneath the whole of this the bed travels with the inking table attached, so that at the time the ink table is receiving the ink from the distributor the forme has just passed under the inking rollers, the grippers on the cylinder have opened to release the sheet just printed, and a fresh sheet has been laid in; on the return journey the type again passes under the rollers, followed by the table supplying fresh ink to the rollers, and the cylinder has revolved with the paper around it over the type. Of this class of machine there are two main types; the stop-cylinder, in which the cylinder remains stationary when the

impression is not being made; and the two-revolution, in which the cylinder always rotates; of which again there are two types—one makes a second revolution in the same direction during the return of the forme-carriage; the other, which is a two-feeder, has inking arrangements at each end, and the cylinder, instead of continuing to revolve in one direction, reverses with the reversal of the direction in which the forme carriage is travelling.

Two-colour machines are mostly of the flat-bed kind, but in their case there are two formes—one colour at one end, and one at the other. As this carries the same sheet for the two revolutions it is only a single feeder. The two-cylinder machines print both sides of the sheet at separate impressions before delivering it, and so are called 'perfecting' machines. They also have an inking arrangement at each end, besides the two formes. Like the two-revolution single-cylinder machines, they are fed from above the cylinder and not below as with the stop-cylinder. In a certain type the sheet when fed in is carried by tapes around the first cylinder, where it receives the first impression; thence it is carried around two smaller drums placed between the two cylinders and on a higher level which leads it to the second cylinder, reversed for receiving the second impression. In another and more modern type the sheet is fed into grippers, and transferred direct to grippers on the second cylinder. All these machines are fitted with automatic arrangements for delivery, which vary with various makes, and all can be fitted with automatic machinery for feeding the sheets. By means of a circular knife the sheet may be delivered cut into two for convenience in the folding operation to follow (see BOOKBINDING). In two main respects rotary machines are entirely different from other P. machines. In the first place, besides impression cylinders they have type cylinders, which is somewhat of a misnomer, as it would hardly be practicable to lock up type in a cylindrical forme, so that they use stereotype plates in place of type. The type is set most often by machinery and locked up in the ordinary way, then a mould is taken in flong (see L'ARTISTE); this can easily be bent for casting from, so that it will fit on to the cylinder. The other difference is in the paper, which is fed in from reels instead of separate sheets, though some rotary machines are adaptable on occasion for single-sheet feeding. These are all-perfecting machines, and are chiefly in use in newspaper offices. They not only print on both sides of the paper, but cut, fold, and when required, paste and deliver in bundles of a predetermined number. Many magazines, whether illustrated or not, are printed on rotary machines, being folded, the sections inserted in the correct sequence, and wire stitched, in some cases into a wrapper, printed in one or two colours (see also PHOTOGRAPHY).

*Intaglio and Photographic Processes.*—The making of engraved or intaglio plates (see ENGRAVING) having been described

under the headings given above, it remains to describe the P. processes and machinery used for this and for flat-surface (planographic) P., as in lithography. The method employed in the P. of intaglio plates of all sorts is to dab the ink well into all the work on the plate, then to wipe the surface with a rag, and to polish it with the ball of the thumb. The paper is placed on the face of the plate on the table of the press and covered with a blanket, and the table drawn through between the two iron rollers. The P. of coloured engravings by this method is necessarily a slow one, as all the colours have to be, as it were, painted on to the plate for every copy printed, although attempts have been made to print each colour from a separate plate. Besides the ordinary copper-plate press mentioned above there are machines, both flat-bed and rotary, which work at far greater

THE PRINCIPLE OF INTAGLIO PRINTING

A, plate inked all over; B, ink wiped off surface; C, print.

speed, and with which the inking, wiping, and P. are all done mechanically (see also PHOTOGRAPHY). In some of the rotary machines the ink is scraped from the surface of the plate by a 'doctor' blade instead of being wiped off; in all cases, however, the ink has to be worked into the incised lines of the plate and the face of the plate cleaned before each fresh copy is printed (see further under PHOTOGRAPHY). Lithography is the process of drawing upon and P. from stone. The principles upon which the process is based are the antagonism of grease and water, the disposition of greasy substances to adhere to one another, and the property of absorption possessed by calcareous stones. A chemically pure surface is covered in the portions it is intended to print with a greasy composition (i.e. has a drawing, etc., made on it), and the rest of the surface is moistened, so that the application of a greasy roller causes the resistance of the wet portion, but not of the greasy part, and an impression can readily be taken from the surface when treated in this manner. This process can also be carried out mechanically, zinc plates with a grained or roughened surface taking the place of the stone. These can be buckled round the cylinder of a litho printing press. Collotype (q.v.) is allied to

lithography. Offset P. is the latest development of planographic P. In this process the P. surface is rubber, either a flat sheet or mounted on a cylinder. Upon this an impression is taken from a litho stone, from type, or from an engraved plate in a lithographic ink, so that work produced by any of these classes may be printed by transferring the ink to the rubber, and thence to the paper. Offset P. and the basic parent process is described in detail in the article LITHOGRAPHY.

Printing Ink, see INK.

Priority, preference in obtaining labour or materials in short supply. The word acquired this special application during the Second World War and the system of P.s. put into operation depended its effectiveness on the setting up of controls. The P.s. Div. of the Board of Trade was formed to deal with the business of obtaining labour, fuel, materials, and capacity for civilian productions (home and export) and to allocate, by arrangement with the Controls, certain raw materials for those purposes, notably steel and timber. In relation to the rationing system commodities for which P.s. are laid down include petrol, milk, bananas, etc., among those given P. being doctors (petrol) and young children (milk, bananas).

In its legal use the word has sev. applications, e.g. as among creditors against a debtor or insolvent where the estate of the debtor is insufficient to meet all claims (see COMPANY AND COMPANY LAW; Winding up; DEBT).

**Prior, Matthew** (1684–1721), Eng. poet and diplomatist, b. of an artisan family at Wimborne Minster, Dorset. He attracted the attention of the earl of Dorset, and was educated at Westminster School and St. John's College, Cambridge, of which he became a fellow in 1688. Through the influence of the earl P. was appointed in 1690 secretary to Lord Dursley (later earl of Berkeley), Eng. ambas. at The Hague; he acted in the negotiations for the treaty of Ryswick (1697), and was under-secretary of state in England (1689). In 1700 he entered Parliament as a Whig, but joined the Tories in 1701. He was commissioner of customs from 1711 to 1714, and ambas. at Paris in 1713, and was imprisoned by the Whigs (1715–17) on their return to power. After his release he lived in retirement on the proceeds of his writing and with the help of friends, in particular Lord Harley. His poetry is contained in the various eds. of his *Poems on Several Occasions* (the chief collection being that of 1719). His attempt to write Pindaric odes, as illustrated by his *Carmen Seculare* (1700), a panegyric on William III., met with no real success, and his odes in bulk are not usually reckoned among his best efforts. *The Hind and the Panther Transferred to the Story of the Country Mouse and the City Mouse*, written in 1681 in collaboration with his friend Charles Montagu, is a travesty of Dryden's *Hind and the Panther*. *Alma*, written in prison in imitation of Butler's *Hudibras*, is a humorous speculative poem on the relations of body and soul. P. is, however, remembered less for these and similar works, such as *Solomon* (1718), *Henry and Emma* (c. 1701), and *English Ballad on the Taking of Namur* (1693), than for light occasional verse in the vein of Herrick. There is sincerity and wit in many of his short poems, such as *The Lady's Looking-glass*, *On my Birthday*, *For my own Monument*, *The Question to Lisetta*, *A Song*, *Hans Carvel*, *To a Child of Quality*, *The Secretary*, and *Jenny the Jost* (first given to the world in A. R. Waller's ed. of the *Poems*, 1905–7). Mostly these are pieces of ironical or unusual badinage, depending for effect on wit and the exact suitability of form. His *Two Imitations of Chaucer* show that he has some of his predecessor's sly humour, and his two epistles *To Fleetwood Shepherd* are cleverly and wittily phrased. His tales are of a Restoration coarseness, but in their author 'we at last reach an English poet who can manage the mechanism of a *conte* as well as the most skilful Frenchman' (Gosse). His epigrams are particularly fine. See A. Dobson's ed. (Penguin Library), 1889, and R. B. Johnson's ed. (Aldine Poets), 1892. See also W. M. Thackeray, *English Humourists*, 1853; A. Dobson, *Eighteenth Century Vignettes* (3rd series), 1896; life by F. Bickley, 1914; and studies by C. W. Legg, 1921, and C. K. Eves, 1940.

**Priory**, community of monks or nuns, governed by a prior or prioress. The introduction of Ps. dates from about the end of the thirteenth century, and in many cases they are still dependent upon abbeys, to which they are finally

responsible. In other cases they are quite independent.

**Pripet, Pripyat, or Prypey**, riv. of the S. of the Byelorussian S.S.R., an important trib. of the Dnieper, joining it after a N. and E. course of 486 m., 43 m. above Kiev. Navigable as far as Pinsk. It traverses a marshy region, much of which has been drained and reclaimed by the Russian Gov. Its trib., the Yatsolda (Yasolda), is connected by the Oginiski Canal with the Nemen (Memel). During the First World War, the area about Pinsk, noted for its marshes, formed a great obstacle to movement and the Russian line was divided at this point. In the autumn of 1915 an Austro-Ger. offensive under Mackensen drove the Russians from this area owing to the fact that the time chosen for the offensive was the driest of the year—Aug. In June 1916 the marshes were again contested by the Russians under Brusilov, who drove out the Austrians. It was the scene of much fighting in the Second World War in 1941 and 1944. See further under EASTERN FRONT OF RUSSO-GERMAN CAMPAIGNS, IN SECOND WORLD WAR.

**Prism**, solid figure whose sections across the longitudinal axis at any point when parallel give the same figure. The shape of the figure gives the name to the P.: triangular, rectangular, etc. The lines joining the vertical of two such sections determine the bounding planes. Its volume is found by multiplying the vertical height by the area of the base.

**Prismatic Sulphur**, monoclinic crystalline form of sulphur obtained by melting the ordinary form and allowing the liquid to crystallise. It is unstable at ordinary temps. and soon changes back to the common variety.

**Prisoners of War.** A prisoner of war may be defined as a public enemy armed or attached to the hostile army for active aid who has fallen into the hands of the captor whether by individual surrender or capitulation. In ancient times P. of W. could be and were killed, unless the belligerents found it more profitable to exchange them or liberate them for ransom. For long, indeed, there were no generally accepted rules regulating the position and fate of P. of W., and it is only within comparatively recent years that definite regulations have been established. The existing law on the subject is based on Convention IV. of the Hague Conference of 1907, which conference adopted, with certain changes, the rules made by the Hague Conference of 1864, and the articles relating to P. of W. contained in the Geneva Convention of 1906. This was somewhat extended in the Geneva Convention of 1920, when delegates of forty-seven nations met at Geneva and ratified a further agreement on the treatment of P. of W. There was further revision in 1949. Under the existing regulations, P. of W. must be humanely treated, protected from violence, and subject to no reprisals. They must be supplied with reasonable nourishment, medical and sanitary facilities must be provided, and the P. of W. are regarded as being in the power not of their actual

captors, but in that of the gov. of the captor. All their personal belongings remain their own, with the exception of arms, horses, and military papers (these constituting booty, *q.r.*). They may be detained in a fortress, camp, *tc.*, or anywhere else except a convict prison, and may be kept within fixed boundaries. One of the prin. changes made in 1907 was in regard to forced labour. The state may utilise the labour of P. of W. other than officers, but it was only in 1907 that it was decided to exclude officers, though the Jap. had previously abstained from imposing forced labour on Russian officers in 1904-5. But in proper cases, those who are put to work must be paid according to rank and ability. Their tasks must, however, not be excessive and must not relate to military operations. Officers are paid the same as those of equivalent rank in the forces of the power capturing them. It is the duty of officers to make all reasonable attempts to escape, provided they have not given parole, but they may be punished if recaptured. Every prisoner of war, if questioned, must declare his true name and rank or render himself liable to the loss of the advantages given to P. of W. of his class, but he need not give any other information. The exchange of prisoners is effected in accordance with agreements called *cartels*, in which the time, place, and method of exchange are fully detailed. The basis of exchange is generally that of strict equivalents, man for man, rank for rank, disability for disability. Certain non-combatants, such as doctors, medical orderlies, and padres, may claim repatriation. A parole is a promise, either verbal or written, given by an officer to secure greater freedom of movement or to obtain special privileges or advantages while held as a prisoner of war. The officer giving the parole pledges his honour to pursue or refrain from pursuing a particular course of conduct, and a breach of this guarantee of good faith may involve the extreme penalty if the paroled prisoner be captured in arms before he has been regularly exchanged. The Convention of 1929 also allowed for information bureaux in the belligerent countries to circulate information about P. of W. During the war, a neutral power should safeguard P. of W.'s interests: the representatives of this power may visit P. of W. camps and question prisoners. The rules outlined above have no application to captured spies. The allegations made against Germany for her treatment of Brit. P. of W. during the First World War were widely pub., and undoubtedly the conditions under which the prisoners lived were not entirely unavoidable or excusable. But Germany, also, brought charges against other allied powers in regard to Ger. P. of W., and though Great Britain observed The Hague regulations, the observance of those regulations by some of the belligerents left much to be desired (see R. F. Roxburgh, *The Prisoners of War Information Bureau in London*, 1915, in regard to the working of that bureau during the First World War).

The judgment in the Nuremberg trial (*q.v.*) showed that in the Second World War the political and military heads of the Ger. Gov. and Wehrmacht and their subordinates subjected P. of W. to extremely bad treatment on a number of occasions. These included the shooting of fifty R.A.F. officers in March 1944. These men had escaped from the P. of W. camp at Sagan, near Breslau (Wrocław) and were shot on recapture, on the direct orders of Hitler. It was not even contended by the defendants in the Nuremberg trial that this was other than murder, in complete violation of international law. With certain notable exceptions, however, Germany on the whole observed the Geneva Convention with Brit. P. of W.; but Fr. prisoners were often ill-treated and Polish and Russian P. of W. were subjected to extreme brutality, some Soviet P. of W. being made the subject of medical experiments of the most cruel kind. Japan broke all conventions, employing P. of W. as unpaid coolie labour and using torture to extract information or as the punishment for trivial offences. Japan was one of the non-signatories of the Geneva Convention, as was the Soviet Union; and Soviet treatment of Finnish, Polish, and Ger. P. of W. during the Second World War has been harshly criticised as inhuman and lacking moral justification. In 1945 the Nobel peace prize was awarded to the International Red Cross Committee for its work done on behalf of P. of W. of all nationalities during the Second World War. In 1946 and 1947 sev. meetings were held at Geneva, organised by the International Red Cross, to consider revision of the clauses of the 1929 convention which affected P. of W. A new Geneva Convention was signed in 1949 (see further under RED CROSS). See P. des Gouttes, *Commentaire de la Convention de Genève du 27 juillet 1929*, 1930; F. W. Heinemann, *Das Kriegsgefangenenrecht in Landkrieg*, 1931; W. S. Flory, *Prisoners of War*, 1940; A. R. Warner, *La Croix-Rouge et les Conventions de Genève*, 1943; and J. Cazeneuve, *Essai sur la psychologie du prisonnier de guerre*, 1944.

**Prisons.** The idea of using P. as places of punishment is comparatively recent. Well into the nineteenth century the punishment for all felonies was death and, for misdemeanours, fines, whipping, the pillory or the stocks. P. were used in the first instance for safe custody and for assisting the Crown to exact its fines, whilst the bridewells were intended to provide work for the unemployed and those who refused to work. During the eighteenth century the distinction between these two types of jails was largely obliterated. The jails of that period and the first part of the nineteenth century were morally degrading and utterly insanitary, and it was against these conditions that first John Howard and later Elizabeth Fry (*q.r.*) agitated.

The jails were generally run for private profit and in so far as there was supervision it was the responsibility of the justices and the local authorities. The

state was, however, responsible for the convicts. Convicted felons who were not put to death had been deported to the colonies; as this became increasingly difficult, alternatives had to be found. The first state penitentiary was built at Millbank in 1821. In 1877 all P., whether convict estab. or local P. were placed in the charge of the Home Office. A board of Prison Commissioners and Directors of Convict Prisons was estab. for their general superintendence. All sentences of three years and upwards were served in convict P. and shorter sentences in what were still called local P. Gradually the regime of the two types of P. was brought closer together until the difference was little more than a name. The distinction was finally abolished by the Criminal Justice Act (1948) with the abolition of penal servitude.

The design of the nineteenth-century P., starting with the 'model prison' of Pentonville in 1842, was based on the belief in separate confinement. Partly this was a reaction against the lack of segregation of the early P., partly the result of a genuine conviction as to the moral value of solitary meditation. Unfortunately most of these P. are still in use. Work in them, typified by the treadmill, was exhausting and, of set purpose, without practical utility. By the end of the century doubts were beginning to be felt about this system. A royal commission was accordingly appointed. Its report, pub. in 1895, vigorously condemned the existing system for its demoralising effects. The commission considered that the aim of a prison system should be 'to awaken the higher susceptibilities of prisoners... and whenever possible turn them out better men and women physically and morally than when they came in.' This statement brought to the fore the fundamental question of the purpose of P. Should they aim primarily at deterring the potential criminal through fear of a prison sentence or at reforming the prisoner? The modern point of view is that in so far as fear of punishment can prevent crime, the shame of imprisonment, the loss of liberty, and separation from all home ties, is as effective a deterrent as possible. The material conditions of prison life, however unpleasant, do not add anything to its deterrent value. Their nature may, however, easily add to or detract from its reformative value. Though the reformative aim is to-day wholly accepted in theory, in practice a certain duality of purpose still remains. The old buildings still create an atmosphere of repression and having been built for deterrence can only be partially adapted to a reformative process. Inadequate space makes vigorous exercises impossible. It frequently prevents the provision of really good workshops and hampers the introduction of other activities that would be valuable for training.

During the first quarter of this century improvements were steadily introduced. Work in association was the rule and meals in association were allowed after a certain length of sentence had been

served. But it was still true that there was little positive training, since nothing was left to individual initiative or individual responsibility. Then an experiment of great importance was tried when special training for selected prisoners was introduced at Wakefield, with more responsibility, more freedom within the prison, and with a more vigorous regime. This was followed up in 1936 by the opening of a camp some m. from Wakefield (New Hall Camp) where selected prisoners live in open conditions. This was the first 'prison without bars.' The belief that lies behind this development is that prisoners cannot be trained to make good use of liberty if they are denied all freedom of choice and all responsibility. It is not intended that life in the open P. should be easier than in the old P. Actually it is more vigorous and makes more demands on the prisoners both physically and mentally.

The Second World War for the time stopped further developments along these lines, but much has been done since. Maidstone prison, with an ancillary camp, is now a training centre for the S.E. Sudbury Park (Derbyshire) has been started as an open training centre for the Midlands and Ley Hill as an open prison for convicts. There are also small camps in connection with Stafford and Exeter. There is one open prison for women at Askham Grange near York. In spite of these developments, in 1947 only about one-tenth of all prisoners were detained in open conditions (this was before Sudbury opened). Whilst maximum security will always be necessary for some prisoners the limits in the development of open P. has certainly not yet been reached.

Wakefield was also the first prison where the experiment of paying wages was tried out. This so clearly improved both the work and morale that it became the rule. The sums earned, however, are small. At the beginning of 1949 the maximum for men was only 1s. a week. It is now about 3s., though the average is much less. In 1949, all prisoners were included in the scheme from the beginning of their sentence. Previously earnings only began after the first month. (It should be noted that in 1947, 23 per cent of the men and 39 per cent of the women had sentences of a month or less and were therefore altogether excluded from the earnings scheme. In 1938 the corresponding figures had been 61 per cent and 71 per cent.)

Whilst wages may provide an incentive to good work, an even greater incentive is interesting work. Here prison work largely fails. Few of the workshops are well equipped. In 1947 about one-third of all prisoners available for work were engaged on making or repairing mail bags. A very small number of prisoners are given vocational training in certain trades; a larger but still small number go out to work, mostly in agriculture. In 1947 this latter number was 968 out of a total of nearly 13,000 effectives and the number is tending to

decline. The employment of a shifting and largely unskilled pop. presents a difficult problem, but the difficulties are intensified by the desire to prevent obvious competition with outside industry and the consequent restrictions placed on prison labour. Actually this competition must exist whether hidden or not.

Though much prison work is without educative value, educational facilities of other kinds are increasing. Evening classes in most P. are now provided by the local authorities, instead of by voluntary workers, and prison libraries are linked to the bor. or co. libraries. Correspondence classes are also provided in some number. The provision of books and classes helps to prevent the mental stagnation that was an outstanding feature of prison life in the past. Though voluntary workers are no longer used for prison classes, they still function as prison visitors, providing a link with the outside world and an unofficial, human relationship. Their work is valuable but there is still room for more visitors with good qualifications.

One modern development, still on a small scale, is the provision of psychiatric treatment. Wakefield has its own psychiatrist. Other long-term prisoners can be sent to Wormwood Scrubs for treatment. A scheme has been drawn up to allow outside psychiatrists to attend short-term prisoners during their sentence with the hope that treatment will be continued after discharge. The scheme was only operating in one area in 1948. Though psychiatric treatment is essential for rehabilitation in some cases, it is admitted by the authorities themselves that prison does not provide a favourable background and that a special institution is needed.

Young prisoners (under twenty-one) are treated as a special class. They may only be sent to certain P. where they are kept in a separate wing and an attempt is made to give them more active training than prison life usually affords. Lewes Prison is the only one used entirely for young prisoners. These special arrangements are recognised as merely reducing the evils inherent in detaining young persons in prison. Hence the proposed substitution under the Criminal Justice Act, 1948, of detention centres (see *under CRIMINAL LAW*).

The Criminal Justice Act introduced a new type of sentence, corrective training, a sentence of two to four years for persons with at least two previous sentences of a certain degree of seriousness. During the first ten months of its existence sentences of corrective training were passed on 1028 men and 48 women. Special wings at Chelmsford, Liverpool, and Wormwood Scrubs are being used for the majority. Some (in Dec. 1949) were still in local P. though it was hoped to absorb them as other special wings were opened. Reading Prison is being used as an allocation centre. There is a larger number of supervisory officials than for other prisoners and the aim is to get more personal knowledge of the prisoners than is generally possible, including knowledge

of home conditions, so as to find out the root of the trouble. Prison punishments are strictly controlled by regulation, the power of the governor being more limited than that of the committee of visiting justices. Punishments may take the form of loss of privileges, restricted diet, forfeiture of association, or cellular confinement. Associated with any punishment there is loss of remission. Unless forfeited by misbehaviour, prisoners receive remission of a third of their sentence. Visiting committees can order a prisoner to be flogged or birched for mutiny or violence to an officer. This is subject to confirmation by the secretary of state.

In 1947 there were thirty-five men's P. (with or without a wing for women) and three P. for women only. The average daily pop. was about 13,300 men and rather under 900 women. The figures for 1949 are considerably higher. This increase is primarily due to longer sentences. As a result, about 2000 men on an average were sleeping three in a cell. The use being made by the courts of the sentences of corrective training and preventive detention is likely to increase this pressure. The prison commissioners deal only with P. in England and Wales. Scottish P. come under the secretary of state for Scotland. The advisory committee to the secretary of state have recommended changes which if carried out would place the Scottish P. well ahead of the Eng. They include the payment of higher wages and the provision of a period of home leave for long-sentence prisoners towards the end of their time. The Criminal Justice Act (Scotland), unlike its Eng. equivalent, has abolished corporal punishment in the P. But even before, it could only be used at Peterhead convict prison.

As regards comparison with foreign countries, if open P. are accepted as desirable, the Scandinavian countries lead the way. In Sweden, when the new scheme is in full operation, open P. will be the rule after the first three months with certain very limited exceptions. Prison earnings are much higher than in England and part of the earnings are set aside for the prisoner on discharge. Home leave for prisoners has been introduced. Denmark has become the pioneer in the treatment of psychopathic prisoners in the special institution at Hørstedvester. In the U.S.A., P. vary greatly as there are both Federal and state P. besides the local jails. The latter are much criticised by the Amers. themselves. In some respects America has been ahead of Britain. The state institution for women at Alderson, for example, provided an educative open prison for women many years before any such development here. On the other hand some of the state P. are more repressive than anything in Britain. On the whole Amer. pris. sentences are considerably longer, such features as wireless in the cells, which are to be found in some P., are doubtless in part due to the greater difficulty of preventing mental deterioration with the long sentence. America makes use of the indeterminate

sentence within a fixed maximum and minimum term. The date of release on parole is determined by a general assessment of the prisoner's character. There is no fixed allowance of remission as in Great Britain.

**Prisrend**, or **Prisren**, cathedral city of Serbia, Yugoslavia, 88 m. N.W. of Monastir, in the dept. of the same name. There are textile, metal, and glass industries. It was occupied by Serbia in the Balkan war of 1912. Pop. 19,800.

**Prishtina**, tn. of Serbia, Yugoslavia, 60 m. N. of Skopje (Uskub). There is trade in grain and wine. P. was captured from Turkey by Serbia in 1912. Pop. 19,800. See also BLACKBIRDS, FIELD OF.

**Pristis**, see SWORDFISH.

**Pritchett**, Victor Sawdon (b. 1900), Eng. author and critic, b. at Ipswich, and educated at Alleyn's School. He spent much of his early life on the Continent and his work shows signs of Fr. and Sp. literary influence. His novels include *Clare Drummer* (1929); *Shirley Sans* (1932); and *It May Never Happen* (1946); and are distinguished by their analytical quality and realism. As a critic, he has pub. *The Living Novel* (1916).

**Prittlewell**, see under SOUTHLAND.

**Private**, see under RANK.

**Private Bills**, see under PARLIAMENT.

**Private Company**, see COMPANY AND COMPANY LAW, *Private Companies*.

**Privateers**, armed vessels owned and officered by private individuals, but acting under a commission from the state, known as letters of marque, which allowed the owners to keep the prizes they captured, and granted them 45 for every man of the enemy killed or taken. By the Declaration of Paris in 1817, privateering was and remains abolished between the signatory nations when engaged in war with each other. See W. B. Johnson, *Wolves of the Channel*, 1931, which traces the hist. of Fr. privateering from the seventeenth century to the days of its extinction.

**Private International Law**, see CONFLICT OF LAWS.

**Private Presses**, see under PRINTING.

**Privet**, or **Ligustrum**, genus of evergreen shrubs. Common P., *L. vulgare*, a native species, is a useful hedge plant, especially in tea.

**Privilege**. In the law of defamation, some kinds of statements are in the exceptional position of being absolutely privileged, e.g. statements made in the witness box; but most kinds of statements entail on the persons who make them unqualified responsibility for all the natural conse-

quences that may flow from them. But there is a middle class of statements which are privileged so long as the person about whom they may be made cannot prove actual ill will, spite, malice, or indirect motive in the utterer. Social relations render it imperative that the law should protect the honest expression of opinion concerning the character and merits of persons to the extent appropriate to the nature of the occasion on which inquiry is made relative to such character or merits, and indeed in most cases persons are under a social duty to make such communications. Such occasions are privileged, and communications made conformably to the duty or right incident to them are said to be privileged by the occasion. See CONFIDENTIALITY; and for the Ps. of Parliament, see under PARLIAMENT. See also DEFAMATION.

**Privileged Communications**, see CONFIDENTIALITY; DEFAMATION.

**Privy Council**, advisory body of the Brit. sovereign, possessing judicial powers. The present P. C. exists as the machinery by which the Cabinet expresses the royal pleasure, or, in other words, it notifies by proclamation (q.v.) or by Order in Council (q.v.) the will of the executive. But the fact that it possesses no administrative powers and only such powers of legislation by Order in Council as correspond to the dwindling *personal* prerogatives of the king, and that both it and the Crown, regarded as an integral part of the gov., have long been superseded by the Cabinet, has resulted in the position that all the anct. and imposing privileges and powers of the P. C. have devolved on the latter body in spite of the legal theory that the privy councillors are the only ministers recognised by law. The apparent incongruity of a *de facto* body of ministers not only wielding the whole of the executive power of the state but initiating all the important legislation (see CABINET; GOVERNMENT; PARTY (GOVERNMENT); PARLIAMENT), while the *de jure* body does no more than give formal expression to such part of the executive will of the state as still nominally falls within the purview of the Crown prerogative (see CROWN), is mitigated to some extent by the fact that the whole of the Cabinet are *ex officio* members of the P. C. In short, apart from its judicial power, the P. C. is restricted at the present day to a more or less nominal exercise of prerogative powers, e.g. the proclamation of ports or fairs, and the formal declaration of war. The hist. of the P. C. is, in a sense, that of the Cabinet, for the latter body was evolved from the unwieldy council of the time of Charles II. It is by no means easy to trace the hist. of the modern P. C. prior to the reign of Henry VI. because its ultimate progenitor was no less a body than the *Curia Regis* of the Norman period, from which parent body there issued in the course of time not only the P. C. but the House of Lords, the various divs. of the High Court of Justice, including the system of itinerant or circuit justices, the Star Chamber, and High Commission

Court. This evolution indicates no more than a necessary div. and specialisation of executive authority in a state polity which has at length become too complex and too artificial for the simple analysis into a king exercising, according to his lights and ability, more or less autocratic powers, and a council of barons exercising advisory functions which waxed and waned according to the degree of the royal ascendancy. Hence many historians, like Gneist, Stubbs, and others, are content to describe the development of the P. C. from the council of Henry VI., when the term P. C. was applied more especially to the paid and sworn councillors who habitually attended and took the oath of secrecy. The personnel of the P. C. varied from time to time up to the year 1641, magnates or nobles alone figuring on it up to the Wars of the Roses, commoners and persons of 'humble birth,' being introduced to the council board after those wars in consequence of the ravages made in the more ancient and noble families. Further, there was a differentiation into *ordinary* and *privy* councillors, the former being merely legal advisers, and members of the Star Chamber, the latter ministers of state. Apparently the ordinary councillors only attended when summoned, and from the fact that the present custom is for members not to assert their right to attend in the absence of a special summons and (perhaps) from the fact that the most striking of the surviving powers of the P. C. are its judicial functions, it is inferred by historians that the *ordinary* councillors of the Tudor and early Stuart period are the *direct* predecessors of the modern *privy* councillors. After the abolition of the Star Chamber and the restoration of 1660, when all members of the P. C. were sworn, it would seem that a further and different development took place: the P. C. grew in numbers so that groups within the main body, such as the Cabal of Charles II., began to form. This tendency to subdivision to further efficiency eventually resulted in the modern Cabinet, the larger body gradually losing administrative powers and evolving into the modern formal P. C.

*Position of the Modern Privy Councillor.*—Privy councillors are nominated by the sovereign, and on being appointed go through the formality of kissing the sovereign's hand and taking an oath to this effect: (1) To advise the king according to the best of their cunning and discretion; (2) to advise for the king's honour and public good without partiality; (3) to keep secret the king's counsel; (4) to avoid corruption; (5) to help and strengthen the execution of what shall be resolved; (6) to withstand all persons who would attempt the contrary; (7) to observe, keep, and do all that a good and true councillor ought to do to his sovereign lord. This oath, as may be imagined, is an ancient one, and in its extent far more applicable to those members of the P. C. who are also members of the Cabinet; indeed, as applied to the *privy* councillor, *qua* *privy* councillor, it is more or less unmeaning in

its pledge of secrecy, for the chief remaining duty of the P. C. is to *proclaim* to the world the will of the executive. A *privy* councillor is *ex officio* a justice of the peace for every co. in England. The head of the P. C. is the president of the council, and the person selected for this dignified office is usually an experienced parliamentarian. Privy councillors hold office during the life of the monarch, but a new sovereign always continues the old councillors in office, and, indeed, is bound to continue in office such of them as are Cabinet ministers at the time of the demise of his predecessor. Some persons are appointed members of the P. C. not because their assistance is required but as a mark of honour on account of personal distinction in some sphere. There is now a King's P. C. for Canada, composed of the ministry and of members outside the ministry. Non-Cabinet members number at present (1950) 256. Federal premiers of Australia are *ex officio* *privy* councillors. For the judicial committee of the P. C., see JUDICIAL COMMITTEE OF THE PRIVY COUNCIL.

*The Privy Council Office.*—Though from time to time the P. C. has been shorn of its administrative functions—thus the Board of Trade and the Ministry of Education are now separate from the council—it has often received new duties. The growth of professional organisations with statutory powers of regulating entry into and discipline within their professions has added new functions. The chief subordinate dept. is the Dept. of Scientific and Industrial Research, a prerogative dept. possessing statutory functions. This dept. in turn has the Geological Survey, the National Physical Laboratory, and some other research stations under its control. Charters are granted by the Crown on the advice of a committee of the P. C. Hence, the administrative questions involved in the grant of charters to univ., municipal bors., and other bodies are dealt with by the P. C. Office. The Judicial Committee of the P. C. advises the Crown on appeals from courts in the Brit. Commonwealth overseas. Appeals, however, now lie only from Australia, New Zealand, and Ceylon, and from the colonies, the right having recently been abolished in the case of Irish, Canadian, Indian, and S. African appeals. The most important professional bodies attached to the P. C. are the General Medical Council and the Medical Research Council. Recent legislation has added to them the Architects' Registration Council, the Dental Board, and the Pharmaceutical Society. These are independent professional bodies, but the P. C. has certain powers of control.

See W. Stubbs, *Constitutional History of England*, 1884–1903; A. V. Dicey, *The Privy Council*, 1887; J. F. Baldwin, *The King's Council in England during the Middle Ages*, 1913; J. E. A. Privy Seal, see SEAL.

Privy Signet, see SIGNET.

Prize Court. P. Cs. are estab. in belligerent civilised states to investigate cases of maritime capture and to condemn property as lawful prize or award restitution and compensation. According to Eng. Admiralty law 'prize' extends to all property captured *jure belli* on the sea or in foreign ports or harbours; or captured on land by naval forces acting alone or jointly with land forces; money received by way of ransom; and property captured in the rivers, ports, or harbours of the captor's country. P. Cs. adjudicate on property belonging to both enemy belligerents and to neutrals and are open to all persons regardless of nationality. They are national tribunals, though they administer rules which may be based on international law. They in fact do administer international law (Privy Council in the *Zamora*, 1916) though the Ger. P. Cs. always insisted that they apply municipal law (see on this the *Panaghiotis*, 1943, for a statement on this point). The law administered by the Amer. P. Cs. is, as in the case of the Brit. P. Cs., international law (*Paquete Habana*, 1900). P. Cs. are not bound by an Order in Council which is contrary to international law.

At the second peace conference at The Hague, 1907, and the London conference, 1908, an attempt was made to establish an international court of appeal to which neutrals, and in certain cases belligerents, might have recourse when dissatisfied with the decisions of the P. Cs. of the captor, but though this was agreed upon in the Declaration of London (q.v.) no such court was set up. P. Cs. may not be set up by a belligerent in neutral ter., though they may sit in the ter. of an ally. Neutral courts may exercise prize jurisdiction where the prize was taken in violation of the national ter., and where the prize was captured and abandoned and is the subject of a salvage claim by the neutral power. The decision of the P. Cs. is final, though the territorial state is internationally responsible; hence a neutral state may claim satisfaction if aggrieved by the decision.

When a belligerent captures a commissioned vessel belonging to the enemy gov., she becomes on capture his own property, and he is entitled to deal with her as he pleases. All persons found on board become prisoners of war, and all goods become the property of the captor. In the case of an enemy merchant ship there is neither unanimous opinion nor uniform practice as to the relation of seizure to ownership. In practice, systematic destruction of enemy prizes has been the exception, and the general rule is that all prizes are brought in for adjudication, unless there are practical difficulties in the way of such a course. During the First World War the Br. P. C. adopted the rule that the destruction of an enemy merchantman is legally justifiable, when the circumstances of the case imperatively demand it (the *Mahrouseh*, 1916). The same principle was held to be applicable

to absolute contraband (q.v.) cargoes. On principle, there can be little doubt that, if the right to capture private property is conceded at all, the destruction of enemy prizes is justifiable in circumstances of *force majeure*; the chief safeguard against it lies in the fact that it is contrary to the interest of the captor to destroy what is certain to become his own property, if such destruction can be avoided. The obligations of belligerents with regard to enemy merchantmen apply much more emphatically to the case of neutral merchantmen, so that the precedents cited for the former may be invoked *a fortiori* for the latter. Under the customary law it has long been an estab. rule that captured neutral vessels must be taken in for adjudication, and if this be found impossible they must be released, even if there be a doubt whether they are neutral or enemy. The plea of military necessity will not avail; and the captor may not arrogate to himself the functions of a judicial tribunal. It is only a valid condemnation of a P. C. that transfers the ownership to the captor; till then he may not deal with the prize as he deems fit. So long as neutral vessels do not violate their neutrality they must be left alone, subject to visit and search in case of suspicion. It has, however, been recognised, even in Brit. courts, that there may be exceptional cases in which destruction may be justified, though not without paying full compensation to the owner. But the question whether the destruction of a neutral ship is justified in cases of absolute military necessity and other exceptional circumstances has been much disputed. The unratified Declaration of London (1909) provided that they must be 'taken into such port as is proper for the determination there of all questions concerning the validity of the prize'; but Articles 50-51 provide that they may be destroyed if the safety of the captor is involved or there is exceptional military necessity; and further that all persons on board must be placed in safety and the ship's papers must be taken on board the warship. During both world wars, however, Germany sank many neutral vessels without providing for the safety of those on board. By the treaty of Washington, 1922, it was declared that a merchantman must be ordered to submit to visit and search before it can be seized and must not be attacked unless it refuses to submit to visit and search or to proceed as directed after seizure; that a merchantman must not be destroyed unless the crew and passengers have been first placed in safety; and that belligerent submarines are not under any circumstances exempt from the universal rules above stated.

Oppenheim, *International Law*, vol. 2: *Disputes, War and Neutrality* 6th ed., by H. Lauterpacht, 1944; S. Jackson, *Manual of International Law*, 2nd ed., 1947; also E. S. Roscoe, *Reports of Prize Cases 1745-1855*, 2 vols, 1905.

**Prize-Fight**, boxing contest, fought with bare fists, for a money prize. It is forbidden in Britain and the U.S.A., gloves always being worn in contests. P.-Fs. were popular in England, 1750-1850.

**Prize Money** originated in remote hist. to encourage adventurous spirits to take to the sea. In 1243 Henry III. created the first privateersmen, who were allowed to indulge in what were virtually piratical activities at sea so long as they gave half the spoils—or prize—to His Majesty. Thus for many centuries prize was the only thing to recommend a life at sea and there were many opportunities, especially in the Elizabethan era, for fabulous captures. In fact, privateering was not abolished until the Declaration of Paris in 1856. In the Commonwealth Act of 1649 the half share previously claimed by the king went to the treasurer of the Admiralty for charitable purposes, but it was not until the reign of William and Mary that pillage was abolished, and an Act passed under which everything in a captured ship had to be condemned as prize and then distributed among the captors. In the reign of Queen Anne (1702-14) the prize fund was vested in the Crown, and a substantial portion of it in the shape of a grant then made to the captors for whom an exact ratio of shares was now laid down.

During the period of the Georges large fortunes were again made out of P. M. Adm. Lord Anson, for instance, in a voyage round the world, took over £1,000,000 in P. M. of which his share came to £125,000. Later, after the battle of Cape Finisterre, the resultant rounding up of a Fr. convoy brought him another £62,991. Adm. Sir Charles Saunders, when commander-in-chief Mediterranean, captured the Sp. treasure ship, *Hermione*, on May 21, 1782 as a result of which his share was £64,963, while every lieutenant concerned received £13,000 and each seaman and marine £485. In addition to P. M. derived from the value of a ship and its cargo, a system of bounty had been introduced by which those officers and men of a ship of war actually present at the capture or destruction of an enemy ship were entitled to have distributed among them a sum calculated at the rate of £5 for each person on board the enemy's ship at the beginning of the engagement.

At the beginning of the First World War it was recognised that modern conditions made it unfair to adhere to the old rule of distributing P. M. only to the actual captors, and it was decided that all those serving in the R.N. at sea should be eligible. At the end of that war P. M. amounted to some £14,000,000 out of which admirals received approximately £3000, captains £800, and able seamen £25. During the Second World War, however, the enemy did not allow so many of his ships to be captured and scuttled them instead. As a result, the total P. M. only amounted to £7,250,000, of which £2,000,000 was allocated to the Commonwealth countries and £1,250,000 to the R.A.F. without whose co-operation

many captures would not have been made. The £4,000,000 left to the R.N. was then distributed in more equal ratios among those who had spent 180 days at sea during the war. This embraced some 57,000 officers and 598,000 men. So an admiral of the fleet only received £40, a captain £16, a lieutenant £13, a petty officer £8, and a seaman £4. Meanwhile the Air Council had decided that as they could draw no distinction between individuals of different commands—which meant that the individual share would be very small—they would apply the entire amount to R.A.F. benevolent and welfare funds.

It had, however, previously been announced on Dec. 19, 1945, that P. M. was now going to be paid for the last time as, under modern conditions, it raised so many anomalies and inconsistencies. In future, should hostilities again break out, it will be assimilated into the normal grant of gratuities.

**Prizren**, see PRISREND.

**Prizzi**, tn. of Sicily, in the prov. of Palermo. Pop. 10,800.

**Proa** (Malay *prahu*), narrow canoe, 30 ft. long by 3 ft. wide, used by natives of the Ladrone Is. The stem and stern are similar, the boat sailing either way. The lee side is flat, so that the canoe resembles half of a vessel, divided vertically in the line of the keel, and a weighted framework is swung out to leeward to adjust the balance.

**Probabilism**, in moral theology, denotes the view that when a person is unable to obtain a sure decision as to the lawfulness or unlawfulness of an act, he may act upon a solidly probable opinion in the opposite sense. P. was first elaborated by Molina (q.v.) and was taught by the Jesuits. It was opposed by the Jansenists (see Pascal's *Lettres provinciales*), but as expounded by St. Alphonsus Liguori (1696-1787) is held by most modern theologians.

**Probability** (in logic) the presumption that some statement is likely to be true or that some event is likely to happen, when sufficient evidence to constitute absolute proof cannot be secured. The term is also applied in logic and mathematics to the amount of antecedent likelihood which exists for the occurrence of a certain event, as calculated from the relative frequency of the occurrence of similar events in the whole range of past experience. In this connection the investigation of P. has been performed chiefly in connection with games of chance. The first work to treat of this was Demolivre's (q.v.) *Duchine of Chances*, and the subject is worked out with especial fullness in such works as J. Venn's *Logic of Chance* (ed. 1888). The same question of P. is the basis of the work of all insurance societies, and their success depends almost entirely upon the accuracy of the formulae and results obtained by their actuaries. The whole subject forms an important branch of mathematics.

**Probability** (in mathematics) is that part of algebra which deals with the P. of chance of the happening of an event

or any one of a number of events one of which must occur. The general definition of  $P$  is stated thus: If an event can happen in  $a$  ways and fail to happen in  $b$  ways, and except for the numerical difference between  $a$  and  $b$  is as likely to happen as to fail, then the  $P$  of its happening is

$\frac{a}{a+b}$  and that of its failing  $\frac{b}{a+b}$ . For example, consider a bag containing six white balls and seven black balls, and apart from the difference in the numbers we are as likely to draw white as black, then the  $P$  of drawing white is  $\frac{6}{13}$ , and of drawing black  $\frac{7}{13}$ . This  $P$  does not state which will actually happen, but that if an infinite number of trials be made, the number of times a white ball is drawn will not deviate very far from this ratio. This method is used in the data of assurance companies in estimating the  $P$  of the occurrence of events. *Certainty*, i.e. that the event will occur without fail, is expressed mathematically as unity, as may be deduced from the definition. Hence, if  $a$  be the  $P$  of the occurrence of an event,  $1-a$  is the  $P$  of its non-occurrence. A few simple laws of  $P$  may be stated: (1) If different events are mutually exclusive, i.e. the occurrence of one event prevents the occurrence of another, the  $P$  of either event occurring is the sum of the  $P$ s of the separate events. (2) If  $a$  and  $b$  are the  $P$ s of two independent events, the  $P$  that both should happen is  $ab$ ; e.g. find the  $P$  of throwing heads twice in two tosses of a coin. For one throw the  $P$  of throwing heads is  $\frac{1}{2}$ , hence for two it is  $\frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$ . (3) If the  $P$  of the happening of an event in one trial be  $p$ , the  $P$  of its happening  $r$  times in  $n$  trials is the  $(r+1)$ th term in  $(p+q)^n$ , where  $q$  is the  $P$  of its not happening in one trial, i.e.  $q = 1-p$ .

Expanding this by the binomial theorem,

$$(p+q)^n = p^n + np^{n-1}q + \frac{n(n-1)}{2} p^{n-2}q^2$$

$$+ \frac{n(n-1) \dots (n-r+1)}{r!} p^{n-r}q^r$$

$$+ \dots + q^n. \text{ The } (r+1)\text{th term} = \frac{n(n-1) \dots (n-r+1)}{r!} p^{n-r}q^r.$$

Two or three examples may be taken to illustrate the type of problem solved by  $P$ : (1) Three cards are drawn from a pack at random; find the  $P$  that they will consist of a knave, a queen, and a king. The knave, queen, and king can each be drawn in four ways; any three cards can be drawn in  $\frac{52 \cdot 51 \cdot 50}{2 \cdot 3}$  ways;  $\therefore$  required

$$\text{chance is } \frac{4^3}{\frac{52 \cdot 51 \cdot 50}{2 \cdot 3}} = \frac{16}{5525}. \quad (2) \text{ In a game}$$

$A$ 's skill is to  $B$ 's as 3 to 2; find the chance of  $A$  winning 3 games at least out of 5. As in law (3)  $A$ 's chance of winning is  $\frac{3}{5}$  and of losing  $\frac{2}{5}$ . Therefore required chance is the first three terms of  $(\frac{3}{5} + \frac{2}{5})^5$  which reduces to  $\frac{1}{125}$ .

**Probate.**  $P$  of a will means the production of it before the  $P$ . court (*q.v.*) or the registrar of that court for the purpose of establishing its validity and genuineness. There are many things which an executor can do without getting  $P$  of a will, but he cannot sue as an executor of the will in any court without producing the  $P$  or copy of it sealed and registered by the court in which it was proved. As a testator may appoint any number of executors,  $P$  may be granted to all of them; but a grant of  $P$  to one executor only enables all to act upon it, with the result that in most cases it is unnecessary for the others to prove. A will may be proved either in *common* or *solemn* form. A will is said to be proved in common form when  $P$  is granted in the absence of the parties interested under the will, but on proof of its identity and genuineness; in solemn form, when a final decree is pronounced by the court. In the latter case the executor must cite the various parties entitled to the property, whether under the will or on intestacy, and satisfy them before the court that the will was duly executed and that the testator was in full possession of his faculties when he made the will. The cited parties have full liberty to dispute the will.  $P$  in common form is revocable; but  $P$  in solemn form is irrevocable as against all the persons cited unless a subsequent will be found.

**Probate Court.** The probate, divorce, and admiralty div. of the high court, owes its existing name and constitution to the Judicature Act, 1873. Prior to that Act there was a court of probate and a court for divorce and matrimonial causes, both presided over by one judge as judge-ordinary and president respectively, while the former court of admiralty was a separate tribunal with a separate judge. There are now two courts of the probate, divorce, and admiralty div., one of the judges being styled president. The probate side of the court is concerned with proving wills and granting letters of administration (*see* PROBATE).

**Probation, see under CRIMINAL LAW.**

**Proboscidea, see under ELEPHANT.**

**Proboscis Monkey**, large Bornean species of leaf-eating monkey (*Nasalis larvatus*) in the male of which the nose is prolonged to hang below the upper lip. It is red in colour.

**Probus, Marcus Aurelius** (A.D. 235-82), Rom. emperor (276-82). He served with distinction under Valerian and later emperors in Africa, Asia, and Germany. Tacitus (275-76) made him governor of Rome's Asiatic possessions, and on his death, the army chose  $P$ . as emperor. He fought successfully against the Gers., driving them out of Gaul, but was murdered by mutinous soldiers. *See* AURELIUS VICTOR, *De Cæsaribus*, and *Epitome*; Champigny, *Les Césars*, 1843.

**Process**, in law, the whole course of proceedings in a civil or criminal cause. In a more limited sense  $P$ . denotes either (a) the writ of summons, warrant, or other instrument by which the defendant is compelled to appear in court, or (b) the

writs which issue at the instance of a party to a suit to compel the other party or some third person or persons to do some act connected with the proper trial of the action, e.g. a writ of *subpoena duces tecum*, to compel the production of documentary evidence (see also MESNE, *Mesne Process* and INTERLOCUTORY PROCEEDINGS). In Scots law P. means the proceedings in a cause and the documents relating to it.

Processions are either secular or religious. Secular P. take place on certain great occasions, usually with the object of allowing some important personage to be seen by the people. Religious P. early formed part of the Christian liturgy (e.g. on Candlemas Day, Feb. 2, and Palm Sunday) and were also held on special occasions to beg some special favour from God (e.g. by St. Gregory to implore a cessation of the plague). They became especially magnificent in the Middle Ages, and at the present time in the Church of Rome they continue to form a specially regulated part of the worship. They have been extensively revived in the Anglican communion, and the practice of par. P. on the Rogation days is not uncommon.

**Process Work**, or more correctly, **Process Engraving**, term generally understood to denote the photo-mechanical method of reproducing drawings or objects on a relief printing plate, or block. The definition thus excludes intaglio and planographic methods such as photogravure (q.v.) and photolithography (see under LITHOGRAPHY). There are obvious practical advantages in having illustrations in the form of relief blocks, rather than drawn on a lithographic stone or engraved in a copper plate. The printing image on a relief block is raised above the surrounding areas and this same principle operates when printing from type. The printer can therefore lock up type and illustration blocks in the same forme and print them both in the one impression. Books have been illustrated in this fashion since the earliest days of printing, and the kind of block largely used over the course of four centuries, prior to the advent of photography, was the hand-engraved wood block. In the nineteenth century the rapid expansion of commercial printing in the realm of periodical and magazine work as well as books, saw the growth of professional engraving. The engraver was not necessarily a creative artist himself, but simply trans. other artists' work into a form acceptable to the printer, often with an amazing virtuosity. With the existence of such a demand for the engraver's work, now quite divorced from the artist, the time was ripe for a mechanical method of block-making that would eliminate the laborious hand work involved.

The early part of the nineteenth century, which saw the beginnings of so many of the mechanical methods in use in the production of printed work, and the materials on which the printer relies, saw the first gropings in the attempt to use the action of light in order to obtain

an exact reproduction of a design or image independently of the uncertainties of hand work. The earliest attempts in this direction were made by Joseph Nicépce, of Chalon-sur-Saône, who, in 1813, took up the study of lithography, but, having some difficulty in supplying himself with the proper stones, started a series of experiments with tin plates coated with resins known to be sensitive to light, especially bitumen, which also possesses the property of becoming insoluble if sufficiently exposed to sunlight. He applied to his tin plates a solution of bitumen dissolved in oil of lavender. When dry, he placed the plates under copies of engravings and exposed them to sunlight, afterwards developing the resulting image with a mixture of oil of lavender and petroleum. This solvent also washed away those portions of the varnish which had been protected from the action of light by the details of the engraved print, leaving the bare metal; the plate was then etched with acids and an intaglio produced, from which prints could be taken with the aid of a copper-plate press. Incidentally his experiments in this direction, with copper plates surfaced with silver, in conjunction with his partner Daguerre, led to the perfecting by the latter in 1839 of the first successful method of producing the photographic image (daguerreotype), thus in effect laying the foundation of all the modern process work as we know it. Nicépce was the first to engrave on metal by mechanical and chemical action, and print copies from the plate. It will readily be seen that from this successful result it was comparatively easy to get away from the slow and costly printing method of the copper-plate press and, by a reversal of the process of etching the black lines into the plate, produce a relief printing surface which could be easily and rapidly used by a letterpress printer.

Process engraving to-day can be divided into two separate categories, line engraving and half-tone engraving. Line engraving is the method used to reproduce drawings on which the artist has worked in sharp black and white definition with no intermediate tone values, e.g. pen or scraper-board drawings (though mechanical stippling can be added to suggest middle tones). The process can be extended to reproduce drawings in more than one colour, provided the colours are solid and flat, and not of varying tonal strength. Half-tone engraving is used to reproduce original subjects consisting not only of contrasting black and white but also intermediate tones of varying depth, e.g. photographs, wash drawings, and pencil sketches. In the field of colour it is capable of reproducing artists' fully coloured paintings, photographic colour-transparencies, and still-life subjects photographed direct. It will be understood from the principle of letterpress printing (see PRINTING) that a relief half-tone plate is only capable of printing an even film of ink on the paper. The appearance of intermediate tone values is therefore illusory and is created by a

regular series of dots of varying sizes, larger in dark areas of the image and becoming smaller, with therefore more white space between them, in the lighter areas. The comparison may be made here between this process and photogravure. The latter also prints a dot formation but as it is an intaglio process the ink is held in recessed cavities etched to varying depths below the surface of the plate. When printed the dots are therefore all the same size, but tonal variation is achieved by the amount of ink transferred to the paper, more in the darker tones and less in the lighter. This, combined with a slight tendency for photogravure to spread on

whole plate immersed in a bath of nitric acid. The acid attacks the unprotected parts of the plate, and after a series of controlled etches, the surface is eaten away and the image is left in relief. The plate is then cleaned up, finished off, mounted on wood to type-height, and is ready for printing. The method of making line blocks in colour varies according to the nature of the drawing supplied, and a process engraver generally prefers a series of working drawings made in black of each colour to be printed. If, however, a fully coloured original is supplied it may be necessary to make a tracing or 'key' of the outlines of all the colours. The key is

#### HALF-TONE SCREENS

The three sections of this picture show the effect of a screen in a half tone block. On the left is a screen used largely by newspapers (65); that in the middle (85) and on the right (100) are used in journals and bookwork. The screen of blocks used in *Everyman's Encyclopedia* is 85 and 100.

the paper, gives a greater effect of continuous tone and a generally softer result than relief half-tone printing. The latter better reproduces sharp clear tonal contrasts. The following, briefly explained, are the details of line and half-tone process engraving.

**Line Engraving.**—A photographic negative on a glass plate is first made of the original drawing, an optical prism being placed at the camera aperture. The prism has the effect of reversing the negative image, so that at the final stage of the process it appears the right way round. A metal plate, usually zinc, is then coated with a light-sensitive solution of albumen and ammonium bichromate and the negative is then printed down on it. The light passing through the clear areas of the negative (the black parts of the original drawing) hardens the coating of the plate on which it falls and renders it insoluble in water. The surface of the plate is next rolled up with ink and washed in water which dissolves the unaffected parts of the coating, leaving only the original image. The image is then further treated with a powder of bitumen or resin to make it acid-resistant, and the

then printed down on to as many separate plates as there are colours to be reproduced. Guided by the key the etcher paints an acid-resist over ('stopping out') the portions of each plate which it is required to print in the various colours, and the plates are then etched in the usual manner.

**Half-tone Engraving.**—As noted above this process is used for reproducing continuous tone originals and relies on the use of a half-tone screen. This is a glass plate with a series of black lines ruled on it at right angles to each other. When placed in front of the negative in the camera the light passing through the interstices of the screen is broken up and falls on the negative as a series of dots, larger in the high lights and smaller in the shadows. The original continuous tone image is thus registered on the negative as a regular series of solid dots of varying sizes. Thenceforward the process is similar in principle to line engraving. Half-tone etching is a more highly skilled operation than line etching, as the etcher has by his own craft to make good certain deficiencies inherent in camera reproduction, replacing tones that have been lost in the

process. The tendency is for light and dark tones to even out, giving an overall flatness and lack of contrast. The plate is given a series of etches, a portion of the image being stopped out before each etch, commencing with the darkest tones and working to the lightest. The effect of this is to etch the shadows least and the high lights most, and by skilful work the tones of the original can be restored and even enhanced. The rulings on half-tone screens vary from 45 to 225 lines to the inch, the choice of screen ruling being governed by the quality of paper on which the finished block is to be printed: 86 screen is the finest suitable for newsprint or similar low-grade paper, 150 screen is the average for good quality catalogue or bookwork on coated art paper; finer screens are used almost exclusively for reproducing scientific or similar illustrations containing fine detail. Half-tone plates are usually made of copper, which is more malleable than zinc and less brittle after subjection to the heat that has to be applied at certain stages of the process.

Colour half-tone is founded upon the principle that all colour values can be broken down into the three primary sensations. From the coloured original a series of three half-tone negatives are made, the light being allowed to pass first through a glass filter, of a different colour for each negative. The three filters are violet, green, and orange (though usually referred to as blue, green, and red) and allow respectively the yellow, red, and blue components of the colours of the original to be recorded in their correct proportions on the three negatives. Half-tone plates are then made from the negatives and printed in yellow, magenta-red, and blue, in exact register to recreate the colours of the original. Yellow being the most opaque ink is usually printed first, and as it is also usually of the greatest colour-density of the three it provides a base on which the red and blue will print with more brilliance. For subjects that have heavy depths of tone it is usual to print a fourth plate in black, and this has also the effect of sharpening the final result and enriching the black tones. Here again much hand work is required to make good the inherent photographic deficiencies. A skilled colour-etcher must learn to recognise, for example, the size of screen dot that is required on any plate so that when combined with the others it will reproduce the correct colour value. Screens as coarse as 80 can be used for printing colour work on a non-coated paper, but for good quality work on art paper 133 and sometimes 150 screen are used. The process is capable of reproducing a wide range of subjects from works of art in oils to commercial studio drawings for magazine illustration and colour-transparencies such as Kodachromes and Ektachromes.

See W. J. Smith, E. L. Turner, and C. D. Hallam, *Photo-engraving in Relief*, 1932, and H. Curwen, *Processes of Graphic Reproduction in Printing*, 1934.

Procida, is. of Italy, at the N.W. end of the bay of Naples, 2 m. from the main-

land. It is of volcanic origin. Vine-growing and fruit culture are important industries. At the tn. of P. on the N.E. coast there are extensive fisheries. Pop. (of is.) 15,000; (of tn.) 3700.

Proclamation, constitutional mode of declaring the king's will (as to which see *under* Crown), or the will of the chief executive of a nation. For the most part Ps. can only be binding on the subject in so far as they are grounded on the law of the land. They are used for solemn declarations of war or peace, on ceremonial occasions, such as the calling of a court or the accession of a monarch to the throne, and for various other purposes. All Brit. Ps. are made by the king in council and must pass under the Great Seal (*q.v.*).

Proconsul. In ant. Rom, a P. was a consul whose year of office was prolonged in order to allow him to complete a victorious campaign. Later it became the general rule for a consul who had spent his year of consulship in Rome to become a P. for prov. war or administration. A P. had no power in Rome itself (*c.* 500-c. 560 A.D.).

Procrastes (Gk. Προκροστις, the Stretcher), in ant. Gk. legend, a robber of Attica, whose other name was Damastes or Polypemon. He forced his captives into a bed, and adjusted them to its length by racking or amputation. He was killed by Theseus.

Procter, Adelaide Ann (1825-1864), poet, was the daughter of Bryan Waller P. She contributed verses to *The Book of Beauty* in 1843, and subsequently to *Household Words* and the *Cornhill Magazine*. In 1858 she collected her poems and pub. them under the title of *Legends and Lyrics*. Some of her verses have charm and individuality. See E. S. Robertson, *English Poetesses*, 1883, and life by H. J. Gibbs.

Procter, Bryan Waller (1787-1874), Eng. poet, b. at Leeds; he practised successfully as a solicitor in London. He contributed to the *Literary Gazette* from 1815, and made the acquaintance of Lamb (whose biography he wrote in 1864) and Leigh Hunt, whose influence is perceptible in his writings, and also knew Robert Browning and Swinburne. Under the pseudonym of 'Barry Cornwall' he produced at Covent Garden a tragedy *Mirandola*, which ran sixteen nights (Jan. 1821), and *English Songs, and other Smaller Poems* (1832). It is by his songs that he is remembered. An *Autobiographical Fragment*, ed. C. Patmore, was pub. in 1877. See life by R. W. Armour, 1935.

Proctor, anglicised form of the Lat. *procurator*, an agent or manager. Technically the word means: (a) univ. officials selected from the masters of arts to enforce the univ. statutes and generally to maintain discipline and good order, and (b) representatives of cathedral or other collegiate churches and of the ordinary diocesan clergy in convocation. It was formerly also used to denote practitioners in the eccles. and admiralty courts, but this use of the word is obsolete since

Parliament enabled solicitors to perform all the legal duties of a P.

**Procurator**, in a general sense signifies a manager or agent, but has come to denote exclusively solicitors or 'law agents' in Glasgow and other Scottish dists., who practise in the inferior courts, and are members of the Incorporated Society of Ps. The Law Agents Act, 1873, placed Ps. in all respects on the same footing as other law agents.

**Procurator-fiscal**, in Scotland, the local officer appointed formerly by the sheriff with the sanction of the home secretary, but now by the lord advocate, whose official duties may be regarded as comprising at once those of the public prosecutor, coroner, and former grand jury of England. The P. of a co. or dist. of a co. is, in fact, the proper person to take the initiative in cases of sudden death or death under circumstances of suspicion, and not only to conduct a post-mortem examination, but generally to carry out all the various preliminary duties that precede the actual trial before a jury.

**Procyon** (α Canis Minoris) is the lesser dog-star, magnitude 0.48; its spectrum intermediate between those of the sun and Sirius. Bessel determined its proper motion and announced its binary nature in 1896. Schaeberle detected the companion, magnitude 13, emitting about  $\frac{1}{25000}$  the solar light, and of over one-half the solar mass. Auwers found (1862) a period of forty years. It has been well studied. Parallax 0.30" gives a distance of eleven light years; speed at right angles to line of sight, 12 m. per sec.; approaching the sun at 3 m. per sec.

**Prodigious** (c. 480-400 B.C.), (Gk. sophist of the time of Socrates, b. at Iulis in Ceos. He lectured at Athens and elsewhere, among his pupils being Isocrates and Euripides. He wrote *The Choice of Hercules*.

**Producer Gas**, see GAS MANUFACTURE, *Gas for Fuel or Power*.

**Production and Productivity**. The term production was originally used in the limited sense of making of goods, and is still so applied in everyday life. Modern economic theory has extended the meaning of the term, applying it to all activities which increase the opportunities for consumption, i.e. it includes not only the making of goods but also their distribution, in short it is defined as the creation of wealth. The distinction is important since the modern theory shows that there is no justification for the differentiation between 'productive' and 'unproductive' work, the latter referring to distribution and services, since the making of goods is not the end of economic activity. Another distinction should also be borne in mind, i.e. production may either mean the actual process of making goods ('production will be started') or the result of this process ('the volume of production').

Production in the limited sense may be individual, batch, or mass production. Individual production still prevails where high craftsmanship and individual finish is required (e.g. bespoke tailoring, handicrafts, etc.). Factory production normally requires that at least a series of

similar products is made ('batch' production). Mass production (q.v.) seeks to make the best use of tools and machinery by a continuous flow of standardised production. Modern methods of production have made possible the steadily rising standard of living in the W. world over the last hundred years. It is now generally realised that industrialisation and the introduction of modern production techniques is necessary in order to improve conditions in the 'undeveloped' countries.

It is the task of economic policy to see that production keeps up with the demand for goods. If too many goods are produced they cannot be sold, production will be decreased and workers lose their jobs; in other words, there is a slump. If production is not big enough to satisfy demand, 'too much money will chase too few goods,' and there is inflationary pressure. The private manufacturer is guided in his production plans by the prospect for profits; in nationalised industries the same considerations must apply if permanent deficits are to be avoided. Production can be restricted by employers to keep prices high, or by trade unions to keep the jobs safe; there was no room for such practices in Britain's post-war economy.

**Productivity**, indicating the efficiency of production, is measured as production per man-hour, man-day, or man-year. The most reliable indication of productivity is production per man-hour, since production per man-day and man-year is influenced by changes in working hours and duration of holidays. The larger the production per man-hour, the greater the productivity. Productivity may be increased by greater effort on the part of the worker, by better arrangement of the individual operations in the factory, or by increased mechanisation and rationalisation. Productivity as well as production can be increased by the incentive of higher earnings (payment by piece instead of time); they are decreased by high and progressive taxation, especially higher rates for overtime. For increased productivity there may be special bonuses, or public commendation and special awards (as in Soviet Russia). In Britain it was realised during the 1939-45 war that increased productivity depended on the willing co-operation of the workers. Productivity councils in factories, composed of employers and workers, seek to find the best ways for increasing productivity. The development councils set up by the Board of Trade for a number of industries also deal with this problem. The Anglo-Amer. Productivity Council, a voluntary body set up by the industry in the two countries, fosters with the help of the Economic Co-operation Administration exchange of information on productivity methods, mainly by visits to U.S.A. See L. Rostas, *Comparative Productivity in British and American Industry*, 1949.

**Production, Census of**. The Board of Trade takes a C. of P. at intervals to ascertain the total amount of industrial productions (gross output) in the United Kingdom; the value of materials, fuel, and

electricity used in production, and cost of work given out; the difference between these amounts, which is the value added in production to materials, etc. (net output); the number of persons employed in production; and other cognate information. These aggregates are analysed to show the results for individual industries or groups of industries, geographical areas, etc. Finished products of one firm frequently form the materials of another, as there is substantial duplication in the total gross output of all firms, but relatively much less within a single industry. This duplication is automatically eliminated from net output, and the duplication in gross output has been estimated for most of the censuses.

The first C. of P. was taken in the United Kingdom for 1907 under powers given by the Census of Production Act, 1906, which strictly defined the questions which might be asked. The second census, for 1912, was interrupted by war and never completed. Later censuses under the 1906 Act were taken in 1924, 1930, and 1935. The Import Duties Act, 1932, and Finance Act, 1933, authorised more detailed inquiries into the production of certain classes of goods. Five such inquiries were held between 1933 and 1939, that for 1935 supplementing the C. of P. for that year. In 1946 a partial census was taken under Defence Regulations. The Statistics of Trade Act, 1947, provided for a C. of P. every year and gave powers enabling full inquiry to be made into the economic factors of production. The first ann. census was taken for 1948.

C. of P. returns are required from factories and workshops, mines and quarries, building undertakings, public utilities, and gov. depts. In 1907 and 1924 all such undertakings made full returns, but at other completed censuses estabs. employing ten persons or fewer were exempt. The 1907 census extended to the whole of Ireland, while reports for 1924, 1930, and 1935 included particulars for N. Ireland. The 1948 census was confined to Great Britain.

Summary particulars for the first four completed censuses were as follows (the figures representing millions of pounds):

Year	Gross Output	Materials and Work Done	Net Output*
1907	1765	1033	697
1924	3747	2106	1518
1930	3371	1789	1504
1935	3565	1876	1625

\* After deducting excise duties.

The following table compares the gross and net output for 1924 and 1935 in the main groups of industries, viz.: A. *Factory Trades*. (1) Engineering, shipbuilding, and vehicles; (2) food, drink, and tobacco; (3) textiles; (4) iron and steel; (5) paper, printing, and stationery; (6) other factory trades. B.—*Non-factory Trades*. (7) Public utility services; (8) mines

and quarries; (9) building and contracting. The figures represent millions of pounds.

Trade Group	Gross Output		Net Output	
	1924	1935	1924	1935
A. (1)	402	491	198	249
(2)	670	664	172	202
(3)	763	446	222	158
(4)	295	281	99	116
(5)	162	184	94	112
(6)	734	771	291	345
Total A.	3026	2837	1076	1182
B. (7)	225	313	145	185
(8)	273	167	226	137
(9)	163	216	81	100
Total B.*	721	728	472	443
All Trades	3747	3565	1518	1625

\* Including gov. depts.

In 1935 there were employed on the average 3,137,600 persons in factory trades and 2,147,900 in non-factory trades. In addition to these there were estimated to be 826,700 persons employed by 204,151 small firms who each employed ten persons or fewer. The number of estabs. in factory trades employing more than ten persons was 18,944.

A full analysis of the results of these C.s. of P. has been pub. in the respective final reports.

**Production, Ministry of, gov. dept. set up on behalf of the War Cabinet, in 1942.** The minister of P. was appointed to carry out all the duties previously exercised by the production executive set up early in 1941, excepting those relating to manpower and labour, which were transferred to the Ministry of Labour. His duties included the allocation of available resources of productive capacity and raw materials (including arrangements for their importation) and the settlement of priorities. He also exercised supervision and guidance of the various depts. concerned with production, but not so as to affect the responsibility of the ministers in charge of these depts. The M. of P. also handled, on behalf of the War Cabinet, discussions in the combined bodies set up in England and the U.S.A. to deal with munitions assignments and raw materials as between the Allies. It organised, in co-operation with the dominions and other empire govts., the general planning of raw materials, machine tools, and munitions of the empire. The first minister was Lord Beaverbrook. In 1945 the M. of P. was merged with the Board of Trade.

**Professional, see under AMATEUR.**

**Professor.** Among the Romans, this term was applied to certain public teachers. In medieval univs. it signified the possessor of a licence to teach, and

was practically synonymous with 'doctor' or 'master.' Such licence was then the only degree granted to students, but later a separate class of recognised lecturers sprang up, to whom the title of P. was applied. The univ. authorities appoint most Ps., but the regius Ps. at the older univs. are chosen by the Crown.

**Profit and Loss Account, see under BOOK-KEEPING, Private Ledger.**

**Profit à Prendre**, right, profit, or benefit enjoyed over the land of another, e.g. rights of common, tithes, rent service. A P. & P. is to be distinguished from an easement in that the latter is in the nature of a mere convenience or privilege without profit, while the former gives the owner of it a right to something of substance. See also COMMON RIGHT OF.

**Profiteering.** It is impracticable to pay for modern war by the proceeds of taxation and savings; and belligerent govts., in order to pay their way, have to borrow from the banking system, thus causing the creation of bank-money (demand deposits) and of currency to supplement it. The First World War thus saw the creation of huge quantities of money while, at the same time, the requirements of total war meant that only a minimum of labour could be spared to produce the goods and services on which the citizen was used to spend his money. Moreover war imposes new patterns of trade and puts its own restrictions on freedom of competition. In the United Kingdom the result, in spite of some price-fixing, was a steep rise in prices, a rise that continued in post-war conditions until, with relaxed controls, the peak of inflation was reached in 1920, in which year wholesale prices were twice pre-war. The public saw the rapidly mounting prices and failed to appreciate how largely they were due to inflation. The temptation to put the blame on the shopkeeper or his supplier was irresistible. 'Profiteering' and 'profiteer' (contrasting with 'volunteer') became well-worn terms of abuse to denote the imposition of unfair prices and those responsible for them, the makers of undue profits. To say that monetary inflation was the great cause of the high prices is not to say that no one took advantage of the scarcity of goods and the plenteousness of money to make undue gains, whether on consumer goods or in gov. contracting. In the summer of 1919 public concern at rising prices had put the 'Profiteering' Act, 1919, on the statute book. This gave the Board of Trade powers to investigate prices, costs, and profits at all levels, and the assistance of central and local committees, with appeal tribunals.

P. remains as a word of abuse for overcharging or alleged overcharging in general: but the Second World War brought no outburst of protestation comparable to that of the first. There was substantial reason for this. Experience in the First World War was put to good account, and early in the Second World War the Prices of Goods Act, 1939, was passed 'to prevent the price of goods . . . specified by the Board of Trade being raised above the

basic price . . . by more than an amount referable to increases in . . . specified expenses,' and giving the board powers to specify basic prices, permitted increases, and permitted prices. Central and local price-regulation committees were set up; and still function. The Act was extended and amended by the Goods and Services (Price Control) Act, 1941, which covered 'services in relation to goods' and gave the board power not only to fix maximum prices but to prescribe the marking of goods. Food prices were controlled under Defence Regulations authority, and basic foods, moreover, were heavily subsidised. Despite these thorough-going measures the Second World War was not conducted without inflation. The Board of Trade index shows a rise of 66.7 per cent over 1938 for the year 1945, with further rises to 72.7 per cent, 89.1 per cent, and 116.2 per cent in the years 1946-1948. But these are wholesale prices, and the cost-of-living figures, thanks largely to the food subsidies, are markedly lower—only 31 per cent above pre-war (Sept. 1, 1939) for each of the three years 1945-47. (The 1947 figure is for the part-year only; to June. A new 'interim index' shows that retail prices rose by one-tenth in the following twelve months.)

It is one of the advantages of a period of relatively stable prices that they tend to become traditional, people feeling that certain prices are inherently 'right' for certain things: so that they will not pay more without sustained protest. The tides of inflation wash away the well-known landmarks, the sense of money values becomes blurred and lost, and the citizen making the occasional as distinct from the habitual purchase has often no notion of even approximate current price. Such conditions invite overcharging. See also PRICE.

**Profits.** Gross P. for the economist as distinct from the accountant are receipts minus (ordinary) costs; while there is general agreement that this residue must be broken down to isolate the element of 'pure' profit, there is considerable divergence of opinion as to how this should be done. One main view is that profit is the reward of risk-bearing; another that it is the remuneration for such *entrepreneur* services as planning, organising, integrating the factors of production, etc. These services tend to be rewarded, like risk-bearing, from the residue left after contractual payments have been met; although nowadays the tendency is to remunerate more and more services by fixed payments, and accordingly from this angle to narrow the field of pure profit. But in so far as we eliminate contract payments actually made in the larger firm we must make parallel adjustments for the smaller firm where the *entrepreneur* supplies his own capital and runs his own business; assigning him a notional salary as 'wages of management' and a further part of gross P. as pure interest, or rather as debenture interest. Adam Smith was the first to distinguish the interest element in P.: 'The revenue derived . . . from stock [capital], by the person who

manages or employs it, is called profit. That derived from it by the person who does not employ it himself, but lends it to another, is called the interest or the use of money. Part of that profit naturally belongs to the borrower, who runs the risk and takes the trouble of employing it; and part to the lender, who affords him the opportunity of making this profit.' Smith also saw that the interest charge included an element of insurance against capital loss. Classical economists developed the analysis of gross profit and, with J. S. Mill, there was a clear division of P. into (1) interest, (2) payment for risk, and (3) wages of management or superintendence. Marshall added the service of combining or integrating the factors of production; and later Marshall, like J. B. Clark, came to regard profit as the product of (unforeseen) change, a product which is seen as non-existent in hypothetical conditions of perfect competition with freedom of supply and demand. While pure profit is very far from non-existent to-day it is often negative for particular firms over varying periods, and there is even doubt whether total pure profit is not negative. (F. A. Walker held that just as there is marginal no-rent land, so there is a class of no-profit *entrepreneurs*.)

Although interest may be segregated from profit, both depend on the earning power of capital, and in practice people invest indifferently in the interest-earning debenture or the dividend-earning share according to which is thought likely to yield the better income, having regard to varying risks and prospects.

**Profit-sharing**, see SHARING OF PROFITS.

**Pognathism**, term describing the degree of projection of the upper jaw in man and apes. It is calculated in sev. ways, one being the angle made by the jaw to a line joining chin to forehead. The projection is greatest in apes and least in Europeans, the Negro type being called pognathous, and the European type orthognathous.

**Prognosis** (Uk. *prognosis*, knowledge beforehand). In the medical world, a forecast of the probably course, duration, and effect of any disease or injury. An opinion on the nature of the disease however is a diagnosis.

**Programme Music**, term applied to music which is not absolute or abstract but descriptive of something outside itself. The earliest composers attempted musical descriptions of actions and events, and the reproduction of sounds of nature, as, for example, in the battle and weather pieces of Elizabethan virginalists. A less crude type of P. M. began with the symphonies of Berlioz and the symphonic poems of Liszt, in which emotional and psychological description is more important than representation of physical action.

**Progrese**, chief port of Yucatan, Mexico, on the N. coast, 25 m. N. of Merida. There are numerous salt lagoons. The main industry in the area served by the port is the cultivation of hennequin (sisal hemp). Pop. 15,000.

**Progression**, see ARITHMETICAL, GEOMETRIC, and HARMONICAL PROGRESSION.

**Progressive Party**, see BULL MOOSE.

**Prohibition**, prerogative writ (*q.v.*) directed to the judge and parties to a suit in an inferior court, commanding them not to go on with it, on the ground either that the court has no jurisdiction in the matter, or that the proceedings are vitiated by reason of some other irregularity.

**Prohibition**, in the sense of laws forbidding the sale of intoxicating liquors, is an Amer. conception which afterwards spread to a few other countries like Finland and Norway. The P. movement in the U.S.A. originated in Maine, where, after a vigorous campaign by Neal Dow, the legislature passed an Act in 1846 forbidding the sale of spirits. In 1851 the legislature passed a further law prohibiting all kinds of alcoholic drinks. By 1855 various full or partial P. laws had been adopted by all the New England states, as well as by some of the states of the N. and middle-W. belt. But in some of these commonwealths the courts declared the laws unconstitutional, and in others they were allowed to become a dead letter. In the eighties the movement was revived, and Kansas became a 'bone-dry' state. In 1898 the Anti-Saloon League was formed, with headquarters in Ohio. It was backed by influential men in the Methodist, Baptist, and Presbyterian Churches. It also became more scientific than the first would-be reformers. Prohibitionists now demanded the insertion of P. amendments in the constitutions of the various states, with result that the state courts would not be able to declare P. laws illegal.

The liquor interests of the country, which paid a gigantic revenue to the Federal Treasury, at first did not take this campaign seriously, but they soon found cause for alarm. Amer. public opinion, especially in the country dists. and in the smaller towns and vills., was forming against them. Even in the cities the people resented the growing domination of the saloon-keepers and the liquor interests in political affairs, by dint of their control of ward, municipal, and state political machines. In the country in general large employers of labour became convinced that the free selling of liquor was a bad thing. In the S. states the question was associated with the problem of Negro crimes against white women. S. leaders felt that if gin could be kept away from the lower type of Negro, there would be less crime. Many states which declined to pass state-wide P. laws adopted a form of local option. Under this a city or a tn. or a co. could vote itself dry. The entry of the U.S.A. into the First World War gave the dry movement enormous impetus. In order to save cereals that could be used for food, Congress enacted laws prohibiting first the manuf. of spirits and, later, of beers and wines. These laws were only for the duration of the war. But the reformers said that what was good for war was good for peace. Congress quickly responded to this sentiment, and by Dec. 1917 it had passed a proposed P. amendment to the constitution through

both houses by the required two-thirds majority. The law, as passed by Congress, provided that the ratification by the necessary three-fourths of the states, should take place within seven years, and that the enactment should come into force a year after its ratification. Within a very short time three-fourths of the states adopted the amendment. In fact, all but two did—Connecticut and Rhode Is. The amendment became operative Jan. 16, 1920. Before this it was necessary for Congress to pass a law defining what was meant by the term 'intoxicating liquors' as used in the amendment. Congress passed this Act in Oct. 1919. It was known as the Volstead Act, after Congressman Volstead, who introduced it.

The Act provided that alcohol, brandy, whisky, rum, gin, beer, ale, porter, wine, and other beverages containing one-half of 1 per cent of alcohol or more should come within the ban of the law. To manuf., transport, import, export, or sell or barter such was illegal. President Wilson vetoed this Bill, but it was passed over his veto Oct. 28, 1919, by 176 to 55 votes in the House of Representatives and by 63 to 20 in the Senate. The Jones law passed in 1929 to tighten up the prosecution of offenders provided that habitual violators of the law should be fined a sum not exceeding \$10,000 or imprisoned for a term not exceeding five years. Most of the states passed enactments for the enforcement of these Federal laws. By these enactments the U.S. Gov. gave up many millions in revenue it formerly secured from the distillers and brewers. But P. brought no real advantages in those dists. where a majority or a large minority of the people were opposed to the principle, though temperance leaders claimed that the benefits of P. were far greater than the evils to which it gave rise. The law was one which could not be adequately enforced in the large cities. The 'bootleggers,' as the illicit vendors were called, soon came into existence, supplying liquor to those who required it. Scotch whisky, largely shipped to Brit. is, in the W. Indies and to the Fr. Is. of St. Pierre and Miquelon, off the Canadian mainland, was the spirit chiefly supplied. This was smuggled into the U.S.A. by means of swift motor-boats which effected landings at various places on the long coastline. There were many cases of death, blindness, and paralysis, caused by people drinking 'Scotch whisky' which was made out of wood alcohol. Even the real Scotch whisky was 'cut'—that is, diluted with more or less harmless ingredients, even water. Gin was made synthetically. Wine was made by securing grape juice from California. But an even more sinister effect of the dry laws was the struggle which went on between gangsters for control of ter. in the big cities where they delivered their bootleg drinks to customers. This led to a contest for mastery between gangs, backed up by their criminal gunmen who did not hesitate to murder, and the forces of law and order seemed helpless. New York,

Chicago, Detroit, and other big cities all had their share of this. 'Speak-easies,' places where one might buy dubious drinks at exaggerated prices, were common in all the big cities. The commission of famous lawyers named by President Hoover and headed by George Wickersham to inquire into the questions of law enforcement in the U.S.A. brought in a report favouring the continuation of the 'great experiment' of P., but this was largely nullified by the individual reports made by most of the members. The data of the U.S.A. Dept. of Justice show that over 51 per cent of all the cases heard in the Federal courts in 1930 were for violations of the liquor laws. Just as the question of slavery became the bone of contention in the irrepressible conflict which led to the Civil war, so P. threatened to become a great political question in the U.S.A. It was to the fore in the presidential election of 1928, but although the country dists. were still actively dry in 1930, many of the large cities were becoming ardently in favour of repealing the P. amendment. Finally by the twenty-first amendment, Dec. 5, 1933, the eighteenth or liquor P. of 1919 was repealed. As a result, each state enjoyed complete home rule in the matter of liquor laws. Some states, e.g. Oklahoma, where Baptist and other Church groups were strongly prohibitionist, remained 'dry.' The 'dryness,' however, was modified by the fact that the Federal law was amended to define as 'non-intoxicating' liquors containing less than 3.2 per cent of alcohol. The sale of weak beer thus became permissible even in 'dry' states.

Experiments in P. have been made and abandoned in Ireland, Finland, Norway, and in certain provs. of Canada. In the case of Ireland and Finland the abandonment was due to economic pressure by wine-exporting countries. In the matter of control, schemes of local option have been more successful. In Britain, the movement made little impression, yet from 1922 to 1931 Edwin Scrymgeour sat as prohibitionist M.P. for Dundee. Prince Edward Is. adopted P. in 1900 and adhered to the policy until 1947. The Maori ter. in New Zealand (known as the King Country) maintains P. as do the Indian reservations in U.S.A. and Canada. The grant of dominion status to India and Pakistan was followed by the adoption of P. on a large scale. The gov. of India estab. P. in its own prov. of Delhi and encouraged the prov. govts. to follow its example; the provs. of Bombay and Madras were the first to take action and the policy is being gradually adopted in other provs. The Pakistan Gov. enacted a P. law which applied only to Muslims, but the Punjab High Court ruled that such legislation was unconstitutional and that if P. was to be introduced it must apply to all citizens irrespective of race or religion. In both India and Pakistan the P. movement received great impetus from the fact that it accords with the religious teaching of the prin. religions of the two countries.

See II. R. Curlewis and D. S. Edwards,

*Prohibition, 1910, and R. E. Hose, Prohibition or Control: Canada's Experience with the Liquor Problem, 1929.*

**Projectile.** The term is applied to a body which describes a free path through the atmosphere, and the name trajectory is applied to the path. Before considering the general case of Ps. a few simple formulae which are used for bodies rising or falling vertically should be understood. If  $u$  is the velocity with which a body is thrown vertically,  $s$  its distance from the place of projection after a time  $t$  sec., and  $v$  the velocity with which it is then moving, the following formulae are used:  $v = u + ft$ ,  $s = ut + \frac{1}{2}ft^2$ ,  $v^2 = u^2 + 2gs$ , where  $g$  denotes the increase of velocity each second and is measured in ft. per sec. or in cm. per sec. in the c.g.s. system. It is usual to take  $g$  as an acceleration of 32 ft. per sec. each sec., and this is written in the form,  $g = 32 \text{ ft./sec.}^2$  or  $32 \text{ ft. sec.}^{-2}$ . When  $g$  acts in a direction opposite to that in which the body is thrown, the - sign must be given to 32 before substitution in the above equations; when

FIG. 1

It acts in the same direction the + sign is given, and a well-known example of the latter is the case where a stone is thrown vertically downwards from the top of a cliff. From these simple formulae it is easy to proceed to the case of Ps. in which the original velocities are not vertical but inclined at any angle to the horizon. Ignoring the resistance of the atmosphere first of all and taking  $u$  as before for the original velocity of the body along the line OP (Fig. 1), where OP is inclined at an angle  $\alpha$  to the horizon, the horizontal component of this velocity is  $u \cos \alpha$  and the vertical component is  $u \sin \alpha$ . The former remains the same throughout the flight of the body, but the latter decreases until the P. reaches the highest point of its trajectory, when it vanishes and then it starts to increase, the motion now being towards the earth. Each velocity can be treated independently and the formulae given above are applicable to the vertical motion of the body,  $u \sin \alpha$  being substituted for  $u$ . Suppose we want to find the time that the P. takes to reach the earth, reckoning from the instant at the beginning of its flight, then as its height above the surface of the earth at the end of its flight is zero, by making  $s = 0$  in the second equation,  $t = (2u \sin \alpha)/g$ . During this time  $t$  the body is moving horizontally with a velocity  $u \cos \alpha$ , and hence the total horizontal distance  $R$  of flight is  $u \cos \alpha \times (2u \sin \alpha)/g = (2u^2 \sin \alpha \cos \alpha)/g = \frac{u^2}{g} \sin 2\alpha$ . It is assumed that the beginning and end of the trajectory are

in the same horizontal plane; if not, that is, if at the end of its path the body struck an elevation or depression, the equation would require modification, but it is unnecessary to consider this case.

From  $R = \frac{u^2}{g} \sin 2\alpha$ ,  $\sin 2\alpha = gr/u^2$ , and from

this it is seen that there are two angles of elevation which give the same horizontal range  $R$ . Thus if  $\alpha = \pi/4 + \theta$  or  $\pi/4 - \theta$ ,  $\sin 2\alpha$  in each case is  $\cos \theta$ , and a body projected at two angles to the horizon, one as much below  $45^\circ$  as the other is above  $45^\circ$ , will have the same horizontal range, although their trajectories are different. (Guns can thus strike objects with two elevations, one giving a low trajectory and the other a trajectory for high angle bombardment. The maximum value for the sine of an angle is 1, and hence the maximum horizontal range for a projectile is  $u^2/g$ , obtained by making  $2\alpha = 90^\circ$ , or  $\alpha = 45^\circ$ , which shows that the maximum horizontal range of a P. occurs when  $\alpha$  is  $45^\circ$ . To find the greatest height attained it is obvious that when this occurs the body has no vertical velocity, and hence  $u \sin \alpha$  is substituted for  $u$  and 0 for  $v$  in the third equation, from which the expression  $s = (u^2 \sin^2 \alpha)/2g$  is easily derived. If  $\alpha$  is  $45^\circ$   $s = u^2/4g$ , which shows that the maximum range of a trajectory is four times the distance of its highest point above the earth. The following considerations will show that the path of a P. is a parabola. If a point Q be taken anywhere on the trajectory and the co-ordinates of Q be  $(x, y)$  (in Fig. 1 these are OM and MQ, respectively, and are referred to axes through O, the  $x$ -axis being horizontal and lying in the plane of the trajectory, the  $y$ -axis being perpendicular to O $x$  and also lying in the plane of the trajectory), then  $x = u \cos \alpha \cdot t$ ,  $y = u \sin \alpha \cdot t - \frac{1}{2}gt^2$ , from which we obtain by eliminating  $t$ ,  $y = x \tan \alpha - \frac{g}{2u^2 \cos^2 \alpha} x^2$ , which is a parabola. An interesting result is obtained by eliminating  $t$  instead of  $x$  in the above equations. In this case it is easily seen that  $x^2 + (y + \frac{1}{2}gt^2)^2 = u^2 t^2$  ( $\cos^2 \alpha + \sin^2 \alpha = u^2 t^2$ ), which is the equation of a circle. This shows that if a number of bodies be started off from O with velocity  $u$  at different angles to the horizon but all in the same vertical plane, after a time  $t$  they will be found on a circle of radius  $ut$  with its centre at the point  $(0, -\frac{1}{2}gt^2)$ , that is, with the centre at a point vertically below O at a distance equal to that through which a body falls in  $t$  sec.

Owing to atmospheric resistance the paths of Ps. are not exact parabolas, and the greater the initial velocity the more the trajectory departs from a parabola. Extensive experiments have been carried out for many years to determine the true paths of Ps. with various velocities and different shapes but this subject is too vast to be dealt with in a short article. Rev. F. Bashforth's work with the electric chronograph (1865-70) showed that the resistance of the atmosphere varies considerably according to the velocity. Between 900 and 1100 ft./sec. the resistance

varies as  $v^3$ , between 1100 and 1350 ft./sec. it varies as  $v^2$ , and above 1350 ft./sec. as  $v$ . With more recent experiments more modern tables than those of Bashforth have been constructed for the use of gunners. The ballistic coefficient  $C$  is very important in compiling tables, and standard trajectories for any particular weapon can be computed only when appropriate values of  $C$  are known. It is then necessary to fire at various angles of elevation, and then suitable tables can be derived. In addition to the ordinary resistance of the atmosphere account must be taken of the direction of the wind and also of the 'drift,' owing to the gyroscopic action produced by the rotation of the Ps. A rough illustration of three trajectories

FIG. 2

is shown in Fig. 2. C and D are two trajectories produced by two angles of elevation, one exceeding  $45^\circ$  by the same amount as the other is less than  $45^\circ$ . The broken line shows the real trajectory when atmospheric resistance is taken into account. See *Reports on Experiments made with the Bashforth Chronograph to determine the Resistance of the Air to the Motion of Projectiles*, 1870; F. Bashforth, *Motion of Projectiles*, 1872; The *Bashforth Chronograph*, 1890, and *Theory of Projectiles*, 1903; F. R. Moulton, *New Methods in Exterior Ballistics*, 1926; J. Kent, 'Projectile Design' in *Mechanical Engineering*, 1932; T. J. Hayes, *Elements of Ordnance*, 1938. For a full explanation of the drifting of Ps. see H. Crabtree, *An Elementary Treatment of the Theory of Spinning Tops and Gyroscopic Motion*, 1914, Appendix. iii.

Projection, see under MAPS.

Projection Tests, see under PSYCHOLOGY.

Prokofiev, Sergei Sergeievich (b. 1891), Russian composer, b. at Ekaterinoslav. He studied under Liadov, Witkol, Rimsky-Korsakov, and Anna Lisipova, at St. Petersburg Conservatoire. He won the Rubinstein prize for his first piano concerto. In 1918 he left Russia, living in Britain, France, Japan, and the U.S.A. before returning to Russia in 1934. The Soviet authorities insisted that he should popularise his music. In 1948, however, it was felt that he had not carried this far enough, and he was accused of showing 'an individualism intolerable to Soviet society.' His efforts at more popular and sympathetic music can be seen in such works as *Peter and the Wolf*, the overture *Toast to Stalin*, and the film music for  *Ivan the Terrible* and *Alexander Nevsky*. His operas include *Loves of the Three Oranges*, *The Gambler* (after Dostoevsky's novel), and *War and Peace* (after Tolstoy's novel). He has also written music for ballet, four symphonies, two

violin and sev. piano concertos, and some piano pieces. His music in his earlier years was distinguished by its hard brilliance; his later works showing a mellowing and maturity of style. See L. L. Sabaniet, *Modern Russian Composers*, 1927, and study by J. V. Nestyer, 1947.

Prokop, Andreas (1380-1431), Hussite leader, b. in Bohemia. He became a monk, and travelled widely in Europe. He joined Ziska's army when the Hussite war began, and after Ziska's death in 1424 P. became the Taborite leader. He was a master of strategy, and won a number of notable victories over superior forces of Gers., Austrians, and Saxons. By 1427 he held Prague and controlled Bohemia, and his followers then began a series of aggressive raids into enemy ter. But P.'s radical social beliefs turned the nobility against him, and in 1434 he was killed at the battle of Lipan by an army led by Bohemian nobles. See Count von Lutzow, *The Hussite Wars in Bohemia*, 1914.

Proletariat or Proletariate, poorer classes of the community. The term *proletariat* was applied by Servius Tullius to the lowest ranks, as being only useful to rear offspring (*proles*). During the twentieth century it has frequently been used to denote the wage-earning class. See SOCIALISM.

Prologue, introduction to a play, poem, or discourse. Aristotle applies the term to that part of a tragedy preceding the *parados*, or first speech of the chorus. It should be a mere address to the public.

Prome, dist. of Lower Burma, in Pegu div., with an area of 2914 sq. m. The chief tn., P., stands on the Irrawaddy, 161 m. by rail N.N.W. of Rangoon. The manuf. of ornamental boxes, paper, and silk-weaving are carried on. P. fell to the Jap. invaders after the road between it and Rangoon was cut (March 1942). It was liberated by Brit. troops in May 1945. Pop. of dist. 436,700; of tn. 28,300.

Promenade Concerts. Special type of popular orchestral concert, cultivated especially at the London Queen's Hall from 1895 until its destruction in 1941, under the direction of Sir Henry Wood, and continued at the Albert Hall. The programmes gradually improved until they contained all the best orchestral music and modern novelties, and a special feature is that the floor of the hall is left bare for people to stand, not to walk about, for which they have neither room nor inclination. P. C. were not new to London in 1895; they were started by P. Musard at Drury Lane in 1840 and by Louis Jullien at Covent Garden about the same time.

Prometheus (Gk. Προμηθεΐς, 'Forethought'), in Gk. legend, son of the Titan Iapetus, father of Deucalion. The stories of his attempt to cheat Zeus in offering a sacrifice to him, of his stealing fire from heaven for man, and of his warning Epimetheus against receiving Pandora as a gift from Zeus are well known. He is generally taken as a type of culture-hero, the earliest teacher and benefactor

of mankind. Zeus punished his presumption by sending an eagle to devour his liver, which was daily renewed, but finally he was set free by Heracles. See Hesiod, *Theogony*, 521-616; *Works and Days*, 54-105; Æschylus, *Prometheus Vinctus*; P. B. Shelley, *Prometheus Unbound*; monographs by B. G. Welske, 1842, E. v. Lasaulx, 1843; A. Milohhofer, 1882; E. B. Tylor, *Early History of Mankind*, 1865; and F. F. A. Kuhn, *Die Herabkunft des Feuers*, 1886.

**Prominences.** At the time of a total eclipse of the sun scarlet projections known as P. are seen in various places along the sun's limb. They assume different forms—clouds, fountains, etc., and it is remarkable how often they resemble some of the extinct reptiles of the Jurassic period. These great tongues of flame consist of incandescent gases which extend 30,000 m. and often much

Harvard University Climax Station  
SOLAR PROMINENCE

Large eruptive prominence, June 4, 1946

more from the sun. More than sixty years ago Janssen and Lockyer independently thought of an apparatus which would show them when there was no eclipse and within comparatively recent times they have been filmed by a special method. On the screen they present an awe-inspiring sight, the enormous tongues rising from the sun and moving out tens of thousands of miles, then falling back on its surface. In some cases they maintain their positions for a time but in others they change very rapidly. Quiescent P. often reach very large dimensions and remain suspended above the sun's chromosphere for weeks or even months and seem able to float for days without much change in form, in spite of the sun's gravity. Eruptive P. appear with the suddenness of an explosion and often change their forms so rapidly that in a few minutes after the eruption commences they are very conspicuous. Measurements of their velocities have shown that these sometimes attain nearly 200 m. per sec. A new instrument known as the spectroheliograph (q.v.), invented by Hale of Mt. Wilson Observatory, is now extensively used to study P. Closely connected with P. are solar 'flares' which have been studied extensively in England by W. H. Newton,

Royal Observatory, Greenwich. These are short-lived patches of luminosity which appear in disturbed regions of the sun and which interfere with short-wave radio transmissions. About twenty hours later magnetic storms are sometimes in evidence, or a display of the aurora. The real reason for 'flares' still awaits an explanation.

**Promissory Note**, unconditional promise in writing, signed by the promisor, to pay on demand, or at a fixed or ascertainable future time, a definite sum of money to, or to the order of, a named person or to bearer (see also NEGOTIABLE INSTRUMENTS). No form of words is essential, but an instrument promising to do anything in addition to the payment of money is not a P. N. A bank note is a P. N. issued by a banker and payable to bearer on demand. An IOU (q.v.), if it contains a promise to pay, may constitute a valid P. N. Where a P. N. runs 'I promise to pay,' but is signed by two or more persons, it is a joint and sev. note, i.e. the makers are both jointly and separately liable on it.

**Promotion**, in the R.N., army, and R.A.F., see under RANK.

**Promoter**, Company, see COMPANY AND COMPANY LAW, *Promoter*.

**Prongbuck**, see ANTLOCAPRA.

**Proof**, in law, means the estab. of the satisfaction of a judge or jury by oral or documentary evidence of the facts alleged in the pleadings (q.v.), though it is also used to denote relevant as opposed to irrelevant evidence (see EVIDENCE). In legal slang it is the recognised term for the written or typed evidence of witnesses, prepared by the solicitor for the use of counsel so that the latter may know what a witness is going to be called to prove.

**Proof**, Burden of, see ONUS PROBANDI.

**Proof Reader**, or **Printer's Reader**, or **Corrector of the Press**, one engaged in the work of proof-reading (q.v.), and who plays an important part in a modern printing office. He usually possesses a good general and technical education and is required not only to detect omissions, literal and typographical errors, but must draw attention to errors of fact, ambiguous statements, and libellous remarks, and ensure that the work is free from errors and inconsistencies. In recent years large printing houses have recognised the reader's aptitude for copy preparation. This work is done before setting the type and the reader attends to details of house style (see PROOF-READING), and eliminates technical and general queries so that setting may proceed without interruption.

In London printing offices readers must pass an entrance examination to the Association for the Correctors of the Press, and in the provs. the Typographical Association stipulate trade qualifications. The Prov. Guild of Printers' Readers also has an examining body.

**Proof-reading**, business of reading through printers' proofs to discover errors for correction. In the early days of print, when type was set by hand, it was

In Proof	In Margin	Meaning
/	g	Delete.
h	a	Insert letter 'a.'

Hasell Watson & Viney Ltd

# PROOF-READING MARKS

customary to correct errors during composition, but since the introduction of mechanical composition the rate of production has increased considerably and it has become necessary to employ trained proof readers (q.v.).

P. marks, illustrated in adjoining column, together with queries to the author, editor, or publisher, are made in the margins of slip or page proof. Reading is done at all stages of composition as follows: *First proof*, on galley proof when the reader must ensure that the matter set conforms to copy and is in accordance with instructions of publisher and author. *Make-up* entails revision of first proof and checking page length, headlines, footnotes, etc. *Press reading* in most printing houses is done after the proofs have been passed by the author so that the press reader, who is responsible for the final correctness of work, can be guided by the author's remarks and instructions. Some printers, however, prefer press reading to be done before proofs are submitted to the author. After the compositor has corrected the type according to the marks made the work is *press revised* and corrections then made are checked on the *machine revise*, which is a proof pulled when the work is sent to the machine for the reader to examine the edges of the pages for type broken in transit to machine. *Foundry revising* is a check of corrections before making a stereo-plate. *Author's revise* is the revising of the author's marks after correction by the compositor.

Newspaper printing is of necessity a speedy process, and the P. is done by the employment of an assistant or copy-holder reading the copy aloud to the reader, who is thus saved the time of comparing proof and copy. This method is also used by general printers for straightforward copy, but it is always necessary to compare technical and complicated matter.

In order to maintain a uniform style in pubs., some printers and publishers set out their preferences in word formations, spellings, capitalisation, and hyphenated and non-hyphenated words, in the form of a house style which forms part of the instructions to the printer and assists the proof reader in avoiding inconsistencies. A well-equipped reference library is essential to a modern P. dept. and should contain Eng., Fr., and Ger. dictionaries, dictionaries of technical, scientific, medical, and musical terms, a gazetteer, a good encyclopædia, biographical dictionary, H. Collins, *Authors' and Printers' Dictionary* (1946), and H. W. Fowler, *Dictionary of Modern English Usage* (1937), or E. Partridge, *Usage and Abuse* (1947).

**Proof Spirit**, as defined by Act of Parliament, is such a spirit as shall at a temp. of 51° F. weigh exactly twelve-thirtieths of an equal measure of distilled water. It contains 57.06 per cent by volume or 49.24 per cent by weight of absolute alcohol. Spirits are termed 'under' or 'over' proof, according as they are stronger or weaker than P. S. Thus 25°

over proof means that 100 volumes of the spirit diluted with water would yield 125 volumes of P. S., whilst 20° under proof means that 100 volumes of the sample contain 80 volumes of P. S.

**Propaganda** (*De propaganda Fide*), name of a Rom. Congregation founded by Gregory XV. in 1622 to regulate eccles. affairs in countries where a Rom. Catholic hierarchy either does not exist or is not fully estab.

**Propaganda**, art of propagating and instilling a belief, particularly a religious or political belief. The word P. is derived from the Congregatio de Propaganda Fide (see above). P. has been used by individuals and organisations since, as far as can be judged, the evolution of organised society; but since the growth of literacy and the invention of wireless and films it has acquired much greater importance. It was used by belligerents in both world wars. Lord Northcliffe's organisation at Crewe House, London, greatly assisted in the collapse of the Hapsburg Empire, by publicising the claims to self-government of various nationalities within it. P. need not necessarily entail the elimination of one set of ideas and the substitution of another, in peacetime, the Brit. Council aims at the peaceful propagation of Brit. culture, while appreciating the value of the cultures of other nations. Gustave Le Bon was the first to treat systematically the fact that P. was a branch of psychology, especially mass-psychology (1895). His study has since been much elaborated and the conclusions aptly learned, especially by the govs. of totalitarian states.

P. may attempt to instil the truth; but since 1918 the word has acquired a normally derogatory and sinister sense, owing to the P. methods of Fascist and Communist states. P. makes use of books, pamphlets, newspapers, radio, songs, slogans, films, festivals, and organised religion. While, during the Second World War Brit. P. was largely based on the maxim that unadulterated facts, plainly presented, ultimately produced the most lasting effect on their audience, all countries involved made use of the emotional appeal. In the U.S.A. this frequently entailed a certain glorification of war, such as the nation-wide tours made by Hollywood film stars, advocating the desirability of buying defence bonds to aid the war effort. P. by any party or state necessarily means a marked stress on the value of the idea which it is wished to impart. P. is therefore strictly more than information, even though the Brit. Gov. dept. for disseminating P. during the Second World War was named the Ministry of Information (q.v.). In Germany, under the direction of Goebbels (q.v.) P. really ceased to have any reliable informative value and became simply the science of moulding opinion to a given belief, by any means available. Emphasis on those who had died for the cause had been an instrument of P. from early times; examples include the early Christian martyrs, the religious martyrs of the Reformation, and twentieth-

century figures such as Edith Cavell (q.v.), and Rosa Luxemburg (q.v.). Goebbels made the recognition of Horst Wessel and other Nazi heroes and martyrs nothing less than a religious cult in which the object of veneration took on a super-human significance. Such treatment may be compared with the public exhibition of the embalmed body of Lenin in the Red Square, Moscow, by the Soviet authorities. Goebbels employed any lie or distortion of fact to suit his purpose, working on the principle that if a thing was stated sufficiently emphatically and frequently it would be believed. His policy achieved a remarkable degree of success in Germany itself, though in countries where there was access to other sources of information it had little efficacy. Similar P. methods, and the same policy of sealing off other sources of information, appear to be practised to varying degrees in Communist states. See G. Le Bon, *Psychologie des foules*, 1895; W. P. Trotter, *Instincts of the Herd in Peace and War*, 1916; Sir C. Stewart, *Secrets of Crewe House*, 1920; E. Stern-Rubarth, *Propaganda as a Political Instrument*, 1921; Lord Ponsonby, *Lies and Falsehood in Wartime*, 1930; Lt. S. Lambert, *Propaganda*, 1938; A. Sturmingen, *Politische Propaganda in der Weltgeschichte*, 1938; E. H. Carr, *Propaganda in International Politics* (1939); F. C. Bartlett, *Political Parties*, 1940; E. Freeman, *Conquering the Man in the Street*, 1940; J. Hargrave, *Words Win Wars: Propaganda the Mightiest Weapon of All*, 1940; and P. Quentin, *La Propagande politique*, 1943.

**Propagation of Plants**, see PLANTS.

**Propeller or Air-screw**, see SCREW-PROPELLER.

**Proper Motion**, angular motion in secs. of arc per annum through which any particular star appears to move relatively to the whole stellar universe. The apparent motion is compounded of the real motion of the star, relative to the other stars, and the motion of the sun in space, and the latter must be eliminated to give the proper motion. This can be done when the star's distance is known. The fact that some stars possess a P. M., shows that the stars are not infinitely far away, otherwise their motion could not be observed. When P. Ms. are large this may indicate that the motions are rapid or that the stars are comparatively close, or both. P. Ms. provide statistical information regarding the distances of the stars, but not of individual stars. When a star's distance is known its P. M. gives its velocity in m. or kms. a sec., at right angles to our line of sight, that is, its tangential or transverse velocity. Its radial velocity—that is, its velocity in a direction to or from the earth—is found by the spectroscopic.

**Propertius**, S. Aulus Aurelius (c. 50–16 B.C.), Rom. elegiac poet, b. at Asisium (Assisi), Umbria, of a well-to-do family. After the battle of Philippi his patrimony was confiscated, but he received a good education and afterwards settled in Rome. Here he became deeply attached to the

famous 'Cynthia,' a courtesan of Tibur. After her death, however, nothing is known of his life. He is said to have had many literary friends in the circle of Maecenas, including Tibullus, Ovid, and Horace. His extant poems consist of four books of about 4000 lines of elegiac verse. Though his work is unequal in quality, no Rom. poet except Catullus so forcibly described the passion of love. His poems are mostly concerned with Cynthia, but the fourth deals with Rom. legend and hist. He was a student of Gk. and Lat. predecessors and was influenced by Virgil, Horace, and other contemporaries, and his own influence on the latter is also evident, especially upon Ovid. A trans. of his poems by H. E. Butler appeared in 1912.

**Property.** P. is either the exclusive right of possessing, enjoying, and disposing of a thing (i.e. ownership as opposed to possession, *q.v.*), or, by extension, the subjects of such exclusive right. The fundamental div. of P. (in the latter sense) in Eng. law, and indeed in most legal systems, though with a varying nomenclature, is into: (1) Things real, consisting of (a) *corporeal* or *immovable* property, i.e. lands, tenements, and hereditaments, and (b) the rights and profits annexed to and issuing out of these, or *incorporeal* property, i.e. rents, annuities, tithes, franchises, (*q.v.*), common rights, advowsons, etc. (see also LAND LAWS, and REAL PROPERTY); and (2) things personal, consisting of goods, money, and other movables. See also CHATTELS; CHOSE IN ACTION; PERSONALTY; PERSONAL PROPERTY; TENURE, LAND. For Scots analogues, see HERITABLE AND MOVEABLE, HERITABLE SECURITY.

**Prophecy** (Gk. *προφητεία*, feminine *προφῆτις*), means 'forth-telling,' and not 'foretelling' or 'future-telling,' which in Greece was done by the *μάντις*. The term prophet thus means 'interpreter' or 'spokesman,' one who speaks for God or for any deity, as the inspired revealer or interpreter of his will. The common belief that a prophet is primarily one who forecasts future events is, therefore, inaccurate. Christian (*haramata*) are generally considered as corresponding to Heb. prophecies. **Muslim prophecy:** Adam is the first of the prophets, Mohammed the last one, and Jesus Christ the last but one.

**Hebrew prophecy:** Ant. Heb. had three words for prophet, *nābhī'*, *rōeh*, and *hoseh*. While the last two words may conveniently be trans. as 'seer, visionary, gazer,' etc., the exact meaning, origin, and semantics of *nābhī'*, the main term for prophet, are still uncertain. In the historical development of Heb. P. two main periods may be distinguished, i.e. the earlier one, of which very little is known, terminating in the middle eighth century B.C., and the following period, which may be considered as the golden age of P. Moses is defined by Jewish tradition as the greatest prophet in Israel (Deut. xxxiv. 10). In the days of the judges (twelfth century B.C.), Deborah and Samuel were pre-eminent; Nathan, Ahijah, Shema'yah, Elijah, and

Elisha are the main prophetic figures of the early kings (eleventh to ninth century B.C.). P., however, springs from simple, even crude beginnings. In the days of Saul and David (eleventh century B.C.), with a few exceptions, the prophets seem to have been rather like wild dervishes (1 Sam. x. 5). As time went on, P. began to change its character and function. Of the second period more information is supplied, namely by the books of the prophets themselves, which now are part of the Bible; Amos and Hosea of the N. kingdom (eighth century B.C.); Isaiah, Micah (eighth century B.C.), Zephaniah, Nahum (seventh century B.C.), Habakkuk, Jeremiah, Ezekiel (sixth century B.C.), in Judah. While very little is known about the activity of Joel, Obadiah, and Jonah, Haggai, Zechariah, Malachi (fifth-fourth century B.C.) are the last representatives of these spokesmen for God and humanity.

It should be borne in mind that nothing is known about the prophetic books or their authors except what can be gathered from the books themselves, carefully studied in the light of the other books of the Bible, of the contemporary hist. of other nations, and of comparative philology, sociology, and religion. While scholars agree that the prophets lived in the above indicated periods, the dates and authorship of various chapters or sections of the prophetic books are the subjects of much controversy. For instance, the book of Isaiah is divided by some scholars into three sections, of which only the first one is attributed to the prophet Isaiah. Chs. xl.-lv., known as second or Deutero-Isaiah, are attributed to an anonymous prophet of the middle sixth century B.C. ('No writer of the Old Testament expresses more clearly than Deutero-Isaiah the idea of absolute monotheism,' W. L. Wardle), and the concluding chs. (lvi.-lxvi.), known as Trito-Isaiah, are even considered as the composition of various authors, and are assigned by some scholars to as late as the third century B.C. The recent discovery, among the 'Dead Sea Scrolls' of two copies of Isaiah (of which one is complete), by some scholars assigned to the second century B.C., provides evidence against the exaggerated theories.

The Heb. prophets, whose words are still vibrant with the plea for social organisation and justice, and for religious reverence, and still able to reveal the holiness and loving-kindness of God, remain unique in their majesty. No exact parallel has yet been discovered, although some scholars have tried to show that there was something analogous in Egypt or in Phoenicia or elsewhere. These great men never saw themselves as having any part in the divine. Their greatness consists first of all in their conception of what God's will was. At the same time, they never worked miracles; they kept their feet always on the ground, their eyes always on human life, their interest directed only to improve it, never themselves. They suffered and endured to create a better world. Jewish ethical

monotheism and also Christianity owe very much to these great figures. See W. R. Smith, *Prophets of Israel*, 2nd ed., 1896; A. B. Davidson, *Old Testament Prophecy*, 1903; E. Sellin, *Alt Testament Prophetismus*, 1912; G. Hölcher, *Die Propheten*, 1914; M. Buttenweiser, *Prophets of Israel*, 1914; A. R. Gordon, *Prophets of the Old Testament*, 1916; H. Gunkel, *Die Propheten*, 1917; J. M. Gray, *A Text-book on Prophecy*, 1919; W. A. O. Allen, *Old Testament Prophets*, 1919; E. Tobac, *Les Prophètes d'Israël*, I., 1919, 1932, II.-III., 1921; T. H. **Prophylaxis**, term for measures taken for prevention of disease.

**Propionic Acid** ( $C_3H_7O_2$ ), fatty acid occurring in crude pyroigneous acid, and prepared by the oxidation of propyl alcohol with chromic acid. It is a pungent-smelling liquid miscible with water (boiling point  $141^\circ C$ ).

**Propolis**, see BEE.

**Propontis**, see MARMORA, SEA OF.

**Proportion** may be defined as an equality existing between two equal ratios. The ratio between two quantities of the same kind is the relation which the one quantity bears to the other, the one being a multiple or part of the other. The ratio of  $a$  to  $b$  is expressed  $a : b$ .  $P$  may then be

expressed  $a : b = c : d$  or  $\frac{a}{b} = \frac{c}{d}$ . Sev. results may be deduced from this definition: (1)

$ad = bc$ ; (2)  $\frac{a}{b} = \frac{c}{d} = \frac{a+c}{b+d} = \frac{a-c}{b-d}$ . A proportion may exist between three quantities  $a, b, c$  of the same kind  $\frac{a}{b} = \frac{b}{c}$ . When

a series of quantities  $a b c d e \dots$  have the property  $\frac{a}{b} = \frac{b}{c} = \frac{c}{d} = \frac{d}{e} = \dots$  these quantities are said to be in continued  $P$ . If

three quantities are in continued  $P$ ,  $\frac{a}{b} = \frac{b}{c}$  then  $ac = b^2$ , and then  $b$  is called the mean proportional between  $a$  and  $c$ , and  $c$  is called the third proportional. The introduction of incommensurable numbers has rendered the above arithmetic definition inexact, in that these numbers cannot be exactly measured in terms of some common unit. Euclid introduced in his geometry a more rigorous definition which embraces the treatment of both commensurable and incommensurable, but it is of rather a too complex character to be very practicable.

**Proportional Representation**, system of voting in elections where the elector

votes for the candidates not by putting a cross against their names, but by using numbers to indicate his order of preference. This system is generally known as that of the 'single transferable vote.' In an alternative system, candidates are elected according to party lists, and votes given to a party in any constituency not sufficient for the election of a candidate are reserved for a second scrutiny, in which these 'remainder votes' are added up. If the total is sufficient for the election of one or more candidates, they are taken from a national list of their party presented in addition to the local lists, and become members of parliament without a constituency.  $P. R.$  involves an intricate system of counting, but it is claimed that the disadvantages attaching to minorities who feel themselves excluded from their legitimate share in the government of their country are lessened by the scheme. There are many systems in different towns and countries; that operating in Tasmania is as follows. Tasmania is divided into five electoral dists., each forming one political constituency being represented by six members. The elector indicates his choice by writing the figures 1, 2, 3, 4, 5, 6 against six names he wishes to elect in the order of preferences indicated by his use of the figures. In the first count first preferences alone are counted, and any candidate who receives the quota of first preferences is elected, the quota being fixed by the formula

$$\frac{\text{number of ballot papers}}{\text{number of candidates to be elected} + 1}$$

The excess ballot papers of the candidate receiving the quota are recounted and given to the candidates who receive the second preference votes. The method is continued to the third preference and so on. This is known as the single transferable vote system, and is the one advocated by the Brit.  $P. R.$  Society. Other systems are: (1) The alternative vote system, in which the voter marks the candidates names in order of preference on the ballot-paper. The names at the bottom are then eliminated in turn, the voters' second choices being distributed among the other candidates. This system is in use in Australian states and was used in Brit. univ. constituencies. (2) The second ballot system. If no candidate receives an absolute majority, a second vote is held to decide between the leading two candidates. (3) The system under which electors vote on a party list. Should a party not receive enough votes in one constituency to gain a successful candidate, its votes are retained for a second scrutiny, when representation in proportion to its total number of votes is granted to it. In Great Britain the Liberal party supports  $P. R.$   $P. R.$  applies for elections to the houses of laity and clergy in the Church of England, and was formerly used in Brit. univ. constituencies. It applies in Eire, in many continental countries, including France, Belgium, and Italy, and, to some

extent, in S. Africa, New Zealand, and Canada (for some municipal elections). Where sev. parties exist, P. R. ensures a hearing for minority opinions; but opponents of the system point to some continental examples as proof that it prevents effective functioning of government. See G. Horwill, *Proportional Representation*, 1925; H. F. Gosnell, *Proportional Representation*, 1931; H. H. Schötkhin, *Die Auswirkungen des Proportionalwahlverfahrens auf Wählerschaft und Parlament*, 1946.

Propylæum (Gk. προπυλαίον), in architecture, entrance gateway or vestibule forming an entrance to a temple or similar sacred enclosure, so treated as to form an important architectural feature. The propylæa of the Acropolis at Athens are especially famous.

Propyl Alcohol (normal), or Ethyl Carbinol ( $\text{CH}_3\text{CH}_2\text{CH}_2\text{OH}$ ), one of the important constituents of fusel oil, from which it is prepared by fractional distillation. It is a colourless liquid (b.p.  $97^\circ\text{C}$ ; sp. gr. 0.8 at  $20^\circ$ ), miscible with water. Isopropyl alcohol, or dimethyl carbinol ( $(\text{CH}_3)_2\text{CHOH}$ ), is an isomer which boils at  $82^\circ$ . It is used as a solvent for essential oils in the perfume industry, and in many industrial processes it can be employed as a substitute for the more expensive ethyl alcohol. It is made commercially as a by-product of the petroleum industry; propylene,  $\text{C}_3\text{H}_6$ , is obtained by cracking petroleum and is then absorbed in sulphuric acid. On diluting the product with water and distilling, isopropyl alcohol distils over.

Prorogation, as applied to parl. procedure, means the interruption of a session of both houses and its continuance in the succeeding session as opposed to an adjournment. The effect is to suspend all business until Parliament is summoned again, whereas an adjournment, which may be of either one or both houses, is merely a matter of ordinary convenience. A public Bill must be renewed after a P., however short, as if it had never been introduced. Impeachments and appeals to the House of Lords are not affected by a P. P. at the close of a session is effected either by the royal command through the lord chancellor in the presence of the sovereign, or by commission; but if Parliament be already prorogued to a fixed date a further P. can only be effected by proclamation. See also PARLIAMENT.

Prose, written expression of thought without, as in verse, any attempt at metrical form. P. and verse (*q.v.*) are the two prin. divs. of literature. In the hist. of every literature poetry preceded P. partly because literature in early times required a capacity for memorableness and partly because no one troubled to write down the speech of everyday use until such time as speech became organized in the form of oratory. In classical times the art of P. is closely allied with rhetoric; and even historians, such as Thucydides, often used the form of *oratio recta*. P. then was studied as carefully as verse, with a view to declamation, and as the spoken quality of P.

is a measure of its success, the definition of Aristotle cannot be bettered—that P. 'must neither possess metre nor be without rhythm' (*Rhetoric*, III. viii. 1). Gk. P. set a high standard with such names as Thucydides, Plato, and Xenophon. Great Rom. P. writers include Cicero, Sallust, and Livy. The last named introduced tricks of style which later influenced Macaulay. European P. as a literary medium was late in starting. No old Fr. literary P. goes back much before 1100, and Fr., It., and Ger. P. reaches maturity only with the Renaissance and the Reformation; but A.-S. P. of good style exists from as early as the seventh century, and Middle Eng. P. from the twelfth to the fourteenth century. Fifteenth-century narrative P. reaches excellence with Malory and Berners, while Malory's publisher, Caxton, worked conscientiously towards the raising of the standard of Eng. P. Conscious rhetoric in P. continued, leading, if the excrecence of euphuism is set aside, to the ornateness of Elizabethan P. and the Book of Common Prayer, and to the rhythm of the A. V. of the Bible, the importance of which cannot be over-emphasised in marking the development of Eng. P. from a narrative to a philosophic instrument. But contemporary with the P. of Milton, Jeremy Taylor, and Sir Thomas Browne, Dryden was writing down the speech of the educated seventeenth-century Eng. gentleman whose habit happened to be good P. This plain Augustan P. of the seventeenth and eighteenth centuries was, however, lifted into a grand style, different from that of the Elizabethans, first by Gibbon, then by Johnson and Burke, leading to the Georgian P. of Southey. Nineteenth-century P. is varied. The elaborate style was practised by De Quincey and Landor, and among their direct successors stand Ruskin and Kingsley, Pater, and also Swinburne and Morris, not forgetting the exquisite P. of Newman. Morris was the exponent of 'Wardour Street' Eng.—excellent for his particular purposes. In the early twentieth century P. tended to disintegrate. This was due partly to the lapse of the family habit of reading aloud, and partly to the popularity of the novel, with consequent eye-reading and no ear accompaniment. While the attempts of certain authors to avoid the time element in P. resulted in a controlled incoherence, other writers sustained the high quality of Eng. P., which since the 1930s has achieved an increasingly high level. This revival may be partly due to the increased popularity of radio, where P. readings have brought back an interest in good P., and partly to the high standard set by such writers as Winston Churchill, Lord David Cecil, Charles Morgan, Rosemond Leumann, and Rose Macaulay. Amer. P. has developed similarly in the twentieth century, attaining possibly a higher average level than Eng. P. but failing to produce such outstanding individual examples. See G. Saintsbury, *A History of English Prose Rhythm*, 1912; Sir A.

Quiller-Couch, *The Art of Writing*, 1916, 1946; H. Read, *English Prose Style*, 1928; J. B. Priestley, *The English Novel*, 1931, 1935; G. V. James, *The Art of the Novel*, 1935; L. Heriger, *Poesie und Prosa*, 1943; R. A. Liddell, *A Treatise on the Novel*, 1947; E. Muir, *The Structure of the Novel*, 1947; H. James, *The Art of Fiction and other Essays*, 1948; and F. PLUTO AND PROSERPINE

**Prosecution**, see CRIMINAL LAW.

**Prosecution**, Malicious, see MALICIOUS PROSECUTION.

**Proselytes** (from Gk.), converts, especially to Jewish faith. Anct. and Rabbinic Judaism did not deprecate the admission of converts. Indeed, genuine P. were welcomed and highly esteemed. The Talmudic law mentions two classes of P., the *ger sodeq*, 'P. of righteousness' (who fully embraced the Jewish religion and were admitted to the enjoyments of all its rites and ordinances), and *ger toshab*, originally a gentile who settled in Palestine and, to obtain the privilege of citizenship, abjured idolatry (these P. conformed in some respects to the Jewish religion, but were allowed only limited privileges). In the early years of the Rom. Empire many Rom. citizens of high rank became P.; and in the eighth century A.D. a large tribe of Tatars, the Khazars, are believed to have been converts to Judaism and to have estab. a Jewish kingdom in

S. Russia, which was destroyed by the Russians in the tenth century.

**Proserpine**, or **Persephone** (Gk. Περσεφόνη), in Gk. mythology daughter of Zeus and Demeter. She was carried off by Pluto, king of the underworld or Hades, who made her his wife, but Demeter, in revenge, refused to allow any fruits of the earth to grow; thus men would have died of hunger had not Zeus intervened and persuaded Pluto to let P. go. It was eventually arranged that she should spend two-thirds (or one-half) of the year with her mother and the rest with her husband Pluto.

**Proskurov**, tn. of the Ukrainian S.S.R., 56 m. N.E. of Kamenets-Podolsk, with an export trade in corn and sugar. Agriculture and market-gardening are the chief industries, but there are also oil-works and potteries. Pop. 40,600.

**Prosody** (Gk. προσωδία), science of versification; that part of the study of language which deals with the forms of metrical composition, including as its two divs. accent and quantities of syllables. See METRE; RHYME; RHYTHM; VERSE.

**Prosopoeia** (Gk. προσωποποιία, lit. face-making), impersonation, or embodiment of some quality or abstraction. Often a figure by which an imaginary or absent person is represented as speaking or acting.

**Prospecting**, see under MINING.

**Prospectus**, see COMPANY AND COMPANY LAW, *Prospectus*.

**Prostate Gland**, large gland, or each of a number of small glands, accessory to the male generative organs. It surrounds the neck of the bladder and the commencement of the urethra in man and other mammalia. In man it is approximately 1½ in. broad and secretes an important factor of the spermiatic fluid. Prostatitis, or inflammation of the P. G. is frequently caused by gonorrhoea and sterility may result. The P. G. is subject to cancer, and sometimes has to be surgically removed. In older men fibrous tissue in the P. G. may impede the flow of urine.

**Prostitution**, sexual intercourse for the sake of gain on the part of a woman. In early civilisations P. was of religious origin and connected with fertility rites, but soon became a means of profit and exploitation. Promiscuity and P. in themselves are evils which can only be checked by educational means and by the gradual acceptance by all nations of high standards of personal and public morality, and by equal moral responsibility being accepted by both sexes for their actions.

The prostitute has, on the whole, been accepted for many years, even during the Christian era, as a 'necessary evil.' This conception is based on a mistaken and now largely discredited belief in the biological necessity of extra-marital sexual intercourse for most males. It has resulted in incalculable physical and spiritual degradation, both individual and national. With few exceptions the prostitute in all ages has been treated as outside the protection of the law and has suffered persecution and exploitation and often physical injury. Shakespeare through King Lear

says: 'Thou rascal beadle, hold thy bloody hand. Why dost thou lash that whore? Strip thine own back. Thou hotly lusts to use her in that wise for which thou whippst her.' He touches the heart of the problem.

In many countries legislation is directed against prostitutes but not against their clients. The Brit. system of moral legislation is designed to protect the young and the helpless against abuse, to prevent public indecency and all kinds of exploitation, and to provide adequate punishment for such offences, but does not include in the category of crime acts of personal and private immorality between mutually consenting adults.

In Great Britain under three Acts of the early nineteenth century, prostitutes are forbidden to solicit to the annoyance of other persons, but this regulation applies to no other women. Prostitutes are also the only persons unprotected by law against sexual exploitation by means of fraud or misrepresentation. Licensees under the Licensing Acts are subject to penalties if they knowingly permit their premises to be the habitual resort of prostitutes. Many legal anomalies exist because of these laws, and present-day conditions demand a careful overhaul of their provisions. Legislation regarding the crimes of procuration and defilement is contained in the Criminal Law Amendment Act of 1885 and later Amendments of 1912 and 1922. The age of consent to carnal knowledge is sixteen years. Brothel keepers, procurers, and men living on the immoral earnings of others, can be punished. On the whole this legislation is successful in punishing and preventing much exploitation of immorality, though it also needs reconsideration.

Practical help for women and girls who wish to leave a life of promiscuity or P. has been for many years the concern of religious and other welfare organisations and is now the subject of international study. Consideration of the problem of male promiscuity, however, lags behind but is nevertheless of urgent importance. Of recent years much has been done to save young girls from P., notably in Great Britain through the Children and Young Persons Act of 1933, which provides for the protection of young people under the age of seventeen in moral danger or in need of care and protection. The recent Children's Act of 1948 gives further power to the state to protect the young. The most callous method of attempting control of P. and its concomitant, venereal disease, is the system of state regulation of P. This system was devised in Napoleonic times and spread rapidly over Europe and to other parts of the world. Briefly, it provides that women who are prostitutes or suspected prostitutes must be on a police register, or live in state-regulated brothels (*maisons tolérées*) and be medically examined for venereal disease at regular intervals with or without their consent. If infected, the woman is detained in hospital till cured, and then returned to her 'work'. If found uninfected, she is given a card marked to that

effect. Under this system, women have no legal status or control over their own bodies, and are completely under the control of the 'morals police' (*police des mœurs*). Their clients are entirely free from all examination or supervision.

An Eng. woman, Josephine Butler, began a campaign in 1864 with the help of famous men and women of many countries, to expose the evils and fallacies of this system. She founded the Association for Moral and Social Hygiene in Great Britain and the International Abolitionist Federation abroad, and was a foundation member of the National Vigilance Association. The facts of the degradation of men and women and of youth, the corruption of officials, the medical absurdity of examination of women only, the false sense of physical security which encouraged and multiplied the use of prostitutes, and finally the proof that the state-regulated brothel inevitably involved the existence of traffickers and *souteneurs* to provide women and girls for the brothels, were gradually realised, and many countries have abandoned the system entirely. France closed the state-regulated brothels in 1946 (though not entirely removing the system). Italy is in process of closing them, and in Europe only Spain and Portugal keep the original system.

Since 1904 many nations have worked together to overcome the scourge of the third-party exploiter and trafficker, and have adopted international conventions, each one further extending protection to actual or possible victims of exploitation and providing for the punishment of the offenders. The League of Nations in 1927 undertook an intensive survey into the problem, which proved beyond all doubt that state regulation of P. encouraged the traffic, and that the traffickers were exceedingly rich and powerful and the network widespread. The United Nations continued the work of the League, and the Fifth Convention for the suppression of the traffic in persons and of the exploitation of the P. of others was in Dec. 1949 adopted by the General Assembly. If this convention is signed and ratified by the majority of nations, it will protect all persons, male or female, of any age, in any country, against any form of exploitation or P., with or without their consent, and will punish those who profit by the immorality of others.

Other conventions concerning obscene pubs, and narcotic drugs, both closely connected with the traffic, have been adopted in the past, and are still under consideration by the Economic and Social Council of the United Nations. The educational and preventive aspect of the problem of sexual immorality, and the danger this brings to the stability of family life, is the subject of careful study by the United Nations, and much information is being collected. The United Nations has granted consultative status to certain non-governmental organisations in this and other fields of work. Among those specially concerned with the problems of P. and traffic in women and children are

the International Bureau for the Suppression of Traffic in Women and Children; the International Abolitionist Federation; the International Council of Women; Fédération Internationale des Amies de la Jeune Fille; Association Catholique Internationale des Œuvres de Protection de la Jeune Fille; Union Internationale des Ligués Féminine Catholique; World Y.W.C.A.; Liaison Committee of Women's International Organisations; World Alliance of Y.M.C.A.; International Alliance of Women; St. Joan's Social and Political Alliance.

A new inquiry into traffic in persons in the Far E. has been contemplated. The appointment of women police in Great Britain and a number of other countries has been of great assistance in the care and protection of women and young people and in preserving order and decency in the streets. In Great Britain men and women have the same duties and powers, but women police are, of course, especially helpful in the questioning and care of women and girl victims or offenders.

The social conscience of men and women, and hence of govs. all over the world, is becoming wide awake to the evils of promiscuity and their stimulation and exploitation by powerful vested interests. Not only cure but prevention is being sought, and no factor is being neglected, either economic, social, or spiritual, national or international. See also VIGILANCE SOCIETIES.

Protagoras (Πρωταγόρας) (c. 480-411 B.C.), Gk. philosopher, b. at Abdera. He was especially celebrated for his skill in the rhetorical art.

Proteaceae, family of trees and shrubs, valuable for timber, found chiefly in Australasia and S. Africa. The prin. genera are *Protea*, *Grevillea*, *Bankisia*, etc.

Protection, in its narrow meaning, is the imposition of a customs duty to impede the entry of foreign goods which compete with home production. In its wider meaning it covers all devices, other than efficiency measures, designed to protect or expand a country's trade and industry (including shipping, banking, and all other services). P. again may be regarded as any practice outside the free trade (*laissez-faire*) doctrine that trade should be free to find its own levels, i.e. that it is to the interest of each and every nation that trade should be uncontrolled by tariffs, bounties, quotas, or similar restrictive arrangements.

The Free Trade case is that to maximise the world's wealth it is necessary to let the principle of specialisation operate to the fullest extent and that this is only possible if all barriers to trade are swept away, including barriers to the movement of men and capital. Under conditions of unrestricted competition the free-trader sees an ideal pattern of world trade. Wherever a trade or an industry is established, he knows it to be situated in the best possible place, having regard to natural resources, supply of suitable labour and proximity to markets; its less efficient competitors, necessarily charging a higher price, having

been forced out of business. As conditions change, owing to public taste, inventions, discoveries, improved transport, etc., estab. firms and industries may lose their competitive advantage, yield place to others, and have to turn to alternative employment. Everywhere only the lowest-cost firms will remain in business, and a lowest-cost highest-efficiency world is a world of maximum wealth, permitting the highest standards of living. Since Free Trade gives this ideal pattern of trade and industry it follows that any interference with freedom to trade, any measure of P., must distort the ideal pattern, i.e. must reduce the field of maximum efficiency and wealth. The Free Trade argument applies not only to the world as a whole, but to any part. While the Free Trade country in a protectionist world cannot hope for maximum prosperity, yet freedom of trade on its part will give it the best possible trade pattern in the circumstances, the highest standard of living possible in a misguided world. The foreigner's tariff against cheap goods worsens the pattern of world trade; he harms himself and his supplier; but further tariffs can only make matters worse. The protectionist world for reasons of its own restricts world trade by shutting out cheap imports; that is no reason why the Free Trade country should restrict trade still further and refuse to take the utmost advantage of cheap production abroad.

While Free Trade theory is attractive, the fact that P. is practised on all hands suggests that the Free Trade case may have its flaws. Free Trade in theory at least seems admirably designed to produce the last ounce of efficiency and extract the last ounce of wealth from the world's resources; but it may be objected that the world to-day is less concerned with a system of trade that allows the minor inefficiency of the worker achieving something less than maximum production and more concerned to have a system which shall eliminate the gross inefficiency of the worker, over long periods, producing nothing at all. Unemployment and its elimination is the outstanding economic problem of this generation and Free Trade is likely to be judged by that test. A Gallup poll in 1949 showed an overwhelming preference for security in employment as against a higher wage. Free Trade frankly accepts the view that progress involves continual change, and that change, far from being resisted, should be met by prompt adaptation. Thus with P. ruled out, an industry driven out of its markets by foreign competition has no alternative, when wages and profits cannot be (further) reduced, but to find other kinds of employment; the skilled specialised labour must be ready to adapt itself to new trades, the factory or other capital must be adapted or scrapped. Undue resistance to change on the part of trade unions, employers' combinations, etc., may cause chronic unemployment, and is incompatible with Free Trade policy. The Free Trade country welcomes the fruits of efficiency from whatever quarter they

come, and promptly proceeds to make what adjustments are involved. If it is not prepared to adjust then Free Trade may be the worst of policies. Against the vagaries of dumping Free Trade has no defence.

In the time of Adam Smith England was much nearer perfect competition than she is to-day when trusts, unions, and combinations of all kinds render competition highly 'imperfect.' Planning, Socialist or other, everywhere replaces the 'invisible hand' of *laissez-faire*, whose benevolent efficiency transmuted, or was thought to transmute, the self-regarding interest of the individual into the general economic interest of the community. For Adam Smith the typical capitalist was the man who advanced the cost of materials and subsistence to workers engaged in home industries; and he saw little difficulty in men changing their jobs under economic pressure. To-day the contraction of one industry and the expansion of another means heavy loss both in capital and in labour skills. If the direction of change is seen as inevitable, if major efficiency is not to be sacrificed to the *status quo*, the question must nevertheless arise whether it is not worth while to try and mitigate the loss. If the decline of an industry can be slowed down, by tariffs or otherwise, the labour problem may be greatly eased, and there may be similar advantages in delaying the scrapping of capital. If, on the other hand, it is claimed that an industry must be protected permanently because there is no alternative work the general answer is that progress and efficiency involve change, and that there is always other work to turn to. Spare workers invite new enterprise. Trade, moreover, is always possible between two countries, even if, to take an extreme assumption, the one can make every type of article more cheaply; since as Ricardo showed it would be profitable (transport costs apart) for the cheaper country to let the dearer country make those things in which its inferiority was least.

The Free Trader tends to rely unduly on the principle that 'imports make exports.' After the Second World War it is clear that imports do not make exports, since the U.S.A. has a 'chronic favourable balance of trade with the rest of the world bending its energies to secure 'scarce dollars.' It is true that after the war there are some special difficulties, but that does not mean that imports and exports balance automatically in normal times. If there was a balance in former days it was because there was machinery working to that end. If there was a balance of trade under the gold standard it was because countries with plus or minus balances each had their part to play. If the United Kingdom over-imported and paid the excess with gold instead of with goods, then there was a balance of payments; but with trade tending to a lower level. Continued payment for imports with gold instead of goods meant deflation and unemployment, leading to lower costs and so to increased exports. Protracted

opposition to wage reduction might, however, delay adjustment indefinitely. Meantime in the plus country inflation based on the extra gold was increasing imports and diminishing exports. Free exchange has its prompt balancing mechanism; but even with free exchange the dictum 'imports make exports' is only half true. An excess of imports reduces the exchange value of the pound, and so boosts exports by making them cheaper; but that is only half the effect, the other half-effect is to reduce imports by making them dearer. The protectionist may properly point out that the tariff-cum-bounty effect of free exchange spreads its benefits under Free Trade to all trades alike, whereas actual tariffs and bounties can be made to concentrate assistance on industries that most need help. The gold standard is 'cruel to be kind.' Unemployment and wage reductions are its normal agents of adjustment. Free exchange, on the other hand, allows money wages to remain intact and, besides providing free trade with a rough and ready tariff-cum-bounty, opposes no barrier to adequate (or indeed inflationary) internal spending in the cause of employment and business activity; while at the same time interposing a barrier to the dissipation of that spending abroad. The International Monetary Fund and the Havana Charter provide for adequate spending by all countries together; but meantime the policy of reciprocity or bilateralism, by ensuring that imports do make exports, by using imports as a bargaining counter to ensure exports, can also claim to conserve the effects of a spending policy. Bilateralism is an expression of planning, and may be achieved not only with tariffs, but notably with exchange control, quotas, gov. bulk-buying, etc. Planning marches with Socialism, but the gov. claimed (Cmd. 7572) that it had to 'embark on a system of bilateral agreements . . . to . . . counter any downwards spiral in international trade.' ('Downwards spiral' implies a tendency to balance but at lower and lower levels; it is not enough that imports and exports should balance.)

Free Traders commonly contrast the advantages of free multilateral trade with the opposite extreme of self-sufficiency. A greenhouse orange is adduced to show the folly of P. In fact, however, if free trade policy represents a country's 'ceiling' in international trade practice the 'floor' is not self-sufficiency, but a policy of reciprocal pacts which, while it may not always give the choicest and cheapest orange, will at least involve no question of a greenhouse product. Much international trade is, in fact, between neighbours or otherwise bilateral. Wider than the bilateral pact is the regional pact. A large low-tariff or Free Trade area may be seen as an approach to world free trade or as a happy mean between under- and over-specialisation. The world that made England rich was a world which gave food and raw materials for her manufactures and services; that world is shrinking; 'Empire Free Trade' or other reciprocal arrangements might arrest or modify the process.

A regional pact for W. Europe is at present (1950) under consideration.

Both the Organisation for European Economic Co-operation and the United Nations trade arrangements and proposals pay great respect to the principle that change should be suitably delayed and cushioned. That seems to be the essence of the case for the P. of committed capital and skills: to slow down and cushion necessary change, not merely because brusque methods are harsh but, having regard to the loss entailed in sudden change, in order to maximise wealth. Even where a case for maximum wealth is not fully made out some degree of P., perhaps semi-permanent, may well be called in to maximise well-being, with due regard to man's high appraisal of security. Such a policy of slowing and cushioning necessary change seems to go as far as practicable towards meeting the much-expressed demand that wages and standards of living should be (permanently) protected. To protect high costs as such would mean the greenhouse orange and the end of international specialisation. At the opposite pole from P. for decaying industries is P. for 'infant' industries, the well-known exception adumbrated by J. S. Mill and the most notable of a number of exceptional cases allowed by Free Traders. On economic grounds a new industry qualifies for P. if it has a good prospect of dispensing with P. after an initial period during which it is sheltered from the price-cutting of old-established rivals. The infant industry argument may be extended. Suppose the world adopts all-round Free Trade at a time when one particular country has estab. a marked predominance in manufs. Having regard to the difficulties incurred in establishing new industries against fierce competition, those of the rest of the world might remain predominantly agric., and extractive for a prolonged period. In these circumstances the terms of trade would be heavily in favour of the manufacturing country; so much so that the agric. and mining countries might well be substantially poorer than under a system of P. In fact, when the United Kingdom was turning to Free Trade in the first half of last century it was predominant in manuf., and there was a great expectation that the world would follow its lead. Other counsels, however, prevailed. It was, above all, Adam Smith's great Ger. critic, Friedrich List (1789-1846), who insisted that for other countries to adopt Free Trade when Eng. manuf. was predominant would pin that predominance on them indefinitely. List saw England as the man who 'kicks away the ladder by which he has climbed.' He was in no two minds about her debt to P.: 'The island kingdom borrowed from every country of the Continent its skill in special branches of industry, and planted them on English soil, under . . . protection. . . . Once possessed of any one branch of industry, England bestowed upon it sedulous care and attention, for centuries. . . . In the Middle Ages trade was regulated and over-regulated, and the mercantile system, which lasted up to the time of

Adam Smith, used tariff and prohibition to secure the precious metals through a favourable balance of trade. But it was not until after Smith had stated the classic case for Free Trade that the modern case for P. began to be formulated. The *Wealth of Nations* was pub. in 1776, and in 1791 Alexander Hamilton stated a case for P. in his *Report on Manufactures* to the U.S. Congress. List's *Outlines of a New System of Political Economy*, urging P. for native industry, was pub. in Philadelphia in 1827. He was then a refugee from Germany, where in 1841-44 he pub. his great work, *The National System of Political Economy* (quoted here). List based himself on nationality, 'the intermediate interest between . . . individualism and . . . entire humanity.' Productive power was the aim: it was a short-sighted policy to buy in the cheapest market to-day if you thereby threw away the chance of being your own manufacturer to-morrow. He considered that food and raw materials needed no P., and that Eng. manufs., fully estab., as they were, needed none either. What did call urgently for P. were the manufs. of immature countries like Germany and the U.S.A. From a report (1816) to the U.S. Congress, he cites Lord Brougham as recommending the sale of Eng. manufs. under cost 'in order to stifle in the cradle the foreign manufactures.' The great and powerful nation was one exchanging the raw produce of tropical and colonial lands against the products of her factories, and List quoted Lord Chatham's declaration that the Amer. colonies ought not to be permitted to make so much as a horse-shoe nail. At the same time he stressed the advantage of native manufs. to home agriculture.

The United Kingdom had turned definitely to Free Trade before the middle of the century; but after a period of hesitation Germany and the U.S.A. took the advice of List and the Amer. protectionist, Henry C. Carey, and instead of following suit proceeded to build up their industries behind tariff walls. Long before the end of the century Germany and the U.S.A., followed later by Japan, were making their competition keenly felt. After the early seventies exports per head, which had nearly doubled twice over since 1840-1844, began to decline, giving rise in the 1880s to the 'Fair Trade' controversy, and in 1903 to Joseph Chamberlain's Tariff Reform campaign, calling for P. and Colonial Preference. The United Kingdom could not expect to keep its early predominance for all time, but, in fact, it was not playing the free trade game. A Free Trade country must be a quick-change artist, and trade unions and employers' combinations were helping to make change a slow business. The whole trend over the last hundred years has been against flexibility—combinations of all sorts on the part of both employer and employee—and finally Socialism and planned trade. The First World War and slump of 1930-32 brought measures of P. in the United Kingdom, the slump intensifying protective measures throughout the

world. Since the Second World War there has been little talk of Free Trade and P., and much talk of multilateralism and bilateralism; and the world looks to international conferences to settle its trade affairs. Planning is the order of the day, whether socialistic or other; and no one proposes Free Trade forthwith as a cure for the present economic ills. International machinery professes to aim at freer trade, if not Free Trade, at multilateral trade as against bilateral trade; but no one suggests that *laissez-faire* (with fixed exchanges) will make imports equal exports, and the great objective of almost every nation is to balance trade. Free Trade involves an act of faith, a plunge into deep water: the nations to-day, with trade patterns distorted by war, and with memories of the ups and downs of trade even in normal times, prefer not to get out of their depth. In 1949 *sec. Organisation for European Economic Co-operation* countries were 'excluded on balance of payments grounds from the benefit of the United Kingdom relaxations' of quantitative control on imports. Convertibility of the £ is a step in the direction of freer trade, but its failure in 1947 served to demonstrate that it must follow, not precede, a balanced trade.

Free Trade presupposes peace. The early Free Traders saw that Free Trade would render the nations of the world interdependent and held that such interdependence would be a powerful deterrent against war. In fact, even in the absence of all-round Free Trade there was nevertheless a high degree of multilateral trade in 1914, when the outbreak of the First World War shattered the delusion that economic interdependence would prevent a general war. In a fully free-trade world specialisation would tend to go to greater and greater lengths, with greater and greater efficiency, and higher and higher standards of living; but in a world subject not only to war but also to mass unemployment such specialisation can be highly precarious. If, war apart, Free Trade to-day has a future as against P., it is because the United Nations organisation is out to remedy the great weakness of international trade; the ever-present danger that a slump in one country may be communicated to all. The United Nations aim at measures to prevent a slump in each and every country, individually and collectively. With such machinery, and a prompt willingness to accept the implications of changing conditions, something like the ideal Free Trade pattern of world trade could emerge from the distortions of war. It is another matter whether, having regard to high capitalisation and highly specialised labour skills, it would not pay the nations better to slow down the rate of accepted change. High capitalisation has its own case for P. Where high output is essential to low-cost production it is a manifest advantage, dumping apart, to have a secure home market, plus access to foreign markets.

Since post-war international conferences have shown such a high regard for the need to avoid abrupt transition it seems a

safe assumption that in fact the prospect of anything like world Free Trade is remote. In Dec. 1949 five economic experts presented to the United Nations their report, *National and International Measures for Full Employment*, on the means of implementing the United Nations' unemployment pledge. The report insists that the maintenance of full employment is vital to international trade, and recommends, *inter alia*, (1) the integration of all national trade policies; and (2) an arrangement by which a nation, heading for a slump, and reducing its imports, would, nevertheless, pay as for unredressed imports. Such a 'super-plan' as (1) is the antithesis of *laissez-faire*, and without two wars so great a departure in the course of a century could hardly have been proposed. In (2) the experts affirm that a pay-in-full-anyhow arrangement is the 'only possible way' to prevent cumulative contractions of world trade. The idea may well prove to be of the first importance for the automatic balancing of trade. The gold standard and the free exchange both have their automatic machinery for making imports equal exports, and the Bretton Woods system of fixed exchanges would have its own automatic machinery if this 'gift' idea were applied, with due safeguards, to all persistent export surpluses.

Free Trade and free enterprise are animated by the spirit of competition—P. and Socialism by the spirit of regulation and planning. Each principle has its merits, and it may be that the coming years will see an increasing acceptance of approximate demarcations between free enterprise and Socialism in the national sphere and between Free Trade and P. in the international sphere; demarcations which, subject to military and political exigencies, will give an approach in each case to the greatest common measure of advantage. *See also* CUSTOMS DUTIES; DUMPING; ECONOMICS; FREE TRADE; IMPERIAL PREFERENCE; MERCANTILE SYSTEM; SAFEGUARDING; TARIFF REFORM; TARIFFS; TRADE.

**Protection of Ancient Buildings, Society for the**, founded in 1877 by Wm. Morris, Burne-Jones, Ruskin, and other distinguished men of that generation interested in art and letters. At first their energy was directed to check the custom of restoration of anct. buildings, and particularly of churches; for at that time a reproduction of what was thought or known to have existed was held to be of greater value than the damaged original.

As years have passed, the society has become more and more one which is consulted by architects, public bodies, and private persons for advice on the preservation of old buildings of all kinds.

**Protection of Ancient Monuments, Act for.** This Act enables the owner of any anct. monument to which this Act applies to appoint the Commissioners of Works as guardians of such monument. The commissioners are also empowered to purchase anct. monuments, and to appoint inspectors to report on the best mode of preservation. The anct. monuments to which the Act applies will be found specified in the schedules to the Act. In England some of the most notable are Stonehenge, Old Sarum, the dolmen (Devil's Den), near Marlborough, Uffington Castle, Long Meg, near Peurith, and other stone circles, Kils Cotty House, and Banbury Castle. In Scotland, the Brit. walled settlement enclosing huts at Harefauils, the vitrified fort on Noth Hill, the pillars at Kilmadine, the Pictish towers at Glenelg, and the cairns at Minnigaff. In Ireland, various earthworks, cists, tumuli, cairns, and mounds in Meath, Sligo, Donegal, and Down. Provision is also made in the Town and Country Planning Acts for the safeguarding of anct. buildings and monuments.

**Protective Colouring, see COLOURS OF ANIMALS.**

**Protector,** title formerly bestowed in England upon the person to whom was entrusted the care of the kingdom during the king's minority, e.g. Lord P. Somerset during the minority of Edward VI. The Privy Council appointed such Ps. Cromwell assumed the title of Lord P. by way of analogy, though in reality he wielded the power of a monarch.

**Protectorate,** indefinite term denoting primarily and historically a state which being *prima facie* independent has surrendered part of its rights to the protector, the presumption being that in all other respects it remains independent. In this sense the term may be exemplified by the status of the Brit. P. of Egypt announced on Dec. 17, 1914, when the Brit. Gov. adopted all measures necessary for the defence of Egypt and the protection of its inhab. and interests, and then, in March 1922, determined its P. and declared Egypt to be a sovereign independent state. In this sense of the word, a distinction must be drawn between states under protection and those under suzerainty. A state under suzerainty is one which being part of the suzerain state has acquired certain of the attributes of international independence, the presumption being that in all other respects it remains dependent. The position of the state under suzerainty does not differ in international theory from that of an individual state in a federal system; but since the dissolution of the Holy Rom. Empire in 1806 states under suzerainty have become rare; although examples are provided by Korea, which was under the suzerainty of China until the war of 1894-95, and by Egypt when under Turkish suzerainty.

To-day, however, the term P. is gener-

ally used to describe those assumptions of limited control over, without actual occupation of, the ter. of uncivilised tribes, which are a notable feature of the modern partition of Africa. Theoretically sovereignty remained with the protected state or tribe, and the conception underlying the theory of a P. depended for its operation on the protecting power finding a strong political organisation in existence, and where, as in Bechuanaland (1890), no such conditions existed, the theory broke down. A P. in this modern sense is a kind of guardianship, frequently of a backward people by a more advanced race, and recognition of the P. relationship on the part of third states is necessary to enable the superior state to represent the protected state in its foreign relations. Complete annexation has generally followed the proclamation of a P., and mostly in the interests of the protected country. Brit. Ps. include E. and W. Aden Ps.; the strip of land, including Zanzibar, now included in the Kenya Colony and P. and formerly known as the E. African P.; Bechuanaland; Nigeria (as distinct from the colony); Nyasaland; Sierra Leone (as distinct from the colony); Somaliland; Uganda; the Brit. Solomon Is. P.; and the Brit. protected Malay states of Johore, Perak, Selangor, Negri Sembilan, Pahang, Kedah, Kelantan, Trengganu, and Perlis, now forming the greater part of the Federation of Malaya. The international status of Ps. in uncivilised regions is recognised in the sixth chapter of the general Act of the African Conference of Berlin, 1885. International law recognises the exclusive claim of the protecting state together with the correlative duty of responsibility for the security of the subjects of other states within the protected area. It is also the better opinion that native subjects of a protected area, when they are temporarily in other ter., are to be regarded as subjects of the protecting state. But in Brit. Ps. the natives are not Brit. subjects but merely 'British protected persons'; in all other respects, administrative and social, these Brit. Ps. are indistinguishable from colonies proper. Even in the most backward P. Brit. colonial policy now realises that the status of self-government should be the ultimate aim.

Where a state, though under protection, has not formally abrogated its control of foreign policy, it is not strictly a P. This was the position of San Marino, which was once under the protection of the pope and later of Italy; and, similarly, of the principality of Monaco. By a treaty of 1918 between France and Monaco, France guaranteed the political independence of Monaco, while Monaco, for her part, agreed to organise her internal economy in conformity with that of France. Inasmuch as there can be no P. without a protecting state, some jurists considered that the free ter. of Danzig before the Second World War was not a P., for though Danzig was under the protection of the League of Nations, the latter, of its nature, could not be a protecting state. Again, mandated ter. were not Ps.

In March 1939 Hitler proclaimed Bohemia and Moravia a P. of the Ger. Reich, von Neurath being made protector. This P., and others which Germany estab. in countries which she overran during the Second World War, never gained recognition by any of the allied nations, and the methods by which Germany governed them bear little resemblance to those generally recognised as signifying a P. (see above). Ps. in the sense of ex-mandated territories, are placed under United Nations' supervision through individual trusteeship agreements. Other colonial Ps. belonging to the overseas empires of the administering powers are not under such supervision. Thus Tanganyika, Fr. Cameroons, and W. Samoa are under supervision by the Trusteeship Council, but not Nigeria, Uganda, N. Rhodesia, or the Brit. Solomon Is. P. See COLONIAL TRUSTEESHIP; TRUSTEESHIP COUNCIL.

Proteins, complex organic substances forming the most important part of animal and plant cells. They consist approximately of carbon 50-55 per cent, hydrogen 6.9-7.3 per cent, nitrogen 15-19 per cent, oxygen 19-25 per cent, sulphur 0.3-5 per cent, and occasionally phosphorus. Their molecular weights are large (and for the most part uncertain), and, as a result, P. are colloidal in nature. They are (with a few exceptions) non-crystalline and insoluble in water (except to form 'colloidal solutions'). They are optically active, levorotatory. Many of them can be 'salted out' from 'solution' by the addition of salts, etc. They can be coagulated by boiling with water, and by the agency of alcohol. P. respond to several colour tests such as the *Biuret Reaction*, a test carried out in alkaline solution by the addition of copper sulphate, when a pink colour results. The *Xanthoproteic Reaction* depends on the formation of a white precipitate with nitric acid, which turns yellow on boiling, and orange when caustic soda is added. Other tests are *Millon's Reaction*, *Molisch's Test*, the *Glyoxylic Reaction*, etc. (q.v.).

P. are classified thus: (a) *Simple Proteins*: Protamines, histones, albumins, globulins, scleroproteins, glutelins, peritins, gliadins. (b) *Conjugated Proteins*: phosphoproteins, hemoproteins, nucleoproteins, mucoproteins. (c) *Protein derivatives*: peptones, peptides, proteoses, metaproteins, amino acids.

A few examples of common P. are egg-albumin, caseinogen (a phosphoprotein present in milk), haemoglobin (a conjugated protein in blood), salmin (a protamine in salmon roe), gelatin (a scleroprotein). No animal can live if P. are withdrawn from its diet. But different P. possess very different efficiencies or 'values.' These values depend on several things, e.g. ease of digestion; amount of amino acids produced, etc. In the process of digestion, the P. are split up into peptones, and these into amino acids; the products are carried away by the blood stream to the tissues, where they help to build up new tissues and replace worn-out cells. Any excess is converted by the liver into urea, which is sent to the kid-

neys for excretion. See FOOD AND FEEDING; BIOCHEMISTRY.

Proteles, see AARD-WOLF.

Proteusilaus (Πρωτεσίλαος), son of Iphiclus and Astyoche, celebrated in ant. mythology for the strong affection existing between him and his wife Laodamia (q.v.). He was the first of the Gks. to be killed by the Trojans, being the first to leap upon the Trojan coast.

Protestant Episcopal Church, Amer. episcopal church in communion with the see of Canterbury. It was introduced into Virginia on the arrival of the first Eng. colonists, in 1607. When the revolution began it had gained a foothold in almost all the colonies. It was still, however, under the jurisdiction of the bishop of London, and had no resident bishops. The movement to gather together under one constitution all the adherents of the episcopal form of government in America began in 1784, but an attempt to secure the consecration of Rev. Samuel Seabury by the Eng. bishops failed on account of some legal difficulty. The consecration was, however, carried out by the Scottish bishops. Three years later the archbishop of Canterbury consecrated Provost and White bishops of New York and Pennsylvania respectively. The P. E. C. corresponds to the Church of England in this country, and while independent of it, there is an intimate fellowship in its administration and form of service. It was founded largely through the efforts of Thomas Bray in Maryland in 1701 as a result of his work in connection with the Society for the Propagation of the Gospel in Foreign Parts. All parts of the U.S.A. are covered by its organisation. There are seventy-four dioceses, eighteen missionary dists. in the U.S.A., and eleven abroad. The government of the church is directed by a general convention which meets triennially, consisting of a House of Bishops and a House of Deputies. In 1919 a national council was formed to act during the times when the convention was not sitting. There have been considerable revisions to its Prayer Book in 1789, 1892, and 1928; but it is modelled closely on the Book of Common Prayer used in the Church of England. There are over 2,378,000 members. The office of the National Council of the P. E. C. is at 281 Fourth Avenue, New York.

Protestantism, term generally but somewhat inaccurately applied to all those who adhere to the principle of the Reformation, whatever may be the differences between them in order or doctrine. The origin of the term is this: At the second Diet of Speyer, in 1529, a decree was received from the emperor forbidding all further action in the direction of reformation until a general council should have met. The decree received the sanction of the Diet, but a solemn protest against it was made by the reformers. This protest, which was not a theological protest, but a legal and ethical one, was joined in by those princes and cities who favoured the Reformation, and hence the term came into general theological use. At first P. denoted the position of the

Lutherans as opposed to both Catholics and Zwinglians. Throughout the second half of the sixteenth century the various groups of reformers were almost as bitter towards each other as towards Rome. It was only through the calamities of the first part of the Thirty Years war (1618-1624) that they learned to unite under the common name of P. In England, until the end of the seventeenth century the term P. was opposed rather to Puritanism than to Catholicism, but since then it has remained the watchword of those who refuse obedience to Rome. See C. T. Bettany, *History of the Reformation and Modern Protestantism*, 1895; J. P. Lilley, *Principles of Protestantism*, 1898; H. Hoffman, *Der neuere Protestantismus und die Reformation*, 1919; P. Tillich, *Protestantismus als Kritik und Gestaltung*, 1929; W. R. Inge, *Protestantism*, 1935; L. Lambinet, *Das Wesen des katholischen-protestantischen Gegensatzes*, 1946; and E. Brunner, *Christianity and Civilization*, 1947.

**Proteus** (Πρωτεύς), in Gk. legend, subject of Poseidon, whose flocks he tended. He was accustomed to come out of the sea at midday and recline in the shadow of the rocks with the monsters of the deep around him, and if any one wanted to know about the future he had to seize him at that time. But it was necessary to be wary, for P. assumed all sorts of shapes in order to escape prophesying, but when he found all his artifices useless he resumed his proper shape and foretold the future (see Homer, *Odyssey*, iv.; Virgil, *Georgics*, iv.).

**Proteus**, typical genus of the family Proteidae, contains amphibians of the order Urodela (i.e. tailed forms); the three species are commonly known as olms. In length they are about one foot, and in colour they are white when in darkness, with red gill-bunches but in the light they become black. The eyes are completely covered with skin, and their habitat is confined to the subterranean waters of Carniola, Dalmatia, and Carinthia. The fore limbs end in three fingers, the hind limbs in two toes. Spawning takes place in April, and the eggs are fastened singly to stones. *P. anguinus*, the olm, is the best-known species.

**Prothallus**, **Prothallium**, or **Gametophyte**, sexual stage of ferns and other cryptogams. The spore, after germination, gradually forms the P., a small green semi-transparent, somewhat heart-shaped scale about 1 cm. in diameter, attached to the soil by root hairs. It bears on the under side a number of pimple-like projections, antheridia, or male organs, and close to the indentation of the heart a cluster of teat-shaped bodies, archegonia. These are the female organs, and each contains an egg (ovum or oosphere). Numerous minute free-moving male gametes (antherozoids or spermatozooids) are liberated from the ripe antheridia, and fertilise the eggs in the archegonia. The fertilised egg (zygote or oospore) develops into a young fern plant, which remains attached to the P. for a time.

**Protoactinium**, metallic chemical element of highly radioactive character; little is yet known about it. Symbol Pa, atomic number 91, atomic weight about 235.

**Proto-Anatolian, Proto-Indo-European, and Proto-Indo-Hittite languages**, see under INDO-EUROPEAN LANGUAGES.

**Protocol** (Gk. πρῶτος, first, and κόλλα, glue, a sheet glued to the front of a MS. and bearing an abstract of the contents and purport), rough draft or original copy of a gov. dispatch, treaty, or other document. For Geneva P. (1921) see GENEVA PROTOCOL.

**Protocols of the Elders of Zion**. In tsarist Russia antisemitism (see ANTI-SEMITES) took the form of 'pogroms', i.e. attacks against the Jews, instigated or connived at by the gov. During the pogrom in Kishinev, 1903, a short form of the protocols appeared in the Russian newspaper *Znamia*. In 1905, the P. were pub. in full in book form ('edited' by Sergei Nilus); they were repub. in 1907, and were later (especially after the First World War) trans. into Ger., Fr., Eng., It., and other languages. The P. are supposed to be an authentic report of twenty-four or twenty-seven secret meetings of Jewish elders, who at the first Zionist congress, held in Basle in 1897, conceived a terrible conspiracy to blow up the major caps. of Europe (using for this purpose the underground railways), to destroy the Aryan race and Christian civilisation, and to erect a Jewish freemason world-state. The slanderous forgery was proved by eminent journalists (such as P. Graves in *The Times*, Aug. 16, 17, and 18, 1921) and historians (such as Burtsev and Curtiss), as well as by law courts in S. Africa and Switzerland. Graves proved a literary dependence of the P. on a polemic booklet of M. Joly against Napoleon III. The foundation, in 1880, by Adolphe Crémieux, a Fr. minister of justice, of the Alliance Israélite Universelle, seems to have been one of the pretexts of this spurious document. See J. S. Curtiss, *An Appraisal of the Protocols of Zion*, 1942.

**Protoevangelium Jacobi**, or **Gospel of the Infancy**, anc., apocryphal gospel attributed to S. James the Less, but dating in its original form probably from the second century with later additions. It is an interesting witness to the early cultus of the Blessed Virgin, though certain passages suggest its Ebionite and Docetic origin. The name P. or *Ur-evangelium* is also given to a hypothetical narrative supposed by some to have formed the basis of the synoptic gospels. See A. Harnack, *Geschichte der Christlichen Literatur bis Eusebius*, 1893-1901.

**Protophages** (Πρωτοφάγες) (fl. 330-300 B.C.), Gk. painter, b. at Caunus in Caria, but spent most of his time in Rhodes. He was remarkable for the care he bestowed upon his pictures, his masterpiece, 'Ialysus,' having taken him seven years to paint.

**Proton**, unit of positive electricity, a hydrogen atom which has lost its single planetary electron. It is one of the ultimate constituent elements of matter.

Protophyta, name for plants of the lowest and simplest organisation.

Protoplasm, see BIOLOGY and CELL.

Prototracheata, see FERRIPATUS.

Protozoa, great group (phylum) of unicellular creatures, the simplest and most lowly organised of living animals, and of great scientific interest and importance. The P. are divided into four classes: (1) Rhizopodaz, or Lobosa, characterised by the protrusion of protoplasmic pseudopodia (false feet); Amoeba, the Foraminifera, and the Radiolaria (described below) are included here. (2) Ciliata, bearing cilia over the whole, or part, of the body; e.g. *Paramecium* (q.v.), *Vorticella*. (3) Flagellata, with a single protoplasmic whip, or flagellum, used in locomotion; e.g. *Euglena*, and the Trypanosomes, one species of which causes sleeping sickness in man. 4. Sporozoa (q.v.), the members of which are all parasitic in habit, have come within recent years to be of very practical concern, owing to the discovery that such diseases of man as malaria are caused by them. One of the simplest forms of P. is Amoeba, which occurs on the mud at the bottom of fresh-water pools and is barely visible to the naked eye as a tiny white speck. Under the microscope it is seen to be irregularly shaped and composed of protoplasm, a jelly-like material with an external layer, ectoplasm, and an inner, more opaque endoplasm, in which is a round colourless body, the nucleus; reproduction is of the simplest kind, namely div. of the nucleus and then of the surrounding protoplasm. There is no sexual reproduction, so far as is known. Many P., though unicellular, attain a wonderful complexity of structure, and it is suggested that some of them are the most complicated and highly organised cells in the whole animal kingdom. The specialisation is most apparent in the ectoplasm, which commonly becomes stiffened to form a protective pellicle or skin. In the Foraminifera and Radiolaria, it deposits calcium carbonate or silica to form a skeleton, and it is these occurring in immeasurable numbers in the ocean which compose the characteristic deposits. In other P. the ectoplasm projects as threadlike or platelike structures capable of movement, and serving both to propel the animal through the water and to bring food within its reach. Many P. form colonies whose individual cells are usually complete and capable of separate existence; there is little differentiation into cells of different types such as occurs in the true multicellular animals (Metazoa). See 'Protozoa', *Cambridge Natural History*, 1906; and W. F. Barraud, *The Invertebrata*, 1935.

Proudhon, Pierre Joseph (1809-65), Fr. Socialist, b. at Besançon. The son of a brewery workman, he was educated at the college of Besançon, became a printer and proof-corrector, and taught himself languages; in 1838 he was awarded a pension from the Besançon Academy. In 1840 his first important work, *Qu'est-ce que la propriété?* was pub., which contained his famous maxim, 'Property is theft'—*La*

*propriété c'est le vol*; this was followed by *Système des contradictions économiques ou philosophie de la misère* (1846). He settled in Paris in 1847, and occupied himself with revolutionary and socialist propagandas. He was a deputy for the Seine; failed in his foundation of a bank for lending money without interest; escaped to Brussels to avoid prosecution for his attack on the Church, *De la justice dans la révolution et dans l'Eglise*, and died at Passy on his return. P. in his Socialism was an economist and not a politician; his ideal was perfect freedom, equality, and justice, which he found in his conception of political 'anarchy' in its philosophic sense of individual freedom from all rule. He ridiculed the idea of a revolutionary change of society. His ideal was a steady working at the abolition of property, interest, rent, and the other economic factors of estab. society. To him property, like slavery, was the murder of individual freedom. As under the monarchy the king could seize the property of foreigners who died in France, under the *droit d'aubaine*, so the state should treat all property under the same right. A fundamental conception of P.'s was that all labour, mental and physical, of high or low class, should be remunerated at the same scale, on the principle that service pays service, and that time is the criterion of value. See lives by O. A. Sainte-Beuve, 1873; J. Duprat, 1929; and D. W. Brogan, 1944; also J. Bourgeat, *Pierre Joseph Proudhon, père du socialisme français*, 1943; H. de Lubac, *Proudhon et le christianisme*, 1945, and *The Un-Marxian Socialist*, 1948.

Protractor, instrument in the form of a graduated semicircle, used in setting off and measuring angles.

Proust, Marcel (1871-1922), Fr. author, b. in Paris. P. was educated at the Lycée Condorcet. His short life was uneventful. Until forced by asthma to lead the life of an invalid, he was received into the stilted Paris society of the nineties. Retiring to a secluded life, he set to work to portray, with immense creative genius in his retrospect, the society he had quitted. The first part of *À la recherche du temps perdu* was pub. in 1913, but the pub. of the second part in 1919, which was awarded the Prix Goncourt, was more enthusiastically received. P.'s phenomenal reputation, however, has been largely posthumous. His writing exposes and illuminates subtle mental processes in a way that has never been surpassed; his work is unique and he is probably the greatest single influence on the literature of this century. In *À la recherche du temps perdu* the atmosphere is indefinite, and the story incoherent. P.'s attitude to time and place follows that of Bergson; he recalls every detail of his childhood as if the past still existed, and as if events did not happen but exist, i.e. men come to events, they do not occur. P. denies the existence of the human soul, and sees reason or intellect as only an instrument which constructs simply errors and delusions. He believes that the only real substance of human

feeling lies in sensation. Occasionally through the turmoil of sensations comes something possessing a special quality: the physical world falls away and an impression of eternity penetrates into man's feelings. He is able to go back *à la recherche du temps perdu* to find that this penetration of the divine has existed all the time. The delusions of time, space, and self vanish: man is in *le temps retrouvé* and has discovered the meaning of life. His importance does not rest on his philosophy alone: his precision of detail has also attracted much attention. He possesses brilliant psychological insight and shows great artistry in his creation of characters and incidents. His novels have a unique poetic quality, every word being carefully chosen and taking a definite place in his pattern. The various novels of *A la recherche du temps perdu* appeared in the following order. They have been trans. into Eng. by C. K. Scott Moncrieff. *Du côté de chez Swann* (Swann's Way) (1913); *L'ombre des jeunes filles en fleurs* (Within a Budding Grove) (1918); *Le côté de Guermantes* (The Guermantes Way), Part I. (1920); Part II. (1921); *Sodome et Gomorrhe* (Cities of the Plain), Part I. (1921); Part II. (1922); Part III. (1923); *La Prisonnière* (The Captive) (1924); *Albertine disparue* (The Sweet Cheat Gone) (1925). S. Hudson trans. *Le Temps retrouvé* (1927), under the title of *Time Regained*. *Letters to a Friend*, trans. by A. and Elizabeth Hamilton (1950), is a collection of P.'s letters, covering the period 1904-19. See lives by C. K. Scott Moncrieff, 1924; L. Pierre-Quint, 1925; P. Souday, 1927; C. Bell, 1927; U. D. Lindner, 1943; J. Bret, 1946; and C. Blondel, *La Psychographie de Marcel Proust*, 1932; K. Jäckel, *Bergson and Proust*, 1934; S. de Souza, *La Philosophie de Marcel Proust*, 1939; F. C. Green, *The Mind of Proust*, 1949; and H. March, *The Two Worlds of Marcel Proust*, 1949.

Prout, Father, see MAHONY, FRANCIS SYLVESTER.

Prout, William (1785-1850), Eng. chemist and physician, b. at Horton, Gloucestershire. Though his early education had been neglected he took a medical degree at Edinburgh (1811) with a thesis on intermittent fevers. He was admitted L.R.C.P. in 1812 and settled in London. He was one of the pioneers of physiological chem. and discovered (1823) the presence of hydrochloric acid in the gastric juice. But he is chiefly remembered as the originator of 'P.'s hypothesis' (1815), a modification of the atomic theory, which gave an impetus to the exact experimental investigation of atomic weights. It was P. who put forward the theory that hydrogen was the fundamental unit from which all elements were formed.

Provençal Language and Literature. The P. language, also called, improperly, *langue d'oc* (its *ter*, does not correspond to that of Provence) or *limousin*, which refers to the dialects and the literary language of the whole of the S. of France, is one of the group of Romance languages that arose from the Lat. tongue. At the

time when its literature was at its height (twelfth to fourteenth centuries) the P. language was spoken over a considerable extent of *ter*, reaching as far N. as the Loire and from the Alps to the Pyrenees. It was one of the earliest of the Romance languages to develop, and in many most important particulars it differed considerably from the N. tongue, the *langue d'oïl*, which political circumstance has made the official Fr. tongue. It stood, indeed, in much closer connection with Catalan than with Fr., and it is also much nearer to Lat. than the *langue d'oïl*. The chief distinction between the P. language and the language of *oïl* is that the former retains the Lat. *s* of unaccented syllables, while the latter has softened it to *z*. Thus we have P. *bona* = Fr. *bonne*, P. *amat* = O.F. *amet*, modern *aimé*. The P. language ceased to be used for literary purposes by the fifteenth century. After three centuries of existence as a vernacular, a revival took place. This revival has been carried on principally by a society known as the *Félibrige*, the purpose of which is 'to bring together and to encourage those who by their writings preserve the language of the land of *Oc*, and also those scholars and artists who study and work in the interest of this region.' The society was formed in 1854 by seven poets, Joseph Roumanillo, Frédéric Mistral, Eugène Garcin, Théodore Aubanel, Anselme Mathieu, Paul Giera, and Alphonse Tavan. On Garcin's secession, his name was replaced by that of Joan Brunet. The association of the *Félibres* contains poets and writers of the first rank, and they have done much to raise P. to the rank of a literary language. The form of P. which they use is the dialect of Saint-Rémy, though many prefer the language of Limousin, which for a certain period was the *langue* of the troubadours. There is an ann. pub. with a wide circulation in the Midi and sev. of the prin. *tas* have P. periodicals. With many Fr. modifications and local differences the P. dialects linger on in S. France, Monaco, the N.W. corner of Italy, and the N.E. corner of Spain.

The Literature.—P. literature contains the earliest fragment of any of the Romance languages, part of a trans. of Boethius which dates from the late tenth century. This is of interest linguistically, but in no other way. P. literature proper begins in the next century. After a period of great prosperity Provence and Catalonia were united in the early twelfth century under the sovereignty of Raymond-Bérenger, and this union of two peoples speaking almost one language gave a fresh impetus to the poetical spirit which must long have been maturing. P. poetry seems, indeed, to us to have had no beginning, no period of tentative strivings after forms and modes of expression. It is first seen in its maturity. The poetry of the troubadours (*q.v.*) was almost entirely lyrical. Thus almost the whole body of the literature, with a few exceptions, epic works described by Fauriel in his *Épopées chevaleresque au moyen âge*, consists of occasional poems remarkable

for their wit and sentiment. Rhyme is easy, and so, in order to increase the difficulty and the artistic merit of their compositions, the troubadours made use of the most intricate systems of rhyme. But the very excellence of their form makes the work of trans. almost impossible.

The golden period of P. poetry was from 1150 to 1280. Among the famous troubadours of this period may be mentioned Marcubru and the Monk of Montaudon, powerful writers of biting satire; Jaufre Rudel, prince de Blais; Rimbaut d'Orange, with whom one of the best of the women poets, Beatrice de Die, exchanged love songs; Arnaut de Mareuil, whom Petrarch speaks of as 'the less famous Arnaut,' referring here to Arnaut Daniel, whom Dante also regarded as the greatest of the love-poets (*Purg.* xxvi.); Folquet, afterwards bishop of Marseilles; Giraut de Bornell, whom the Ps. themselves have always considered as their greatest poet; and Peire Cardinal, one of the greatest of the satirists. These are but a few out of a long list of more than 400. The decay of P. literature began with the Albigensian crusade, and the close association of the 'heretics' with Provence led to their language being strictly banned by the eccles. authorities. By the end of the thirteenth century the true P. literature was dead.

Provence, maritime prov. of France according to the anc. div. It was bounded on the S. by the Mediterranean Sea, and derived its name from the Rom. prov. of Gaul known simply as *Provincia* (the prov.). It included the modern depts. of Basses-Alpes and Bouches-du-Rhône, together with some parts of Drôme, Vaucluse, and Alpes-Maritimes. The country was a prosperous one, though it had a varied and troubled hist. during the centuries from the death of Lothair (855) until the death of Count Raymond-Bérenger IV. (1245). Its boundaries were continually changing. Its cap. moved from Aix to Arles with Marseilles as another important city. On the death of Raymond-Bérenger IV. the co. passed to his daughter Beatrice; by her marriage with Charles of Anjou it came under Angevin rule. It was during the preceding period, however, under the house of Barcelona, that P. became the seat of that literature which has given the chief celebrity to its name and the chief interest to its hist. The hist. of P. during the later Middle Ages was extremely troubled, and P. was drained of her wealth in wars between her Angevin kings and their enemies. It was claimed at one time by John of Gaunt. Charles, count of Maine, on his death in 1481, bequeathed P. to

Louis XI. of France, but it was not finally annexed to the Fr. crown until the next reign (Charles VIII.). P. kept some privileges, including an assembly of estates which existed into the seventeenth century, and it never became as absorbed in France proper as the other provs. did. P. still retains a most individual character. There are many Rom. and some Hellenic remains around Marseilles. See A. Fabre, *Histoire de Provence*, 1833; T. A. Cook, *Old Provence*, 1905; R. Bernoulli, *Die romanische Portalarchitektur in der Provence*, 1906; E. Camau, *La Provence à travers les siècles*, 1907-30; C. Headlam, *Provence and Languedoc*, 1912; E. Benévent, *Provence*, 1931; and F. M. Ford, *Provence*, 1938.

**Proverb** (from Lat. *pro*, forth, to the world, and *verbum*, word), fragment of folk-literature or, as the Gks. phrased it, 'a wayside saying' (*παροιμία*) embodying a moral lesson or obvious truth. Though, like 'epigram,' it is a word which defies succinct explanation, the essence of its meaning may be gathered from the sum of the following definitions. According to Synesius, Aristotle remarked that 'a proverb is a remnant from old philosophy, preserved amid countless destructions, by reason of its brevity and fitness for use.' Cervantes speaks of Ps. as 'short sentences drawn from long experience'; Lord Russell described them as 'The wisdom of many and the wit of one,' and a profound truth is enshrined in the observation of the Abbé de Saint-Pierre: 'Les proverbes sont les échos de l'expérience.' 'Shortness, sense, salt,' and, be it added, popularity are common attributes of Ps. Sometimes they are alliterative as the Scottish 'Better a toom (empty) house than an ill tenant,' or the It. 'Traduttori, traditori' (Translators, traitors); sometimes they are metrical like the Gk. *ἡδίσταρα μάθιστα* (No pain, no gain). Often they substitute the concrete for the abstract, as in 'The wine-cup drowns more than the ocean,' which is another way of saying that 'More die from drunkenness than drowning,' and often again they embrace a moral apophthegm, as in the biblical 'Whatsoever a man soweth, that shall he also reap,' and the Turkish 'God makes a nest for the blind bird.' Most Ps., moreover, are 'scraps of unfathered wit or wisdom' whose origin is unknown; the stamp of popular approval alone makes a saying, however shrewd, a saw. But exceptions to this are: 'One butcher can face many sheep' which was the comment of Alexander, when his generals described the magnitude of the Persian armies, and also Emperor Ferdinand's retort to his doctor, 'Kaiser bin i' knüdel muss i' haben' (The king shall have his dumplings), which is now universally recognised as amusingly typical of an obstinate man. The same truth will often be found expressed proverbially but variously in different countries. The Gks. equivalent to 'Coals to Newcastle' is 'Owls to Athens'; in the Middle Ages men spoke of 'Indulgences to Rome,' and orientals similarly say 'Pepper to Hindustan.' The Eng. 'gift horse' derives from

a Lat. P. quoted by St. Jerome (*Ep. ad Ephes.*, proem): 'Equi donati dentes non inspicuntur,' as also does the medieval rhyming Lat. hexameter, 'Si quis dat mannos, ne quere in dentibus annos' (If any one gives horses, don't find out their age from the teeth). It has been said that Ps. enshrines national traits; there is a Machiavellian ring about 'Revenge is a morsel for God' which betrays its It. origin, and only an Eastern slave could have invented the subtle counsel; 'Kiss the hand thou canst not bite.' In conclusion it may be observed that adages are as old as the hills, and are common to all languages and people; the Sp. have as many as 30,000, whilst Wander actually estimated the Ger. at 145,000. These concise expressions were especially popular in the Middle Ages and abound in the writings of Cervantes, Rabelais, and Montaigne; but they are in rarer use to-day.

Prin. early collections of Ps. in Eng. are J. Taverner, *Proverbs or Adages out of Erasmus* (1539); J. Heywood, *Proverbs* (1546), and *Epigrams* (1562); J. Florio, *First Fruits* (1578), and *Second Fruits* (1591); G. Herbert, *Jacula Prudentum* (2nd ed., 1640); J. Howell, *Proverbs* (1659); J. Ray, *Proverbs* (1671) (5th ed. 1813); and J. Fuller, *Gnomologia* (1732). See G. W. F. Freytag, *Proverbia* (Arabic), 1838-43; Le Roux de Lincy, *Livre des proverbes français*, 1859; G. L. Apperson, *English Proverbs and Proverbial Phrases*, 1929; and *Oxford Dictionary of Proverbs*.

**Proverbs**, Book of (Heb. *Mishle-Shelomo*, 'Solomon's Proverbs'; Gk. *προιμίαι*; Lat. *Proverbia*), the first and most famous of the Wisdom books (or gnomic literature) of the Bible. In the Heb. Bible it belongs to the third div., called *Ketubin* or 'writings,' and follows the Book of Psalms. It is rich in language, form, and matter. Tradition ascribes the B. of P. to Solomon, whose name is attached to some chapters (i. 1; x. 1; xxv. 1), but according to some scholars it was the custom of the times to borrow the name of some famous man in the past to lend distinction to a new compilation. Ch. xxx. is ascribed to Agur and ch. xxxi. to King Lemuel and to his mother, but nothing is known of either of them. The book is divided by some scholars into five sections (i.-ix.; x.-xxii. 16; xxii. 17-xxiv.; xxv.-xxx.; xxx.-xxxi.), by others into nine parts (xxiv. 23-34 being considered as a separate section, and chs. xxx.-xxxi. being subdivided into four parts). As to its date, the B. of P. is generally assigned to a late post-exilic period (400-250 B.C.), but the close likeness in form of some of the material in P. with the recently discovered Egyptian book of wisdom called the 'Teaching of Amen-em-ope,' and the anct. tradition of the wisdom and the sayings of Solomon (cf., e.g., 1 Kings v. 9-12), show that the B. of P. may well contain reminiscences of Solomon's sayings. The B. of P. is a guide to right-living and purity in the daily round of duties; it is, indeed, confined within the limits of this life's horizon. It condenses in pithy sentences various

forms of evil, its motto being 'Trust in God and do the right.' Like the Book of Job it deals with providential rewards and punishments, but it is occupied with their practical application rather than with their theological significance. Anger, idleness, lustfulness, misuse of the tongue, violent or fraudulent ways of attaining wealth, are held up to reprobation, but the dominant note of P. is insistence on wisdom, regarded as a divine attribute.

Providence, port of entry and cap. of P. co. and of Rhode Is., U.S.A., on Narragansett Bay, 44 m. S.W. of Boston, Massachusetts. It is noted for manufacturing industries, including jewellery, tools, locomotives, firearms, cotton, and woollen goods, mostly along the banks of the Woonasquatucket and Moshassuck. Dyeing, slaughtering, and meat packing are also carried on. P. was founded on commerce, but immigration in the early twentieth century, particularly of large numbers of Its. and Fr., has much altered its traditional New England character. It has many fine public buildings, among them the magnificent new State House, the city hall, a Rom. Catholic cathedral, the Union railway station (1897), Butler Hospital, and Brown Univ. (a Baptist institution, founded 1764). Settled by Roger Williams (1636), it contains Roger Williams Park to the S. Pop. 23,500.

Province, in Rom. hist. meant ter. outside Italy under the administration of a governor or proprietor. The etymology of the word is doubtful, but it was specifically applied to the dist. round Massilia (Marseilles) which, as Rome's first conquest outside the It. peninsula, was known as Provincia and which is still known as Provence (q.v.). Subsequent conquests were also formed into Ps. The Ps. which Cæsar found in existence were fourteen in number: Seven European—Further and Hither Spain, Transalpine Gaul, It. Gaul with Illyricum, Macedonia with Greece, Sicily, and Sardinia with Corsica; five Asiatic—Asia, Bithynia, and Pontus, Cilicia with Cyprus, Syria and Cete; and two African—Cyrene and Aethiopia. To these Cæsar added three new ones by the creation of the two new governorships of Lugdunensæ Gaul and Belgica, and by constituting Illyricum a separate P. Subsequently Britain was added. The word P. is now used for the regions or dists. which go to form a federation, in which meaning it is obviously almost interchangeable with state—thus the constituent political divs. of the Canadian federation are called Ps.; but those of the commonwealth of Australia are called states; while the constituents of India are still (1950) known as governors' Ps., though some of them, e.g. Bihar, W. Bengal, are now under the new constitution, styled states or member-states of the union of India. Before the Fr. Revolution the word P. was used for the many famous historic dists. into which France was divided before the system of depts. took their place (see FRANCE, Population). The political divs. of Belgium, Holland, Spain, and many other

unitary states are also known as Ps. For eccles. purposes England and Wales are divided into three Ps. Canterbury, York, and Wales, each being under the jurisdiction of an archbishop or metropolitan.

Provinces Wellesley, Brit. colony since 1793, on the W. coast of the Malay Peninsula, formerly part of the crown colony of Penang in the Straits Settlements. It averages 8 m. in width and 45 m. along the coast. The prov. is extensively cultivated. Rice, sugar, pepper, tobacco, rubber, tapioca, spices, and coco-nuts are produced. P. W. fell to the Jap. in Jan. 1941, but was recovered on the Jap. surrender in 1945. After the Second World War it was included in the Malayan Federation. Pop. about 120,000.

Provins, tn. in the dept. of Seine-et-Marne, France, 58 m. S.E. of Paris. It has some fine specimens of Gothic architecture and is noted for the cultivation of roses. It was known as Prævium in Rom. times, and was an important medieval city. Pop. 8900.

Provision (law), in the reign of Henry III., besides the older forms of legislation by charter and assize, that of Ps. was added, e.g. the Ps. of Oxford or ordinances for checking the king's misrule drawn up by the barons under Simon de Montfort in 1258, and those of Westminster, 1259 (re-enacted as the Statute of Marlborough, 1267), exempting knights from jury service, limiting the right of distraint, checking abuse of wardship and succession, etc. From the reign of Edward I. legislation was by statute and ordinance. The word P. now means simply a legal or formal statement providing for something, as in the clauses of a statute. A proviso is a qualifying clause in any legal document by which a condition is introduced, generally beginning with the words 'provided that,' or a conditional stipulation affecting an agreement, contract, or grant. Where there is a conflict of meaning between a P. in a statute and a clause in a schedule to the Act, the P. prevails as being a part of the operative clauses of the Act. See also INTERPRETATION ACT.

Provisional Order. P. Os. are issued by gov. depts. when a local authority promotes a private Bill. Before granting the order the dept. to whom application has been made for it may hold a local inquiry into the matter, and cause full provision to be made for serving notices upon all persons or bodies interested. The Confirming Act (where required) is obtained by the dept. itself if the Bill based on the P. O. is unopposed; if opposed the Bill must be supported by the local authority at their own expense. P. Os. can only be made when a statute has been passed which specifically empowers a minister to issue them. They therefore may be regarded as an example of delegated legislation, but are really part of the central authority's pre-legislative work, for they are only provisional unless Parliament has passed a Provisional Orders Confirmation Act, giving the force of law to a number of them simultaneously. In the case, however, of a P. O.

for a reconstruction scheme under the Housing Acts, confirmation is not necessary unless it is proposed to take lands compulsorily.

Provisions of Oxford, see under MONTFORT, SIMON DE, EARL OF LEICESTER.

Provisors, Statute of. This, a celebrated statute which was passed in 1350, was the culminating point of the remonstrances against the papal pretensions to the disposition of eccles. benefices, and, in particular, against the making of provisions or reversionary grants during the lives of incumbents. It maintained the rights of patrons, and threatened all who procured promotion by papal provision with forfeiture and banishment. It was frequently re-enacted in consequence of no less frequent evasions, and later was strengthened by the Statutes of Praemunire (q.v.).

Provo, city and co. seat of Utah co., Utah, U.S.A., 39 m. S.E. of Salt Lake city. Its chief manufs. are woollen goods and flour. It manufs. also steel goods, crockets, and sugar. It is named after Provot, who explored the valley in 1825. P. is the seat of Brigham Young Univ. Pop. 18,100.

Provost (Lat. *praepositus*, prefect, the chief of a body or community), in Scotland, denotes the chief municipal officer or magistrate, corresponding to the Eng. 'mayor' (q.v.). The Ps. of Aberdeen, Dundee, Edinburgh, Glasgow, and Perth are entitled Lord Ps. In France *prévôt* is applied to persons who discharge various functions (marshal, magistrate, mayor, or justice). In England it is apparently restricted to the heads of certain colleges in the univs. of Oxford and Cambridge. There is also a P. of Eton.

Provost-Marshal, commissioned officer specially appointed by the general officer commanding a corps on active service to arrest deserters and other offenders against military law and to carry out the sentences passed by courts-martial. The P.-M. is the chief of the military police in a garrison tn. or camp.

Proxy (derivation apparently the same as that of proctor (q.v.)), agency of a substitute, or by extension the name for the agent himself. Until 1868 in parl. procedure a peer of Parliament could by a crown licence constitute another peer, of the same degree in the peerage with himself, his P. to vote for him in his absence. In company law a P. is a writing authorising a person to vote in place of a shareholder at a certain meeting or at a series of meetings. Ps. are also used in bankruptcy proceedings. They are allowed in convocation and in Amer. political conventions. During the Second World War Brit. forces were able to vote by P. at political elections. Marriage by P. is possible in some countries; it was much done in Germany during the Second World War. It cannot take place in England.

Prudential Assurance Company Ltd., The. The Prudential Mutual Assurance, Investment, and Loan Association was founded in 1848 as an ordinary life office; it instituted industrial assurance in 1856.

and was responsible for its remarkable development. The company was registered under its present name in 1867 after absorbing sev. smaller companies. In 1919 it began to transact general insurance: fire, accident, burglary, marine, etc., and now has a world-wide business. It has business in one-third of the homes in the United Kingdom and N. Ireland, and is the largest life office in the Brit. Commonwealth, having branches throughout the commonwealth and the Near E. It also has agencies for fire and marine business in the prin. cities of the world, and a subsidiary fire office in New York. In 1912 the P. A. C. first introduced the 'block' system to centralise the collection of premiums, a system since widely adopted in the United Kingdom, U.S.A., and France. In the two world wars the company subscribed largely to gov. loans, and has over 90 per cent. of its funds invested in the United Kingdom.

**Prudentius, Aurelius Clemens** (A.D. 348-c. 405), poet of the early Lat. Church, b. in Spain, and a contemporary of Ambrose, Augustine, and Jerome. His works include hymns and poems on religious subjects, such as the *Cathemerinon* and *Psychomachia* (a religious allegory). He is regarded as the foremost poet of the early Lat. church. See ed. of T. Obbarius (1845) and H. Dressel (1860). See lives by J. P. von Ludewig, 1692; H. Brockhaus, 1872, and J. Bergmann, 1921; also E. Euguet, *De Prudentio Carminibus*, 1883; F. St. J. Thackeray, *Translations from Prudentius*, 1890; G. Boissier, *La Fin du paganisme*, 1898; and T. R. Glover, *Life and Letters in the Fourth Century*, 1901.

**Prudhoe**, vil. and urb. dist. of Northumberland, England, situated on the N. bank of the Tyne, 10 m. W. of Newcastle, and about the same distance E. of Hexham. There are the ruins of a Norman castle built 1161-82 by Odinel de Unireville, on the site of a Brit. fort. It later belonged to the Percys. About 60 per cent. of the employable labour is engaged in coal-mining. The remainder are occupied in agriculture or brick manufact., or on work in the large fertiliser factory built in 1911. Thomas Bewick, the engraver, was b. in the dist. Pop. 9500.

**Prudhomme, René François Armand Sully**, see SULLY-PRUDHOMME.

**Prud'hon, Pierre Paul** (1758-1823). Fr. historical and portrait painter, b. at Cluny and educated at the Dijon Academy and in Italy. He won the Grand Prix de Rome (1782), where he resided till 1789, becoming a friend of Canova. His chief works include 'Justice and Divine Vengeance pursuing Crime' (1808 Louvre); 'Rape of Psyche' (1812); 'Interview between Napoleon I. and Francis II. after Austerlitz,' and 'The Empress Josephine.' He also decorated the Louvre with ceiling paintings. See lives by C. Clément, 1872; C. Martino, 1924; R. Ragnay, 1928; J. de Goncourt, *L'Art du XIX<sup>me</sup> siècle*, 1882; and E. Hildebrandt, *Die Malerei und Plastik des 18. Jahrhunderts in Frankreich*, 1921.

**Prune**, dried plum, and also the name

of varieties of plum-trees which are cultivated as being specially suitable for drying on account of their firm texture. Large quantities, mostly sun-dried, are imported into Britain, although it has been demonstrated that Brit. grown fruit dried by artificial heat in specially constructed drying stoves compares very favourably with the imported fruit. The art of plum drying is most highly developed in California, and more than a third of the imports are derived from that state; but the finest quality comes from France, where the fruit is boiled immediately after gathering and then when cool is exposed to the sun in trays until thoroughly desiccated. Ps. are valuable for their laxative qualities.

**Prunella**, or **Prunello**, smooth (black or purplish) woollen stuff used for the uppers of gaiters and shoes, or as 'lasting,' formerly also for clergymen's and bar-risters' gowns.

**Pruning**, art of regulating plant growth by cutting away superfluous and unwanted shoots and branches with the object of (1) regulating the shape, and/or (2) increasing the production of flowers or fruit. P. tools (knife, sécateurs, or saw) should be sharp so that they leave clean-cut surfaces, edged with healthy bark intact so that they callus over quickly. Large cut surfaces, following the removal of big branches, should be protected from weather and fungus infection by a dressing of Stockholm tar, white lead paint, or a proprietary tree antiseptic. P. cuts should be made immediately above a suitably placed bud or lateral shoot, or flush at the base of the junction with a larger branch. Otherwise any stub will only die back and invite disease. Severe P. encourages wood growth; light P. fosters development of fruiting wood. Therefore, where new wood growth is required, P. should necessarily be severe. When trees are young, P. for fruit must be subordinated to P. for wood growth in order to build up the branch framework of a well-balanced tree and to form a shapely specimen. In later years P. is less severe and is devoted to the removal of diseased or weak growth, to the keeping of the branch work open to air and sun, and to the renewal and formation of fruiting wood. Apples and pears are pruned on similar lines. Winter P. may be carried out at any time while trees are dormant, usually before the winter spraying is done. There is no single ideal P. system. The growth habit of individual varieties must be studied. Some varieties bear on fruit spurs along the branches, some at the tips of shoots as well. The type of tree, its root-stock, and its manuring and performance during the previous season also influence the amount of P. needed. Generally weak growers can be pruned more severely than strong ones. Winter P. largely consists of shortening, leader shoots and cutting back laterals more severely, and, in the case of mature fruiting trees, of thinning fruit spurs and developing renewal fruit-bearing wood. Root P. is carried out when young trees of five to six

years fail to respond to top P. by fruiting, and is done in Nov. Summer P. is a distinct operation; chiefly essential on cordon, dwarf pyramid, and wall-grown trees, and usually consists of restricting tip growth of the current season. The Lorette system of P., developed by Louis Lorette, of Wagonville, France, aims at the forced development of fruit-buds by consistent severe P. throughout spring and summer, with no winter P. It is particularly suited to pears, producing heavy crops, but more practical for amateurs than commercial growers.

**Various Fruits**—Apricots fruit on the current season's and on mature wood. P. is done in the growing season with the object of keeping up an abundant supply of wood growth. Cherries, once framework is estab., are pruned in July, though orchard trees need little P. Peach and nectarine may be pruned in Feb. to induce growth of framework wood, and renewal fruiting wood when trained indoors or on walls; in April out of doors for bush trees, and again in autumn. Plums (including damsons) need little P. when desired shape is estab. Any cutting-out of branches is best done in June or July to avoid silver-leaf infection. Black-currants, after the third year, are pruned by cutting out about one-third of the older branches at ground level during the winter, to maintain a steady supply of renewal fruiting wood. Red and white currants are pruned by methods similar to those used in the case of apples, by cutting laterals back to within two buds of the base in winter or spring. Brambles (loganberry, raspberry, hybrid berries) require the fruited wood cut away at soil level in late autumn, with new canes to take their place. Blackberries only need dead wood and old wood cut out, and thinning. Figs need surplus suckers and shoots removed in autumn. Gooseberries may be spur-pruned as red currants or allowed to develop long shoots and merely thinned in winter. Nuts need P. in winter to thin out old wood, and in summer when side shoots are shortened to about five leaf buds.

**Ornamental Trees and Shrubs**.—Deciduous trees are best pruned between early June and Dec., though most may be pruned in winter. Maples, birches, and walnuts bleed if pruned in late winter or spring; stone fruits like cherries should be pruned before mid July. Evergreen trees and shrubs are best pruned in April or May. Flowering shrubs are pruned according to their habit of growth. Those which produce their flowers on new wood ripened the previous year are pruned as soon as the flowers fade; those which produce their flowers on older, mature wood are pruned in Feb., but most shrubs need no regular P. Roses are pruned according to their type. Tea, Hybrid Tea, Hybrid Perpetual, Pernetiana, Polyantha, and climber tea roses are best pruned in March or April. Other climbing roses are pruned just after flowering, while ramblers are pruned according to whether they flower on new or old wood. Most climbing plants may be pruned in

Feb. or March, though flowering kinds such as *Lonicera* and *Wistaria* are also pruned after flowering.

See H. Dunkin, *The Pruning of Hardy Fruit Trees*, 1934; H. Dallimore, *The Pruning of Trees and Shrubs*, 1945; and C. R. Thompson, *The Pruning of Apples and Pears by Renewal Methods*, 1949.

**Prunus**, genus of deciduous and evergreen trees and shrubs (family *Rosaceae*), bearing racemes of white or pink flowers, followed by drupaceous fruits with a smooth stone. Almonds, peaches, apricots, plums, and cherries belong to the genus. Other species include *P. Padus*, bird cherry, a handsome Brit. tree often grown in shrubberies, and *P. laurocerasus*, the cherry or common laurel.

**Prussia**, former name of a region in N. Europe. The area has varied considerably in size and political construction at different times. It has been (1) the ter. of the Borussi, heathen tribes of Slav origin, covering regions on the E. bank of the R. Vistula, as well as the whole of the later prov. of E. P.; (2) 1701-1866, a Hohenzollern kingdom, ruled by the family which had previously been electors of Brandenburg. A section of it, lying between the E. border of Pomerania and the R. Elbe, was part of the Holy Rom., later Austrian, Empire; (3) 1866-1918, the largest and most influential Ger. state. The term was expanded to cover all the conquests made while Bismarck was in power. This meant that it applied to almost all N. Germany; (4) 1918-45, the remnants of (3) left to Germany after the peace treaties following the First World War. The last P. was a republic.

The republic of P. in 1935 had an area of slightly more than 113,000 sq. m. By the treaty of Versailles (1919) and the div. of Silesia P. had been deprived of 21,646 sq. m., but had received as an addition the principality of Waldeck in 1929. It comprised the greater part of N. Germany, bounded on the N. by the Baltic, Mecklenburg, Denmark, and the North Sea; on the S. by Thuringia, Saxony, and Czechoslovakia; on the E. by Poland; and on the W. by Belgium, the Netherlands, and Luxembourg. The pop. of P. in 1935 was 40,745,000. It was divided into fifteen provs. of which one was the cap., Berlin. Other large cities were Cologne, Breslau (now Wrocław), Essen, Frankfurt-on-Main, Dortmund, Düsseldorf, Hanover, Duisburg, Wuppertal, Gelsenkirchen, Bochum, Magdeburg, Königsberg (now Kaliningrad), Stettin (Szczecin), and Kiel. About three-fifths of the republic consisted of lowland and belonged to the Great N. European plain. The S.E. was the more mountainous portion. The Sudeten chain separated P. from Austria and Bohemia and included the Riesengebirge with Schneekoppe (4929 ft.), the highest mt. in P. The land, drained by the Rts. Vistula, Oder, Niemen, Elbe, Weser, Ems, and Rhine, possessed a good canal system, much of it constructed at the beginning of the twentieth century. The coast-line was over 1000 m. long and possessed most of Germany's important seaports, excepting Hamburg, Lübeck, and Bremen.

**Education and Religion.**—Education was compulsory, and attained a high standard on the technical side. The largest Prussian univ. was at Berlin, and the next in size were Breslau, Bonn, Göttingen, and Halle. In 1935 rather less than two-thirds of the pop. was Protestant, the rest being Rom. Catholic, with a Jewish pop. of about 100,000. This last was practically exterminated by Hitler.

**Constitution.**—After the abolition of the monarchy a Prussian constituent assembly was elected by universal suffrage in 1919. A republican constitution was adopted. P. was governed by a Cabinet appointed by a premier who was elected by the Diet, which itself was elected for four years by universal suffrage on a basis of proportional representation. The *Staatsrat* (State Council) was an advisory body, consisting of representatives from the provs., elected on the basis of one to every 50,000 inhab. For local gov. the fifteen provs., each under a governor, were divided into gov. dists. under a president, rural circles under elected deliberative assemblies, and urban circles under a burgomaster. When the National Socialists seized the gov. of P. in Jan. 1933, the constitution was abrogated and popular gov. and the Diet abolished. P. was put under the absolute rule of a *statthalter* (governor), who appointed his own Cabinet. Hitler, the Ger. chancellor, was *statthalter*; while Goering was Prime Minister. Ironically the liquidation of P., formally decreed by the Allies after the Second World War, was prepared by the Nazi regime, though for an entirely different reason.

**History.**—The kingdom of P. grew out of Brandenburg, conquered from Slav tribes in the tenth century by Otto I. Henry the Fowler estab. it as a frontier unit, a mark, to guard the line of the Elbe against the Wends, in the belt of forest and marshy plain which stretched unbroken across to Russia. From the Elbe the mark extended E. in the later Middle Ages to and across the Oder, its progress facilitated by the arrival of Ger. colonists from the W. It carried with it Christianity and a feudal organisation of Ger. lords over Wendish serfs, which long characterised it. As an electorate the mark passed in 1155 to the Hohenzollerns, by origin a Swabian family. The country was poor and barren, surrounded by rival states, but Hohenzollern rule, under a succession of capable and ruthless electors, was steadily consolidated. At the Reformation the country became Lutheran, though the elector later became a Calvinist. The elector gained much from the secularisation of property at this time. In the thirteenth century the military order of the Teutonic knights conquered and Christianised the pagan Boruss, in the S.E. Baltic, but had then declined before the advancing power of Poland. In 1825 this ter., E. Prussia, was declared a secular duchy by the grand master of the Teutonic Order, Albert of Hohenzollern, under Polish suzerainty. In 1614 Brandenburg gained the duchies of Jülicher and Cleves by

inheritance, and in 1618, on the death of the duke of P., P. and Brandenburg were united under a single Hohenzollern. Under Frederick William, the Great Elector (1640–88) (q.v.), Brandenburg-Prussia became a leading European power. Frederick William, more than any other, gave the Prussian monarchy its specific form and character. Energetic, opportunist, and totally unscrupulous, he built the two bastions of the monarchy, the standing army, and the efficient, centralised administrative system. At the peace of Westphalia he secured part of Pomerania and additions to Brandenburg in the S.W., across the Elbe. His armies defeated the Fr. and the Swedes, while out of Swedish conflicts with Poland he secured the complete independence of E. Prussia from Polish suzerainty. Frederick William's son, Frederick I. king of P. (q.v.), raised his country to the status of a kingdom, crowning himself at Königsberg in 1701. His title was a Prussian and not a Brandenburg one, since the emperor insisted, for reasons of prestige, that the royal title should be associated with Hohenzollern ters. beyond the boundaries of the empire. Frederick II, the Great (1740–86) (q.v.) used the army collected by his father to take Silesia from Austria, and, in the first partition of Poland, gained W. P., thus linking his previously scattered ters. He also encouraged economic reforms. His Silesian policy inaugurated the struggle for supremacy in Germany between Hapsburg and Hohenzollern which ended in Prussian victory in 1866, and greatly upset the existing balance in Europe. In the Seven Years war (1756–63) P. was attacked by Austria aided by Russia and France, but survived very largely because of the subsidies supplied by her new ally, England. Then onwards, until the outbreak of the Fr. revolutionary wars, P. enjoyed a period of peace. In 1806 Frederick William III. (q.v.) was forced into war by Napoleon and defeated at Jena and Auerstädt. He was deprived of all Polish ters, except W. P., and of all land W. of the Elbe, but at the end of the wars with France P. was re-estab. and her ters. extended. By the peace of Vienna P. obtained N. Saxony, Danzig, Thorn, the former Polish prov. of Posen (Poznań), Swedish Pomerania, and Rügen, and most of the Rhineland and Westphalia. The rivalry between P. and Austria became more bitter. William I. (q.v.) became king in 1861. Bismarck (q.v.) was made his Prime Minister in 1862. In 1864 P. went to war with Denmark and obtained Schleswig-Holstein: two years later she fought and defeated Austria at Sadowa. The free city of Frankfurt, the duchy of Nassau, the electorate of Hesse, and the kingdom of Hanover were subsequently annexed. A N. Ger. confederation, headed by P., was estab. In 1870 the Franco-Prussian war broke out, and the hegemony of P. within the Ger. federation was completed at Versailles on Jan. 18, 1871, when King William I. of P. was elected emperor of the Ger. Empire. Alsace-Lorraine became

part of the empire, but was garrisoned largely by Prussians. P. was far stronger than all the rest of the states of the empire combined, and William I. further increased the strength of the Prussian Army, and founded a Prussianised Ger. Navy. The 'Prussian philosophy', which seems to have originated in Brandenburg rather than in the E. or W. Prussian provs., which always displayed a certain amount of independence, put into action by the Great Elector and followed by his successors—the belief in the complete supremacy of the state, and the dominance in that state of the military and civil servant classes, both drawn from the Prussian nobility—was, under the empire, instilled into all Germany. William II. (q.v.) succeeded in 1888. With Bismarck's fall from power in 1890 the consolidation of the empire ceased, and a policy for the aggrandisement of P. was adopted which led to a period of disintegration from 1890 to 1918. On Nov. 13, 1918, after the First World War, P. was proclaimed a republic, and William II. abdicated. The relations between the Reich and P. were the outstanding problem of the empire, and remained the difficulty of the republic until the revolution of 1933, the Prussian Gov. being dissatisfied with the amount of autonomy allowed to it by the Federal Gov. The strong social-democrat element in the Prussian Gov. led to an alliance of the *Junkers* with the Nazis, in the hope of regaining their former dominance through a Nazi revolution. But the Nazi victory of 1933 brought the Prussian provs. under the direct control of the Reich, and the prov. governors (*Oberpräsidenten*) were put in a position parallel to that of the governors (*Reichsstatthalter*) in the other Länder. P. was, in fact, merged with the Reich, and ceased to possess an individual political personality, though Prussian ideals had a high place in Nazi policy, and Prussians continued to provide the majority of the military leaders of Germany. Prussianism was, however, harnessed to National Socialism: it did not control it. In Feb. 1946 the Allied Control Council sanctioned the dissolution of P., whose constituent provs. were scattered over the four occupation zones (Brit., Amer., Fr., and Russian), other parts going to Poland. P.'s historical dissolution was probably inevitable, since the name had been so closely and exclusively identified with Ger. militarism since the seventeenth century, while Poland traced the hist. of Ger. aggression, through the Teutonic Prussian knights, back into the Middle Ages. Prussia, East, see EAST PRUSSIA.

Prussia, West, see WEST PRUSSIA.

Prussian Blue,  $\text{Fe}_4(\text{Fe}(\text{CN})_6)_3$ , dark blue solid which is precipitated by the addition of potassium ferrocyanide to a solution of a ferric salt. It is insoluble in water and dilute acids, but is acted on by alkalis. Commercially it is prepared by oxidising a mixture of ferrous sulphate and yellow prussiate of potash or potassium ferrocyanide. As a dye it has been superseded by aniline products, but it is still used as a pigment in water-colour painting.

Prussiates, salts of prussic or hydrocyanic acid. Yellow prussiate of potash or potassium ferrocyanide is a lemon-coloured crystalline solid made from potassium carbonate, scrap iron, and nitrogenous waste. It yields a deep blue precipitate (Prussian Blue (q.v.)). Red prussiate of potash, or potassium ferricyanide, is an orange-coloured solid made by passing chlorine through a solution of potassium ferrocyanide, and is used in the making of blue-prints.

Prussic acid, see HYDROCYANIC ACID.

Prut, see PRUTH.

Prutenic Tables, astronomical tables, based on the Copernican system, drawn up by Reinhold in the sixteenth century, and dedicated to the duke of Prussia, whence the name 'prutenic.'

Pruth, or Prut, riv. of the U.S.S.R., and trib. of the Danube, flows for 360 m. between Rumania and Bessarabia, from the Carpathian Mts. It joins the Danube on the left below Galatz. Total length, 500 m. Drainage area, 10,700 sq. m. It was the scene of battles in 1944 between the Russian armies of Marshals Zhukov and Konev and the Ger. and Rumanian armies under Manstein. See under EASTERN FRONT OF RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

Prutoth, basic factor in the Israeli system of coinage. Cupro-nickel coins are struck to the value of fifty or a hundred P. In June 1949 the fifty-P. coin corresponded in value to the Eng. shilling.

Pruvium, see PROVINCS.

Pryde, James (1866-1941), Scottish painter, b. in Edinburgh. He was an imaginative artist, his appeal being both emotional and decorative. His art verged on fantasy and occasionally exhibits a touch of the genius of Blake. Little recognised, except by other artists, during his lifetime, he became regarded after his death as one of the few great romantic painters of the twentieth century. The theatre markedly influenced his style, which also displays a tendency to the macabre. In the sensitive 'Miss Jessie Buxart' and the humorous 'Dr. Pryde' he showed himself a master of imaginative portraiture. His finest paintings include

'Romantic Landscape,' 'The Unknown Corner,' and 'The Slum.' These represent the most striking of his variations on the architectural theme. Through such work he strongly influenced such painters as Orpen and Nicholson. His work, however, varied in quality; some of it was merely repetitive and had been anticipated by Guardi, Piranesi, and Wm. Kent. See life by D. Hudson, 1949.

**Prynne, William** (1600-69), Puritan antiquarian and pamphleteer, b. at Swainswick, educated at Bath Grammar School, and matriculated from Oriel College, Oxford, in 1618, graduated B.A. in 1621, admitted student of Lincoln's Inn the same year, and was called to the Bar in 1628. P. is chiefly remembered for his *Histrio-Mastix* (1632), a work against stage plays; for a supposed reflection in it upon the queen, Henrietta Maria, he was prosecuted, committed to the Tower, fined £5000, expelled from the univ. and from Lincoln's Inn, ordered to stand in the pillory, and to lose both ears. He was at various times fined and imprisoned for his writings, which number fully two hundred. On the assembly of the Long Parliament he petitioned for redress, and the House declared his sentence illegal, and voted him £4000 by way of reparation. He sat in Parliament for Newport in Cornwall, but he opposed Cromwell's party, regarding the commonwealth and protectorate as illegal, being bitterly opposed to sectarianism and the levellers, and sided with the king. After the Restoration he sat for Bath. He was appointed keeper of the records in the Tower on which he did considerable research and pub. some important material. Historians increasingly stress his importance as an antiquarian of some scholarship rather than as a political pamphleteer. See E. W. Kirby, *William Prynne*, 1931.

**Pryntelersak**, Eskimo name for motorboat, replacing increasingly the umiak (q.v.) in N. waters.

**Prypoc**, see PRIPET.

**Przemysl**, fortress, in Galicia, Poland, on the San, just W. of the Curzon line, 56 m. W. of Lwow. It is a Rom. Catholic and a Gk. sec. It trades chiefly in grain, wood, and machinery. During the First World War the Russian forces under Gen. Ruzsky swept over this region in Sept. 1914, and when Lwow fell the Austrians, under von Auffenberg, withdrew into P., which was soon invested. It was relieved very soon by Austro-Ger. forces, who in turn were driven back and the place again was invested. It sustained a siege of five months, and did not surrender until March 22, 1915. In May 1915 Austro-Ger. forces, under von Mackensen, commenced an offensive against the Russians, who were forced back beyond the San. In this region the Russians made P. the centre of their line, but Mackensen attacked it on both flanks, causing them to evacuate it on June 1, from which time it was free from Russian occupation. P. fell to the Gers. in the invasion of Poland in 1939. It was captured by the Russian marshal Konev, in his great S. advance, on July 28, 1944. Pop. 52,000.

**Psalmody**, in its widest sense, signifies the Psalms of David set to music and sung. Frequently, however, the term is restricted so as to exclude all but the metrical versions of the psalms to which short grave airs are either set or adapted. The practice of psalm-singing in the Christian Church dates from its very beginning, and the Psalms have always formed the basis of public devotions. The Psalms were not turned into metre until after the Reformation. Until then the use of Lat. made popular singing impossible. The claim of the reformers that the people had the right to sing in their own tongue, and to simple melodies, necessitated the use of metre which illiterate people could commit to memory, along with tunes of the requisite simplicity. Metrical P. was for centuries in use in all the reformed churches. It died out in England in the mid nineteenth century. In Scotland and in churches of the same tradition it still continues, along with hymns, in the 1650 Scottish version. The poetical quality is necessarily very inferior to the stately Eng. prose. In the Rom. Church metrical P. has never been used. See J. Julian, *Dictionary of Hymnology*, 1892, and M. Patrick, *Four Centuries of Scottish Psalmody*, 1919.

**Psalms**, Book of, in modern Heb. Bibles begins the third section of the O.T. canon, that of the writings or hagiographia. In the Septuagint version it comes second in this group. The Heb. title is 'Songs of Praise,' the word 'psalms' being taken from the Septuagint rendering *psalmoi*. In each version the Psalms are 150 in number, though they are differently divided. The Septuagint has also a 151st Psalm ostensibly Davidic, but frankly recognised as an addition to the original book. In the Heb., as in the R.V., the psalter is divided into five books, viz. Ps. I.-xli., xlii.-lxxii., lxxiii.-lxxxix., xc.-cvi., and cvii.-cl. The close of each of the first four books is marked by a kind of doxology. Most of the psalms have titles, some of which ascribe the composition to some author such as David or Asaph, while others denote the occasion of composition and others the manner in which the psalm is to be sung or accompanied. Some of these latter terms, such as Selah and Hallelon, are very obscure. The Psalms consist of poetic outpourings of devotion to God, deeply spiritual in character, and showing every aspect of the religious character. Their depth and catholicity have thus made them worthy to hold the position they have ever held in the services not only of the Jewish but also of the Christian Church. A most important question with regard to the psalms is their authorship, and with this is closely bound up the question of their date. It is an ascertained fact of criticism that the historical ascriptions are not trustworthy. This may be seen, on an examination of those psalms attributed to David, the founder of Heb. psalmody. In these are found not only the use of conventional terms, but also borrowing from other psalms. Style and vocabulary prove some of them to be late, while in others the existence of the

Temple seems to be pre-supposed. Generally the Psalms may be said to be modelled on the prophets, and therefore to be later than these. Very few of the Psalms can be said to be earlier than the seventh century B.C. S. R. Driver, in his *Introduction to the Literature of the Old Testament* (8th ed.), gives the following as pre-exilic: Ps. ex., cl., xcl., xc., and lxxiv. The bulk of the Psalms, however, are post-exilic, and many of them (e.g. lxxiv., lxxix.) belong to the period of the Maccabees. See also **PENITENTIAL PSALMS**. See J. P. Peters, *The Psalms as Liturgies*, 1922; A. C. Welch, *The Psalter in Life, Worship, and History*, 1926; N. H. Snaith, *Studies in the Psalter*, 1934; and W. O. Vesterley, *A Fresh Approach to the Psalms*, 1937.

**Psaltéry**, obsolete instrument of the dulcimer type, triangular in shape and with strings stretched across its frame harp-wise, which were played with the

PSALTÉRY

bare fingers or with a plectrum. It became extinct during the seventeenth century. It is usually used in the Bible to translate the Heb. *nēbēl*.

**Psammethkos**, or **Psammethichus**, see **EGYPT, History**.

**Psammite Rocks** (*psammos*, sand), gravelly and sandy rocks. See **SANDSTONE**; **GRAVEL**, etc.

**Pseudomorphism**, assumption by a mineral of a form other than that which really belongs to it. Pseudomorphs may generally be recognised by the absence of sharpness in the crystal angles, while the faces usually present a granular, dull, or earthy aspect. Pseudomorphs may be formed in sev. ways, such as (1) by *infiltration*, when the cavity previously occupied by a crystal is refilled by the deposit of different mineral matter from the infiltration of a solution; (2) by *investment*, or a superficial encrustation of one mineral on the crystal of another; (3) by *replacement* which is a slow and gradual substitution of particles of new and different mineral matter for the original particles, which are successively removed by water or other solvents; and (4) by *alteration* or the gradual chemical change which crystals sometimes undergo, their composition becoming so altered that they are no longer the same minerals, although they retain their old forms.

**Pseudonym**, term used to denote a fictitious name (or *nom de plume*) adopted by an author, and, though less frequently, the pseudonymous work itself. From the earliest times various writers have for different reasons produced works under Ps. In former ages the chief reason was political, the pub. of works or articles attacking the existing order of things or

unpopular institutions being in the highest degree dangerous. Posterity has never yet satisfactorily pierced the identity of 'Junius,' which P. has been variously assigned to Lord Temple, Sir Philip Francis, Richard Glover, and many others; while François Marie Arouet has never been known by any other name than 'Voltaire.' At the present time, except in countries where the free expression of opinion is still fraught with serious consequences, the adoption of Ps. is resorted to either for private reasons, or as a pure literary conceit. Many actors and actresses also adopt Ps., the reason apparently being to find a more glamorous name, although the custom may have originated from the time when acting was considered a vulgar profession. Sir Henry Wood composed music under the P. of Paul Klenovsky, thinking that a Russian name would receive a better hearing than an Eng.

Some famous Ps. include:

*Adeler, Mac*, Charles Heber Clarke; A. E., George W. Russell; *Anstey, P. T.* Anstey Guthrie; *Bab*, Sir W. S. Gilbert; *Brachcomber*, J. B. Morton; *Brill, Currer*, Ellis, and Acton, the Brontë sisters; *Byglow*, Hosca, James Russell Lowell; *Billings*, Josh. H. W. Shaw; *Birmingham*, George, Canon J. O. Hannay; *Boven*, Marjorie, Margaret Long; *Bos*, Charles Dickens; *Bridle*, James, O. H. Mavor; *Carmen Sylva*, Elizabeth, queen of Rumania; *Carroll*, Lewis, C. L. Dodgson; *Chase*, Beatrice, Olive Katharine Parr; *Conrad*, Joseph, J. C. Korzenowski; *Corno di Bassetto*, George Bernard Shaw; *Cornwall*, Barry, B. W. Procter; *Dagodel*, G. R. Sims; *Dane*, Clemence, Winifred Ashton; *Draper*, M<sup>rs</sup> H., Dean Swift; *Elia*, Charles Lamb; *Eliot*, George, Marian Evans Cross; *Fongasse*, C. K. Bird; *France*, Anatole, J. A. Hawkins; *Iconoclast*, Charles Bradlaugh; *John o' London*, Robert Lynd (later Frank Swinnerton) and Wilfred Whitten; *Loli*, Pierre, J. Vland; *Ludwig*, Emil, E. L. Cohn; *Markenzie*, Compton, M. Compton; *Maurois*, André, Emile Herzog; *Merriman*, Henry Selon, Hugh Stowell Sont; *Molière*, J. B. Poquelin; *Novalis*, Fr. V. Hardenberg; *Orzcy*, Baroness, Mrs. Montagu Barstow; *Ouida*, Louise de la Ramée; *Pertinax*, André Gérard; *Peterborough*, H. E. Wortham; *Phiz*, Hablot Knight Browne; *Q*, Sir A. T. Quiller-Couch; *Romains*, Jules, Louis Farigoules; *Rowley*, Thomas, Thomas Chatterton; *Rutherford*, Mark, Wm. Hale White; *Sand*, George, Mme. Dudevaux; *Sapper*, H. O. McNeill; *Sinjohn*, John, John Galsworthy; *Stendhal*, Marie Henri Beyle; *Taffrail*, Henry Tappell Dorling; *Twain*, Mark, Samuel L. Clemens; *Voltaire*, François Marie Arouet; *Ward*, Artemus, C. F. Browne; *Y. Y.*, Robert Lynd. Collections of Ps. include: A. Franklin, *Dictionnaire des noms, surnoms et pseudonyms latins de l'histoire littéraire du moyen âge*, 1876; S. Halkett and J. Laing, *Dictionary of Anonymous*

and *Pseudonymous Literature of Great Britain*, 1883-88; E. Weller, *Lexicon Pseudonymorum*, 1886; W. Ousling, *Initiale and Pseudonyms*, 1886; P. G. Brunet, *Dictionnaire des ouvrages anonymes*, 1889; F. Audet, *Pseudonymes canadiens*, 1936; and H. Ehrencron-Müller, *Anonym-og Pseudonym-Lexicon*, 1939.

**Pseudopodia**, see ΔΜΟΒΑ.

**Psilomelane** (Gk. ψίλος, smooth, and μέλας, black). Hydrated oxide of manganese with or without varying amounts of barium and potassium. There is no crystalline system. Its common form is amorphous, botryoidal, massive, reniform, and stalactitic. It is iron black in colour, passing into dark steel grey. There is a brownish-black streak, and a submetallic and opaque lustre. The hardness is 5-6, and sp. gr. 3.7-4.7. It occurs mainly as sedimentary or residual deposits. P. is a source of manganese used in the manuf. of alloys.

**Psilorati**, see IDA, MOUNT.

**Psittaci**, see PARROT.

**Psittacosis** (Lat. *psittacus*, from Gk. πσιττακος, parrot), virus disease of parrots which acquired prominence in 1930 when the infection was transmitted from parrots to human beings in England and other countries. The symptoms resemble those of typhoid, or of a pulmonary disease. P. is frequently fatal in humans: it is being treated experimentally with aureomycin.

**Pskov**, or **Pleskov**, name of a region and its cap. in the R.S.F.S.R., and of a lake (50 m. long and 13 m. broad) partly in that region and partly in the Estonian S.S.R., being a S. extension of Lake Peipus. Mainly low-lying, with higher ground in the S. and S.E., and over 800 lakes, the region is drained by the Shelon and Lovat flowing to Lake Ilmen and the Velikaya flowing to Lake P., whilst the Dvina runs for 100 m. along the S.E. borders. In spite of the vast tracts of forest (birch, pine, and aspen) and marshes, flax, oats, rye, etc., are extensively cultivated. The lumber trade is important. It was captured by the Gers. in Feb. 1918, just before the treaty of Brest-Litovsk. The area is 16,678 sq. m. Pop. 2,000,000.

The tn. of P. lies on the banks of the Velikaya, 9 m. S.E. of Lake P. The cathedral and kremlin still bear witness to those days of prosperity when, like Novgorod, the city was an independent and republican community, besides a member of the Hanseatic League. There are tanneries, and it trades in hemp, flax, and timber. P. has suffered by being a border city in a strong strategic position. The main part of the city with its kremlin and the ruins of its formidable medieval ramparts, stands on the E. bank of the Velikaya at the head of the composite waterway linking it with the gulf of Finland. It was founded in the eleventh century as an outpost colony of Novgorod, but in the fourteenth century it gained its independence which it did not lose until the little republic was absorbed by Basil III. of Moscow in 1510. Before 1914 it was not only the terminus of the important

railway from Orel along which Ukrainian wheat was exported, but also a naval base. In the Second World War it fell to the Gers. on Aug. 8, 1941, and was held by them for nearly three years. During the spectacular Russian advance of 1944 it became essential to Russian strategy to prevent the Gers. guarding Estonia from retreating on E. Prussia and this involved the capture of P., which was effected on July 23. Pop. 58,800. See further under EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

**Psoriasis**, skin eruption, the cause of which is unknown. It has a localised distribution, appearing especially in the elbows and knees, and adjacent parts of the limbs, and consists of very scaly patches which often become chronic.

**Treatment**.—For *acute* P. considerable caution is called for, and local application of calamine lotion, and salicylic acid and zinc oxide ointment; for *chronic* P. arsenic internally and a tar and salicylic acid ointment locally, after the scales have been removed. Desquamation may be promoted by treatment with ultra-violet rays.

**Psychasthenia**, form of psychoneurosis (q.v.) characterised by a generalised lowering of nervous tension and therefore of the general level of psychological performance. Janet used the term to describe one of the two groups (hysteria was the other) into which he subdivided psychoneurosis, and under it he included obsessions, compulsions, fears of all kinds, states of doubt and indecision, and feelings of fatigue. He suggested that in these cases the interference with volitional behaviour by irresolution and doubt, and the compulsion towards meaningless acts, which the patient has great difficulty in controlling despite the fact that he has good insight and recognises his symptoms as being morbid, were due to an inherent failure to achieve apperceptive synthesis. The absence of harmonious integration between the cognitive and the affective-conative functions would thus explain the lack of interest, the difficulty in sustaining attention, the absence of energy, and therefore the inability to act. Most modern authorities believe, however, that the condition is due to conflict causing a disruptive dissociation and regard Janet's views as being descriptive rather than explanatory. See M. Craig and T. Beaton, *Psychological Medicine*, 1926; R. G. Gordon, D. T. Harris, and J. R. Rees, *An Introduction to Psychological Medicine*, 1936; and D. K. Henderson and R. D. Gillespie, *A Text-book on Psychiatry* (6th ed.), 1944.

**Psyche** (Gk. ψυχή), in Gk. legend, the youngest of a king's three daughters, Aphrodite, jealous of P.'s beauty, ordered Cupid (Eros) to inspire P. with a love for the most contemptible of men; but Cupid himself fell in love with her. Unseen and unknown, he visited her each night. Her jealous sisters told her that in the darkness she was embracing some hideous monster, and P. therefore shone her lamp on Cupid while he slept, and saw the most beautiful of gods. Cupid awoke, censured her for

her mistrust, and fled. P. set out to look for Cupid and eventually was united to him for ever, becoming immortal. In this story P. represents the human soul, which is purified by suffering and misfortunes, and thus prepared for happiness.

Louvre

'PSYCHE,' BY J. PRADIER

Psychiatry, branch of medicine which deals with mental ill health, however produced. The way in which mental illness is treated reflects the theories which are held about it; for instance, the belief that mental illness was due to demonic possession led to its treatment by some method of exorcism. Modern concepts emphasise the interdependence of body and mind and particularly the close connection between the activity of the brain and that of the mind. Modern treatment employs physical methods to alter the activity of the nervous system and, through that, of the mind, and psychological methods which deal with the mind directly. Some forms of mental illness respond better to one, some to the other, while many patients do best with a combined approach.

The classification of mental illness presents considerable difficulties. It may be classified according to the alleged cause, the obvious symptoms, or the physical disease of the brain with which it is associated. A convenient classification is as follows: (1) conditions of incomplete development, idiosyncrasy, and feeble-mindedness, either primary, due to some defect of the germ-plasm, or second-

ary, due to environmental cause operating before, during, or after birth, with arrest of the development of the brain and mind; (2) conditions of mental disorder, the psychoneuroses (see PSYCHONEUROSIS) and psychoses (see PSYCHOSIS); (3) conditions of mental decay: the various types of dementia.

The dividing lines between these groups are by no means definite, e.g. the feeble-minded may be psychoneurotic or psychotic, and in the group of organic psychoses, including general paralysis of the insane, the psychoses due to alcohol, etc., dementia may be a prominent feature.

*Treatment of Mental Illness*—Where physical factors are of major importance in the causation, treatment is largely that of the underlying physical cause e.g. the treatment of general paralysis of the insane with malaria and penicillin, the treatment of psychoses occurring in myxedema (a disease of thyroid deficiency) with extract of the thyroid gland. Physical methods of treatment are described under psychosis (q.v.). Drugs are used mainly to decrease anxiety and restlessness and to procure sleep. Certain drugs such as amphetamine sulphate are used as stimulants e.g. in depressive illnesses. Many patients, particularly those with mild anxiety states respond well to rest in bed. In severe restlessness and excitement, e.g. mania, continuous baths at body temp are useful. Many patients refuse food and it is necessary to ensure that they get sufficient.

*Psychological Treatment and Psychotherapy*—The object is (1) to modify the environmental factors in order to provide satisfactory environmental conditions when possible; (2) to produce such a change in the patient that he can readapt himself to his environment with, when possible, an increased understanding of himself and his illness.

(1) Admission to hospital is, of course, a major alteration of environment and can be handled so as to prove of great benefit. It may be necessary to remove a patient from an environment often the home, which is not suitable. Occupational therapy, the organised provision of an occupation suitable to the patient, is of the highest value in the treatment of both hospital and out patients. Trained psychiatric social workers are invaluable, for example, making contact with a patient's home and employers, in adjusting home and working conditions where necessary, and in helping patients to find suitable clubs and other social activities.

(2) Minor psychotherapy uses simple explanation and discussion of problems, and of the nature and origin of the illness, and is often combined with reassurance. Suggestion may be given indirectly by the whole atmosphere of consulting room and hospital, by the physician's personality, and sometimes in the use of inert medicines; or directly with the patient, either fully conscious or hypnotised. Suggestion is particularly effective in the hypnotic state (see HYPNOTISM). Major psychotherapy includes those

analytical methods which aim at a complete understanding of the patient by himself. It is indicated for some of the more complex and severe psychoneurotic illnesses and has been used occasionally in some psychoses. Treatment is very prolonged and expensive and is therefore not available to all who might be expected to benefit from it. There are sev. schools of major psychotherapy, the best known being the psychoanalysis of Freud (q.v.), the analytical psychology of Jung (q.v.) and the individual psychology of Adler.

Many mental illnesses can be traced to emotional conflicts having their origin in early childhood, and the work of child guidance clinics is of great prophylactic importance. In these clinics, the number of which is steadily increasing, the work is carried out by a psychiatrist, a psychologist, and a social worker as a team. Together they arrive at an estimate of the handicaps and possibilities of the child and are able to give advice and treatment accordingly. See D. K. Henderson and R. D. Gillespie, *A Text-book of Psychology* (6th ed.), 1944; J. D. Campbell, *Psychiatric Psychiatry*, 1946; D. Curran and L. Nuttmann, *Psychological Medicine*, 1947; and A. F. Tredgill, ed., *Text-book of Mental Deficiency* (7th ed.), 1947.

**Psychical Research, or Parapsychology.** scientific study of the facts and cause of mediumistic and other alleged supernormal phenomena beyond consciousness. Such phenomena as yet unexplained by known laws include telepathy, clairvoyance, hypnotism, hallucinations, dream fulfillment, divining, nigra-volutions, and hauntings. It is clear that these investigations are important, since, if the phenomena are satisfactorily established, our ideas of life, personality, and mind (perhaps even of space, matter, and time) are inadequate, and must be modified to include the new facts. For the evidence for telepathy and hypnotism see separate articles. The evidence for rhabdomancy or 'dowsing,' the divination of water and other minerals by means of a twig, suggests that the explanation is not physical, but that the dowser possesses the faculty of clairvoyance. P. R. has also been applied to spiritualistic phenomena, such as spirit messages, automatic writing, and materialisation (see under SPIRITUALISM), and to the investigation of haunted houses, poltergeist disturbances, and similar phenomena.

Organised P. R. originated with the foundation of the Society for P. R. in 1882; past presidents include Wm. James, Sir Wm. Crookes, Sir W. Barrett, Henri Bergson, Sir Oliver Lodge, C. D. Broad, Lord Rayleigh, and H. H. Price. The society includes among its members many men and women of great eminence in the world of science and letters. Other societies with similar aims include the Amer. Society for P. R. and the Institut Métapsychique International in Paris. Harry Price (q.v.) founded in 1925 the National Laboratory of P. R., the first laboratory equipped for such a purpose in Great Britain. The Perrott Studentship in P. R. has been estab. at Trinity College,

Cambridge, and the Blennerhasset Trust with the same object at New College, Oxford. There is also the Hodgson Fellowship in P. R. at Harvard Univ., and an International Congress of P. R. meets occasionally in various parts of the world. See also under **PSYCHOLOGY**. See W. J. Crawford, *Reality of Psychic Phenomena* (2nd ed.), 1919; F. A. Schrenck-Notzing, *Phenomena of Materialisation*, 1920; Sir W. Barrett and T. Besterman, *The Divining Rod*, 1926; T. Besterman, *Inquiry into the Unknown*, 1936, and *Some Modern Mediums*, 1937; G. **Psychoanalysis**, name given to the special technique discovered by Sigmund Freud (q.v.) for the exploration of the mind in search of those repressed thoughts and ideas of which the subject is unconscious.

According to the psychoanalysts, many forms of mental disorder are to be regarded as the consequence of conflict between repressed and unconscious ideas and conscious thoughts; the abnormal conduct which accompanies the disorder being the expression in action of these unconscious ideas. Freud's doctrines have developed, in particular, from his studies of dreaming. Dreams, he claims, are dramatisations of unconscious wishes, made possible only through the relaxation in sleep of the conscious system of ideas and thoughts. In waking life the conscious system is able to repress with greater completeness any expression of the unconscious system in thought, and even in sleep it exercises the role of a 'censor,' restricting expression to forms which appear meaningless when recalled and scrutinised. Most people dream but most people are not mentally disordered. The distinction between the normal and the psychoneurotic individual is, therefore, not that the latter alone has an unconscious region of his mind but that it is in some way disturbing his behaviour in such a way as to reduce his happiness and his social effectiveness. The object of the psychoanalytic therapy is to restore him to happiness and social usefulness by making him aware of the unconscious forces which are disturbing his conduct and so enabling him to bring them under voluntary control. This insight into the previously unknown causes of his illness is gradually gained during a series of sittings with his analyst lasting generally many months. The length and cost of the analytic method of cure very severely limits its general usefulness, and more rapid methods of treatment are often employed, although Freud himself condemned the attempt to accelerate the process of P.

The causes of psychoneurotic disorders

are very generally found to lie in early emotional relationships with the parents. The typical form of this relationship (called the Oedipus complex in the case of male patients and the Electra complex in the case of females) is a strong emotional attachment to the parent of the opposite sex and jealousy and hatred of the parent of the same sex. Both the love and the hate are normally unconscious and the conscious attitudes may be very different. The unwillingness of the patient to recognise this source of his troubles is attributed by Freud to repression, the active banishment of the system of feeling from the conscious mind into the region of the unconscious. The cure depends on the removal of this repression and the consequent emergence of the repressed system into the conscious mind where it can be dealt with in a rational manner.

The use of the term repression in trans. of Freud's works has led to a widespread misunderstanding in which he is supposed to be using the term not in the severely technical sense of psychoanalytic theory but in the more popular sense of forbidding people to do what they want. Thus it is thought that Freud taught that men would all be mentally healthy if they were allowed to do what they liked, and that, in particular, children should not be prohibited from doing what they want to do. This was far from his thought. Freud considered that the prohibition of primitive impulses was a necessary condition for the development of civilisation. Nor does P. give any support to the curious idea that mothers should refrain from kissing their sons lest they should develop an Oedipus complex. Freud thought, on the contrary, that the love relationship between parent and child was a necessary part of the healthy emotional development of the child. It was the concomitant development of hatred and the banishment of the whole system into the unconscious that he regarded as harmful.

The psychoanalytic method has been found valuable in the treatment of some forms of neurosis, although others are resistant to it. As a method of treatment of the psychoses or insanities it has not been found generally successful, although it is undoubtedly helpful in providing a theory of their causation. The understanding of the causation of disorders of behaviour provided by P. has been found of great value in the treatment of delinquents by Alchorn and others, even when the use of the full psychoanalytical technique is not possible.

P. is not, however, merely a system of therapy. Its acceptance leads to concepts of the mind and of mental processes which in turn result in new views of many forms of human activity. Thus psychoanalysts have investigated problems of the social conduct of men—customs (dress, totem and taboo, religious ritual, political action, etc.); of art; of education; of literature and primitive story-telling. In every one of these fields it has shed much light. At first the new views pro-

voked a great deal of opposition, but they are now receiving the general approval of orthodox psychological and medical authorities. See the works of Freud, in general, especially *Introductory Lectures on Psychoanalysis* (Eng. trans.), 1934; *An Outline of Psychoanalysis*, 1949 and *Three Essays on the Theory of Sexuality*, 1949; (i. Rohelm, *Psychoanalysis and the Social Sciences*; A. Alchorn, *Wayward Youth*, 1936; E. Glover and M. Brierley, *An Investigation into the Technique of Psychoanalysis*, 1940; G. Richard, *La Psychologie et les problèmes psychiques et moraux*, 1946; E. Jones, A. Brill, etc., *Psychoanalysis To-day*, 1946; and A. Freud, *The Psychoanalytic Treatment of Children*, 1947.

Psychology may be broadly defined as the science of mind. The word is derived from the Gk., and means the science of the soul. In ancient and medieval times P. was regarded as a branch of philosophy dealing with the principle of life, sensation, intelligence, and conation, especially in human beings. It was essentially speculative and static, in contrast to the modern practical and dynamic study of P. The chief psychological theses of the scholastics included the unity and unifying power of the soul, its essential connection with the body, its spirituality and immortality, the freedom of the will, and the dependence of the intellect upon sense data. Modern P. is, however, regarded as a branch of experimental biology. It may be defined as the science of mind or, more specifically, as the positive science of human behaviour and thought. Its predominantly experimental character has led to a decline of interest in such purely speculative questions as that of the relation of mind to body. It is known that mental processes are related to changes in the nervous system but the experimental psychologist is inclined to be little interested in whether this relation is one of parallelism or of mutual interaction. The tendency of physiological P. has generally been to favour the former view, or to regard both psychical and physiological events as different aspects of the same series of events. On the other hand, there are still exponents of the interactionist view that psychical events act on the nervous system and are acted on by events in the nervous system. Generally the experimental psychologist is impatient of such problems which affect little if at all his actual observations, and he is inclined to suspect that the existence of such questions is merely due to the inadequacy of language to express relationships of an order so remote from the problems of practical life with which language was designed to deal.

The idea of applying the method of scientific experiment to the problems of the mind arose about the middle of the nineteenth century with measurements of the least difference of a light or other stimulus which could be just perceived as a difference in sensation. Soon afterwards the physiologists were studying the sensations of colour and sound, while Ebbinghaus was making studies of the rate of forgetting of nonsense syllables.

In 1879 the first psychological laboratory was founded at Leipzig Univ. These earlier researches were dominated by the atomistic ideas of the pre-scientific associationist P. The method for P. was regarded as that of finding the simple elements out of which the complex processes of the mind were made up. Thus thought was regarded as a chain of simple ideas linked together by bonds of association, and perceptions were regarded as compounds made up of elementary sensations. The cramping effects of this system of ideas were overcome by the Gestalt psychologists (Wertheimer, Kohler, and Koffka) at about the time of the First World War, and experimental P. was enriched with a large number of researches in which for the first time the complex processes of thought and perception were studied as realities in their own right and not as mere aggregations of simpler elements.

A problem which early attracted attention in P. was that of the nature of learning. Thorndike conducted experiments on animals learning to get out of puzzle boxes and concluded that their learning was due to the mechanical operation of the Law of Effect—that the cat tries all sorts of behaviour at random, and that any bit of behaviour that happens to succeed is more likely to occur next time, while those bits of behaviour followed by failure are less likely to recur. Later researches (such as those of Kohler on chimpanzees learning) make it clear that insight or understanding of the situation is an essential part of learning, and it is now clear that even the learning of a cat is not so blind and mechanical a process as Thorndike had supposed. In considering the application of P. to education it is particularly important to avoid the view of learning as a mechanical stamping in of right responses and to consider it rather as a matter of progressive understanding.

One part of work in P. followed the tradition of the Ger. laboratories and was concerned primarily with the establishment of general laws of human P. A totally opposed tradition was started in England by Sir Francis Galton in which the centre of interest was the difference between individuals. The study of individual P. was particularly taken up by the Amer. psychologists. Its most important advance came, however, from the work of Binet in France who made the first practical series of intelligence tests as a means of measuring the relative general intellectual capacities of different individuals. Binet's scale of intelligence tests was much improved by Terman in America and is now used for the clinical measurement of intelligence differences, particularly for the detection of mental defect (see MENTAL TESTS). Other forms of intelligence test are used for distinguishing the children with sufficient intellectual capacity to profit by a grammar school education. Another important advance in P. came not from the psychological laboratories but from the doctor's consulting room. Early in the present century Freud (q.v.) brought

forward a revolutionary theory of the nature of the unconscious mind, generally called the theory of psychoanalysis (q.v.). This theory opened new vistas of the determination of human behaviour which have had important influence both on psychological theory and practice. Important modifications of psychoanalytic theory as well as changes in the technique of treatment have been made by Jung, Adler, Reik, and others.

An important branch of P. of relatively recent development is that of social P. Early experiments in P. treated the individual as an isolated unit, ignoring the influence of the social setting. In some experiments, such as those on suggestion, the influence of the social situation became obviously of paramount importance. Social P. may be defined as the scientific and experimental study of the individual in his relationship with other individuals and with social groups. Such problems as anti-semitism, class conflict, re-education of delinquents, conditions of harmonious relationship within industry, military discipline, etc., all obviously belong to this branch of P. So, to a large extent, do the problems of character and of school education. Lewin has devoted himself to the task of developing concepts adequate to the problems of social P. In this development P. is obviously related to the sciences of sociology and anthropology, as the earlier experimental P. was related to physiology.

The development of the theory of intelligence testing required new mathematical techniques. The discovery of statistical methods originally by Galton and developed by Pearson and Fisher has made possible the adequate treatment of quantitative results in P. which would otherwise have been impossible. From the relatively simple use of correlation coefficients by early workers on testing has developed the use of matrix algebra in factor analysis which puts this branch of psychological study beyond the grasp of those without special mathematical knowledge. This is one example of the fact that modern P. is inclined to be a somewhat difficult branch of study. Psychologists are often blamed for adopting a technical jargon which obscures their meaning from a lay reader. This, however, is a necessity arising from the fact that the science of P. is dealing with concepts which have generally no place in ordinary everyday thought, and that therefore there are no generally understood words for them. Scientific P. is in no different case from any other science; the uninitiated reader would find it difficult to read a modern text-book on physics or chem. In order to understand any science a student must learn its technical language. Even the student of P. may, however, be exasperated at discovering that he must learn many technical vocabularies—that of psychoanalytic theory, for example—as well as that of learning experiments and mental testing. It must be remembered, however, that P. is a young science, and complete agreement in technical vocabulary is unlikely so long as

new ranges of fact are being assimilated. It is to be hoped that this will be only a transitory situation.

The success of the intelligence tests led psychologists to hope that equal success would be obtained in testing qualities of character (or personality). This proved to be a much more difficult task. It is not obvious along what particular lines character should be tested in order to give the maximum amount of information. If one measured all traits of character distinguished by different names, the number would be prohibitively large. There is now general agreement, with minor differences, as to the main character traits which it is convenient to measure. Some of these can be measured by suitably devised tests; some can only be assessed by those who have had the opportunity of seeing the everyday behaviour of the individual in question. The main importance of character testing is in clinical P., where disorders of personality are diagnosed. For this purpose, the most satisfactory kind of tests are found to be those of the 'projection' type in which the person tested is asked to construct a story, make a drawing, or to report the pictures he can see in a formless ink-blot. The mental productions he makes under these conditions can be interpreted by a skilled tester as revealing his peculiarities of personality and his personal problems. Such tests are not easy to apply and need special training and powers of intuitive judgment in the person using them.

The practical applications of P. are now manifold. It is important in education both as providing means of assessing the abilities of children and also of giving guidance as to methods of learning and teaching. Teachers now commonly include a course of educational P. in their training course. Starting from the work of Taylor and Galbraith, there has been increasing application of psychological principles and methods of selection to the problems of industry. The application of industrial P. is, in this country, largely carried out by the National Institute of Industrial P. A closely related practical problem occurs in time of war when much of the energy of psychologists of all countries is devoted to devising and carrying out methods of selection amongst the large number of recruits, of improving methods of drill, and of electing the most suitable officers. Psychological clinics in most educational areas use psychological methods in the treatment of problem children, both as a means of reducing the educational difficulties of such children and also in the hope that early treatment of mental peculiarities may prevent the development of serious mental disorder later. Methods of treating delinquent children have been developed by Homer Lane, Alchorne, and others. These are also influencing the approved schools and other institutions to which convicted children are sent, and it is hoped that early psychological treatment of such children, with an emphasis on re-education rather than punishment, will prevent their

developing into habitual criminals. The Institute for the Scientific Treatment of Delinquency also applies psychological treatment to adult offenders.

New and as yet unsolved problems in P. are raised by the experiments of psychical research (q.v.) (now commonly called parapsychology). The reality of communication between minds without sensory contact (telepathy) was demonstrated as early as 1831 in the early days of the Society for Psychical Research, but they attracted little scientific attention till they were reinvestigated in the parapsychological laboratory of Duke Univ., N. Carolina, under the leadership of J. B. Rhine. It is now clear that parapsychology phenomena are not (as was at one time supposed) limited to telepathy but that there can also be paranormal knowledge of future events and of events not known to any other mind. There has been considerable reluctance to accept these findings amongst psychologists and other scientific workers because they do not fit the system of expectations raised by the naturalistic philosophy which is the generally accepted point of view of the scientific world. On the other hand, it is reasonable to consider them as an important challenge to current psychological theory. Where in any science the unexpected is proved to happen, there is a possible point of advance in theory. The soul as an entity, which seemed to have disappeared from the theory of scientific P., may be found to be required as a necessary hypothesis for the explanation of the facts of parapsychology.

Psychoneurosis, term applied to conditions characterised by various mental and physical signs and symptoms, for which no physical cause can be demonstrated. It constitutes reactive evidence of a failure in adaptation within the personality. Whereas superficial examination may suggest that the cause lies in the individual's failure to achieve harmonious adjustment to his environment, fundamentally the real trouble is always within the ego itself. An example of this is provided by the case of the soldier who 'breaks down' in war. Here the true-breaking stress is not due to the conditions in battle (whose role is merely precipitant) but to his failure satisfactorily to solve the conflict between his instinct of self-preservation and the demands made upon him by his ideals of duty, loyalty, and self-respect. Thus the existence of psychoneurotic symptoms always implies the presence of mental conflict, and psychotherapy aims at removing them by discovering and solving the latter. Such a conflict, whatever its nature, induces a marked state of deep insecurity, which manifests itself emotionally in the form of anxiety. The symptoms in P. may be either physical or mental, and the former can be sensory, motor, or visceral. The sensory or purely subjective disturbances may occur in any or all of the systems of the body and may take the form of anaesthesias, hyperaesthesias, and paresthesias. Such symptoms, which were regarded at one time as 'imaginary,' are none the less real because they are hysterical. Motor manifestations include paralysis, paresis, tics, tremors, and anomalies of gait and speech. Visceral symptoms include tachycardia, vomiting, diarrhoea, polyuria, etc. Reactions in the mental field include (1) phobias of all kinds, e.g. of heights, enclosed spaces, disease, etc.; (2) amnesia; (3) trance states and somnambulisms; and (4) obsessions. Clinically P. may be subdivided into (1) neurasthenia; (2) anxiety

states (including 'anxiety neurosis' and 'anxiety hysteria'); (3) hysteria; and (4) obsessive compulsive P.

*Anxiety states* are a form of psychoneurotic reaction characterised by morbid or pathological anxiety. They are the commonest of all the psychoneuroses and fortunately the most amenable to treatment. While the patient may frequently ascribe his condition to some trifling situation or environmental difficulty, the picture as thus presented will be clearly illogical, for the emotional reaction will be obviously out of all proportion to the alleged cause. The real stress or conflict is endopsychic, though the patient may be unaware of its existence or at least of its connection with his symptoms. According to Freud the basis of anxiety neurosis is always in the sexual life, but this theory is not universally accepted. Among the predisposing causes may be included a morbid heredity, a morbid family environment (e.g. maternal anxiety), and an emotionally unstable, timid, worrying type of personality. Any type of external stress (e.g. fear, frustration, or failure in the domestic, financial, sexual, or other sphere), may serve as a precipitating factor. Freud distinguished two types of anxiety state: (1) Anxiety neurosis and (2) anxiety hysteria. The former term he applied to the type of case in which the anxiety is experienced primarily in the mental field, and the latter to conditions in which somatic manifestations constituted the most prominent feature. This classification, however, is liable to lead to some confusion and is not by any means universally accepted or used. The symptoms of anxiety states may be both very numerous and very varied. The mental symptoms include fears of all kinds, from vague inexplicable states of tension and apprehension to specific phobias, in which the fears have become focused on or attached to various objects and situations, and secondary to these fears, irritability, depression, excitability, difficulty in concentrating, faulty memory, intolerance of noise, etc. The somatic symptoms may be referred to any one of the bodily systems, and frequently it is with them that the patient is mainly preoccupied and because of them that he first seeks advice. Palpitation, hyperpnea, dyspnea, dyspepsia, constipation, diarrhoea, tics, tremors, pains of various kinds, and easy fatigability are only a few of the very many forms in which psychosomatic anxiety may manifest itself. Treatment in the first place demands that the patient should be firmly reassured regarding his physical health, and he must be helped to accept such reassurance by a thorough investigation of his physical condition. The true cause of his symptoms is then sought by psychiatric examination and explained to him. Since all psychoneurotic reactions are, to some extent, defence mechanisms against some unpalatable truth, it is not surprising that the most difficult part of the treatment frequently lies in overcoming the patient's 'resistance' to accepting the explanation.

The *obsessional psychoneuroses* are characterised by a continuous preoccupation with some apparently unimportant idea or group of ideas, to the comparative exclusion of most other interests and to the distress of the patient. They may be divided into (1) *obsessive ruminative states* and (2) *obsessive compulsive states*. Clinically these are distinguishable by the fact that in the latter the preoccupation manifests itself as a compulsion to some form of activity, which is always symbolic, although frequently illogical or purposeless. Obsessional reactions tend to occur in the intellectual, critical, over-conscientious, and rather introverted type of personality. It is said that it would be difficult to develop an obsessional P. without a relevant constitutional predisposition. The mechanism in the production of the obsessional P. may be explained as follows. There exists in the patient's mind an idea or a wish, which is of such a nature that it is repugnant and intolerable to the super-ego, and whose relevant effect is therefore one of guilt or reproach. The ego endeavours to prevent such an idea from entering consciousness by substituting for it either another idea, which is indifferent in itself, or (in the compulsive variety) an act. The genesis of the condition is therefore a conflict between a wish and a fear. This subterfuge does not, however, enable the patient to get rid of the affect, which now attaches itself to the substitute idea or act, and thereby maintains the latter in consciousness, and accounts for its 'compulsive' quality. The treatment of the milder forms of obsessive rumination and compulsion is the same as the treatment of anxiety states in general. In the severe types of illness treatment is a much more difficult matter and usually some form of analytical psychotherapy is called for. There would appear to be good grounds for believing that psychoneurotic illness is more prevalent than was at one time suspected. It has been stated that at least one-sixth of the hospital out-patients attending the depts. of general medicine, one-third of those receiving benefit under the National Health Insurance Scheme for a month or more, and an even higher proportion of patients seen in general practice, are not suffering from any physical disease but from some form of P. Some authorities, however, claim that the figures are much higher than these. It is indisputable that the loss of time and efficiency due to psychoneurotic reactions must constitute a serious adverse factor in the national economy. See also HYSTERIA; NEURASTHENIA; PSYCHOPATHOLOGY; SHELL-SHOCK. See R. G. Gordon, D. T. Harris, and J. R. Rees, *An Introduction to Psychological Medicine*, 1936; E. Miller, *The Neuroses in War*, 1940; D. K. Henderson and R. D. Gillespie, *A Text-book of Psychiatry* (8th ed.), 1944; and F. Dunbar, *Psychosomatic Diagnosis*, 1945.

**Psychopathology.** The simplest classification of mental illness is into the psychoses and the psychoneuroses and,

while transitions between these two groups may and do take place, they are nevertheless exceptional occurrences. Considered from the biological angle there are sev. points on which they may be distinguished. In a psychosis a complete or total change in the personality of the patient takes place and his appreciation of reality is qualitatively altered, with the result that his behaviour is correspondingly affected. In psychoneurosis, on the other hand, there is no outward evidence of a personality change, for there is only a part reaction. The appreciation of reality may be diminished (i.e. quantitatively altered) but it remains qualitatively unaffected. In consequence, unlike the psychotic, there is nothing in the behaviour of the psychoneurotic to indicate that the meaning which reality has for him differs in any way from the meaning which it holds for the normal individual. In psychosis the change in reality values may be partly expressed as a projection (i.e. purely subjective experiences may be ascribed to external personal agencies), but projection of this kind does not occur in the psychoneuroses. Neither is speech, as such, disturbed in the latter, but in the psychoses distortion may occur, for here the content of the unconscious finds direct verbal expression. In the psychoses, too, there is frequently a regression to an infantile level of activity, which is not found in the psychoneuroses, except in the absence of clear consciousness. As regards their aetiology, while there is no evidence of direct biological transmission of mental disorders, heredity is believed to play a more important role as a predisposing factor in the psychoses. In the psychoneuroses early environmental influences are regarded as the main determinant, although a neurotic heredity is also frequently present. The psychoses may be broadly divided into organic and non-organic groups, according to the presence or absence of a discoverable physical cause, e.g. in Amentia (mental deficiency) there is a failure in development of the cortical cells; in Dementia they undergo degenerative changes, while in the toxic psychoses these cells and their connections are poisoned by endogenous or exogenous toxins or infections. In the schizophrenic, paranoid, and affective reaction groups, while the exact aetiology is still obscure, a combination of some psychological factor with an hereditary disposition is suggested as the cause. To appreciate the importance of the part which early environmental influences can play in the development of psychoneurosis it must be borne in mind that mental development occurs gradually and progressively as a reactive response to the demands of adaptation, and that the latter fundamentally involves conflict between the instincts and the environment. The instincts are in-born forces and form part of the innate equipment of man and animals. There are probably only two, self-preservation and sex (some include a herd instinct), and the patterns for their expression are either hereditary

or acquired, but some of the former may not mature until after birth. The acquired patterns, in response to the demands of environment, increase both in number and complexity as age increases. Instinctual satisfaction is accompanied by a feeling of pleasure, and in early life it is this so-called pleasure principle which governs all the activities. Later the demands of reality bring about the substitution of the reality principle, which makes possible the abandonment or postponement of the pleasurable attainment. This substitution constitutes the dividing line between the primary phase when all associations are entirely subjective (*i.e.* undifferentiated consciousness) and the beginning of the development of object consciousness. The first and most important objects differentiated by the child are its parents, but since already an exclusive association has been established with its mother, this entails the recognition of a rival. Here then is its first impact with an environmental obstacle, the peculiarly intimate nature of which creates the ambivalent situation in which love and hate co-exist and contend for supremacy. The partly conscious formulation of an ideal to be like them results from the child's early identification with its parents: it is this fact which renders even their unconscious example such a potent factor in the formation of its habits. This parental training, at first by example only and later by precept as well, is subsequently continued by its teachers and companions, and it is during this training phase that the foundations of its future specific reaction trends as well as its general emotional attitudes are laid down. As its contacts outside the home circle increase, they provide the necessary stimulus for its adaptation to the requirements of society, but success or failure adequately to achieve this can already have been largely preconditioned by the nature of the environmental influences in the home. Meanwhile the personality, which has been described as the synthesis of innate endowments, environmental influences, and the reactive trends resulting from conflicts between these two, is being slowly formed and on the soundness of this synthesis will depend its future stability. Failure harmoniously to integrate these formative factors will later provide the intrapsychic tension underlying some form of psychoneurotic reaction, for psychoneurosis is essentially evidence of failure of adaptation or conflict within the ego itself, which induces a severe sense of insecurity with its attendant emotional state of anxiety. This emotional tension, if sufficiently severe, sets up excessive autonomic and endocrine activity producing symptoms due to disturbances of circulation, digestion, respiration, etc. Displacement of the affect from the original conflict is thus facilitated and a conversion hysteria may result. Or alternatively, with the failure of the mechanism of repression, the brunt of the conflict may fall in the psychic field, and manifest itself as an intense emotional preoccupation ending possibly

in an hysterical amnesia or a fugue. If, however, the partial failure of repression is followed by the substitution for the repressed material of some apparently irrelevant idea or aimless act, to which the affect is displaced, an obsessive compulsive state will result. The personality make-up (and certain other factors) would appear to have some influence in determining the particular type of psychoneurotic reaction that occurs. Thus the hysterical reaction would appear to occur chiefly in the uncritical non-introspective type. On the other hand the obsessive compulsive types of reaction are found mainly in the over-consciousness, ultra-critical, introspective and more highly intelligent groups. See R. G. Gordon, D. T. Harris, and J. R. Roes, *An Introduction to Psychological Medicine*, 1936; E. Miller, *The Neuroses in War*, 1940; D. K. Henderson and R. D. Gillespie, *A Text-book of Psychiatry* (6th ed.), 1944; and F. Dunbar, *Psychosomatic Diagnosis*, 1945.

Psychophysics, that branch of experimental psychology (*see* **PSYCHOLOGY**) which deals with the correlation of mental with physical changes, when physiological conditions are kept constant.

Psychophysiology, that branch of experimental psychology (*see* **PSYCHOLOGY**) which deals with the correlation of mental events with physiological changes.

Psychosis. The name given to certain serious mental disorders most of which satisfy the legal criteria of insanity (*q.v.*) in that the patient cannot take care of himself or is a danger to others, or both; in addition psychotic persons show one or more of the following mental abnormalities: (1) loss of touch with or distortion of accepted interpretations of reality, shown, for example, in hallucinations, delusions, or disorders of thought; (2) severe and lasting emotional disorders, *e.g.* the abnormal elation of spirits in mania, the profound depression of the depressive psychoses, the lack of correspondence between ideas and feeling, and the lack of depth of feeling in schizophrenia; (3) a retreat from normal social relationships to a state of excessive dependence or hostility; (4) a return to infantile habits such as open masturbation, soiling with excreta, etc.; (5) disintegration of the personality so that infantile impulses are given direct or but thinly veiled expression; (6) acute disorders of intellectual function, as in delirious states, or permanent intellectual deterioration in the dementias.

There is never a single cause for the mental state of a person. Thus overwork, so frequently blamed for nervous breakdown, is never a sufficient explanation for P. or psychoneurosis (*q.v.*). There are three groups of factors, constitutional, psychological, and physical, which have to be considered in every case. In certain types of psychotic and psychoneurotic reaction, especially the manic-depressive psychoses and schizophrenias, the constitutional (*i.e.* hereditary) factors are particularly important, but it may require the operation of psychological factors

(e.g. emotional upset) or physical factors (e.g. organic illness of any kind) before a predisposed person becomes manifestly psychotic or psychoneurotic. In other cases (e.g. deliria in acute infections) the physical factor is clearly the major one. The main types of psychotic reaction are described under insanity (q.v.).

Treatment of psychoses is usually carried out in hospital, but by no means all psychotic persons are in hospital, many being able to carry on a fairly normal life despite some psychotic symptoms. Treatment includes care and control and general medical attention. Suitable occupations are provided. Close supervision may be needed to prevent suicide. Of more specific treatment mention must be made of certain fairly recent advances which have revolutionised psychiatric practice: (1) the treatment of general paralysis of the insane, a dementing P. due to syphilitic infection of the nervous system, by means of infection with malaria, or artificially produced hyperpyrexia, and penicillin; (2) the treatment of schizophrenia by insulin injections almost daily, over a period of weeks or months, to produce hypoglycaemic comas; (3) the treatment of depressive states by electrically induced convulsions; (4) the treatment of certain severe and uncontrollable psychotics by pre-frontal leucotomy (q.v.), an operation on the brain; this operation is also of value in some severe psychoneurotic illnesses; (5) the use of drugs to produce prolonged sleep in the treatment of tension states and mania. The outlook in some of the illnesses so treated has completely altered, many patients recovering or improving for whom there would otherwise be little hope. See also under PSYCHIATRY; PSYCHOLOGY; PSYCHOPATHOLOGY. See D. K. Henderson and R. D. Gillespie, *A Textbook of Psychiatry* (6th ed.), 1944.

Psychotherapy, see under PSYCHIATRY. Psychrometer, alternative name for wet- and dry-bulb hygrometer (q.v.).

Ptah, god of anct. Egypt. At a very early period the prin. gods of Egypt were grouped into the Triads, consisting of husband, wife, and son. P., Sekhet, and I-em-hetep form the great triad of Memphis. P. was the self-created architect of the universe, and with assistance he carried out the work of creation under the command of Thoth. The Gks. identified him with Hephaestus, the constructor and builder of things. He is usually symbolised in the mummy-shape of Osiris.

Piarmigan (*Lagopus mutus*), smallest Brit. grouse, frequenting the highest mts. in its more S. range, and extending throughout the Arctic and sub-Arctic regions of the N. hemisphere. It formerly occurred in Cumberland and Wales, but in Britain is now confined to N. Scotland. It is an excellent instance of protective colouring, assimilating itself perfectly to its surroundings, the plumage becoming as it changes white, grey, red, or brown, except for the wings, underparts, and legs, which are always white. It hatches its young in June in a mere depression among moss and stones. The

males are monogamous. Poulterers import P. from Norway, where they are snared.

Pteris, see BOGHAZ KEUI.

Pteridophyta (Gk. πτερον, a fern (from πτερον, a wing, with reference to the feathery fronds), and φυτόν, a plant), the great group, or phylum, of the plant kingdom which comprises the ferns and their allies: horse tails, club-'mosses,' and many extinct plants, some of which were of large size and became transformed into coal deposits. The remaining phyla of plants are the Spermatophyta (seed plants, including those with flowers), Bryophyta (mosses and liverworts), and Thallophyta (algae, fungi, and lichens). The P. are also known as vascular cryptogams, since there is no obvious sexual process in their mode of reproduction: microscopic spores are formed and these develop into small independent bodies called prothalli, which reproduce sexually and give rise to a new generation of adult plants, so that there is an alteration of generations. See articles on the individual plants, etc.

Pteris, see BRACKEN.

Pterodactyl, Pterosauria, or Wing-fingered Lizard, name for members of an extinct family of reptiles found in the Jurassic system of the Mesozoic era. They varied greatly in size; while some species had a wing expanse of about 25 ft., twice that of the albatross, others were hardly bigger than sparrows. They are among the most remarkable and strange forms of life revealed by palaeontology.

FOSSIL OF PTERODACTYLUS (RASSI-ROSIKIN (JURA)

Though essentially reptiles, they resembled birds in many respects. The breastbone has a keel to which the flying muscles were attached. The bones are often hollow and the skull forecasts avian characteristics. The resemblance between Ps. and birds is, however, the result of the similar mode of life, and does not imply any direct evolutionary relationship. The jaws of Ps. are long, powerful, and armed with teeth. The forelimbs possess four digits, three with claws and the fourth or outer one greatly prolonged to support a membranous wing.

Pteropods, or Sea Butterflies, group of Opisthobranch molluscs, comprising about a hundred species, which are organised for

swimming freely in the ocean, having a pair of fins developed from the sides of the mouth and neck, enabling the animal to progress by flapping. There are two families in the group. The Thecosomata are provided in the adult form with small glassy shells; though the young of all P. are protected by a shell, the species belonging to the second order, Gymnosomata, are naked when adult. In some parts of the ocean they exist in immense numbers, discolouring the water over vast tracts, and in high lats. they, especially *Clione borealis*, constitute the prin. food of the baleen or whalebone whales, which strain them from the water with the whalebone sieve. The iridescent fretted shell of *Clione cuspidata* is the best-known shell of the Thecosomata. The shells of some form a considerable sediment at great depth.

**Pterosauria, see PTÉRODACTYL.**

**Ptolemaic System**, system of the universe, as held by the Gk. philosophers and physicists, and expounded by Ptolemy (q.v.). The earth, a sphere, is the centre of the universe and the heavenly bodies move round it in circles. Earth, the stable element, occupies the lowest place, then water, the fluid, and the ether beyond. The 'crystalline' sphere of the heavens in which the stars were fixed revolved round the earth, and, to account for differing motion of other bodies, other spheres, contained within the great one, carried the moon, nearest, then Mercury, Venus, the sun, Mars, Jupiter, and Saturn in that order. There were thus eight spheres. The system was full of difficulties, and later astronomers added a ninth sphere to account for the precession of the equinoxes, a tenth to cause day and night; this was the 'primum mobile.' The sun sphere had to be placed eccentrically, a first movement towards discovery of the elliptical orbit, to account for variations in its motion. To account for the irregularities in the motions of the planets, the final form of the Ptolemaic scheme attributed two motions to each of the bodies. The first was a motion in a circle (the *epicycle*) round a centre which in turn moved in a larger circle, known as the *deferent*, the centre of which was the earth. The motion of the sun did not conform to this scheme, it moved round the earth, the circumference of the circle lying between the deferents of Venus and Mars. The moon, known to be the nearest body to the earth, also moved in a simple circle round the earth.

**Ptolemais, see ACRE, ST. JEAN D'.**

**Ptolemy**, or Claudius Ptolemaeus, astronomer and geographer, was a native of Egypt, and lived at Alexandria during the first half of the second century A.D. His chief works were the *Almagest* (*Μεγάλη Συναξίς τῶν Ἀστρονομικῶν*), the *Γεωγραφικὴ Συναξίς*, a lesser work, both astronomical, and the *Geographia* in eight books. As an astronomer his work is not so independent; he summed up the knowledge of the Gks. and followed Hipparchus almost entirely. His works are, however, our only source of knowledge of ant. astronomy, and were the only authoritative work till the time of Copernicus. In geography he followed

Marinus of Tyre, but much was the outcome of his own genius. All the eight books on geography, except the first, a portion of the seventh, and the eighth, form a catalogue of places, with lat. and long., and brief descriptions; the other portions deal with the theory of lat. and long., the shape and size of the earth, extent of surface, and modes of projecting maps on a plane surface. He constructed twenty-six maps and a general one of the earth. His works were the authority on geography till the fifteenth century. Among other works are: *The Centiloquium*, a 'canon of kings' (chronological list of Assyrian, Persian, Gk., and Rom. kings), *De Apparentiis et significationibus Inerantium*, *De Aëlemate*, and *Planisphaerium*. He wrote on the musical scale and possibly on optics. He discoveredvection (q.v.), and extended the use of trigonometry.

All Gk. works on P. have been superseded by Heiberg's ed. of the astronomical work of P. (1899-1907), to which has been added a Ger. trans. of the *Syntaxis* by Manitius (1912-13). The eds. of Erasmus and Elzevir contain numerous errors. See 'Claudii Ptolemaei Geographia' (ed. C. Muller, and C. T. Fischer in *Bibliotheca scriptorum graecorum*, 1883 and 1901); T. G. Itylands, *Geography of Ptolemy*, 1893; L. O. T. Tudeer, *Studies in the Geography of Ptolemy*, 1927; J. W. Kubitschek, *Studien zur Geographie des Ptolemaeus*, 1931; and P. Schnabel, *Text und Karten des Ptolemaeus*, 1938.

**Ptolemy**, or Ptolemaeus, dynasty of Macedonian kings, who ruled in Egypt from 323 to 30 B.C. The founder, *Ptolemy I.* (323-283 B.C.), was the son of Lagus, one of Alexander the Great's most trusted generals. Egypt was his share of Alexander's conquests. He assumed the title of king in 303 B.C. P. or Soter I. commenced the great library and museum at Alexandria where, under his patronage, Euclid taught mathematics; it was through him that the worship of Serapis was introduced. His name Soter (Saviour) was earned by the assistance he gave to the Ithodians when they were besieged by Demetrius (301).

**Ptolemy II.**, called Philadelphus (283-246), was chiefly famous for his splendid court and general delight in luxury, and his encouragement of commerce. His first wife was Arsinoë I., daughter of Lychniachus. After repudiating her he married his sister, the beautiful Arsinoë II., the widow of Lysimachus, and deified her at her death. P. built the great lighthouse at Alexandria known as the Pharos. He delighted in the library and encouraged all intellectual pursuits. Manetho, the priest-historian, flourished during his reign.

**Ptolemy III.** (*Euergetes I.*) (246-221), son of P. II. and Arsinoë I. He married Berenice, the daughter of Magas. He invaded Syria, reduced Mesopotamia and Babylonian and Susiana, while his fleet were triumphant as far as Thrace. He left many monuments in Egypt, among them the unfinished temple of Edgu.

**Ptolemy IV.**, called Philopator (221-204), son of P. III. He married his sister, Arsinoë III. He was a debauchee who started the gradual decline of his kingdom.

**Ptolemy V.**, called Epiphanes (204-181), son of P. IV. and Arsinoë III., was only five years old when he came to the throne. He married Cleopatra, daughter of Antiochus. His reign was chiefly remarkable for the cruelty displayed in the suppression of native rebellions. The Rosetta stone was inscribed during his reign.

**Ptolemy I. I.** (Philometor) (181-145) and **Ptolemy VII.**, nicknamed Physkon, ruled jointly, sons of P. V. and Cleopatra. Philometor married his sister Cleopatra, and their infant son succeeded as P. Philopator. His uncle P. Physkon murdered him and seized the throne, marrying the widow (his sister) of his brother P. Philometor.

**Ptolemy X.** was murdered by the people, and an illegitimate son of Soter II. succeeded, known as Auletes the flute-player (80-51). Rome supported him and when the people drove him out restored him. His son P. Dionysus succeeded (51-47); the boy was only ten when he came to the throne, and he ruled jointly with his beautiful sister Cleopatra. He perished in the war against Rome, and his younger brother P. Philopator was placed on the throne. He died by poison; tradition asserts that Cleopatra was responsible for his death. Caesarion, Cleopatra's son, by Julius Cæsar, was officially known as P. XIV. He was murdered by Octavianus, 30 B.C.

See also under EGYPT. See J. Mahaffy, *The Empire of the Ptolemies*, 1895.

**Ptomaines**, poisonous bodies formed in putrefying animal matter. They are not a chemically distinct group, for some (like putrescine) are amines, others (creatinin) are amino-acids, while neurine is tetramethylvinyl-ammonium hydroxide. Not all the P. are poisonous, some being perfectly harmless. A supposed common property, which related them to the alkaloids, was their alkalinity. Creatinin, however, when pure, does not affect litmus nor does it combine with acids like a base. Putrescine,  $(CH_2)_4(NH_2)_2$ , and cadaverine,  $(CH_2)_5(NH_2)_2$ , are two well-known P. contained in putrefying albumen.

**Ptosis**, drooping of the upper eyelid which may affect either or both eyes. The condition is caused by paralysis of that branch of the third motor oculi nerve which controls the raising of the eyelids. In some cases this may be a congenital condition. In acquired cases it may be associated with general disease or caused by local lesions.

**Ptyalin**, amylolytic ferment in saliva. Its function is to convert insoluble starch to sugar.

**Puberty**, occurring between childhood and adolescence, is that period when, in both sexes, the generative organs become capable of exercising the function of reproduction. The changes that begin then and the full development of the body and mind take many years. In girls the form

begins to develop and the menses appear, while in boys the voice 'breaks' and semen may be discharged. The change generally occurs more rapidly among girls than boys, and it is also noticeable that at this time their rate of growth is also quicker than that of boys. The age at which P. begins varies, and is determined, among other things, by climatic conditions, but in temperate climates, generally, it may be said to take place among girls at from twelve to fourteen years, and among boys from fourteen to sixteen. At this time care should be exercised, particularly with girls, because of the stress which the nervous system is subject to, and overstrain, whether physical or mental, should be guarded against.

**Public Address Broadcasting**, see under LOUDSPEAKER.

**Publicani**, or **Farmers-General**, business men of anc. Rome, who bid every *lustrum* (five years) at a public auction, held by the newly appointed censor in Rome, for the right either of collecting the taxes due to the state treasury from the lands of Italy and the provs., or of contracting for the execution of public works. Often the P. formed joint-stock companies (*societates publicanorum*). Drawn from the equestrian ranks, they rapidly acquired great political influence as the capitalist class, their enormous wealth being amassed often by gross extortion and embezzlement.

**Public Assistance**, term used since 1928 in Great Britain for poor relief. See POOR LAW.

**Public Company**, see under COMPANY AND COMPANY LAW.

**Public Debt**. Wherever a matured state has existed, some system of taking a portion of the capital of the country in the form of a loan to meet the purposes of government has co-existed. The anc. world of undeveloped political societies knew nothing of P. D. for the simple reason that mankind had not as then attained to the idea of investment generally, and, while commerce was in its infancy, govts., like individuals, relied upon hoarded treasure to meet temporary exigencies. In England, prior to the revolution of 1688, there was no national debt, or, in any case, there exist practically no items in the P. D. of Great Britain referable to that period. This seeming anomaly is due to the simple fact that when the gov. of the day obtained grants from Parliament those grants were always followed by a formal release of the monarch from his obligations. The kings of the fourteenth and fifteenth centuries raised loans under the name of benevolences, a practice constantly resorted to by later monarchs. Charles I. strained the archaic and unpopular laws to raise money, while most of the Tudor and Stuart monarchs received subsidies from the Commons. But the indebtedness of the state was never acknowledged, and it would never have occurred to any one that money ostensibly or in fact required for the purpose of carrying on a war or any other purpose of government was repayable at interest.

Nearly the whole of the Brit. P. D. prior to 1870 (in March 1866 it amounted to £806,000,000) had been contracted for 'unproductive' purposes and the borrowing by present-day govts. for permanent public works (productive loans) is essentially a feature of the more liberal conceptions of the modern state.

The method of raising forced loans under the privy seal ceased at the beginning of the seventeenth century. After the Restoration the customary mode of raising loans was by the issue of tallies in anticipation of revenue, though even when William III. became king the actual *recognised* debt was no more than £84,888 Gs. 9d., borrowed on tallies in anticipation of duties on Fr. linens (Palgrave's *Dictionary of Political Economy*). The beginning of the national debt may be said to date from the reign of Charles II., when the London goldsmiths began the practice of advancing money to the Exchequer on the security of an assignment of some branch of the public revenue. But it was not till 1694 when the Bank of England was incorporated that it really became a permanent institution, as Charles II., with the assistance of the Civil administration, practically repudiated the state's indebtedness by ceasing to pay interest. On the grant of the bank charter, in consideration of a loan of over a million, Parliament reserved to itself the right to redeem the national debt at any time after 1705, with which redemption the charter of incorporation was to expire. It is a commonplace of hist. and economics that, far from redeeming, succeeding govts. merely increased their indebtedness. During Queen Anne's reign the P. D.

amounted to £51,000,000; in 1763, after the Seven Years War, it reached £146,000,000; the Amer. War of Independence increased it by £121,000,000, while at the close of the Napoleonic wars no less than £601,000,000 was added, when it reached £900,000,000 (Jan. 1816), the ann. expenditure for interest and management being over thirty millions.

The ordinary sources of revenue have from time to time continued to be supplemented by loans, and a more practical inquiry is that which is directed to devising some scheme for its progressive reduction. Sir Robert Walpole, alarmed by the rapid increase in the P. D., instituted a sinking fund (*q.v.*) by the instrumentality of which a reduction in capital amount to the extent of £7,000,000 was effected before the beginning of the Seven Years War in 1756. Pitt created a permanent sinking fund in 1786; another was set up in 1875, and yet another by Baldwin in 1923.

The disadvantages attendant on the existence of a P. D. are in the popular mind more than outweighed by the public guarantee such a debt affords of a convenient form of investment, although at a low rate of interest, besides which the P. D. has been, perhaps, the prin. means of establishing the general advantages of a banking system.

The P. D. of Great Britain is classified into: (1) the *Permanent or Funded Debt*, which the gov. is under no obligation to redeem at any stated time; (2) the *Unfunded Debt*, made up of loans repayable at certain dates; and (3) *Terminable Annuities*, by means of which the capital sum is, at the expiration of the annuity, written off the P. D. The funded debt includes

The following table shows the amount of the national debt of Great Britain at the dates specified (including the Irish debt):

<i>Date</i>	<i>Debt £ million</i>	<i>Annual charge, including terminable annuities £ million</i>
1727 (accession of George II.)	52	2.4
1784 (end of Amer. War of Independence)	243	9.5
	<i>Gross debt, including terminable annuities</i>	<i>Annual charge, including interest, management, and new sinking fund £ million</i>
	<i>£ million</i>	
1815 (end of Napoleonic wars)	861	32.6
1803 (end of S. African war)	798	27.0
1911 (beginning of the First World War)	706	24.5
1823	6,657	321.0
1838	7,111	226.8
1911	10,478	230.0
1942	13,049	257.2
1913	15,670	315.9
1944	18,416	414.9
1945	21,237	465.0
1946	23,373	465.0
1947	24,967	515.9
1948	25,722	525.0

The composition of the national debt for 1938 and 1948 was as follows:

	1938 £ million	1948 £ million
<b>Total national debt*</b>	<b>7,111.7</b>	<b>25,722.4</b>
<b>Less Bonds tendered for death duties and held by National Debt Commissioners (Victory Bonds and 4 per cent Funding Loan)</b>	<b>118.0</b>	<b>101.6</b>
<b>Net total national debt*</b>	<b>6,993.7</b>	<b>25,620.8</b>
<b>Total funded debt</b>	<b>3,364.8</b>	<b>3,902.0</b>
2½ per cent Consols	276.1	276.0
4 per cent Consols	400.7	398.4

\* Excluding external debt arising out of the First World War.

† Including bonds tendered for death duties and held by the National Debt Commissioners.

March 31, 1948  
£ thousand

**External Debt:**

United States—Government Loan	1,089,646
Loan from Reconstruction Finance Corporation	42,198
Canadian Government Loans	324,614
Government of Union of South Africa	79,997
Other debt (payable in external currency)	18,379
<b>Total external debt</b>	<b>1,554,834</b>

debts on account of the Bank of England stock, and that of the defunct E. India and South Sea Companies. In 1817 it was about £800,000,000; in 1894 it and the terminable annuities had been reduced to £635,000,000, partly from Goschen's sweeping reduction of the interest to 2½ per cent (since further reduced to 2½). The total reduction in the P. D. from 1837 to the beginning of the Boer War of 1899 was £153,000,000; but the expenses of that war and operations in China added an equal sum to the debt, and the gross amount in 1909 was £754,000,000. In 1917 the funded debt was over £3,900,000,000, about half being 3½ per cent war loan and the other largest items 3½ per cent conversion loan, consols, and 2½ per cent t. t. sury stock. The unfunded debt was over £21,000,000,000, of which the largest item was the floating debt (nearly £700,000,000, some £500,000,000 treasury bills, and £200,000,000 treasury deposit and ways and means advances). Other large items all over £100,000,000, were national savings certificates, 3 per cent savings bonds (1965–75), and 3 per cent savings bonds (1960–70).

The First World War, with its peculiarly difficult financial problems, caused the emergence of special measures with loans for war expenditure which small investors could take up and resulted in a considerable inflation of the national debt of all the belligerents. The need for money in Great Britain saw war loans held, not only on the books of the Bank of England, but also on the post office

register. Moreover war savings certificates were introduced becoming national savings certificates at a later date.

The national debt is administered by National Debt Commissioners, by whose agency measures for reduction, etc., are made. They do not, however, manage the sinking fund, or the Brit. debt to the U.S.A., this being an account known as the exchange account of the Treasury, which was set up during the First World War. For fuller details of the debt to America see DEBT and DEBT CONVERSION.

The growth and hist. generally of the national debt from 1694 to 1786 will be found in the Command Paper No. 9010, 1898.

*Local Debt (see also LOCAL TAXATION RETURNS; LOCAL TAXATION GRANTS).*—To ascertain the full indebtedness of the community to its members the aggregate debt of the various local spending authorities of Great Britain should be taken into account. The increase in this item of the public expenditure in recent years has been rapid (see also under MUNICIPAL TRADE), by reason principally of the constant augmentation of power and duties cast upon the shoulders of local authorities, and the wide sphere of municipal trading activity. The local debt of Great Britain and Ireland stood at £227,405,436 in 1890; it rose to £623,879,000 in 1909–10, and, from bearing a proportion of something like 30 per cent to the national debt (strictly so called) in 1890, it was in 1911 nearly equal to it. It must be borne in mind

# REVENUE AND EXPENDITURE OF LOCAL AUTHORITIES IN ENGLAND AND WALES

1946–47  
£ thousand

**Revenue:****(a) Income from.**

Rates	313,247

Net outstanding debt . . . . . 1,367,251

that local debt is represented by considerable capital assets in the forms of land, houses, schools, hospitals, transport, water, gas, and other municipal undertakings. Details of these municipal enterprises will be found under MUNICIPAL TRADE.

*United States of America.*—The P. D. of the U.S.A. in 1791 was \$75,463,478; it had fallen nearly 50 per cent by 1812, after which it rose to \$127,331,933. During the following years it began gradually to decrease until 1836. After the civil war it reached its highest point in 1866, when it amounted to \$755,763,929. It subsequently fell until the Sp. Amer. war, when it rose again.

## U.S.A. PUBLIC DEBT

	\$ million
1914	1,155
1919	25,452
1925	20,516
1929	16,931
1930 (lowest post-war)	16,145
1935 (after the New Deal)	32,524
1945	259,115
1946	269,898
1947	258,376

(The U.S.A. has no foreign debt; the figures show the total internal.)

*United States Local Debt.*—Beside the gross national debt of the Federal Gov., swollen as it is with the costs of war and totalling nearly \$270,000,000,000 in 1946, the aggregate debt of the separate states, mostly deficit and public works borrowings, looks small and is indeed greatly

exceeded by the aggregate municipal debt. Figures for 1946 (in \$ million) are state, 2358; co., 1437; municipal, 8197; school, etc., 3930; total, 15,922. Michigan, Nevada, and Wisconsin have no debt; Florida has no bonded debt; Columbia has no bonded debt not covered by slinking fund; and Alaska has no funded debt. Naturally the E. states, being more completely developed, have larger commitments than the more juvenile states towards the W. The total local debt of New York State in 1930 was \$250,249,447, while the city of New York accounts in 1946 show a total gross funded debt of \$2,895,125,000. The local debt of the other states is shown as follows:

	\$
Louisiana	155,829,000
Arkansas	114,421,000
Pennsylvania	113,388,000
California	121,737,000
Illinois	109,296,000
Minnesota	82,176,000
Tennessee (total direct and assumed debt)	79,016,000
Missouri	67,499,000
West Virginia	65,339,000
New Jersey	62,816,000
Massachusetts	57,261,000
South Carolina	53,114,000
Alabama	51,789,000
Mississippi	48,889,000
North Carolina	30,143,000
Connecticut	22,835,000
New Mexico	22,240,000
Rhode Island	20,517,000
North Dakota	18,949,000
Maryland	18,713,000
Colorado	18,294,000

South Dakota	18,272,000
Maine	10,414,000
Kansas	9,250,000
Washington	6,884,000
Virginia	6,378,000
Ohio	6,317,000
Arizona	5,788,000
Kentucky	5,464,000
Indiana	4,427,000
Idaho	4,418,000
Texas	4,102,000
Georgia	3,992,000
Vermont	2,682,000
Oklahoma	2,597,000
Oregon	2,239,000
Wyoming	2,020,000
New Hampshire	1,596,000
Montana	1,499,000
Nebraska	970,000
Utah	509,000
Idaho	340,000

The following tables show the P. D. of various commonwealth and foreign countries for selected years, the data being obtained from the United Nations Statistical office *Monthly Bulletin of Statistics* (Oct. 1948). By subtracting 'domestic' from 'total' the foreign debt can be calculated.

**Public Health.** The preservation and improvement of P. H. through the coercive action of local governing bodies is a development of the later part of the nineteenth century. Prior to that period it was considered no part of the duty of the state to control the physical environment of the individual. In 1845 a royal commission appointed to inquire into the causes of disease among the inhab. of tns. reported to Parliament that the dists. inhabited by the labouring classes, and often by tradesmen in large tns. and in many small tns., were in such a noxious state from want of drainage, cleanliness, proper ventilation, and adequate water supply, and from the prevalent overcrowding, that typhus, fever, cholera, consumption, scrofulous, and other chronic complaints existed to an appalling extent. Modern P. H. methods are founded upon the studies of Sir E. Chadwick, Sir J. Simon (1816-1904), Dr. S. Farr (medical jurist), and others regarding the effect of environment on health, and upon the researches of Pasteur (q.v.) and Koch (q.v.) in the science of bacteriology.

The first Public Health Act was passed in 1875, and this notable piece of legislation, mainly concerned with environmental hygiene, remained in force, though amended in detail, until the passing of the Public Health Act of 1936. Among the more important Acts and regulations affecting the P. H., which were passed subsequently to 1875, and on which various services were founded, were the Factory and Workshop Act, 1901, Midwives Act, 1902, Education (Administrative Provisions) Act, 1907, Housing and Town Planning Act, 1909, Public Health (Tuberculosis) Regulations, 1912, Public Health (Venereal Diseases) Regulations, 1916, Milk and Dairies (Consolidation) Act, 1915, Maternity and Child Welfare Act, 1914, Ministry of Health Act, 1919, Blind Persons Act, 1920, Housing Act, 1925, Local Government Act, 1929, Public Health Act, 1936, Housing Act, 1936, Factories Act, 1937, and Food and Drugs Act, 1938. Some of these Acts have been partly or wholly repealed, and they are mentioned because they initiated or extended important P. H. services. Thus the school medical service, for the medical examination and treatment of schoolchildren, was estab. by the above-mentioned Act of 1907. This Act is repealed and the relevant powers are now incorporated in the Education Act, 1921. Similarly with the other Acts mentioned, e.g. the Maternity and Child Welfare Act is repealed, but similar provisions are to be found in the Public Health Act, 1936. The Local Government Act, 1929, an Act of far-reaching importance, transferred the functions of the old boards of guardians to the councils of cos. and co. bors. (see LOCAL GOVERNMENT). The Public Health Act, 1936, Housing Act, 1936, and the Food and Drugs Act, 1938, consoli-

dated previous legislation and are now the prin. Acts under which the greater part of the duties of P. H. depts. of local authorities are carried out.

In detail public hygiene or health, as expressed in the Acts administered by the various local authorities, was concerned with sewerage and the disposal of waste matters of all kinds, drainage, and sanitary conveniences, the abatement of nuisances, the collection of refuse, and offensive trades; infectious diseases (including tuberculosis and venereal disease) and, generally, the prevention of infection from disease; midwives, maternity and child welfare; estab. of hospitals; unsound and adulterated food; burial and cremation; pollution of water; regulation of factories and workshops; housing and tn.-planning; estab. of mortuaries; lighting; ventilation; and regulation, generally, of dairies, cowsheds, and milkshops, water supply, public baths and washhouses, recreation grounds, and construction of buildings. It is unnecessary, however, in this article to consider either the machinery of local gov. or the general powers of local authorities, these aspects of the subject under consideration having been fully dealt with under LOCAL GOVERNMENT and MINISTRY OF HEALTH.

**Sewerage.**—A local authority (i.e. a dist. or tn. council) is bound to provide and maintain such sewers as may be necessary to drain their area, and may carry their sewers under any lands they choose, subject to compensation to the owner. All sewers are repairable at the public expense (except those constructed for private gain or to irrigate land), though under the Metropolitan Management Acts sewers in new streets may be constructed by tn. councils wholly or partly at the expense of adjacent landowners. There has been much controversy over the distinction between a sewer and a drain, but, in simple language, a drain serves only one premise, whereas a sewer receives drainage from two or more premises.) The local authority is bound to dispose of ordinary sewage matter, together with liquids from factories, but no injurious matter like chemical refuse or steam may be drained or let off into a sewer. Where persons responsible for trade premises want to discharge waste matter from them they must first apply to the local authority for permission to do so. The question of the disposal of sewage is dealt with under Sect. 14 of the Public Health Act, 1936, and that of the drainage of trade premises under the Public Health (Drainage of Trade Premises) Act, 1937. Unpurified sewage may not be discharged into any stream or lake, and most of the larger rvs. are protected in this respect by local Acts. The disposal of sewage matter has always been an economic problem, by reason not only of the cost of disposal without creating a nuisance, but also of the non-existence of any effective method of saving money by the use of the sewage matter for manure or for any other useful purpose, the whole usually finding its way as deodorised sludge into the

**Drainage and Sanitary Conveniences.**—The duty of draining a house falls upon the owner or occupier. Usually, in large tns., houses are drained into the public sewers, but in the smaller tns. and in thinly peopled dists. it is common to drain into cesspools. New houses must be drained into a sewer if there be one within 100 ft. of the premises. In default of the owner or occupier, the local authority is bound to effect a proper drainage, and can recover the cost from the owner or occupier. The local authority is empowered to enforce the provision of a proper water-closet or earth-closet, in every dwelling-house, and to make by-laws for a compulsory water supply for flushing the first-mentioned kind of convenience. Tn., metropolitan bor. and urb. dist. councils alike have power to construct sanitary conveniences for public accommodation. *See also* SANITATION OF BUILDINGS; SEWAGE.

**Abatement of Nuisances.** (*See under* NUISANCE for the general legal conception of a public nuisance.)—The nuisances which may be dealt with by a local authority are in practice limited to those expressly mentioned in various statutes (mainly the Public Health Acts, 1875, 1936) as falling within their powers of abatement. A P. H. nuisance, unlike a common law nuisance, is dealt with before a court of summary jurisdiction at the instance of the local authority. The law relating to these nuisances is now contained in Sect. 92 of the Public Health Act, 1936, which describes them as 'statutory nuisances.' They comprise: any premises; animals; accumulations or deposits; dust or effluvia from any trade, business, factory, etc., prejudicial to health or a nuisance; also any factory, workshop, etc., not properly ventilated or not kept clean or free from noxious effluvia, or so overcrowded as to be prejudicial to the health of the employees; and any other matter declared by the Act to be a statutory nuisance. The procedure is that the sanitary branch of the local P. H. dept. serves on the responsible person an abatement notice, and if this is ignored the local authority goes to a justice of the peace, who issues a summons and the court may then make a nuisance order requiring compliance or, in default, levy a fine, or the local authority may also abate the nuisance and recover the cost.

**Collection of Refuse.**—The local authorities outside the London area may or may not undertake to collect house refuse. They usually do so, and free of charge; but if they undertake to collect trade refuse or garden rubbish they may make a charge. If they do not undertake the duty themselves, they may make by-laws imposing the duty on occupiers. In London, however, this duty falls upon the bor. councils, the by-laws relative to it being drafted by the London Co. Council (L.C.C.).

**Offensive Trades.**—Offensive trades, under Sect. 107 of the Public Health Act, 1936, are those of a blood boiler, bone boiler, fat extractor and melter, fel-

l-monger, glue-maker, gut scraper, rag and bone dealer, size maker, soap boiler, tallow melter, or tripe boiler, together with certain trades, businesses, or manufs. which were offensive trades under an older Act of 1907, and also any other trades, etc., which the local authority, by order confirmed by the Ministry of Health, declare to be an offensive trade in their dist. It is unlawful to establish an offensive trade without the consent of the local authority, who may give consent to the estab. of an offensive trade for a limited period. The authority may make by-laws to prevent or diminish any injurious effects arising from offensive trades in their area. *See under* OFFENSIVE TRADES.

**Notification of Infectious Diseases, and Disinfection of Premises and Articles.**—Under the Public Health (Infectious Diseases) Regulations, 1927, certain infectious diseases must be notified by the head of the family to which the patient belongs (or, in his default, by any one in charge of the patient) to the dist. medical officer of health. The specified diseases are smallpox, cholera, diphtheria, membranous croup, erysipelas, scarlatina, scarlet fever, typhus, typhoid, enteric, relapsing, continued, and puerperal fever, consumption, and any other infectious diseases which the local authority may, with the approval of the Ministry of Health, add permanently or temporarily to the list. This was repeated in the Public Health Act, 1936, regulations under which Act or under similar sections of superseded Acts add various other diseases, including plague, cerebro-spinal fever, acute poliomyelitis, encephalitis lethargica, all forms of tuberculosis, ophthalmic neonatorum, acute primary pneumonia, dysentery, and malaria. Medical practitioners called in to visit the patient must also send certificates to the medical officer of health, stating the name and address of the patient and the nature of his disease. Keepers of common lodging-houses are also required to notify both the medical officer and the poor-law relieving officer of cases of infectious disease occurring in their houses. Power is conferred on local authorities by the Public Health Act, 1936, to remove to hospital an inmate of a common lodging house who is suffering from a notifiable infectious disease, and also on a court of summary jurisdiction to order the closing of the common lodging house on account of the occurrence of such disease. By the Milk and Dairies Order, 1926, dairymen in dists. where the Act has been adopted are bound to notify cases of infectious diseases occurring among their employees, and may also be required to disclose the sources of their milk supply. Where patients cannot be effectually isolated in the premises where they may happen to be, the police may, on an order of a magistrate of the local council, and subject to the consent of the superintending body of the hospital, remove them to any suitable neighbouring hospital. Where the Infectious Diseases (Prevention) Act, 1890 (substantially re-enacted in Part V. of the Public Health

Act, 1936), has been adopted, the local authority may provide free temporary accommodation for the members of a family in which infectious disease has broken out while the council disinfect their dwelling. The local authority may provide nurses where the hospital has not sufficient accommodation for the patients. Under the Public Health Act, 1936, a fine of £5 may be inflicted upon a person who exposes himself in a public place or place of entertainment, when he knows he is suffering from a notifiable disease; or allows a patient under his charge to do so; or gives or sells or exposes infected clothing or bedding; engages in a trade or occupation involving risk of spread of infection; or allowing a child, in his care, to attend school when the child is suffering from such infection. (See also under LANDLORD and TENANT as to letting infected premises.) Under the Public Health Act, 1936 (re-enacting the Infectious Diseases Notification Act, 1925), a local authority may pay the expenses of disinfecting bedding, clothes, and other things, if the disinfection be carried out by them or under their directions, and they may direct articles which have been exposed to dangerous infection to be destroyed, subject to compensation.

**Tuberculosis.**—The administrative methods by which tuberculosis is controlled are separate and distinct from those in connection with other types of infectious diseases. Tuberculosis schemes in England and Wales are administered by co. and co. bor. councils and, in London, by the L.C.C. An organised service dealing with the disease was initiated under the Public Health (Tuberculosis) Regulations, 1911, which required notification of all cases of pulmonary tuberculosis. This requirement is extended to non-pulmonary cases in 1912. Powers and duties in relation to treatment were contained in the Public Health (Tuberculosis). This requirement was extended. The present law is to be found in the Public Health (Tuberculosis) Regulations, 1930, and the Public Health Act, 1936 (Sects. 171-75). The regulations relate to notification by medical practitioners and the Act to treatment. It is the duty of the council to make adequate arrangements for the treatment of persons in their area, at or in dispensaries, sanatoria, and other approved institutions. Without prejudice to other provisions in the Act, the local authority may make such arrangements as they think desirable for the treatment of tuberculosis, and the council of a co. or co. borough may make arrangements for the after-care of persons who have suffered from tuberculosis.

**Maternity and Child Welfare.**—The forerunner of the modern child welfare clinics was that which was opened in Paris in 1892 by Dr. Pierre Budin, in which year, too, Variot estab. milk stations (*gouttes de lait*) where clean milk was distributed to poor mothers. This movement spread to England in 1899 through the estab. of a milk station at St. Helens, Lancashire. The system of clinics

and milk depots, largely carried on by voluntary societies, was regularised and put under the general supervision of the Ministry of Health by the passing of the Maternity and Child Welfare Act, 1918, now repealed and included in the Public Health Act, 1936 (Sect. 204). Notification of births was not made compulsory until 1915, though Huddersfield Corporation in 1906 had secured parl. powers for compulsory notification of births in that borough. A Midwives Act of 1902 estab. a board whose duty it was to publish a roll of certified midwives and to regulate their training and examinations. The last amending Act, that of 1936, estab. in all areas of England and Wales a full-time service of midwives employed by local authorities or by voluntary organisations. In Scotland the Maternity Services (Scotland) Act, 1937, goes further than the Eng. Act by providing for the services of doctor as well as of a maternity nurse at each confinement. When the family are in comfortable circumstances the question of arrangements for antenatal supervision or for confinement hardly concerns the P. H. dept., but under the Public Health Act, 1936, the usual notification is sent by the doctor after the birth; and in practice no further action is taken by the P. H. dept. of a local authority. The legislation which laid the foundation of the modern system of child welfare was comprised in the Notification of Births Act, 1907, and the Notification of Births (Extension) Act, 1915. The Act of 1907 was adoptive only, but the later Act made notification compulsory in all areas. Both Acts were repealed by the Public Health Act, 1936, Sect. 203 of which make compulsory the notification to the Ministry of Health of births in all areas. The onus of notification is upon the father, if residing in the house at the time of the birth, or any person in attendance at the time or within six hours of the birth; but in practice notifications are almost invariably made by the doctor or midwife (notification should not be confused with registration (*q.v.*)). The infantile mortality rate has steadily declined for many years (71 per 1000 in 1929; 53 in 1938; 48 in 1944; and 43 in 1946) and this rate is a fairly reliable index of the environmental conditions into which children are born and in which they spend the first twelve months of their lives; the fall which has taken place is closely related to the improvements in the standard of life, in housing, dietary, and in education. Improvements in communal hygiene and the work of the child welfare clinics are also factors to be taken into consideration. The law on the protection of children was contained in the Children Act, 1908, and the Children and Young Persons Act, 1932; but the relevant sections have been incorporated in Sects. 206-20 of the Public Health Act, 1936, which also contains some additional provisions. Sect. 206 makes it necessary for any person who undertakes for pay the nursing and maintenance of a child under nine years of age, apart from its parents or

having none, to give notice to the welfare authority. The welfare authority must appoint child protection visitors whose duty it is to visit from time to time any foster children in their area and satisfy themselves as to the health and well-being of such children. The Ministry of Health, in conjunction with the Ministry of Education, institutes a system of inspection of school children for the purpose of checking malnutrition, and the maintenance of clinics where dental, eye, and other troubles may be treated.

**Provision of Hospitals.**—The public, as distinct from voluntary, hospitals were owned and managed by local authorities. The public hospitals sprang from the parochial system of the forty-third year of the reign of Queen Elizabeth and these parochial functions were later transferred to boards of guardians. Early in the nineteenth century all types of sickness, including cholera, typhus, and smallpox, were being treated in workhouse institutions. It was not until the passing of the Public Health Acts of 1866 and 1875, prompted by the cholera epidemics, that the local authorities set up by the Municipal Corporations Act, 1835, were empowered to build hospitals for infectious and other diseases. There are now over 600 infectious disease hospitals, half of which were erected for the treatment of smallpox. The Insurance Act, 1911, stimulated the growth of sanatoria for tuberculosis. Under the Local Government Act 1929, all the functions of the boards of guardians were transferred to co. boroughs and co. councils, including the treatment of the sick in hospital. The Metropolitan Asylums Board of London, which once administered the isolation and mental hospitals of London, was dissolved and the hospitals of that area transferred to the L.C.C. These transferred hospitals became vested in Public Assistance Committees, the intention of Parliament being that the hospitals so transferred should be operated, not under the Poor Law Acts, but under the Public Health Acts. By 1936 almost all the public hospitals in England and Wales had been so transferred—numbering 577, with about 130,000 beds; while the other hospitals in the ownership of local authorities, including isolation hospitals, maternity homes, and sanatoria, numbered in 1939 an additional 1200 with nearly 60,000 beds. Whilst some of the hospitals transferred were modern in character, others were buildings erected originally as workhouses and were in need of much adaptation in order to function as hospitals. The mental hospitals and institutions for the mentally defective were generally managed by co. and co. boroughs. There were before the Second World War about 1000 voluntary hospitals, containing 90,000 beds. The Health White Paper (1944) was proposed to create joint regional authorities for the administration of services, such as hospitals and specialist treatment, which could only be made fully effective if they could draw on the resources of areas larger than those of most

existing local authorities. In conformity with the institution, by the National Health Service Act, 1946, of a comprehensive national health service available to all, and for which the minister of health is responsible, provision was made for the minister of health to take over all voluntary and public hospitals, subject to the teaching hospitals being given special treatment. Supplementary services, such as midwifery, maternity and child welfare, are provided through the local authorities. Regional hospital boards to administer the hospital and specialist services were set up in about a score of regions, each large hospital or related group of hospitals having a management committee. Except in the case of voluntary teaching hospitals, endowments were to pass to a new fund, which the minister of health would administer, the capital value of the fund being apportioned among the regional boards and the income from each portion passing to the boards. See further under NATIONAL HEALTH SERVICE ACT, 1946; HOSPITALS.

**Unsound and Adulterated Food.**—Both the medical officer of health and the inspector of nuisances have power to seize any unsound article sold or exposed for sale and intended for the food of man, and to take it before a magistrate, who may condemn it and order its destruction, and fine or imprison the owner or person in whose possession it was found. Under various Acts local authorities have power to make by-laws for preventing the sale of unwholesome provisions in markets or fairs. There are also stringent statutory provisions against the sale of adulterated butter or milk; and samples of butter, margarine, and milk may be taken by the public analyst, or any one acting on his behalf, without warning of his intention to analyse. Vendors of horseflesh are bound to indicate the nature of their business by a conspicuous notice outside their premises. The legal standards of cow's milk are described in the Sale of Milk Regulations, 1939. Under Sect. 24 of the Food and Drugs Act, 1938, it is forbidden to add any water or colouring matter, or any dried, condensed, or separated milk to milk intended for sale; it is illegal to sell as milk a mixture of cream and separated milk. The Milk and Dairies Order of 1926 was passed with the object of improving the conditions under which milk is produced. It contains many provisions for securing cleanliness, including provisions for cattle inspection, cleanliness of dairies, and workers in them, and of conveyance and distribution. Pasteurisation is provided for in the Milk (Special Designations) Order, 1936, and 1938. This includes tuberculin-tested milk. Sect. 25 of the Food and Drugs Act, 1938, prohibits the sale of tuberculous milk. Cream which is artificial must be so labelled (Food and Drugs Act, 1938). The sale of dried milk is governed by regulations of 1923 and 1927, and similarly condensed milk. The Food and Drugs Act also contains provisions on the adulteration of butter and the moisture content of butter and margarine. The use

of chemical preservatives for food is strictly limited by the Public Health (Preservatives, etc.) Regulations, 1925 and 1927. Other regulations for the control of food deal with slaughtering, meat marking, and the handling and sale of meat.

**Pollution of Water.**—See *Sewerage* above and **WATER SUPPLY**.

**Regulation of Factories and Workshops.**—See **FACTORY LEGISLATION**.

**Housing of the Working Classes and Repair of Houses.**—This wide subject is dealt with under **HOUSING**. But it may be mentioned here that although the Public Health Act enables the P. H. dept. to require repairs to buildings other than houses, the extent of the repairs which can be enforced is much more limited than by using powers under the Housing Act. Repairs under the Public Health Act must come into the category of defects which are prejudicial to health or a nuisance (Sect. 92). Thus a dwelling-house or an office building with a leaky roof, defective downspouts, drains, or sanitary conveniences may come within the provisions of Sect. 92 of the Public Health Act, 1936, because such defects may be either nuisances or injurious or likely to cause injury to health. But worn floor-boarding, broken or missing rails to staircases, defective doors, broken plaster, are by no means either nuisances or injurious to health and can only be dealt with under the comprehensive powers afforded by the Housing Act. While, however, powers to enforce repairs, under the latter Act, can only be used once within a period of years, notices under the Public Health Act in respect of minor repairs can be, and are, served repeatedly as often as defects, properly coming within that Act, are discovered.

**Water Supply.**—It is the duty of the local authority to provide a general supply of water if danger to health arises from unwholesomeness or insufficiency of the existing supply. This is without prejudice to their powers to compel owners of houses to provide a supply of water thereto (Public Health Act, 1936, Sect. 3.) Par. councils may utilise wells, springs, or streams for water supplies. Local authorities may make by-laws for preventing contamination, waste, or misuse of waters of a public supply. They may also close or restrict the use of water from a polluted source (Sect. 140).

**Public Baths and Washhouses.**—Where a local authority have adopted the Baths and Washhouses Acts, 1846-95, since extended by the Public Health Act, 1925, they may purchase or lease existing baths in or near their dist., or erect baths and washhouses or provide open-air bathing places, together with all necessary furniture and appliances.

**Recreation Grounds.**—Most tn. and dist. councils have full power to provide pleasure and recreation grounds and to regulate the use of the same. In the administrative co. of London, where such grounds or 'lungs' are recognised to be vital to P. H., the L.C.C. and the various bor. councils have power, under the Open

Spaces Act, 1906, and the Metropolis Management Acts, to purchase or lease ground for this purpose.

**Construction of Buildings.**—Under Sect. 61 of the Public Health Act, 1936, power is given to local authorities to make by-laws in respect of the construction of buildings, and for their guidance in such matters the Ministry of Health have issued a series of model by-laws indicating a desirable standard. The main object of these by-laws is to ensure the construction of houses whose walls shall be of proper thickness, materials and construction adequate to resist fires (see also **FIRE WALL**), foundations and site consistent with the health of the inhab., and the sanitation, access at the rear, lighting and so forth, strictly conformable to all reasonable requirements. See also the article **HOUSING**.

**Port Health Administration.**—This is mainly a matter for the Board of Trade under the Merchant Shipping Acts but port health authorities are constituted by the Ministry of Health which exercise over shipping within their area functions similar to those of sanitary authorities on land. Port health authorities (previously known as Port Sanitary Authorities) are constituted under the Port Sanitary Regulations, with powers derived, now, from Sects. 2-10 of the Public Health Act, 1936. Thus the master of every ship coming from abroad must notify, by wireless, to the Port Health Authority the existence of any person suffering from some notifiable infectious disease. The authority can appoint medical officers (commonly referred to as boarding medical officers) to examine persons suffering from infectious diseases, and to require the master to take steps for the destruction of vermin. The duties of the authority also include the supervision of all imported foodstuffs intended for human consumption.

In the U.S.A. the various states have P. H. services similar to those of Great Britain adjusted to their individual needs. The International Health Div. of the Rockefeller Foundation has granted a generous donation for the purpose of educational tours for the teaching of hygiene. These tours cover such depts. of P. H. as administration for P. H. officials, specialists in tuberculosis, infant hygiene, school hygiene, the health administration of ports, and demographic statistics, etc. The League of Nations estab. a special health committee and pub. monographs on the organisation and working conditions of P. H. services in different countries of the world, besides issuing the International Health Handbook. A constitution for a World Health Organisation (of which the League of Nations had made an important beginning) was agreed upon by the United Nations in Paris in June 1946 (see **HEALTH ORGANISATION**, **WORLD**). See also **HYGIENE**; **HOUSING**.

The bibliography on the subject is enormous, but for the most part each authoritative text-book covers the same ground. The bibliography at the end of

the article on LOCAL GOVERNMENT will apply to this article. See Stella Churchill, *Health Services and the Public*, 1928; G. B. Bannington, *English Public Health Administration*, 1929; G. Newiman, *The Huddling of a Nation's Health*, 1939; W. M. Frazer and C. O. Stallybrass, *Textbook of Public Health* (10th ed.), 1940; and ann. reports of the Ministry of Health.

**Public Houses**, see INNS AND INN-KEEPERS and LICENCES AND LICENSING LAW.

**Publicity**, see ADVERTISEMENT and PUBLIC RELATIONS OFFICER.

**Public Liability Insurance**, see under INSURANCE.

**Public Libraries Act**, see under LIBRARIES.

**Public Meeting**. It is a somewhat unconstructive principle of Eng. law that any person may meet another person or an indefinite number of persons at any appointed place so long as they do not thereby break the law. This principle is a mere application of the constitutional liberty of the subject, and to understand the limitation of that principle it is only necessary to define an 'unlawful assembly' and to specify the various acts in places of public resort that are forbidden by statute or local by-laws. An unlawful assembly is generally defined as a 'meeting of great numbers of people under such circumstances of terror (by reason, for example, of their weapons or generally menacing attitude) as cannot but endanger the peace and raise fears in the minds of reasonable people of the neighbourhood. The knowledge by an agitator or other person convening a meeting that his appearance is likely to provoke a breach of peace according to the better opinion makes the meeting *ipso facto* unlawful. Among forbidden acts in public places by meetings are the blocking up of public thoroughfares or interfering with the general convenience of other people, or the annoying thereby of tenants of adjacent houses. The general principle is that a public thoroughfare is provided for no other purpose than to provide a means for the public of passage and repassage. A place of public resort like Trafalgar Square or Hyde Park is analogous thereto, and, strictly, persons have no right whatever to hold P. Ms. for the discussion of any question, whether social, religious, political, or otherwise. See also PUBLIC ORDER ACT (1936).

**Public Opinion**, resultant of individual opinion and wishes on questions of public life. The existence of an informed P. O. is an essential basis for a strong democratic system. The spread of education amongst the broad mass of the pop., and especially the inclusion of civics, i.e. knowledge of the workings of national and local gov., is a necessary foundation, and book publishing free from the control of the gov. of the day has long been recognised as essential for the expression of P. O., and for the provision of facts upon which it can be based, to which has been added in more recent years the use of radio and film. The possibility that these and similar media

could be used to mould P. O. according to the wishes of the ruling party has been demonstrated with especial force by the totalitarian systems of the twentieth century, with the necessary corollary of a rigid censorship. P. O. has become a matter for attempted scientific investigation, usually by the technique of sampling (see GALLUP POLL), and the historical study of P. O. at various periods, and, for example, in connection with particular elections, has been undertaken.

**Public Order Act (1936)**, passed at a time when various para-military organisations, in imitation of the Fascists and Nazis, adopted black, brown, green, or other distinctive shirts, marched in procession, and held political meetings which not infrequently led to disturbances of the peace. This development was in the nature of things far more marked on the Continent than in Britain, where, however, there were occasional clashes between the 'black shirts' of the Brit. Union of Fascists and the Communists. The Public Order Act prohibits both para-military organisations and the wearing of uniforms in connection with political objects. It also gives powers to the police for the preservation of public order on the occasion of processions. If the chief of police, having regard to the time or place at which, and the circumstances in which, any public procession is taking place or is intended to take place and to the route proposed, has reasonable ground for apprehending that the provocation may occasion serious public disorder, he may give directions imposing upon the organisers or participants such conditions as seem necessary for keeping public order, including conditions prescribing the route. No conditions, however, restricting the display of flags, banners, or emblems may be imposed by the Act except such as are reasonably necessary to prevent risk of a breach of the peace.

**Public Policy**, see CONTRACT.

**Public Prosecutor**. This officer's duty is to take criminal proceedings under the superintendence of the attorney-general, in cases of importance or great difficulty, or in cases where, from the unwillingness or failure of the person aggrieved to prosecute, it is desirable in the public interest that the offender should not escape justice. In cases of importance or difficulty the P. P. must give advice to clerks of justices and to chief officers of police and other persons concerned in the proceedings. He may also assist private prosecutors by authorising them to incur special costs to obtain scientific evidence or the help of counsel. The office, prior to 1908, was held by the solicitor for the time being to the Treasury, but is now a separate office. For U.S.A. see STATE ATTORNEY.

**Public Record Office**, archives of the central gov. of Britain, ant. and modern. Few records have survived from the period in which administration was carried on in the king's court without any great degree of specialisation of function. With the developing scope and activity of the royal gov. was introduced an increasing

specialisation of the work, as the surviving records show. The first Pipe Roll is preserved from 1131, the first Receipt Rolls from Henry II's reign, and the first Memorial Rolls from that of John; the twelfth-century Plea Rolls witness a well-developed judicial organisation. In a third stage the constant growth of business and staff produced recurring subdivisions of gov. depts. and their records, as, for example, the Curia Regis (*q.v.*) divided as regards its judicial functions into king's bench and common pleas. Moreover the depts. 'ceased to follow the king' and his perambulatory court, and by necessity acquired a fixed location for business, staff, and records. The Tudor period saw sev. innovations, new machinery of government, new courts, and the introduction of directing 'boards.' The chief contribution of the period was the implementing of an existing tendency: secretaries finally became, as secretaries of state, the chief executive officers for domestic and foreign affairs, and a special repository is provided for their papers. The modern Treasury and Admiralty were estab. in the succeeding century. The close of the eighteenth and the first three-quarters of the nineteenth centuries were a period during which the administrative divs. which had evolved from medieval times were reformed and modernised.

The first repository for official documents was in the Treasury of the Receipt in Westminster, where, save for a short period in the Tower during the fourteenth century, records were housed until the opening of the nineteenth. The ever more numerous sections of administration, however, began to look after their own records, in repositories in many places in London. The work of scholars like Dugdale, Madox, and Rymer, whose *Fœdera* appeared in 1704-17, caused a growing awareness of the treasures of historic material which lay in the neglected records. In 1703 House of Lords committees were set up to consider 'the Method of keeping Records in Offices' and 'Ways to remedy what shall be found to be amiss.' Their reports appeared in 1719; in 1732 there was a report on the fire in the Cotton Library, and others of the same century dealt with specific repositories. It was not until 1800, however, that a truly comprehensive report appeared, namely, that of the 'Select Committee appointed to enquire into the State of the Public Records.' A series of six commissions, collectively called 'The Record Commission,' was appointed, and produced reports in 1812, 1819, and 1837. Criticism of their work led to inquiries by a House of Commons Select Committee, whose report of 1838 included a plan for the collection of public records into one place under one authority, the former being Chancery Lane, and the latter the master of the rolls.

The first and most important of the statutes by which the work of the dept. is still regulated is the Public Record Office Act of 1838, resulting from the report of 1836. An Order of 1852 en-

larged the field of public records to which the Act applied. An Act of 1877 set up a procedure to determine whether or not any given class of documents were of sufficient 'value to justify their Preservation' in the P. R. O., and to regulate their elimination if they were not. An Act of 1898 extended from 1715 to 1660 the dates of documents to which the Act may apply.

The existing situation is as follows. All documents in gov. depts., and divs. (except the court of probate) of the supreme court and in older royal courts, are in the charge and superintendence of the master of the rolls and may be, and are removed into his custody by 'counter-signed warrant.' The P. R. O. has absolute discretion as to the administration of these, usually known as the legal section. For 'departmental' records, though many transfers have been made, no warrant has in practice been used; thus they are held to be still the property of the transferring depts. (though in 'charge and superintendence' of the master of the rolls) who may requisition and withdraw them, and are prime movers in making transfers, and in controlling their frequency, volume, and scope, and the extent to which the public may have access to them; the P. R. O. has, however, a recognised advisory capacity, and the master's rules lay down conditions under which transfers will be accepted. The records of the state paper office occupy a position midway between the two above. All home and foreign documents down to 1782 are classed as 'state papers,' and are held in the same formal custody as 'legal' records. Those of subsequent years are, with later records from the Foreign and Home Office, classed as 'departmental' records. The date 1782 was chosen (in 1909) to denote the official differentiation of the secretary of state's office into separate colonial, foreign, and home depts. The records of the Colonial Office are, however, classed as 'departmental' records whatever their date, because that office does not wholly originate from the secretary of state's activities. Legal and departmental records are treated equally in technical considerations of storage, repair, etc., notwithstanding their difference in status. It should be noted that 'legal' is a misleading term as applied to the records of most medieval courts, since they are in fact preponderantly administrative.

The conservation of the records includes their assembling and housing, and the elimination of unwanted documents; their sorting, numbering, labelling, and listing, and their distribution and packing; the provision of summaries of their location; and their repair and binding. The making of the records available to students entails the provision of means of reference and of public search rooms, and includes photographic facilities and pubs. by the P. R. O.

The Act of 1877 dealt with the elimination of documents, being specifically designed to prevent not improper destruction, but only unnecessary preservation. The master of the rolls was

empowered to make rules on the subject, and the first (1882) set up a body of inspecting officers, at least three in number, plus a representative of the dept. concerned. They were to submit schedules of documents to be destroyed, to be laid before Parliament. Under new rules of 1890, still current, documents existing or 'about to exist' in gov. depts. are subject to a schedule prepared in gov. depts., but then submitted to the inspecting officers. To the end of 1948 seventy-four schedules of legal and 308 of departmental records were made.

A committee of 1943 divided the life of modern records into three phases; the first comprised files in current use; the second those needed only for occasional reference; the third those no longer normally required. The second phase had often resulted in neglect, and a permanent repository was required. By 1948 five stations on an incomplete extension of the underground railway had been taken over and utilised, in a process known as the 'Limbo' scheme.

The use of photography has been developed, and photostat machines were employed during the First World War. In 1910 the large macrophotograph machine was introduced.

Activities of the P. R. O. outside the Act include the supervision of manorial records and par. tithe apportionments. The Historical MSS. Commission (q.v.) has carried on from the P. R. O. the work on papers and MSS. of private families and institutions. Under the commission was created in 1945 a national register of archives to organise the collection of information about and the compilation of a central index of private and local archives of all dates and kinds. The boards and commissions of nationalised industries have an obligation to consult the P. R. O. about their records. See Royal Commission on Public Records (1910), *First Report*, 1912; M. S. Giuseppe, *A Guide to the Manuscripts preserved in the Public Record Office*, 1923, 1924; V. H. Galbraith, *Introduction to the Use of Public Records*, Part I: *Introductory* (H.M.S.O.), 1949.

**Public Relations Officer**, head of an information div. in a gov. dept. or other body. He is the normal channel of information between the gov. dept., municipal corporation, public utility service, or other body, and the press or public. Some P. R. Os. or press officers were introduced into gov. depts. after the First World War, but it was only in the early part of the Second World War that separate P. R. divs. became a part of the organisation of all but the smallest depts., and the Ministry of Information was set up with functions which included the provision of common service facilities for depts. requiring publicity material. Home information services expanded rapidly during this time. In the period between the setting up of the Central Office of Information on April 1, 1946, emphasis shifted from publicity connected with the war-effort to publicity concerning the

national economic difficulties, and the more important measures of social legislation. The Central Office of Information (unlike the Ministry of Information, which it succeeded) has no responsibility for the policies underlying information projects, but is solely a common service technical agency working at the request and to the requirements of the ministerial dept. The idea of using publicity for any project often originates with an administrative branch or div. of the dept., and the P. R. O. or press officer, in addition to advising on the type of publicity most likely to be effective, is responsible for executing that part of the publicity which is organised departmentally (e.g. ministerial press conferences and the briefing of voluntary organisations working in conjunction with the dept.). He also secures the co-operation of the Central Office of Information in the production of publicity material for which the Central Office is responsible technically (e.g. press and poster advertising, films, booklets). On occasions the idea of using publicity originates with the P. R. O. or information div. and not with the administrative div. concerned. This is partly because the information div., through its wider contact with the public and the organs of public opinion, may become aware in advance of the administrative div. that a particular problem or situation is developing which may call for the use of publicity; and also partly because other officers of the information div., being recruited mainly from the press or advertising world, are by their training and experience more alive than the administrator can expect to be to the contributions which publicity can make to the attainment of administrative ends. Three main criticisms emerge from the evidence given recently by the Newspaper Proprietors' Association and the Newspaper Society to a Treasury committee on the services performed by press offices in departmental divs.; that press offices tend to become apologists for their depts., and are reluctant to give information which would present their dept. or its policy in an unfavourable light; that they prevent direct contact between a newspaper representative and the administrative head of the branch or div. concerned with the subject-matter of the inquiry; and that press officers too often tend to regard their obligation to the press as discharged by the issue of a written official handout, and are loath to supplement the handout (or 'release') on request by background information and guidance. But overriding conditions govern the work of gov. depts., including parl. privilege and the right of the House of Commons to first-hand knowledge of certain governmental or departmental decisions; and again security considerations may be involved, or again the pub. interest might be ill-served by premature publicity.

**Public Revenue**. The income yielding assets of the state (Britain) are the Crown lands and certain investments, such as shares in the Anglo-Persian Oil Company and in the Suez Canal. Dividends from

these shares are paid directly into the Consolidated Fund. The commissioners of Crown lands collect the rents arising from the properties and pay over the proceeds as net revenue. Of the fees received by depts., the receipts of the post office are the largest, so large, in fact, that the post office is classed as one of the revenue depts. Many other depts. collect minor sums and some pay these receipts directly into the Consolidated Fund. But the majority treat their receipts as appropriations in aid, the receipts being paid into the paymaster-general's cash account, where they are placed to the credit of the services concerned and the depts. draw a proportionally smaller sum from the Exchequer for their voted expenditure. But all these sources of P. R. are trifling compared with taxation, a fact which was still further emphasised during the Second World War when the rate of income tax and surtax rose very sharply. The Board of Inland Revenue collects direct taxes, the chief items of which are Income tax, surtax, and estate duties; while the collection of indirect taxes is the prov. of the Board of Customs and Excise. The accountant and comptroller general, who is the head of the financial dept. of the Board, receives from the local collectors a statement of receipts (and payments for expenses), and from the surveyors' reports he can ascertain the amount of duty which should have been collected and paid in. The accountant and comptroller general transfers money daily from the general account of the commissioners of Customs and Excise to the Consolidated Fund at the Bank of England, retaining a certain sum for current expenses. In order to avoid unnecessary transfers of money the revenue depts. draw upon their receipts for expenses, and moneys so used are treated as advances on account of the vote. The Board of Inland Revenue treat departmental expenditure in the same way. They too draw money from their general account to pay for rate expenditure, and the money is periodically repaid by the Treasury.

The taxation and other sources of P. R. (Great Britain) in the financial years 1938-39 and 1948-49 were as follows:

	1938-39	1948-49
	£ million	
<b>Inland revenue:</b>		
Income tax	335.0	1,367.6
Surtax	62.5	97.9
Death duties	77.4	177.1
Stamp duties	21.0	56.4
Profits Tax (National Defence Contribution)	21.0	199.1
Excess Profits Tax	—	79.8
Other inland revenue duties	1.6	0.7
Special contribution	—	79.4
<b>Customs and Excise:</b>		
Customs	226.3	823.3
Excise	114.2	733.5
Motor vehicle duties	35.0	52.7
Sale of surplus war stores	—	99.6

1938-39 1948-49  
£ million

Surplus receipts from certain trading services	—	28.0
Post office (net receipts)	9.5	—
Post office fund	1.4	—
Broadcast receiving licences	—*	11.7
Crown lands	1.3	0.9
Receipts from sundry loans	5.7	17.7
Miscellaneous	12.9	180.6
<b>Ordinary revenue total.</b>	<b>927.2</b>	<b>4,006.6</b>
Post office	79.0*	152.7
Income tax deducted from excess profits tax post-war refunds	—	8.7
<b>Self-balancing revenue total</b>	<b>79.0</b>	<b>161.4</b>
<b>Total ordinary and self-balancing revenue</b>	<b>1,006.2</b>	<b>4,168.0</b>
<b>Total other receipts, repayments, etc.</b>	<b>190.2</b>	<b>382.0</b>
<b>Grand total gov. receipts</b>	<b>1,196.4</b>	<b>4,550.0</b>

\* Included in post office self-balancing revenue.

Most modern systems of state revenue present essentially the same features as that of Great Britain, though the individual sources may go by different names. In the above list the heads are merely popularly designated, and the classification, however convenient, is economically as unscientific as the assumed div. into tax receipts and non-tax receipts. A classification more in accordance with old economists is that into taxation direct and indirect, and Crown revenue. But modern economists have repeatedly shown not only that the incidence of so-called direct taxes is often on other persons than those primarily intended to bear the burden, and, conversely, that many indirect taxes are in reality direct (e.g. some stamp duties are a direct deduction from income, while frequently indirect imposts on commodities remain on the shoulders of those from whom they were originally collected in spite of the economic assumption that they are passed on to the consumer), but that the whole of the revenue from the post office and other state monopolies, together with the receipts from stamp duties, is, in reality, taxation, though its precise incidence may be difficult to determine in particular cases. It is not a little anomalous that the most productive source of P. R. should be a tax which in its origin was no more than a temporary war tax (see INCOME TAX). The pre-1932 Brit. system of restricting customs and excise duties to a more handful of commodities was not only advantageous to trade generally, but conducive to a high yield of revenue (see on this EXCISE DUTY; CUSTOMS DUTIES).

A circumstance that made the Brit.

levy more productive than those of most other countries was that it was designed exclusively for purposes of P. R. uncomplicated by a policy of protective duties. It is clear, too, that the greater the number and amount of protective duties, the less must be the revenues from purely customs duties, a deficiency which must necessarily be made up in other ways, as, for example, by the *octroi system* (see OCTROI).

The total public revenue in Great Britain for various financial years since 1880 is as follows:

	£
1880-81	81,872,000
1900-01	140,124,000
1913-14	198,243,000
1918-19	889,021,000
1919-20	1,339,571,000
1920-21	1,125,985,000
1929-30	814,971,000
1937-38	875,718,000
1938-39	930,935,000
1939-40	1,049,189,000
1940-41	1,408,867,000
1941-42	2,074,057,000
1943-44	2,819,851,000
1944-45	2,819,851,000
1945-46	3,281,450,000
1946-47	3,311,223,000
1947-48	3,841,359,000
1948-49	4,006,591,000

*Local Taxation Revenue.* The total amounts received by local authorities in England and Wales from the rates in the

financial years ended March 31, 1914, and specified years thereafter were:

	£
1913-14	71,276,000
1930-31	149,896,000
1935-36	164,914,000
1940-41	203,892,000
1945-46	221,000,000
1946-47	239,000,000
1947-48	278,000,000
1948-49 (estimated)	266,801,000

SCOTLAND	£
1944-45	24,285,000
1945-46	23,306,000
1946-47	28,019,000
1947-48	32,073,000

In addition to block grants (£59,129,000 in the United Kingdom in 1947-48 and £8,580,000 in Scotland) under the Local Government Acts 1929 to 1946, local authorities receive other large gov. grants, e.g. from the Ministry of Education for purposes of education, from the Home Office for police expenditure, from the Ministry of Health for housing, etc. They also receive large sums from gov. depts. as reimbursements in respect of expenditure on emergency services. Total gov. grants to local government authorities in 1946-47 amounted to £252,113,000 for England and Wales, and in 1944-45, £25,874,000 for Scotland.

*United States.*—The P. R. for the U.S.A. for the years ending June 30, 1947, and June 30, 1949, was as follows:

#### General and Special Accounts:

##### Internal revenue:

	1947 \$	1949 \$
Income tax . . . . .	20,305,568,454	29,482,283,759
Miscellaneous internal revenue . . . . .	8,049,467,726	8,318,022,991
Social security taxes . . . . .	1,644,315,349	1,913,145,400
Taxes upon carriers and their employees . . . . .	340,057,125	563,832,724

##### Railroad unemployment insurance contributions

for administrative expenses . . . . .	14,171,002	9,739,295
Customs . . . . .	191,078,260	381,484,796
Surplus property . . . . .	2,485,796,668	589,078,103
Other miscellaneous receipts . . . . .	1,944,867,485	1,482,918,452

Total budget receipts . . . . .	41,718,325,110	42,773,505,520
---------------------------------	----------------	----------------

##### Deduct:

Appropriation to federal old-age and survivors' insurance trust fund . . . . .	1,459,491,921	1,690,295,705
Refunds of receipts . . . . .		2,837,542,005
Net budget receipts . . . . .	43,258,833,189	38,245,667,810

#### Trust Accounts, etc.:

Federal old-age and survivors' insurance trust fund . . . . .	623,332,497	1,023,769,341
National service life insurance fund . . . . .	1,504,130,636	690,051,535
Railroad retirement account . . . . .	322,611,274	635,401,876
Unemployment trust fund . . . . .	1,289,398,022	1,173,175,672
Other trust funds and accounts . . . . .	1,504,515,849	1,302,028,241
Total receipts, . . . . .	5,244,027,279	5,724,426,671

The omission of cents in the separate items accounts for the apparent inaccuracy in certain totals.

**Public School**, term which has greatly varied in meaning at different times. It can be used in a wide sense to denote (as in the U.S.A.) a school which is not under private ownership and control. In England, however, the term has gained a special, narrower meaning. According to the terms of reference of the Fleming Committee (1912) P. S. are 'schools which are in membership of the governing bodies' association or the headmasters' conference.' The election of a headmaster to the latter of those organisations normally depends on his school (1) possessing a certain amount of independence; (2) undertaking some post-general certificate work; (3) containing a certain number of boys over the age of thirteen; (4) having a number of former pupils at univs. Such schools number rather fewer than 200. Slightly less than half are 'independent' schools, the rest being aided by grants from local education authorities or from the Ministry of Education. They are controlled by a board of governors or other constitutional authority. P. S. were often founded for religious or philanthropic purposes, some of them dating back to the Middle Ages (Winchester, 1382; Eton, 1440), but the majority were founded in the eighteenth and nineteenth centuries. Eton is said to have been the first grammar school to receive the name of P. S., the meaning then being that scholars might come to it from any part of England, and not, as was generally the case, from the immediate neighbourhood of the school. The exclusive P. S. have been frequently criticised because they began as foundations for poor scholars and grew into a privilege of the wealthy. Both Eton and Winchester were enjoined in their charters to provide for free place pupils, 'paupers or indigents,' but, like many other P. S., both in time established exclusive traditions. This exclusiveness has often been the chief difference between many a P. S. and the old grammar schools from which sev. P. S. originated. Features common to all P. S. are the prefect system, religious teaching, a high regard for team games, and an emphasis on character building. But these features also prevail in many grammar or other secondary schools, private or otherwise, and it is therefore often hard to define a P. S. otherwise than by reference to the important social and economic aspect. A large number of P. S. are residential, which makes them more expensive, and although some have always been day schools, even these, on account of their social pre-eminence, have been in a position to choose their pupils carefully. But though in the past many boys went to P. S. from recognised preparatory schools, many were able to enter by obtaining open scholarships. Since 1944, when the Education Act allowed local authorities to provide education of the P. S. type where this seemed to suit parents and pupils, many boys have gone to famous P. S. by way of the qualifying common entrance examination taken by children at the age of eleven. It may

be doubted whether the traditions of the P. S. differ substantially from those of the endowed grammar schools. Both groups had suffered a great decline by the early nineteenth century, and were in need of reform. The Public Schools Act of 1868 was the outcome of a royal commission set up in 1861 to investigate the working of nine schools—Eton, Harrow, Winchester, Shrewsbury, Charterhouse, Rugby, Westminster, St. Paul's, and Merchant Taylors'—but the last two were subsequently omitted from the operation of the Act of 1868. It appeared evident that some schools at least had instituted reforms in the standard of accommodation, curriculum, and moral tone before the commission was appointed. About this time a number of new P. S. were founded. These include Marlborough, Cheltenham, Radley, and Lancing, all in the 1840s; Wellington in the 1850s; and Clifton in the 1860s. Canford, Stowe, and Bryanston were established after the First World War. The P. S. revival had much influence in the general state of education. These largely exclusive schools heralded the beginnings of a national system of education. The headmasters' conference was established by Thring of Uppingham as a protest against the exclusion of the seven schools dealt with in the Public Schools Act from the Endowed Schools Act of 1869. In 1910 an association of governing bodies of P. S. was founded. Two years later a similar association in respect of girls' schools was formed, the schools belonging to it being generally termed P. S., although the term is more commonly used in connection with boys' schools. The Eng. P. S. has, since 1850, been responsible for educating a very large proportion of the leading figures in Eng. public life. Among the most famous P. S. masters are Arnold of Rugby (q.v.), James of Eton, Samuel Butler of Shrewsbury (q.v.), Thring of Uppingham (q.v.), and Henry Montagu Butler of Harrow (q.v.). The chief contribution made by Thring and others to the school world was to restore to it the ideal of the Christian gentleman. While recognising the great achievement of P. S. in scholarship, it is not unfair to assume that the development of the mind is not a primary consideration, and that the chief concern is the moulding of an upright character through the corporate life of the school, and the training of a good citizen, though critics, often from the P. S. themselves, have complained that they encourage class isolation. This criticism, however, has lost much of its force since the beginning of the twentieth century, and especially since 1911. See W. O. Lester-Smith, *To Whom do Schools Belong?*, 1913; Sir R. Livingstone, *Education for a World Adrift*, 1911; H.M.S.O., *Public Schools and the General Educational System*, 1944; J. F. Wolfenden, *The Public Schools Today*, 1919; and *The Public Schools' Year Book*.

**Public Service Vehicle** is defined in Sect. 121 of the Road Traffic Act, 1930, as 'a motor vehicle used for carrying

passengers for hire or reward other than a vehicle which is a contract carriage adapted to carry less than eight passengers; or a tramcar or trolley vehicle.' A 'contract carriage' is defined in the same Act as a 'motor vehicle carrying passengers for hire or reward under a contract express or implied for the use of the vehicle as a whole at or for a fixed or agreed rate or sum.' The Act of 1930 gave a local authority, who, under any local Act or Order are operating a tramway, light railway, trolley vehicle, or omnibus undertaking, powers to run P. S. Vs. on any road within their dist.; and also with the consent of the Traffic Commissioners for the traffic area on which any other road is situate, on that road without having to obtain a special par. Act or Order. Under the Act of 1930 the local authority had to obtain a licence from the Traffic Commissioners, but the Act has been amended by the Transport Act, 1947, the general effect of the amendment in this particular being that a passenger road transport service is exempted from the necessity of obtaining a licence under the provisions of the Road Traffic Act; i.e. the types of vehicles to be employed and stopping places must be approved by the licensing authority for the area. The licensing authority, formerly the Traffic Commissioners, is now renamed the Licensing Authority for Public Service Vehicles.

**Public Stores.** The Brit. Gov. appropriates certain marks, the most familiar of which is the broad arrow, for the purpose of distinguishing P. S. By the Public Stores Act, 1875, it is a misdemeanour punishable by imprisonment up to two years to put any of these marks without authority on non-gov. stores. To obliterate such marks so as to conceal the fact that stores are gov. property is a felony punishable with penal servitude up to seven years.

**Public Trustee, gov. official** whose office was opened in 1908 under the Official Trustee Act, 1906, and through whom the state acts as executor and trustee under a will, or as trustee under a settlement and in other similar capacities. The value of the trusts accepted up to the end of the financial year 1948-49 was over £552,879,000. The facts of any trust, new or old, in which it is desired that the P. T. should act may be brought to his notice by letter or interview. The appointment is effected in the same way as a private trustee, or by an order of the court. The P. T. can act solely or jointly with others. Executors who have obtained probate can transfer their duties to him under an order of the court. He can also act as an administrator with or without the will annexed. Strict secrecy is observed in all matters dealt with in the dept. of the P. T. Accounts in simple form are furnished to the beneficiaries as required.

**Public Utilities.** The chief services covered by the leading P. U. are the supply to the public of water, gas, electricity, and tramways.

**Water.**—About two-thirds of the co. bors., nearly all non-co. bors., and half of

the urban dists. of England and Wales control their own water supply. In London in 1902 the London Water Companies were taken over by the Metropolitan Water Board, under the Metropolitan Water Act of that year. Comprehensive provisions relating to water supply are contained in the Water Act, 1945, under which the minister of health is given the duty of promoting the conservation and proper use of water resources and securing the effective execution by water undertakers, under his control and direction, of a national policy relating to water. *See further under WATER SUPPLY.*

**Gas.**—Before the nationalisation of the gas industry there were some 1046 gas undertakings in the United Kingdom, of which 275 were local authorities, 405 statutory companies, and 366 companies working without statutory powers. The ann. make of gas was approximately 418,000,000,000 cub. ft., of which about 36.5 per cent was made by local authorities. In addition, about 52,000,000,000 cub. ft. of gas was purchased from coke ovens. The ann. amount of gas sold at the present time (1950) is at least double that sold in 1920, and over 30 per cent is used for industrial and commercial purposes. Gas production yields also valuable residuals such as coke, tar, ammonia, etc. Since the Gas Regulation Act, 1920, the normal method of charging for gas has been changed from the volumetric (cub. ft.) basis to the thermal basis, under which the charge is based on the number of heat units contained in the gas. For this purpose the unit of heat is the therm (100,000 Brit. Thermal Units), and the number of B.Th.U. produced by the combustion of 1 cub. ft. of gas under certain conditions is known as the calorific value. Normally, gas is subject to tests for calorific value, purity (freedom from sulphuretted hydrogen), and pressure (minimum 2 in.).

The gas industry was nationalised by the Gas Act, 1948, which estab. twelve Area Gas Boards to which existing gas undertakings were transferred. The Gas Council exercises certain functions, mainly advisory and financial, in respect of the Gas Area Boards.

**Electricity.**—*See BRITISH ELECTRICITY AUTHORITY.*

**Tramways.**—General legislation relating to tramways and light railways is contained in the Tramways Act of 1870 and the Light Railways Act of 1896 and 1913, which were up to 1919 administered by the Board of Trade, after which they were taken over by the Ministry of Transport under the Act of 1919. *See further under TRAMWAYS.*

**Public Utilities in the U.S.A.**—In the main the chief public utility owned and operated by most Amer. cities is the water supply. In some conspicuous cases enormous sums, running into millions of dollars, have been spent to bring a supply of pure water from great distances. The supply of electricity is mainly in the hands of private corporations. Before the Second World War these produced 96,000,000,000 kilowatt hours. The

installed generating machinery totalled 14,500,000 h.p. Approximately 24,850,000 customers were served, nearly 20,500,000 being householders. About 70 per cent of the people in the U.S.A. now live in electrically wired homes. Electric service is available to practically every community of 1000 pop. or above, and to 50 per cent of the communities between 250 and 1000 pop. The number of electrified farms is estimated at 700,000.

The supply of gas is also largely in the hands of private corporations. Statistics issued before the Second World War showed that the gas industry had 15,800,000 customers who bought nearly 2,500,000,000 cub. ft. of gas. This includes both manufactured gas and a vast supply of natural gas (g.r.). In some instances this is piped for great distances. For instance, natural gas from W. Virginia is piped nearly 300 m., supplying customers *en route* and also in the distant cities of Cincinnati, Ohio, and Covington and Newport, Kentucky. Street railways are almost entirely privately owned by corporations, and there is no city of any size which has not a complete network of them.

**Public Works Administration**, *see* WORKS AGENCY, FEDERAL.

**Public Works Loan Board**, created in 1817 for the purpose of advancing money to municipal authorities for public works. These include conservation of rivers, or main drainage, prisons, public libraries and museums, housing, waterworks, and any works for which a local sanitary authority is empowered to borrow under the Public Health Acts. Before advancing money the commissioners must take security for repayment with interest at the rate authorised by the special Act relating to the loan. The security is generally on the rates, but it may be on any other property. By the Public Works Loans Act, 1897, the rate of interest on loans secured on local rates was reduced to not less than 2½ per cent. If the loan is not repaid the commissioners have power to enter into possession of, and, if necessary, sell, the mortgaged property. By the Local Authorities Loans Act, 1915, a temporary measure passed to check competition by local authorities, after the Second World War, in the open market, local authorities are prevented from so borrowing (subject to certain exceptions) and must obtain their capital requirements from the gov. through the P. W. L. B. Repayment to the board is by means of yearly annuity and the privilege of repaying the debt before its due date can be allowed only by paying a fine to the board depending on current interest rates. The rate to be paid by the local authority is ½ per cent above that at which the gov. is able to borrow. Limited permission to borrow without recourse to the board is given in certain cases. This is important to the local authorities as it may enable them to borrow at lower rates and maintain contact with their local markets of small investors. There are other exceptions to the rule that all borrowing must be through the P. W. L. B.; the local

authority may borrow from trusts and charities under its control; effect a temporary loan pending the receipt of revenue; borrow from another local authority which holds funds which it is empowered to lend; or borrow by stock, to redeem a previous stock issue. Local authorities may also borrow from their sinking funds, reserves, or other internal resources. The current rates of P. W. L. B. interest were fixed in June 1945 at 2 per cent on loans for not more than five years; 2½ per cent on loans for more than five, but not more than ten years; 2½ per cent on loans for more than ten, but not more than fifteen years; 3 per cent on loans for more than fifteen, but not more than thirty years; and 3 per cent on loans for more than thirty years. During the financial year 1947-48 the commissioners advanced loans amounting to £246,119,648, 78 per cent of which was for the purposes of the Housing Acts. The average rate of interest was £3 0s 10d. per cent in 1945-46; £2 10s 6d. per cent in 1946-47; and £2 12s. 2d. per cent in 1947-48.

**Public Worship Regulation Act**, *see* ECCLESIASTICAL COURTS.

**Publishing** (Lat. *publicare*, to make public property), term generally applied in a restricted sense to the process of selecting, printing, and issuing reading matter for distribution to the public. Even in this limited sense it includes the issue of newspapers, magazines, and other periodicals, musical scores, directories, time-tables, and highly specialised works of reference. If, however, the material pub. or made known is not otherwise specified, the term is generally held to mean the P. of books. It signifies the activity of that part of the book trade which is the link between authorship and printing on the one hand and bookselling on the other. It covers a wide field which may conveniently be divided into educational and general. Educational P. includes the works of scholarship, research, and instruction issued by the learned presses attached to the major univs. in Europe and the U.S.A. or by independent firms of publishers who specialise in this field, sometimes combining it with general P. The term 'general P.' covers the issue of all the miscellaneous books consisting of religious and philosophical writings, poetry, plays, fiction, biography, memoirs, travel books, expositions of hist., science and art, belles-lettres, and books for children (other than school books). The work characteristic of P. in this field is the reading, criticising, and selecting of MSS.; the editing, planning, and commissioning of books; the negotiating of agreements with authors, editors, artists, and literary agents; book production (involving decisions of the kind and quality of paper, size of page, number of pages, type and binding styles); and finally the marketing of the finished product. The first function is the relationship between the publisher and author. Until recent times it was not unusual for a publisher to acquire the copyright in an author's work in return for either an outright payment or a royalty on copies sold, but now it is more

usual for the author to lease to the publisher the exclusive right to print and issue the work in book form. There are many varieties of publishing agreements framed to meet special cases. Most contracts provide for books to be financed by the publisher and for the remuneration of the author by way of royalty (normally a percentage of the retail price of each copy sold). Some books, however, are pub. on a 'half profits' or 'half proceeds' basis, the author and publisher sharing equally; others are subsidised as propaganda by commercial concerns, political groups, reformist or religious bodies, but these are a minute proportion of publishing output.

*Historical.*—To-day the distinction between the bookseller and publisher is, with a few exceptions, firmly estab. In classical and medieval times, however, the bookseller employed copyists and became the producer (or publisher) of his own stock-in-trade. Even after the introduction of printing bookelling, printing, and P. were conjoined occupations (see BOOKSELLING; PRINTING). In England the book trade was consolidated by the incorporation of the Stationers' Company in 1557 during the reign of Queen Mary. The charter was confirmed by Queen Elizabeth in 1559. The company included both printers and booksellers (or stationers), both functions often combined in the same person. It was vigilant in the protection of its monopolies and became an instrument of gov. in suppressing seditious and, in the religious field, controversial literature. Towards the end of the sixteenth century the bookseller began to separate himself from the printer, his business being to secure the copyrights of the books he wished to sell and to employ a printer to have them printed, and even—a further new departure—to engage authors to write. He also helped to stock his shop by exchanging books with fellow booksellers. These developments were often opposed by the printers, who resented their economic dependence on the book-seller. The tendency grew and the book-seller-publishers in Elizabethan times became the influential members of the Stationers' Company. Notable among them were Simon Waterson, the publisher of Camden, Wm. Ponsonby, Spenser's publisher, and Humphrey Cooper, whom Bacon authorised to publish his works. The monopoly system was a further grievance of the small printer-publisher. The system was strengthened by James I., and the Stationers' Company operated under the control of the Crown. For instance, the privilege of printing the Bible was vested in a group of publishers in partnership, including the king's printer, Robert Barker, who pub. the authorised version in 1611. In addition to the Bible, other monopolies were grouped as Ballad Stock, Irish, Lat., and Eng. Stock. The monopoly system encouraged pirates, and the prevalence of pirated eds. (not necessarily corrupt texts) in Elizabethan and Jacobean times was an indication of the difficulties small printer-publishers had in

making a living. The 'free' publishers lost the day, and finally for political reasons the Star Chamber decree of 1637 placed the book trade under strict licence and supervision. The power of the Star Chamber was, however, declining, and from 1640 to 1643 the licensing orders, and even the necessity to register with the Stationers' Company, were neglected. Parliament, however, became nervous of the freedom enjoyed by the publishers, and in 1613 issued an ordinance which invoked a censorship similar to that under the Star Chamber. It was against this ordinance that Milton wrote—and pub. without licence—his *Areopagitica* in 1644. Fifty years later his hopes were realised, and the licensing of the press was abolished (see also PRESS; FREEDOM OF THE). Although for the most part literature suffered from the conflicts of the times, poetry owed much to Humphrey Moseley, the publisher of Milton, Cowley, and other contemporary poets. With the Restoration licensing control was increased. The Licensing Act of 1662 took away the power hitherto exercised by the Stationers' Company and placed it in the hands of a newly created official, surveyor of the inprimery and printing presses. The trade, still in its traditional centre in St. Paul's (churchyard), struggled on until the Fire of London destroyed the stocks of a large number of publishers. The Licensing Law lapsed, and trade began to revive. One of the leading publishers was Henry Herringman who took over some important copyrights from Moseley on the latter's death. Another publisher whose name is remembered is Samuel Simmons who bought the copyright of *Paradise Lost* from Milton for £10 (equivalent to about £150 at the present time). Simmons sold the copyright for £25 in 1680, and it later passed to Jacob Tonson the elder, whose activities dominated P. in the second half of the seventeenth century. With the growth of the reading public larger financial returns became possible. Authors who in earlier days had ignored or despised remuneration from the sale of their books, depending rather on the munificence of patrons, now began to look to the publisher-bookellers for the reward of their labours. Tonson, for instance, paid larger sums for the copyrights of current works than did his predecessors. Yet Dryden, for whom he pub., was far from satisfied.

In 1691 the Licensing Laws ended. With them also went the powers of the Stationers' Company in keeping a control which, although often perverted for political ends, had served as some measure of protection for the P. profession. The next step was the passing of the Copyright Act in 1709 during the reign of Queen Anne (see COPYRIGHT). This granted copyright for fourteen years for new books with the addition of a further fourteen years if the author survived the first term. Thus ended the practice of holding copyrights in perpetuity. A number of publishers were encouraged by the Act in the practice of co-operative P. Another

characteristic of the period was the replacement of patronage by subscription. P. Tonson continued to flourish and became the publisher of Addison and Steele. Pope's *Pastorals*, his first work, was pub. by Tonson, but for the majority of his works Pope went over to Bernard Lintot. Tonson was succeeded by his nephew, Jacob Tonson the younger. One other foremost publisher of the day deserves mention as he is a link with the twentieth century—Wm. Taylor whose business in Paternoster Row was taken over in 1724 by Thomas Longman, the founder of the House of Longman (*q.v.*). Longman had a share in the pub. of Johnson's *Dictionary* and his son, also Thomas Longman, was with other publishers, including John Murray (*q.v.*), founder of the firm of that name, concerned in Johnson's *Lives of the Poets*. Two other publishers who shared in that venture were Thomas Cadell and Joseph Johnson, who later increased their reputation by becoming respectively the publishers of Gibbon and Cowper. Robert Dodsley is another publisher whose name is linked with that of Samuel Johnson. Johnson thought well of publishers, and unlike Dryden preserved amicable relations, which strengthened the professional status of both authors and publishers. One result of the Copyright Act of 1709 was to encourage the reprint of contemporary authors in cheap eds. This caused some resistance in the trade but was upheld by a decision of the House of Lords in 1774. Cheap books were a feature of the business built up by James Lackington, who was, it is said, the first to sell remainder vols. at reduced prices. From 1780 onwards the Minerva Press, which he ran, was turning out mystery novels to feed the circulating subscription libraries which, from their beginnings in Edinburgh earlier in the century, had become popular in London.

By the beginning of the nineteenth century the publishing trade had come to be a profession in its own right as distinct from bookselling. The publishers associated with the romantic movement in literature were Thomas Longman, son of the founder of the firm, and John Murray, the third of that name, also Charles and James Ollier, Shelley's publishers, and Taylor and Hessey, who pub. Keats, and later Edward Moxon, to whom Tennyson and Browning owed their early pub. Edinburgh, through the activities of Archibald Constable and the Ballantyne brothers, and with the rise of the House of Blackwood (founded in 1801), came to rival London as a literary and publishing centre.

The valuable literary properties of the Victorian era estab. the reputation of a number of famous publishing houses in addition to those already mentioned—Chapman & Hall, the publishers of Dickens, Trollope, and Meredith; Smith & Elder, of Thackeray; Chatto & Windus, of Swinburne; George Allen, who was associated with Ruskin in a joint publishing venture. Scottish publishers who in course of time estab. houses in London

were Adam Black, who took over the *Ency. Brit.* in 1827 from Constable when the fortunes of that house declined, Wm. Collins, John Blackie of Glasgow, while Daniel Macmillan, also from Scotland, set up first as a publisher and bookseller in Cambridge in 1843. The increasing market for books of all kinds presented the trade with many problems resulting from free and uncontrolled competition. The Booksellers' Association, which was formed in 1850 and included a number of publishers, endeavoured to prevent books from being sold below their pub. price. The association, which had a short life, failed in this purpose, which was not accomplished until the Net Book Agreement was negotiated in 1901 by the Publishers' Association founded in 1896, Sir Frederick Macmillan being chairman at the time of the agreement.

Meanwhile publishing enterprise in the Brit. Isles had its parallel in the U.S.A. in the nineteenth century. Not being parties to the International Copyright Convention, Amer. publishers were free to reissue the works of popular Eng. writers without payment, a practice which Dickens denounced during his first visit to America in 1842. With the estab. of London branches of reputable Amer. firms, notably Putnam & Sons, Scribner's, Harper Brothers, Lippincott's, Appleton's, and Ginn & Co., the necessity of linking the trade on both sides of the Atlantic by professional agreement became apparent and since then Eng. and Amer. P. has been closely associated. International co-operation was also the purpose of the International Publishers' Congress, which met for the first time in Paris in 1896 and at intervals since then in other European cities.

Towards the end of the century Wm. Heinemann, J. M. Dent, Fisher Unwin, Alfred Nutt, Gerald Duckworth, Edward Arnold, John Lane, and the firms of Hodder & Stoughton, Methuen's, Harrop's, and others were coming to the fore with new authors whose reputations stretched forward into the twentieth century. An outstanding venture of this time was the pub. of the standard classics of Eng. literature in substantial form and at a price within reach of the reading public which the advance of education had created. In this connection the names of Grant Richards and J. M. Dent should be mentioned, the former for the *World's Classics* series and the latter for the *Temple Shakespeare*, the *Temple Classics*, and *Everyman's Library* (*q.v.*).

During the First World War the P. trade had to face many of the problems which confronted it in a worse form twenty-five years later; chief among them was the destruction of stocks from air attack and the shortage of paper. The number of new books and reprints pub. in the United Kingdom declined from 11,500 in 1914 to 7700 in 1918, and from 15,000 in 1939 to 8700 in 1945. The difference between the figures for 1914 and 1939 is evidence of the increased activity of P. in the years between the wars, the peak year being 1939 with 17,100 titles.

Cheap eds., the growth of circulating libraries and of book clubs (*q.v.*), contributed to this increase. The book trade strengthened itself to meet the problem created by modern production methods by the formation of a joint committee (of the booksellers' and publishers' associations) to place some of the related needs of the publisher and bookseller on a basis of mutual co-operation. This was one result of a report by a delegation of publishers and booksellers sent to Germany and Holland in 1928 by the Society of Bookmen (a small, unofficial but influential body representing all aspects of the book world) to study trade organisation. The delegation was led by Stanley Unwin, an exponent of co-operation, who became president of the Publishers' Association in 1933 and was knighted in 1946. Another co-operative venture, initiated by Unwin, was the National Book Council set up in London in 1924, and later known as the National Book League, a valuable link between publisher, bookseller, and the reading public. In consequence of these and other movements P. was better organised than in 1914 to meet the difficulties of the Second World War, and one of the most notable effects of this was the exemption by the Brit. Gov., as a result of representations from all sections of the trade, of books from the purchase tax. In an effort to economise materials and labour, and at the same time to preserve some freedom of action, the Publishers' Association set up a technical advisory committee. As a result of its work a voluntary agreement without precedent in P. was reached on a 'war economy standard' of book production. Even in this way, however, it was impossible to maintain stocks of Eng. books, depleted during the winter of 1940-41 by over 20,000,000 vols. destroyed by enemy air attack. With this handicap the book trade had to meet the insistent demand for books both in the United Kingdom, among the forces abroad, and for export. Wartime restrictions were not completely relaxed until 1949 when there was a return to normal paper supplies. The costs of printing and binding were, however, doubled since 1939. This led to an increase in the price of books, although only by a half or a third. The value of the post-war trade in the United Kingdom accordingly rose to over £30,000,000 per annum (over a fifth being export) as against £10,000,000 in 1939. The number of titles pub. each year since the war was, on the other hand, lower than before the war, although the 1939 total of 14,904 was nearly equalled by the 1948 total of 14,686. The number of copies that these totals represent is not known, but in post-war practice there was a tendency to issue larger eds. than was the practice formerly. *See also* PAMPHLETS. *See* Sir Stanley Unwin, *The Truth About Publishing*, 1926, 1946; F. **Puccini, La**, *see* JOAN OF ARC.

**Puccini, Giacomo Antonio Domenico Michele Secondo Maria** (1858-1924), It. operatic composer, b. at Lucca, of a musical family. He studied under Bazzini, and later under Ponchielli, at Milan. Ponchielli persuaded him to take part in a competition for a one-act opera advertised by Sonzogno, and he wrote *Le Villi* (1883); but the prize was won by Mascagni's *Cavalleria Rusticana*. *Le Villi* was, however, produced at Milan in 1884, and drew Ricordi's attention to P. He commissioned P. to write another opera, *Edgar*. This failed, but P. had his first great success with *Manon Lescaut* at Turin in 1893. Three years later he wrote his most popular work, *La Bohème*, and soon accumulated a large fortune from his music. He was the predominating figure in It. music in his time; and his operas which combine to some extent the sensuous melody of Rossini and Verdi with the richness of modern 'Impressionist' harmony, were exceedingly popular. His other works include *La Tosca* (1900); *Madame Butterfly* (1904); *The Girl of the Golden West* (1910); and *Turandot* (unfinished). *See* lives by A. Neisner, 1928; R. C. Merlin, 1930; V. Seligman, 1933; and F. Thiess, 1947.

**Puck**, otherwise Robin Goodfellow, mischievous elf in folklore. He figures in Shakespeare's *A Midsummer Night's Dream*, as well as in Goethe's *Faust*, and is also utilised by Dryden, Burton, and Ben Jonson. The character may have come to England with the Scandinavian or Dan. settlers, his Dan. name being *Pokker* and his Celtic *Puca*.

**Pud**, *see* POOD.

**Puddingstone**, *see* CONGLOMERATES.

**Puddling**, *see* IRON AND STEEL, *Steel and Wrought Iron*.

**Pudens** (fl. c. A.D. 60), Rom. senator, baptised by the apostles. His name he is identified with the P. mentioned by St. Paul (2 Tim. iv. 21). He was the father of St. Praxedes and St. Pudenciana and it is probably on the site of his house that the first Rom. basilica of Santa Pudenziana was built. *See* A. Bettrigiani, *La Basilica di Santa Pudenziana*, 1934.

**Pudsey**, municipal bor. of the W. Riding of York-shire, England, 4 m. E. of Bradford and 3 m. W. of Leeds. It has an important woollen trade, and possesses dyeing and fulling mills. Machinery is made, and iron and brass founding carried on. The name P. occurs in Domesday Book, but in the early sixth century P. and the neighbourhood appear to have been the centre of the considerable kingdom of Elmet, which retained its independence for more than 300 years after other more petty kingdoms had been subdued by the Saxons. The bor., incorporated in 1899 and enlarged in 1937, includes Fulneck, a Moravian settlement since 1745, and Farsley and Calverley. The cricketers John Tunnicliffe, Herbert Sutcliffe, and Leonard Hutton were born in P. Pop. 30,200.

**Pudukottai**, former native state of S India, between Tanjore and Madura. Between 1923 and 1947 P, with sev other states, had an agent of the governor-general in charge of the Madras States Agency. In Feb 1948 an agreement was signed between the ruler of P and the Indian Gov providing for the merging of P in the Madras prov. Area 1100 sq m. Pop 438 300. The tn of P is well laid out and contains sev. fine buildings. Pop 26 100.

**Puebla** 1 State of Mexico on the high S plateau of Anahuac. It has a healthy

in the vicinity and marble is quarried. Pop 148 700.

**Pueblo**, term meaning a tn or vil in Spain or Sp America more especially a communal vil or settlement of Indians. In Amer archaeology P is applied to a tribal dwelling of the aborigines of New Mexico etc.

**Pueblo**, city and co seat of P co, Colorado U S A, 102 m S L of Denver. It is the second largest city of Colorado, and an important industrial centre, it is one of the greatest smelting centres in the U S A, and also manufs bricks and

PUEBLO AT TAOS NEW MEXICO

F A 4

climate and fertile soil. It is drained principally by the R. Salado and Atzac. Cotton, coffee, sugar etc are grown and cattle are reared. There are unexploited mineral resources. Area 13,124 sq m. Pop 1,294 700. 2 City of Mexico, cap of the state of P on the R. Atzac 65 m E S.E. of Mexico city. P ranks as the fourth largest city in Mexico. It is an old Sp city, founded in 1532 with broad streets, many fine Sp colonial churches, and a Doric cathedral begun in the middle of the sixteenth century. There are many houses of the colonial period, with grilled windows and balconies and façades decorated with patterned and highly coloured tiles. The Teatro Principal, built in 1790, claims to be the oldest existing theatre on the Continent. P is a busy manufacturing city and produces cotton and woollen goods, leather goods, soap, glass tiles, and pottery, tobacco and boots and shoes. Iron founding and distilling are carried on. Coal is mined

tiles. 85 per cent of the world's molybdenum is produced by the Climax mine. There are oil wells, stone and marble quarries, and coal mines in the vicinity. Pop 52 200.

**Pueblo Nuevo del Terrible**, tn of Spain in the prov of Cordova, 20 m N.W. of the city of Cordova. P is highly industrialised with foundries of lead, zinc and other metals. It is the heart of a large mining area. Pop 17 900.

**Pueblos**, tribe inhabiting New Mexico and Arizona which embraces a number of nations related to each other by culture, but not by language, and remarkable for the fact that in their dist art to be found the most curious rock structures and ruins. They were discovered by Father Marcos de Niza (1539). See P. E. Goddard, *Indians of the South west*, 1921, and F. H. Roberts, *The Village of the Great Kivas on the Zuni Reservation*, 1932. **Puelche**, tribe of S Amer Indians,

inhabiting Central Argentina. They were an offshoot of the Araucanians of Chile, and intermarried with the Patagonians and Pampas Indians. They migrated beyond the Negro R. The P. are nomadic in character.

**Puenteareas**, tn. of Spain, in the prov. of Pontevedra, on the R. Tea, 17 m. S. of Pontevedra, in a vine-growing dist. There are porcelain manufs. and a ruined castle. Pop. 13,600.

**Puente Caldelas**, tn. of Spain, in the prov. of Pontevedra, 7½ m. E.S.E. of the tn. of Pontevedra, with tin mines and sulphurous springs. Pop. 8,500.

**Puente Genil**, tn. of Spain, in the prov. of Cordova on the Genil, 33 m. S. of the tn. of Cordova. Olive oil is produced, and linen goods are manufactured. Pop. 19,700.

**Puente Nacional**, tn. of Colombia, in the prov. of Santander, on the Rio Suarez, 11 m. S. of Velez, with coal and iron mines. Pop. 16,000.

**Puerperal Fever, or Child-bed Fever**, severe fever, occurring after childbirth. It is due to the presence of microbes (*Streptococci* and *Staphylococci*) in the blood, and may be caused by the retention of a piece of the placenta, the smallest portion being sufficient to cause serious symptoms. It may also be carried from one woman to another by a careless nurse or medical man. The symptoms usually appear in from two or three days, and begin with one or more chills, followed by a rapid rise of temp. and pulse, accompanied by sleeplessness, severe abdominal pains, with the lochia (vaginal discharge) becoming suppressed or fetid. The condition is extremely grave, that caused by the retention of placenta being perhaps a little less so than the other form. Peritonitis or septicemia (blood poisoning) may supervene. Treatment consists in removing the cause, if possible, and frequent uterine douching with an antiseptic fluid. Morphia may have to be resorted to to induce sleep when hot fomentations fail to relieve the abdominal pain sufficiently, while stimulants are sometimes considered necessary, and all food must naturally be fluid and easily digestible. Sulphonamides and penicillin are most useful drugs in curing P. F.

**Puerperal Insanity**. There is no special form of insanity peculiar to the reproductive period in the female, and the psychoses which do occur then do not differ materially from similar reactions in other periods of life. They belong to the infection-exhaustion group, and while they may exemplify organic-reaction types, there is an increasing tendency to believe that the infective exhaustive state serves as a precipitant of a latent reaction type of another kind (e.g. mania-depressive psychosis and schizophrenia) more frequently than was formerly believed. In such cases investigation has revealed a psychopathic make-up, either with a definite hist. of hereditary predisposition or of individual instability due either to constitutional or environmental factors. It has been shown that in the absence of other predisposing and precipitating fac-

tors, the existence of sepsis during the puerperium plays a relatively unimportant part, *per se*, in the causation of a psychotic breakdown. Knowledge that the child is illegitimate (especially where this is likely to involve serious social consequences), desertion by or death of the father, fear of childbirth, a neurotic attitude towards motherhood (preconditioned by relationships and conditions in the parental home), and a maladjusted married life, are all considered important predisposing factors. The importance of the effect upon the mother of the father's attitude towards the pregnancy and birth has also been stressed.

The puerperal psychoses are usually divided into three groups: (1) insanity of pregnancy, (2) P. I. proper, which includes all cases occurring within six weeks of labour, and (3) lactational insanity. The mental disorder of pregnancy is usually melancholia and its most important aspect is the danger of suicide. This is greatest when the delusions are self-accusatory in type, but they also frequently lead to an intense dislike of and unfounded accusations against the husband. Hallucinations may develop. The prognosis is very good in cases occurring before the fourth month. In psychoses which first appear after this, the prognosis still remains favourable but the condition frequently does not clear up until after the baby is born. When a breakdown occurs at the time of delivery or in the first two weeks of the puerperium, the psychosis usually takes the form of mania. The attack is commonly acute, food may be refused, and transitory delusions and hallucinations, both visual and auditory, may be present. Remissions followed by a recrudescence of the confused excitement are not uncommon. In the later stages of the puerperium, the disorder is usually depressive in character, with delusions of unworthiness, suicidal tendencies, and possible attempts at infanticide. The psychoses occurring during the period of lactation are usually melancholias of sub-acute type, with self-accusatory delusions and suicidal and infanticidal tendencies. With regard to the prognosis in psychoses occurring after delivery, it may be said, generally speaking, that the sooner they occur after the birth of the child the better the outlook. Those which first appear late in the lactational period tend to run a long course. See also **INSANITY AND PSYCHOPATHOLOGY**. See Sir M. and T. Beaton, *Psychological Medicine*, 1926; R. G. Gordon, *An Introduction to Psychological Medicine*, 1936; D. K. Henderson and R. D. Gillespie, *A Text-book of Psychiatry* (6th ed.), 1944.

**Puerto Ancon**, see ANCON.

**Puerto Barrios**, tn. of Guatemala, on the gulf of Amatique, on the Atlantic coast. It lies about 200 m. from the cap. and is the terminus of the international railways of Central America. Most of the import trade of Guatemala goes through this port. Pop. 27,000.

**Puerto Bello**, see PORTO BELLO.

**Puerto Cabello**, or **Porto Cabello**, port

with an excellent harbour, in Venezuela, S. America, situated to the N.W. of Valencia. After La Guayra it is the chief port of the state, and exports coffee, cocoa, sugar, hides, and skins. It is connected by rail with Valencia and Caracas; both railroads were built with Brit. capital. During the S. Amer. War of Independence it was surprised and taken by revolutionaries under Paéz, 1823. A wireless station was estab. at P. C. in 1912. There are shipbuilding facilities, corn and cotton mills, saw mills, and beef-packing plants, as well as cigarette factories. P. C. has considerable trade in hides, woods, copra, gold, and coffee. Pop. 32,000.

**Puerto Cortes**, formerly Caballos, largest port of Honduras, Central America, on the Atlantic coast. It is 207 m. from Tegucigalpa, and stands at the mouth of the Ulua R. The exports include hides, coffee, gold, rubber, and mahogany. Pop. 8000.

**Puerto de Caibarien**, see CAIBARIEN.

**Puerto de Santa María**, seaport of Spain, in the prov. of Cadiz, on the bay of Cadiz, 5 m. N.E. of the city of Cadiz. It has an export trade in sherry, and important manufs. of leather, glass, soap, etc. Bull fights take place here. It has declined in importance since the nineteenth century. Pop. 19,800.

**Puertollano**, tn. of Spain, in the prov. of Ciudad Real, 30 m. S.W. of the city of Ciudad Real. P. is the centre of a rich coal-mining area. Pop. 24,200.

**Puerto Madryn**, small port of Argentina in the ter. of Chubut, on the Golfo Nuevo. It was founded by the Welsh colonist, Parry Madryn, in 1885. It is the N. terminal of the Belgrano railway to Trelew and Rawson. Pop. 2500.

**Puerto Mexico**, see COATZACOALCOS.

**Puerto Montt**, tn. of Chile, cap. of Llanquihue prov., 670 m. S. of Santiago and 80 m. from Osorno (q.v.). It stands on a magnificent bay, and is the terminus of the S. railway, and point of embarkation for Chiloe and Punta Arenas. The port is much used by coasting steamers and serves a sheep-farming dist. Leather, wheat and timber are exported. Pop. 45,000.

**Puerto Plata**, port of Santo Domingo, W. Indies, on the N. coast of the is. It is a cable station connected with St. Thomas, Leeward Is. Cotton, coffee, bananas, and tobacco are exported. P. P. is of great commercial importance. Pop. 12,100.

**Puerto Principe**, or Camagüey: 1. Prov. of Cnba, bounded on the W. by Santa Clara. It has an area of 11,000 sq. m., and, its surface affording excellent pasturage, the chief industry is cattle raising. Copper-mining is carried on. Pop. 487,000. 2. City of Cuba, cap. of the prov. of the same name. It is the third city of the is., and is situated 340 m. from Havana, about 550 ft. above sea level. It has many anct. buildings, including the churches of La Morced and La Soledad. The first named was built in the early seventeenth century by missionaries of Our Lady of Mercy. Its high altar of

silver was made from 40,000 Sp. dollars. La Soledad was a seventeenth-century hermitage. Camagüey is the centre of a cattle-raising dist. and exports (from Nuevitas, with which it is connected by rail) cattle, hides, and sugar. Pop. (city) 80,500; (urb. dist.), 155,800.

**Puerto Real** (Portus Gadetanus in Rom. times), seaport and summer resort of Spain on the bay of Cadiz, N. of San Fernando. There are dry docks, wharves, etc., and a trade in wine and oil. Ship-building and repairing are carried on. Pop. 10,000.

**Puerto Rico**, formerly called Porto Rico is. of the W. Indies, one of the Greater Antilles, 60 m. E. of San Domingo. P. R. is a possession of the U.S.A. It is about 100 m. long, with an average width of 39 m., and has an area of 3435 sq. m. A mt. range traverses the is. from E. to W. The highest mt. is El Yunque in the N.E. (4985 ft.). From the mts. the ground slopes gradually to the sea on the N. and W., and more abruptly on the S. and E. The mt. slopes facing N. are deeply dissected by the many streams, which have formed narrow valleys and sharp ridges. The N. and E. slopes have a heavy rainfall, the S. and W. being drier, e.g. the rainfall of San Juan is 60 in., of Ponce on the S.W. coast 36 in., but both places enjoy the 'temperate' tropical climate of is. influenced by trade winds. The higher slopes are forested, and supply valuable timber, including sandal-wood and ebony. Agriculture is the chief industry and rum is manufactured. The fertile soil produces sugar, coffee, tobacco, oranges, pineapples, and other tropical fruits, sea-is cotton, and vegetables; over 700,000 metric tons of sugar are produced annually. Bat guano and phosphates are abundant. The fisheries are also profitable. Other industries include cigar- and cigarette-making and the manuf. of hats and embroideries. Minerals, including gold, silver, copper, iron, bismuth, mercury, platinum, tin, and nickel, are found but little worked, and there are extensive salt-works. A gov. agency, the Industrial Development Company, has assisted in the estab. of factories for the production of textiles, glass, shoes, cement, etc. From May 1948 certain estab. industries and new concerns were granted twelve years' exemption from certain taxes, including income tax. San Juan, on the N. coast, is the cap. and chief port; other tns. include Ponce, which has also a good harbour, Mayaguez and Arecibo. There are over 2000 m. of good roads and nearly 400 m. of railways. The is. is subject to hurricanes, one in 1928 causing great damage.

P. R. was discovered by Columbus in 1493, and in 1508 was explored by Ponce de León (q.v.). It remained a Sp. dependency until it was ceded to the U.S.A. in 1898 by treaty after the Sp. Amer. War. The constitution of P. R., as estab. by the 'Jones Act' of 1917, was amended in 1947. There is representative government. The governor, who since 1948 is elected by popular vote every four years, is the executive power; his executive

council comprises seven heads of depts. There is a bicameral legislature. The amendment of 1947 also provided that all heads of the depts. of the Insular Gov. be appointed by the governor; the auditor of P. R. and the justices of the supreme court continued to be appointed by the President of the U.S.A. Eng. is the official language but Sp. is the native tongue. Pop. 2,146,700 (about 750,000 of this total are bilingual). See T. White, *Puerto Rico and its People*, 1938; B. Pagán, *Puerto Rico: the Next State*, 1942; E. S. Garver and E. B. Fincher, *Puerto Rico: Unsolved Problem*, 1945; R. Tugwell, *The Stricken Land*, 1947; also *Puerto Rico Monthly Statistical Reports*, beginning 1943.

**Puerto Varas**, tn. of Chile, in the prov. of Valdivia, on the edge of Lake Llanquihue, and near the Osorno, Calbuco, and Tronador volcanoes. It is in the Chilean 'Switzerland,' 16 m. from Puerto Monto (q.v.) and 650 m. from Santiago on the S. railway line. P. V. is a noted beauty spot. Pop. 44,000.

**Puff-Adder**, or *Bitis arietans*, ophidian reptile in the family Viperinae, and sub-family Viperidae. It is a native of Africa and S. Arabia, and is regarded with dread on account of its very poisonous nature. It attains a length of 5 ft., is yellowish-brown in colour, has a depressed head and small eyes. It is nocturnal and carnivorous, and when surprised puffs out the upper part of its body.

**Puff-Ball**, fungus of the family Lycoperdon (q.v.). P.-Bs. generally grow on the ground, and are roundish, at first firm and fleshy, but becoming powdery inside, the powder consisting of the spores, among which are many fine filaments, loosely filling the peridium. See also BOVISTA; FUNGUS; LYCOPERDON.

**Puff-Birds**, or Buceoninae, from a sub-family of Galbuidae, family of coraciiform birds. When in repose the birds puff out their plumage, which is dark in colour with patches of white.

**Puffin**, bird of the family of Alcidae or Auks, sub-order of the Alcae in the order of Charadriiformes. The body is compact and the plumage close; the head is large, with a stout bill, with which the P. catches fish. The Common P. (*Fratercula arctica*) is found on the Brit. coasts, and lays its eggs in any crevice of the rocks or in a burrow which it makes. It is a little larger than a pigeon, and lays only a single egg at a time. The tufted P. (*Lunda curvata*) is another important member of the family. See also under AUK.

**Puffin Island**, otherwise Priestholm or Yns Seiriol, lies off the N.E. coast of Anglesey. It is  $\frac{1}{2}$  m. long, and is noted as the home of puffins. In the sixth century Seiriol, a hermit, had a cell on the is.

**Pugachev**, formerly Nikoláevsk, tn. of the R.S.F.S.R., in the region of Saratov, 100 m. S.W. of Samara, on the Irghits. It is the centre of a farming region and trade in cattle and corn is carried on.

**Pug-dog** (etymology uncertain; possibly from Lat. *pugnus*, fist, or a weakened form

of puck—M.E. *pouke*, goblin), smallest dog of the mastiff family, probably introduced into England from Holland. It became very popular in England during the reign of William of Orange, when it was known as 'Dutch P.' Its popularity died out for a time, but was revived about 1885. It can do with less outdoor exercise than any other variety of dog, but has a greater tendency to put on fat. It is amiable, but indolent. Points: body short, square, and cobby; wide chest; ribs deep and well rounded; legs strong, straight, and well under, of moderate length; feet firm, with well split-up toes, and nails black; head large,

PUG

T. Fall

massive, round; muzzle short, blunt, and square; eyes large, dark, lustrous, and set well apart; mask and ears black, and head heavily wrinkled; markings clearly defined; thumbmark on forehead, and back-trace very black; tail curled slightly over the hip; coat soft, smooth, short, and glossy; colour, apricot or silver-fawn. There is also a black variety.

**Puget Sound**, inlet of the Pacific Ocean, in Washington, U.S.A., extending from the E. end of the strait of Fuca, in a direct line for about 80 m. It has an area of about 2000 sq. m. and a number of is., Vashon and Bainbridge being the largest. The two main branches are Admiralty Inlet and Hood Canal. It has a gov. navy yard. The shores are well wooded, and fir is shipped to foreign ports for use in shipbuilding. The sound is also remarkable for its fish.

**Pugilism**, see BOXING.  
**Pugin**, Augustus Welby Northmore (1812-52), Eng. architect, b. in London and educated at Christ's Hospital. He was the pioneer of the revival of Gothic architecture in the nineteenth century.

His first important work was the designing of the furniture of Windsor Castle, 1827; but he subsequently undertook all sorts of commissions (especially eccles.), and in 1838-43 was employed by Sir Charles Barry in providing the detailed drawings for the Houses of Parliament. P. became a Rom. Catholic, and designed many Rom. Catholic churches, including the cathedral of St. George at Southwark (severely damaged during the Second World War). He pub. *Contrasts; or a Parallel between the Architecture of the 15th and 19th Centuries* in 1836 and *The Principals of Christian Architecture* in 1841. In these books P. set out his idea of the close connection between Christianity and Gothic architecture, and attacked what he held to be the 'pagan' method of architecture of his immediate predecessors and some of his contemporaries. See lives by B. Ferrey, 1861, and H. Sirr, 1918, and studies by P. Waterhouse, 1891, and M. Trappes-Lomax, 1932; also D. Gwynn, *Lord Shrewsbury, Pugin, and the Catholic Revival*, 1946.

**Puglie**, see **APULIA**.

**Pulsane Judge** (Fr. *puls* and *né*; Lat. *post natus*, after born). The judges of the sev. divs. of the high court of justice, other than the lord chief justice of England and the president of the divorce court, are somewhat inappropriately termed P. Js. to denote their inferiority in rank to the above-mentioned chief judges and the judges of the court of appeal and the House of Lords.

**Puket**, port on the E. side of Salang (or Junkseylon) is., on the W. of the Malay Peninsula. Its importance is due to its valuable tin-mines. Pop. about 30,000.

**Puleinella**, see **PU'NCINELLO**.

**Pulex**, see **FLEAS**.

**Pulicat**, tn. of Madras prov., India, in the dist. of Chingleput, 25 m. N. of Madras. It was one of the earliest Dutch settlements on the Indian mainland, and dates from 1609. It came into Brit. hands in 1825. Pop. 10,000.

**Pulitzer, Joseph** (1847-1911), Amer. newspaper owner. b. in Mako, a small Hungarian vil. His father was Jewish, his mother Austrian. He was educated in Budapest. Rejected by the Hungarian Army and the Fr. Foreign Legion, he made his way to the U.S.A., where he served in the civil war. Later he studied law, but did not practise, securing instead a position as reporter on the Ger. paper *Die Westliche Post*. He took a part in the revolt of the Liberal Republicans against the corruption in their party. Having sold some shares in *Die Westliche Post* at a good profit, he went on a visit to Europe. Then, returning to St. Louis, he bought a moribund Ger. paper and sold it at a good profit, and in 1878 he bought the *St. Louis Dispatch*. He and the owner of the *Post* agreed to a merger, and the *Post-Dispatch* became one of the leading papers of the city. By 1880 P. had become its sole owner. In 1883 he bought the *New York Herald* (q.v.), and by 1887 also started evening and Sunday eds. Near Brooklyn Bridge he erected to house his papers one of the first tall office buildings

in New York city. P. brought to New York a different journalism from any it had known up to that time. It revelled in the sensational but also made slashing attacks on the forces of corruption in business and politics. Among P.'s gifts was the endowment of the school of journalism at Columbia Univ. and a fund for the gift of ann. cash prizes for the best newspaper work, drama, and literature in the U.S.A. each year. See life by D. C. Seitz, 1924.

**Pulke**, see **PU'LOQUE**.

**Pullet**, see under **POULTRY**.

**Pulley**, see **BELTS** and **BELTING**.

**Pullman, George Mortimer** (1831-97), Amer. inventor, b. in Chautauqua co., New York. He invented the Pullman sleeping-car. He built his first car in 1859, and in 1863 the 'Pioneer,' at a cost of \$18,000, the first of the cars to bear his name. He organised the Pullman Palace Car Company, of which he was president, and in 1887 originated the vestibule train. He also founded a model tn. called Pullman near Chicago, which is now absorbed in that city.

**Pullman**, vil. of Washington, U.S.A., in Whitman co. The state college for science and agriculture is in P. Pop. 4400 in 1910.

**Pulmonata**, see **GASTEROPODA**.

**Pulo Penang**, see **PENANG**.

**Pulp** (paper-making), see under **PAPER**.

**Pulpit** (Lat. *pulpitum*, that part of the Rom. stage on which the actors recited or performed their parts); in eccles. architecture, the wood or stone erection from which the preacher speaks. Traditionally the P. is on one side of the nave. Pisano's marble P. at Siena is a masterpiece; there are fine wooden Ps. in the Low Countries. Eng. Ps. of the Jacobean period are frequently very finely carved. Sometimes Ps. were built in the open air, e.g. Donatello's P. attached to the outer wall of Prato cathedral. The word also signifies a reading-desk, and this alone is the meaning of the Fr. *pupitre*.

**Pulque**, or **Pulke**, one of the national intoxicating drinks of the Mexicans, which has never been supplanted since the time of the Aztecs. It is produced by procuring the fermented juice of the *maguey*, the *Agave americana*. See **AGAVE**.

**Pulse**, periodic change in the shape of an artery due to changes in blood pressure caused by the beating of the heart. When the blood is expelled from the heart at each systole the elastic walls of the aorta are suddenly distended, and this distension is communicated to the other arteries, the movement becoming feebler and feebler as it travels away from the heart. Where an artery approaches very near the surface, the intermittent distension of its walls can be perceived visually, or if it can be compressed against a hard structure the throbbing can be discerned by touch. It is customary to gauge the action of the heart by feeling the throbbing of the radial artery at the wrist, as it can be conveniently compressed against the bone. The P. beat does not take place at the same time as the heart beat, as the wave of distension and relaxa-

tion has to travel from the heart to the wrist, but the general character of the beat is maintained. The distension occurs when the blood is being forced into the arteries; the relaxation occurs as the blood flows out of the arteries into the capillaries. There are also subsidiary beats, of which the most important is caused by the diastolic wave, indicating the back-flow of the blood towards the heart as the out-flow ceases. The frequency of P. beat varies with age, sex, and other conditions. In a new-born babe the rate is 130 to 140 times per min.; in an adult man about 72 per min.; in an adult woman 80 per min. The rate is lower when the subject is sitting, and lower still when lying down. Food, exertion, excitement, and stimulants increase the rate. A strong beat generally indicates vigour, while a feeble P. denotes debility. There are, however, many small indications which convey important information to the practised observer.

**Pulse**, term for leguminous agric. plants, particularly beans and peas.

**Pulsometer**, see PUMES.

**Pulteney, William**, second Earl of Bath (1681-1764), Eng. statesman, b. in London. He entered Parliament in the Whig interest in 1705, and was secretary of war from 1714 to 1717. He supported Bolingbroke in 1725, and assisted in forming 'the Patriots,' a party whose object it was to harass the gov. With his allies he eventually succeeded in undermining Walpole's power, and was invited, but declined, to form an administration in 1742, in which year he was created earl of Bath. He was an able, and at times a vitriolic, speaker, but not a sound statesman.

**Pultowa**, or **Poltava**, see POLTAVA.

**Pultusk**, tn. of Poland, on the Narev. Originally the residence of the bishops of Płotsk, and was the scene of a battle between the Fr. and Russians in 1806. Pop. 20,000.

**Pulverised Coal**. The object of P. C. is to make a solid fuel as nearly gaseous as possible, gas being regarded as the most perfect fuel state at present known. P. C. is sufficiently fine when 85-95 per cent passes through 200 mesh. This mixture in the presence of adequate air ensures complete combustion. The coal is pulverised by abrasion or chopping machines, crushing rolls, or ball mills. Since P. C. may form an explosive mixture, for safety purposes the quantity of air conveying the fuel to the burners is kept under 30 per cent of the amount necessary for complete combustion. The remaining 70 per cent is introduced at the burner. There are three methods of handling P. C.: (1) the unit system, where it is taken direct from the pulveriser by fan to the burner, (2) the bin storage system, where it is stored in a bin with feeders delivering any required quantity to the burners, (3) the ring-main system, where it circulates through a main pipe provided with a number of valves, each capable of tapping off a supply for use in various furnaces. With P. C. firing, an increased load can be obtained quickly at a reasonable efficiency

and without undue generation of smoke. P. C. is used in metallurgical furnaces, cement-making kilns, and for firing high-pressure water-tube boilers. Until recent years P. C. was considered to have many disadvantages, such as the danger of explosion, slagging, and grit emission from the chimney. All these difficulties have now been overcome in the modern P. C. plant.

**Puma** (*Felis concolor*), large Amer. carnivore, belonging to the cat family. Unlike its relation, the jaguar, it shows no trace of the feline markings when adult, the upper parts being a uniform yellowish-red, the under surface being a lighter colour. It was this uniformity of colour which led to its being mistaken for a member of the lion family, and the popular name of 'mt. lion' still survives among the Rockies. P. is its Peruvian name, and from the Brazilian comes its other popular name of cougar. The name of panther was given to it by the early settlers. The average length of the body from snout to root of tail is about 3 ft. 6 in., while the tail, which is about the same thickness throughout, measures somewhat over 2 ft. The P. is timid in the presence of men and shows great reluctance to attack them; it is rather inclined to try to make friends. It feeds on deer, sheep, horses, and other animals, and proves very destructive on account of its killing far more than it can eat.

**Pumice**, light kind of lava (q.v.), usually consisting of obsidian made spongy or porous by the escape of steam or gas during the process of cooling. It is used for smoothing or polishing, or for removing stains.

**Pump**, machine for lifting fluids, forcing them to a higher level, or transferring them from one place to another. The work done by a P. is measured by the weight of fluid lifted and by the total head in ft. (see Fig. 1). The total head includes suction head, delivery head, and losses due to the friction of the fluid in the pipes, bends, and valves calculated in ft. head. The suction head is due to the air pressure on the surface of the fluid and would raise a column of water 34 ft. in a complete vacuum. A complete vacuum, however, is not attainable, and owing to leaks and pipe friction it is only practical to attain a suction head of 25 ft. The recommended suction head is 20 ft. for reciprocating Ps. and 15 ft. for centrifugal Ps. For hot fluids or fluids such as petrol there should be no suction head, and the P. should be below the level of the fluid, as the vacuum would otherwise cause the fluid to vaporise. Any reduction in air pressure at high altitude would also mean a corresponding reduction in the possible suction head. Delivery head is limited only by the design of the P. and the power available to drive it. Frictional head, caused by friction in pipes and bends, can be reduced by increasing the size of the pipes, which reduces the velocity of the fluid in the pipe. A normal pipe line is designed to give a loss of 5 ft. head per 100 ft. of pipe.

The prin. types of Ps. are (1) reciprocating Ps.; (2) rotary Ps.; (3) centrifugal Ps. Other means of raising fluids include the hydraulic ram, air-lift Ps., Archimedes' screw (q.v.), chain Ps., etc.

**RECIPROCATING PUMPS.**—The simplest form of reciprocating P. is the suction P. as illustrated in Fig. 2. The barrel is fitted with a piston worked by a handle pivoted in the P. casing. Valves are provided at A in the piston and at B at the lower end of the barrel, both opening in an upward direction. On the upward stroke of the piston the valve A remains closed and the air in the chamber between the valves becomes attenuated and is therefore at reduced pressure. The atmosphere pressing on the water in which the P. is sunk thus forces the water and air up through valve B into the chamber. On the downstroke of the piston valve B is immediately closed and the compression causes any air in the chamber to escape through valve A. By repeated strokes of the piston all air is thus exhausted and water is forced up to fill the chamber and escape above A with every downstroke, each upstroke lifting this on the closed valve A into the upper part of the P. barrel to flow from the spout.

**Diaphragm Pump** (Fig. 3).—This is used for draining building foundations and works on the same principle, but is fitted with a flexible diaphragm instead of a piston. The stroke is therefore much shorter, but owing to the area a large quantity of water can be raised to a low head usually not exceeding 10 ft.

**Suction Pump.**—This is another form used in wells and boreholes where it is usually power driven, the principle being as described above. The piston and valves, however, work in the lower part of the barrel at or near water level, the piston being operated by a crank at the surface through a long rod in the barrel. The part of the barrel above the piston is known as the rising main and the perforated filter at the lower end the strainer or snorer (or windbore). With this type of P. all the work of lifting water is done on the upstroke of the piston, which has to be allowed for by using a balance weight on the driving gear. To overcome this difficulty a double-acting P. is used in which there are two pistons, each containing a valve. Each piston or bucket has its own rod, the rod of the lower piston passing through the upper piston and its rod (see Figs. 4 and 5).

**The Plunger Pump.**—The principle of this P. is shown in Fig. 6. As the plunger rises the pressure is reduced in the P. chamber, closing valve A and causing valve B to open, allowing the water to enter the chamber under air pressure. On the downward stroke valve B is closed and the water forced through valve A into the delivery pipe. In this type it is usual to fit an air vessel C above the valve A, containing air which acts as a cushion and damps out the impulses of the plunger which would otherwise cause water-hammer in the pipes. A single plunger P. is illustrated but three or more

plungers are used on one P., each plunger having its own suction and delivery valves but having common suction and discharge pipes. This arrangement gives a more even flow.

**Horizontal Double-acting Pump.**—This is shown in Fig. 7, S being the suction pipe and D the delivery; two sets of suction valves, B and B1, and delivery valves, A and A1, are fitted and operated by the action of the plunger. With the right stroke B1 is closed and water forced through A1, while A is closed and water drawn through B. The left stroke closes A1 and opens B1, while B is closed and water forced through A. This type is commonly used for boiler-feeding work, the plunger being directly operated by a steam piston of rather larger area, so that steam at a pressure of 100 lb. per sq. in. in the boiler can be used to force water into the boiler at about 120 lb. per sq. in., i.e. with and against the pressure in the boiler.

Reciprocating Ps. are generally used for raising comparatively small quantities of fluid to high heads and have the advantage of being self-priming as the piston exhausts the air in the suction pipe. It is usual, however, to fit a foot-valve on the suction pipe to keep it full of water and reduce time lost in exhausting air when starting.

**ROTARY PUMPS.**—These include a wide variety of designs, the object of which is the elimination of impulses obtained in reciprocating Ps. by providing in effect a piston moving continuously in one direction. No valves are required as the flow is always in one direction, and as the air is exhausted from the suction pipe the atmospheric pressure forces the fluid to the P. in the same manner as in reciprocating Ps. The suction head is usually limited to a few feet, as rotary Ps. rely on fine running clearances instead of the more positive seal obtained with a plunger and valves. Viscous fluids such as thick oils can be handled with many types of rotary Ps. owing to the absence of valves.

**Gear Pump.**—This (Fig. 8) is one of the most common types and is used on most petrol engines for circulating oil to the bearings. One gear is driven and this drives the other gear in the opposite direction, the oil being carried round by the gear teeth from the suction side to the delivery side of the P. The gears are made to fit closely in the casing, and the gear teeth in contact with each other form a seal which prevents the oil getting back to the suction side. Those Ps. work at pressures up to 80 lb. per sq. in.

**Drum Pump.**—This pump (Fig. 9) consists of a casing containing two drums coupled by gears situated outside the casing. One drum A has two projections similar to gear teeth in form which mesh with two grooves in the large drum B. During the rotation of the drums the teeth on drum A sweep the fluid through passage C, drum B merely acting as a seal or rotary abutment.

Other types of rotary abutment Ps. have different numbers of teeth or vanes but use the same principle (see Fig. 10).

(DOUBLE  
SUCTION)

**Rotary Vane Pumps** (Fig. 11).—These consist of a circular casing containing a drum or rotor mounted eccentrically and fitted with sliding vanes. As the rotor is revolved the spaces between the blades increase and decrease in volume, thus drawing in the fluid through port A and expelling it through port B.

Both reciprocating and rotary P.s. are self-priming, that is, they are capable of exhausting the air in the suction pipe, if in good order, and will therefore start pumping without first filling the suction pipe with fluid.

**CENTRIFUGAL PUMPS.** These P.s. work on the principle of a fan, having a volute casing in which an impeller (a series of curved vanes) rotates at high speed, the fluid being thrown outwards by centrifugal force and then collected in the volute casing which directs the flow of fluid along the delivery pipe. This type of P. must be primed with fluid before it will start pumping as there are no valves or seals in the P. itself. Once started, the column of fluid passing through the delivery pipe itself acts as a continuously moving piston, causing the atmospheric pressure to force water up the suction pipe as in the case of reciprocating and rotary P.s. It is usual to fit a foot-valve and strainer and a priming cock to enable the P. to be primed before starting. The advantages of the centrifugal P. are smooth flow, the small size of the P. required for output, the high speed of impeller shaft permitting direct drive by electric motor or high-speed engine, and good control of flow. Unlike the positive P.s. a delivery valve can be closed to reduce the starting load on the motor or to control the flow. The power required is in proportion to the weight of water lifted so when the valve is closed the power required is only that necessary to overcome friction losses in the P.

The small sizes of P. (Fig. 12) have the suction pipe entering the centre of the impeller at one side, but as this causes an end thrust on the shaft the larger P.s. are fitted with a double suction which balances the thrust (see Fig. 13).

**Turbine or Multi-stage Pumps.**—These are similar in principle, but consist of a number of impellers on one shaft, the fluid being guided from the delivery of one impeller to the suction of the next by means of guide vanes and ducts, each impeller building up additional pressure. Turbine P.s. are now built to give pressure of 1250 lb. per sq. in. or over 2900 ft. head. They are also built as borehole P.s. with up to twelve stages of small diameter driven by a shaft through the rising main guided by water-lubricated bearings from a vertical spindle motor.

**Submersible Pumping Unit** is a type of equipment developed to meet the demand for a self-contained unit simple to install and economical in operation. The unit consists of a single or multistage vertical spindle turbine P. direct-coupled to an electric motor specially designed to work under water and mounted below the P. and strainer, a non-return valve being

fitted above the P. to retain the water in the rising main. The complete unit is bolted direct to the rising main and lowered into the well or borehole until it is below the surface of the water, thereby eliminating suction troubles and the need for priming. This is especially useful when the motor is started automatically by means of a float or pressure switch as the P. is always primed ready for starting. The short direct drive from the motor to the P. eliminates troubles due to alignment of long shafts, as when a borehole P. is driven from the surface, and the need for bearings and supports in the rising main, giving a more efficient unit. Submersible P.s. are available in a wide range of sizes from 5½ in. diameter for use in a 6-in. diameter borehole and capable of delivering 300 to 3000 gallons per hr. to 430 ft. head to P.s. suitable for 14 in. diameter boreholes, capable of delivering up to 100,000 gallons per hr. The special small diameter motors used are of the squirrel-cage type, grease-lubricated, to give 6000 to 10,000 hrs. running before requiring attention.

**OTHER TYPES OF PUMPS.—Pulsometer Steam Pump** (Fig. 14). This P. is in a class by itself, using steam pressure directly on the surface of the water for forcing water up the rising main and using the vacuum created by condensation for filling the suction pipe with water. There are two P. chambers which work alternately, being supplied by steam through a ball valve V which oscillates between the two chambers. As steam enters chamber C the suction valve A is closed and the water driven through discharge valve B until the water level in C reaches the level of the discharge chamber. Here, owing to the rapid increase in surface area, condensation of the steam takes place, causing valve V to be drawn over, closing the steam port in C, further condensation causing C to refill with water through valve V. The process is then repeated in chamber C'. This P. is used mainly by contractors for emergency work, as it requires no foundations and can be slung on a chain or rope. Steam can be supplied through a flexible pipe.

**Air-lift Pump** (Fig. 15).—This is used in boreholes and has the advantage that no moving parts are in contact with the water. A pipe supplying compressed air is taken to the lower end of the rising main and air is forced into the water through a series of small holes. The air mixing with the water in the pipe lessens its sp. gr. so that the weight of water outside the pipe forces up the mixture of water and air inside.

The **Hydraulic Ram** (Fig. 16) uses the force of a large flow of water to raise a small quantity to a high level. Water from a dam is led through a straight drive pipe to the ram, and flows through valve A until the velocity causes the valve to close. This stops the flow, causing a sudden rise in pressure which forces open valve B to the delivery pipe. After this energy is spent, valve A opens again by its own weight and the cycle is repeated.

FIG. 15. AIR-LIFT PUMP

An air vessel C is fitted above valve B to even out the flow and reduce damage to the pipes due to water-hammer. Rams are also made which will raise a supply of clean water from a well, using riv. water as the source of power operating a spring-loaded plunger which pumps the clean water. See N. Swindin, *Modern Theory and Practice of Pumping*, 1924, and A. Allcott, *Pumps*, 1938.

**Pumpnickel**, bread made from coarsely ground unbolted rye. It is especially associated with Westphalia.

**Pumpkin** (*Cucurbita Pepo*), half-hardy plant of the family Cucurbitaceae, with large solitary yellow flowers and rough leaves which are sometimes eaten instead of spinach. The gourd-like fruit is used either as a vegetable, like vegetable marrow, or as a fruit in tarts, etc.

FIG. 16. HYDRAULIC RAM

**Pun.** Addison defined a P. as 'a conceit arising from the use of two words that agree in sound but not in sense.' This definition occurs in the sixty-first number of the *Spectator* in an article in which Addison sketches the hist. of P. from the time of Aristotle. Ps., of course, cannot be trans. Punning was much in vogue in England in the sixteenth, seventeenth, and eighteenth centuries, but it has now dropped into disrepute in literary circles. It survives, however, in the U.S.A., and in the Eng. Christmas pantomime; while radio variety shows of the calibre of 'Itma' have raised its prestige somewhat in twentieth-century England. Though somewhat puerile, like the anagram and the acrostic, it has in former days been employed by writers and orators of repute, notably by Lamb and Clecro. Shakespeare used the P. a great deal, and with a high degree of skill. In his day the P. was an acknowledged literary device, and was not necessarily intended to be humorous; thus Shakespeare puts a P. into the mouth of Lady Macbeth during the most tragic moment of the play, to heighten the horror. Speaking of the murdered Duncan, she says: 'If he do bleed, I'll *gild* the faces of the grooms withal, For 't must seem their *guilt*.'

**Puna**, see POONA.

**Punans**, survivors of the Caucasio-Mongoloid tribes of S.E. Asia (preceding the separation of Borneo, Sumatra, and Java from the mainland). They are a primitive nomad hunting tribe of Borneo living in the remote jungle and are physically akin to the Kenyahs and Kleméntans. They live in small, much scattered groups and remain hidden in the depths of forest and jungle. Like the Kenyahs of the north-central highlands they are short of stature with a comparatively long body and are very sturdily built; the head is comparatively short (sub-brachycephalic) and inclined to be square; the most distinctive characteristic is a well-developed nasal bridge, with nostrils shot far forward and upward; their skin is of a fine silky texture and either pale fawn or even

of a greenish hue. A Punan community generally acknowledges a titular chief, whose authority depends on his age and reputation and is not formally defined. Monogamy prevails, though occasionally polyandry occurs. Endogamy within the group is not countenanced. Their God is Ball Penyalong, made in the image of a crocodile carried round by a Punan group wherever it goes. Burial and funeral rites are unknown and the Punan idea of the after-life seems to be devoid of any doctrine of retribution as well as of any other moral significance. P. are great believers in charms and sorcery and their medicine men are noted for their knowledge and skill. The chief art of the P. is that of the hunter and in tracking and trapping. The P. understand the Kayan dialect but a simplified form of the Malay language has long been established. See C. Hose, *The Payan Tribes of Borneo*, 1912, and *Natural Man: a Record from Borneo*, 1926.

**Punch**, alcoholic beverage. The name is derived from *punch*, Hindi for five, the original drink containing five ingredients, including tea and arrack. P. is now composed of spirits, spice, sugar, fruit-juice, and water.

**Punch and Judy**, the most famous and popular Eng. show for hand puppets. Punch, an abbreviation of Punchinello (q.v.), was brought to England about 1660 by travelling It. showmen. Judy, or Joan, is said to have derived from Mrs. Noah in the old deluge play; she appeared as Mr. Punch's shrewish wife after 1688. The story is attributed to Silvio Fiorillo, a seventeenth-century It. comedian, and in Eng. marionette theatre was gradually adapted to popular tastes until an epic poem of Punch emerged, with traditional scenes in which the merry, shameless, shrill-voiced fellow beats his wife and baby, defies morality and religion, and outwits the Devil. See J. P. Collier, *Punch and Judy*, 1870; D. Cuthrop, *Punch and Judy, a Corner in the History of Entertainment*, 1925; and C. H. Grandgent, *The Tragic Comedy or Comical Tragedy of Punch and Judy*, 1928.

**'Punch, or The London Charivari'** (from Punchinello, the chief character in a well-known puppet show of It. origin). Brit. illustrated weekly jour. It first appeared on July 17, 1841, but it was not until Bradbury and Evans became the proprietors in the following year that the paper was put on a sound footing. Mark Lemon was the editor from its foundation until 1870, and he was in turn succeeded by Shirley Brooks, Tom Taylor, Sir Francis Burnand, Sir Owen Seaman, E. V. Knox ('Evoe'), and ('K. Bird' ('Kougasse'), who became editor in 1948. P. contains much satirical humour, both pictorial and written, and is noted for the high standard of its dramatic and literary criticism. Douglas Jerrold and Thackeray were the two giants on the literary side in the paper's early days. P. has always been fortunate in securing the best black-and-white artists of the day; the list includes Leach, Doyle, Tenniel, Charles Keene, Du Maurier, Harry Furness, Lin-

ley Sambourne, Phil May, E. T. Reed, Bernard Partridge, Ernest Shepard, and Leonard Raven-Hill. See M. H. Spielmann, *History of Punch*, 1895.

**Punchestown**, racecourse in co. Kildare, Eire, near Naas, famous for its steeple-chases.

**Punchinello** (**Puleinella**), traditional figure of the Commedia dell'Arte (q.v.) and ancestor of Punch, having something in common with Harlequin (Arlecchino). He wears a black mask, and a large nose, is a rogue and braggart, with a rough country wit. Punch of the Punch and Judy (q.v.) show derives his name from the same source.

**Punctuation** is the insertion in written matter of stops and other points to facilitate quick and accurate reading. Stops correspond to the necessary pauses and inflections in speech. P. was invented by the Gks., but present symbols are derived from the Venetian printer Manutius (1450-1515). The stops proper, in descending order, are full stop, colon, semicolon, and comma. Other points used are the question and exclamation marks, hyphen, dash, brackets ('parentheses'), apostrophe, and quotation marks. Of these latter, many are comparatively recent additions.

The full stop, followed by a space and initial capital, marks the end of a period (sentence); it is replaced when requisite by a question or exclamation mark. The colon, formerly used to mark the main div. in an elaborate period, is now used almost exclusively to signify that there is something to follow, e.g. *There are four elements: earth, air, fire, and water*. It may be followed by a dash when it introduces a fresh paragraph. Commas mark the minor divs. of a sentence, or separate the items of such a series as *earth, air, fire, and water* (enumeration). The most frequent uses of the comma are in enumeration and in the following two ways: *The ship will sail to-morrow, but we go aboard to-day* (co-ordinate sentences which are joined by a conjunction); *The earth, as we all know, revolves round the sun* (parenthetical). In such a sentence as the ship example, a semicolon is indicated if such closely associated sentences are not joined by a conjunction: *The ship will sail to-morrow; we go aboard to-day*. Brackets ('parentheses') separate extraneous matter. The primary use of the dash is to mark an abrupt pause or change of construction: *All about—what do you think?* It is often used in lieu of brackets, and less properly as a maid-of-all-work in lieu of commas, semicolons, and colons. It is an awkward and ugly stop, which should not be used unnecessarily. The question mark is used after a sentence in question form or spoken interrogatively: *You will come?* The exclamation mark follows an exclamation, or an emphatic prayer or command. If used after an affirmative sentence, it expresses dissent or contempt: *She expected her house to be built in a week!* The hyphen, when used to mark an unfinished word at the end of a line, is a very ancient device. It is now also used

extensively to unite two or more words thus: *red-hot, self-esteem*. By a curious convention, it may not be used between adjective and noun, even when the compound has a special sense, e.g. *cast iron, square leg*; except when the compound is used adjectivally, e.g. *cast-iron pipes*. Nor may it be used between a recognisable adverb and adjective; write *a highly respected man*; *a much esteemed man*. The apostrophe formerly marked an elision, e.g. *belov'd*. Now its chief use is to mark the possessive case, thus: *Men's clothes, St. Thomas's Hospital*. With plurals ending in *s*, the apostrophe follows the *s*, e.g. *old wives' tales*. Quotation marks, commonly called inverted commas, are in fact literally inverted commas followed by apostrophes. They signify that the words enclosed are those actually used, e.g. *'I am down in the dumps'* she said; *She was 'down in the dumps'* she said. By a natural extension quotation marks are also freely used in handwriting and typescript to signify that a word or phrase is the name or title of a book, ship, inn, etc., a foreign term, or used in a technical or slangy sense. They should never be used in this fashion needlessly, as they are ugly and distracting, especially in print. Contractions are usually indicated by adding a point when the word is unfinished an apostrophe when the elision is in the middle of a word: *York's, won't*. See R. A. Skelton, *Modern English Punctuation* (2nd ed.), 1949.

**Pundit** (Hind. *pandit*, learned man), teacher in India, especially a Brahman versed in the Sanskrit lore and language, and in the science, laws, and religion of the Hindus. Native Ps. have done much as geographical explorers and surveyors in Tibet and other parts. Chief among these may be mentioned Nain Singh, Chandra Das, and A. Krishna.

**Pungwe, Pungue, or Arwangwa**, riv. of Portuguese E. Africa, flowing E. from the Manica tableland, then S.E. to the Indian Ocean, discharging N. of the Bost estuary. Fontesville is at the head of navigation.

**Punio Wars**, see CARTHAGE and HANNIBAL.

**Punishment**. The term P. is commonly differentiated from those sanctions whereby the wrongdoer is made to compensate the injured party by payment of damages or otherwise, by including in the connotation of the term only sanctions in the shape of suffering experienced by the wrongdoer which are imposed for the public benefit. The scale of Ps. in Eng. criminal law is for the most part prescribed by statute; but judges, though restricted as to maximum, may award as little P. as they deem fit. The existing forms of P. are death (see CAPITAL PUNISHMENT), imprisonment (see PRISONS), and fine (q.v.). Lesser forms of P. are subjection to supervision under a probation officer, binding over to keep the peace (see RECOGNISANCES), and in the case of youthful offenders detention in approved schools, though no treatment ordered by a summary court in the case of children or young persons under seventeen counts as a

conviction (see also BORSTAL SYSTEM and CHILDREN ACTS). As to preventive detentions see under PREVENTION OF CRIME ACTS. See also CRIMINAL LAW, PENAL STATUTES.

**Punishment in the Royal Navy** is awarded under the powers conferred by the Navy Discipline Acts, 1884 and 1886, amended by King's Regulations. The Articles of War specify the various offences both against naval discipline not punishable under ordinary law, and civil offences which are also punishable by naval courts-martial. For serious offences courts-martial are ordered, but captains of ships of and above the rank of commander are empowered to award summary P. up to three months' detention or imprisonment and dismissal from the service with or without disgrace, which latter involves forfeiture of all medals, pay, and pensions, together with inability to serve under the goy. in any capacity. Lesser summary Ps. include disrating, stoppage of leave and pay, extra work, etc., and may be awarded by more junior officers. P. by courts-martial may involve death, long terms of imprisonment, and dismissal from the service, in addition to disrating or loss of seniority (in the case of an officer). Officer offenders are always tried by court-martial, but during wartime disciplinary courts may be convened to deal with junior officers.

**Punishment in the Army** is authorised by the Army and Air Force (Annual) Act, 1939 (q.v.). Section 44 of the Act specifies the Ps. for the offences listed in Sects. 3-10, i.e. against military discipline, and in Sect. 41, i.e. against civil law or the ordinary law of the land. Ps. can be awarded by courts-martial (q.v.) or by certain authorities having power to deal summarily with less serious offences. Officers and warrant officers are normally tried by courts-martial. However, for the less serious offences certain specified general officers and brigadiers are empowered summarily to try officers below the rank of lieutenant-colonel, and warrant officers. In each case they can, should they think it advisable, remand the case for trial by court-martial, or award Ps. as follows: forfeiture of seniority or of seniority counting for promotion, and a severe reprimand or reprimand, or both (officers); and forfeiture of seniority of rank or severe reprimand, or both, or reprimand or deduction of ordinary pay, or both, as authorised by the Army Act (warrant officers). In the case of other ranks below the rank of warrant officer, serious offences are tried by court-martial. A commanding officer can deal with specified minor offences by summary trial. He can remand for trial by court-martial any case which he considers to be too serious for his powers, or he can award (a) detention for not more than twenty-eight days; (b) for drunkenness only, a fine not exceeding £2; (c) any deduction of ordinary pay as is authorised by the Army Act; (d) to a soldier (not N.C.O.) on active service, field P. not exceeding twenty-eight days; (e) forfeiture of all ordinary pay for a period not exceeding twenty-

eight days (active service only); and (f) minor P.s. unless detention exceeding seven days has been awarded for the offence.

There is the right to trial by court-martial in all cases where the P. (in the case of officers and warrant officers) is other than a reprimand or severe reprimand; and in the case of all other ranks other than warrant officers is other than one of the minor P.s. specified; then the officer summarily disposing of the case will before awarding P. offer the accused the choice of trial by court-martial. P.s. which courts-martial can award to officers are death, penal servitude (for not less than three years), imprisonment (for not more than two years), cashiering, dismissal from his majesty's service, forfeiture of seniority, severe reprimand or reprimand, stoppages. For other ranks the P.s. are death, penal servitude (for not less than three years), imprisonment (for not more than two years), detention (for not more than two years), discharge with ignominy, reduction to lower grade or forfeiture of seniority (for N.C.O.s only), severe reprimand or reprimand (for N.C.O.s only), forfeitures, fines, and stoppages.

*Punishment in the Royal Air Force* is regulated by the Air Force Act and King's Regulations and Air Council Instructions for the Royal Air Force. The Air Force Act, like the Army Act, has no continuous operative force but is brought into operation with such amendments as may be necessary from year to year. The Act makes provisions for the pub. of Rules of Procedure and these regulate the procedure of courts-martial, and deal with various other matters, including the confirming and reviewing of sentences. The Air Force Act (Sects. 4-40) specifies various offences against service discipline which are not punishable by the civil or ordinary law of the land, and in Sec. 41 makes additional provision also for the P. of offences which are punishable by the ordinary law. The P.s. possible for offences under the Air Force Act are laid down in the following scale, namely: for officers death (reserved for offences in relation to the enemy such as treachery), imprisonment, cashiering, dismissal, forfeiture of seniority, severe reprimand, reprimand, and stoppages of pay; and for airmen death (limited as above), imprisonment, detention, discharge with ignominy, severe reprimand or reprimand (for N.C.O.s only), and stoppages of pay. Serious offences are normally dealt with by either a general or a dist. court-martial. An officer or warrant officer may be tried only by a general court-martial, but airmen may be tried either by a general court-martial or a dist. court-martial. A dist. court-martial cannot award the death penalty. In addition when an offence is committed on active service trial may take place by a field general court-martial, which is a more summary method of disposal; a field general court-martial can award the same P.s. as a general court-martial. In dealing with offences under Sect. 41 of the Air

Force Act, i.e. offences against the ordinary law, a court-martial may award the same P.s. as are provided for by the ordinary law. In addition to the above King's Regulations and Air Council Instructions for the Royal Air Force make provision for the summary disposal by commanding officers of offences which are not of a serious nature. The P. in such cases may take the form of field P. (on active-service only), detention, confinement to camp, severe reprimand or reprimand (N.C.O.s only), stoppages of pay, and extra duties.

**Punjab** (from two Persian words meaning 'five rivers'), region of the Indian subcontinent, watered by the Indus and its four great affluents, the Jhelum, Chenab, Ravi, and Sutlej. It is bounded on the W. by the N.W. frontier provs., on the N. by Kashmir, on the E. by the United Provs., and on the S. by Sindh and Bayawalpur. The physical character of the N. contrasts strikingly with that of the S. dists. In the N. the whole surface is traversed by spurs from the Himalayas, which enclose deep valleys. In the S. the surface is unbroken by any important eminence, with the exception of the Salt range, about 2000 ft. high, between the Indus and the Jhelum. The climate in the plains is most oppressively hot and dry in summer, but cool and sometimes frosty in winter. Little rain falls except in the dists. along the base of the Himalayas. This caused the Brit. administration to utilise the rivs. for irrigation purposes. A network of canals was constructed; these canals included the Bari Doab, Chenab, Sirhind, Jhelum, and W. Juma. In 1916 over 15,000,000 ac. of land in P. were irrigated in this way. The chief crops are wheat, indigo, sugar, cotton, tobacco, opium, buck-wheat, rice, barley, millet, and maize. Cattle are reared, and dairying and wool and hide industries are carried on. Over a quarter of the filled area is devoted to wheat cultivation; both this and barley are winter rain crops, reaped in March and April. Sheep are reared for their wool. There are rich deposits of rock-salt, and oil is formed in the Attock region. Cotton-weaving is the chief industry. The manufacturing industries are largely centred in the large towns, Amritsar, Lahore, Multan, etc., and have become important since the beginning of the twentieth century. Blankets, woollen rugs, and carpets are made, and there are large silkweaving and metal-working industries. In 1862 the first railway in the P. was opened; Karachi, Lahore, and Delhi are connected by the trunkline which crosses the P. In 1946 there were nearly 6000 m. of metalled roads. Lahore, Amritsar, Ambala, Rawalpindi, Simla, and Multan are the chief towns. The main languages groups speak Punjabi, W. Punjabi, and W. Hindi. (see further under INDIA. Language, and INDO-EUROPEAN LANGUAGES). There are three main religious divs.—Hindu, Sikh, and Muslim. At the 1941 census the Hindu community numbered 7,530,400, the

Sikh 3,767,400, and the Muslim 16,217,200. There were 505,000 Christians. Area 98,184 sq. m. Pop. 29,309,800.

**History.**—The early hist. of the P. is that of a region which by situation became the battleground and melting pot of a succession of invading races. Alexander the Great invaded the P., and reached the R. Beas (Hyphasis). He turned back in 326 B.C., and died in 323. Gk. rule ended at his death. From the third century B.C. until the tenth A.D. the P. was subjected to a series of foreign invasions and was split into a number of weak and petty states. It was thus easy for the Turkish aggressors of the tenth and eleventh centuries to conquer the region and wipe out Buddhism. Delhi became the cap. of a Turkish or Afghan sultanate; but the country had little peace. There were intermittent Mongol attacks: Jenghiz Khan (q.r.) devastated the P. in 1221. In 1398 Tamerlane proclaimed himself emperor of India after sweeping across the P. From 1556 to 1707 the P. was ruled by a succession of Mogul emperors, the first of whom, Akhar, was the greatest. Lahore was estab. as the cap. After 1707 the P. was annexed by the Mahrattas, who, in turn, were defeated by a Muslim coalition. In 1799 Ranjit Singh (1780-1839) laid the foundations of a Sikh kingdom in the P. (see further under SIKHS) and by 1820 he had consolidated the P., from the Sutlej to the Indus, under his rule. Relations between the P. and Britain were, however, already strained before Ranjit Singh's death. After it war soon broke out. Two wars were fought, in 1845 and 1848-49. After Gough's victory at Gujrat (1849) the P. was annexed. It was at first governed rigorously but fairly by a Board of Three, but by 1853 the P. was administered by a chief commissioner who in 1859 was made lieutenant-governor. It was under Dalhousie's Indian administration that the P. was given a network of military roads, of the greatest value to the people. The P. became of the first importance in the Indian mutiny, the viceroy being able to do little from Calcutta. If Brit. rule there had collapsed, as it had in the N.W. provs., probably the whole of N. India would have been overwhelmed. Fortunately the new prov. supported the Brit., and the fact that the initiative in the rebellion came from the Bengal army seems to have been decisive with the Sikhs. Between 1896 and 1910 the P. suffered serious mortality from the plague. The effects of the plague were, however, far-reaching. It raised the standard of living and wages among the poorer, temporarily relieved the pressure on land, and checked the movement of the tns., which might have been expected as a corollary to the introduction of W. industry and ideas. Disturbances occurred during the unrest in India at the time of the Minto reforms, but it is not evident that they were motivated by political considerations in the P. Probably they originated in agrarian grievances. Serious semi-revolutionary disturbances occurred in the P. (as well as

in other provs.) in 1919 following the deportation of two Nationalist leaders (see further under AMRITSAR). In the same year the P. was made a governorship. The following ten years saw a great advance in the estab. of educational institutions. The univ. at Lahore was extended and elementary and secondary education was also made available to larger numbers.

The P. made considerable progress under prov. autonomy, which was introduced in 1937, owing largely to the efforts of the Unionist Party of Sir Fazl-i-Husain, who was a far-sighted political leader of the P. These efforts included extension of education, road construction, expansion of public health facilities, hospitals, encouragement of industry, and improvement of agriculture. But the outstanding feature of P. hist. under prov. autonomy to 1945-46 was its possession of a stable ministry with a declared policy of equal opportunity for all, without domination by any class or community.

After the Independence of India Act was passed and the boundaries decided, there followed reciprocal massacres. The seeds of trouble were sown in March 1940, when the Muslim League in a meeting at Lahore adopted 'Pakistan' as their battle-cry and target. This was a new idea to the Muslim peasants of the prov. and caught on rapidly. By the end of 1946 the fear of Hindu domination had become a dominating influence. This fear was accentuated by the stories of Muslims murdered in Bihar. The fear of Hindu domination was easy to arouse because in the W. Punjab the peasant was predominantly Muslim, while the trader and moneylender were largely Hindu and Sikh. Thus, when early in March 1947 trouble broke out in Lahore, Amritsar, and Multan, the peasant Muslims of the N. looted the shops and butchered their owners. Had Hindu and Muslim alone been concerned the partition of the P. might have been effected without serious bloodshed. But many of the victims were Sikhs, and the Sikhs were as resolved to prevent the domination of the Muslim as the Muslims were the domination of the Hindu. Though only 4,000,000 in a total of 29,000,000 the Sikhs were a formidable community, noted for their martial traditions. The settlement cut their small community in two for at midnight on Aug. 14 over 1,500,000 Muslims found themselves suddenly cut off from the rest of their community. Before partition of India came into force on Aug. 14, riots in such cities as Peshawar, Rawalpindi, and Lahore since Feb. 1947 had already induced some 500,000 Hindus and Sikhs to migrate to E. Punjab. After Aug. 14 another 1,500,000 Hindus and Sikhs crossed the border E., and another 500,000 were on the move. In the reverse direction the Muslim minority in E. Punjab, generally poorer and more disorganised than its Hindu and Sikh counterpart, was moving out of the dists. adjacent to the border. More than 1,000,000 people are known to have crossed previously into W. P. and

another 1,000,000 were on the move. Yet another 2,600,000 were at that time too far from the border to be able to move; these were partly in camps whence they would have to move sooner or later and partly living crowded together for self-protection in vills. and townships. Thousands of men, women, and children died on both sides during the consequent cross-migrations. As a result of partition the W. P., comprising 62,100 sq. m. and a pop. estimated at 16,870,000, went to Pakistan; the E. P., 35,684 sq. m. and a pop. of 11,628,900, went to India. See PUNJAB, EAST, and PUNJAB, WEST, for the P. after partition. See also under INDIA; PAKISTAN.

See Sir J. Dowle, *The Punjab, North-west Frontier Province, and Kashmir*, 1916; H. K. Trevasakis, *The Land of the Five Rivers*, 1928; F. L. Brayne, *The Remaking of Village India*, 1929; T. W. Paustian, *Canal Irrigation in the Punjab*, 1930; M. L. Darling, *Wisdom and Waste in the Punjab Village*, 1934; H. Calvert, *Wealth and Welfare of the Punjab*, 1936; A. Ullay, *The Co-operative Movement in the Punjab*, 1937; and T. Singh, *Sikhism: its Ideals and Institutions*, 1938.

**Punjab, East**, prov. of the dominion of India. As a result of the Indian Independence Act, 1947, the prov. of the P. was partitioned between India and Pakistan, India receiving the E. part, which became known as E. P. The boundary was drawn from Kashmir along the course of the Ravi. E. of Lahore along the Sutlej to the borders of Sind, N.E. of Bahawalpur. E. P. is divided into 124 municipalities. Simla is the cap. Other tns. are Ambala, Amritsar, Jalandhar, and Patiala. Wheat, cotton, sugar, and barley are the chief crops. There are manufs. in the tns., especially in Amritsar, which possesses large textile industries. Area 35,684 sq. m. Pop., estimated at partition, 11,517,900. (For E. P. before 1947, see under PUNJAB.)

**Punjab, West**, prov. of the dominion of Pakistan. Under the Indian Independence Act, 1947, the P. was divided between India and Pakistan. W. P. contains the dists. of the Lahore, Rawalpindi, and Multan divs. of the former P. prov. Lahore is the cap. and contains a univ. Multan and Rawalpindi are the other large tns. Agriculture is the most important industry: cotton, rice, sugarcane, and wheat are the chief crops. There are numerous manufs. in the large tns. Cotton spinning and pressing factories make up the majority of the seasonal factories. There is also a flourishing textile industry. Area 62,100 sq. m. Pop., estimated at the partition, 16,870,000. (For W. P. before 1947, see under PUNJAB.)

**Punkah**, or **Punka** (Hind. *pankhā*, fan), large machine for ventilating apartments, used in India and tropical climates. It is generally a movable fan-like frame of wood covered with canvas or calico and hung from the ceiling. A servant outside the room keeps the fan in motion by pulling a cord passing over a pulley through the wall.

**Puno**: 1. Dept. of S.E. Peru, bordering on Bolivia, almost enclosed by ranges of the Andes. It was formerly a silver-mining area; stock-raising and mining are now the chief occupations. Area 26,133 sq. m. Pop. about 730,300. 2. Cap. of above, on the bay of Puno and the W. shore of Lake Titicaca, 110 m. from Arequipa. Alpaca wool is exported and some silver mines are still worked. Pop. 16,000.

**Punt**, flat-bottomed shallow boat, broad and square at both ends, and propelled by a pole. It has no stem, keel, or sternpost, and the width at each end is at least one-half of the width at the widest part. Subject to these conditions a P. may be any length or width.

**Punta Arenas**, Chile, see MAGELLANES. **Punta Arenas**, or **Puntarenas**: 1. Prov. of Costa Rica, Central America, extending along the S.E. coast. Pop. 53,000. 2. Cap. of the prov. of the same name, on the E. coast of the gulf of Nicoya. There is trade in rubber and coffee. Pop. 3500.

**Pupil**. The circular central aperture in the iris curtain immediately in front of the crystalline lens of the eye, through which light may pass and be focused in the retina. Under the influence of intense light and when viewing near objects the P. contracts, but poor light or the viewing of distant objects generally causes it to dilate. This contraction and dilatation may also be caused by the action of various drugs. For instance, opium causes it to contract, while belladonna and cocaine cause it to dilate. This action affords a method of detecting medically whether a person is addicted to this habit. The P., in cases of nerve degeneration, sometimes fails to react to the influence of light.

**Pupillus**, **Orbilius** (113-c. 23 B.C.), Rom. grammarian and schoolmaster, b. at Beneventum. He opened a school at Rome in 63 B.C., and among his pupils was Horace, who gives him a reputation for flogging. He wrote a work referred to by Suetonius as *Periologos*.

**Pupin**, **Michael Idvorsky** (1858-1935), Amer. physicist and inventor, b. in Idvor, Serbia. He studied physics and mathematics at Cambridge Univ. and under van Helmholtz at Berlin Univ. He was prof. of electromechanics at Columbia from 1901-31, and became known as the inventor of telephonic devices and for his discoveries concerning X-rays. His best-known work is his autobiography *From Immigrant to Inventor* (1923), awarded the Pulitzer prize for 1924.

**Puppets**, figures used in dramatic presentation, made to move by various methods, usually jointed, covering the following types: *Marionettes*, jointed P. operated by wires or strings from above; *rod P.*, jointed, operated by rods from below; *glove P.*, manipulated by the hand; *flat P.*, unjointed, used in model theatre shows and 'juvenile drama'; *shadow P.*, flat, jointed figures, whose shadows are cast on a screen: these are sometimes transparent, and are worked by rods. The origin of P. is uncertain, but there is proof of their existence in Greece and

Egypt earlier than in India, where, according to tradition, the god Siva fell in love with a puppet. Many small painted figures with movable limbs, used in religious rites, were found in tombs at Thebes and Memphis. Marionette theatres flourished in all the large tns. of auct. Greece, and this art was undoubtedly borrowed by the Romans, and carried through central Asia to the Orient. Shadow P. in China (140-86 B.C.) developed from bone or horn images used in magical celebrations. This high form of artistic representation, with its bizarre figures and grotesque humour, reached its peak in Java, where P. representing auct. heroes and ancestors resemble fantastic ornaments. Oriental puppet-shows were originally religious; comic figures were introduced for light relief, and gradually became increasingly important.

European P. derived from painted images and mechanical statuettes used in religious festivals. Marionettes were introduced to Europe by travelling It. showmen, and each country gradually adapted It. conventions, devices, and dialogues to national tastes and folklore. It. showmen estab. a permanent theatre in London in 1573, and Capt. Pod was the first Eng. showman (1599). In France the first reliable records of P. are of those shown by Broché in the second half of the seventeenth century, although they must have existed in France, Germany, and other European countries long before then. String marionettes predominated in the sixteenth century, but in the seventeenth hand P. took precedence, and typical figures such as Polichinelle, Punch, Hanswurst, and Guignol appeared. The puppet theatre played a considerable role in all civilised European countries, and was attacked incessantly by the regular theatre and the Church. In the eighteenth century Punch was included in most of the dramas shown by Robert Powell, a famous showman whose booth was opposite St. Paul's. In Italy, where marionette theatres had long held the same prestige as other theatres, *fantoccini* were used for the performance of long plays, ballets, and grand opera. The art declined gradually, but was revived at the beginning of this century by artists who realised its importance as a dramatic medium, and as an educational development. See C. Magnin, *Histoire des marionettes en Europe*, 1852, 1862; Helen H. Joseph, *A Book of Marionettes*, 1922; M. von Boehn, *Dolls and Puppets*, 1932; J. Russell, *The Puppet Theatre*, 1946; and M. Batchelder, *The Puppet Handbook*, 1947.

**Purāna** (Sanskrit *purāṇa*, old), name of each of a class of sacred Hindu poetical works in the Sanskrit language, treating of the creation, destruction, and renovation of worlds, the genealogy of gods and heroes, the reigns of the Manus, and achievements of their descendants. Like the Pantras, they are the chief foundation of the popular creed of the Brahminical Hindus. There are eighteen chief P., and eighteen supplementary 'Upa Purānas.' They are supposed to have been compiled by

Vyāsa, and were probably admitted to the sacred literature of Hinduism in the sixth or eighth century A.D. See H. H. Wilson (trans.), preface to his *Īshnu Purāna*, 1840; E. Burnouf and E. L. Havvetto-Besnault (ed. and trans.), *Rhāgarata Purāna*, 1840-84; F. Neve, *Les Pourānas*, 1852; J. Muir, *Sanskrit Texts*, 1868-71; A. B. Keith, *Sanskrit Classical Literature*, 1923, and *History of Sanskrit Literature*, 1928.

**Purbeck Beds**, in geology, marls, fresh-water limestones, and shales, with estuarine and marine beds, containing fossils such as *Cyparis Purbeckensis*, *Paludina*, and *Ostrea distorta*, which form the top beds of the Upper Jurassic system. They attain a thickness of about 400 ft. near Swanage, and are remarkable for their 'dirt beds' and they also afford the ornamental 'Purbeck marble.'

**Purbeck, Isle of**, peninsular dist. of S.E. Dorsetshire, England, between Poole Harbour and the Eng. Channel, terminating in St. Alban's Head. Purbeck Hills (chalk) traverse it from E. to W. P. was once a deer forest, but the scenery is now mainly heathland and downs. Corfe Castle is in the centre. Marble, limestone, pipe-clay, and potter's clay are found. See Ida Woodward and J. W. G. Bond, *Purbeck*, 1908.

**Purcell, Henry** (c. 1659-95), Eng. composer. b. probably in Westminster, London. Tradition says that his father was Henry P., master of the abbey choristers, but it is now thought that P. was the son of Henry's brother, Thomas. P. was a chorister at the Chapel Royal. As a youth he was assistant to Hingston, keeper of the instruments at the Chapel Royal. His position was really that of an unpaid apprentice, and he succeeded Hingston as keeper in 1683, being made 'composer in ordinary' to the king in the same year. He succeeded Blow as organist of Westminster Abbey in 1679, having earlier been one of Blow's pupils. In 1682 he became one of the organists at the Chapel Royal. These official duties required the composition of much church music; his many anthems include *My heart is inditing and Thou knowest, Lord, the secrets of our hearts*. His *Te Deum* and *Jubilate*, written in 1694, are outstanding. P. also wrote some excellent chamber music, e.g. the celebrated *Golden Sonata*. He wrote an opera *Dido and Aeneas* and sev. quasi-operas and masques, notably *Timon of Athens*, collaborating with such poets as Dryden and Congreve in the productions. The 'Trumpet Voluntary,' originally entitled *The Prince of Denmark's March*, and actually written by Jeremiah Clarke (c. 1659-1707) was erroneously attributed to P. during the last century. P.'s music shows the influence of Blow and also of Italy and the It. operettists; its expressiveness and purity have never been surpassed by any other Eng. composer. He is Handel's equal in melodic beauty. P.'s music in the past has suffered from neglect because much of it was written for specific occasions, and later seemed to lose its point. He died in London, and was buried beneath the organ in Westminster

Abbey. See lives by P. A. Scholes in *The Book of Great Musicians* (22nd ed.), 1947; D. Arundell, 1927; A. K. Holland, 1932; and J. A. Westrup, 1937.

**Purchase System**, see COMMISSION, MILITARY.

**Purchase Tax**, tax introduced by Sir (later Viscount) John Simon, as chancellor of the exchequer, in the Finance (No. 2) Act, 1940, and levied on the purchase of certain specified goods from registered dealers (generally wholesalers) by unregistered persons (generally retailers). Sir John Simon introduced the tax as a source of substantial additional revenue for his second war budget (presented April 23, 1940). While discouraging unnecessary spending at home, P. T. was not intended to touch exports, raw materials, food, drink, or articles already subject to a heavy duty. A register of wholesalers was to be compiled and it would be the business of the seller to get the tax from the purchaser at the time he received payment for the goods. Sir Kingsley Wood, who succeeded Sir John Simon in the same year as chancellor and moved the second reading of the Finance Bill (May 29), revised the earlier plan considerably. He abolished the flat rate, which had been proposed by his predecessor and substituted a rate of 33½ per cent on the wholesale value of luxuries and goods which could be dispensed with or replacement of which could be postponed, and one of 16½ per cent on the wholesale value of a wide range of goods. In the lower rate schedule were included articles like clothing, boots and shoes (excepting children's clothing and footwear). In 1948 Sir Stafford Cripps reclassified goods liable to P. T., reducing the categories to four: (a) exempt; (b) 33½ per cent; (c) 66½ per cent; (d) 100 per cent, and in his budget announcement moved a large range of articles among these groups, the majority being reductions. Net excise receipts from P. T. were: 1946, £118,251,626; 1947, £181,105,011; 1948, £216,505,106.

**Purdah** (Hind. and Pers. *purdah*) (E. India), curtain, especially one serving to screen women from being seen by strangers; hence, figuratively, the Indian system of secluding women of rank.

**Purfleet**, former urban dist. of Essex, England, 7 m. S.W. of Tilbury with oil storage tanks. In 1936 it became part of the urban dist. of Thurrock. Pop. 8500.

**Purgatives**, see APERIENTS.

**Purgatory** ('a place of purgation' from Lat. *purgare*, to cleanse). In theology, the place in which the souls of the departed who die in a state of grace and yet have not fully expiated their sins at the moment of death are detained until they have done so. According to the council of Florence (1438-45), the souls in P. can be helped by the prayers of the faithful on earth. This doctrine is implicit in the practice, dating from early Christian times, of offering suffrages for the dead, and is based on 2 Mac. xii. 46. The doctrine of P. was denied by Luther, but was reaffirmed by the council of Trent (1545-63). It is held, though in a less

precise form by the Orthodox Church, representatives of which assisted in the formulation of the doctrine promulgated at Florence. The suffering of P. consists in being deprived of the vision of God.

**Puri**, see JÜGGERNAUT.

**Purification**, see ABLUTION.

**Purification of the Blessed Virgin Mary**, Feast of the (Feb. 2), originated in Jerusalem at the end of the fourth century, was adopted by Constantinople in 542, and spread throughout the E. and finally to Rome, perhaps under Gregory I (590-604). It commemorates the presentation of Christ in the temple on the fortieth day after his birth (Feb. 2) and the purification of Mary. It acquired its predominantly Marian character in the W. by the addition of the procession with candles in honour of Mary, under Sergius I. (687-701). See CANDLEMAS.

**Purim**, or the Feast of Lots, Jewish festival, commemorating the deliverance of the Jews of Persia from the plot of Haman, recorded in the Book of Esther. P. is celebrated on Adar 14. In ancient times the meal (*se'ulah*) was one of the main aspects of P., but the Temple authorities granted no recognition to this feast, refusing even to have the *Hallel* sung on it. The *Mishna* and the *Tosefta*, however, omit all reference to the P. dinner; they are concerned only with the reading of the *Megillah*, or 'scroll' of Esther. While all the laws of Judaism are traced to the Mosiac legislation, the regulation that this *Megillah* should be recited annually is a later addition.

**Puritans**, The, in the days of Elizabeth and the early Stuarts, name applied as a term of derision to a party in the Church of England who wished to purge the estab. eccles. system from so-called popish abuses. Later it came to include more revolutionary groups, many of which aimed at the entire destruction of Anglicanism. The name was in use at least as early as 1561, and refers to that purification in worship and doctrine to which all P. looked forward. The P. were all united in opposing the Church of England as they found it, but their constructive proposals differed vastly. This makes the P. in opposition (sixteenth and early seventeenth centuries) relatively easy to define; but the P. of the Civil war period, and of the era of disintegration which followed it, include so many types that generalisation is frequently dangerous. The two main divs. of P. in the sixteenth century (later known as Presbyterians and (congregationalists) both followed Calvinist doctrine, but differed in their views on Church government. But in the next century the term came to include Baptists, Unitarians, and Quakers, whose theology was frequently antinomian or Arminian. The earliest P. were a party within the estab. Church, regarding themselves as orthodox Anglicans, and (like Pryn and Prynne) heartily disliking and repudiating the name Puritan. But many later P. resisted the idea of any estab. Church, and professed toleration of other opinions in varying degrees.

Extreme Protestant views had penetrated into England under Edward VI., and during Mary's reign a number of clergy fled to Calvinist Geneva and absorbed Calvin's ideas (see CALVINISM). In spite of Elizabeth's attempt at a *via media* in Church affairs, therefore, a strong nucleus of potentially Puritan opinion existed in England even at her accession. Many of her bishops, Swiss exiles themselves, at first condoned the practice of a Protestantism more rigid than that envisaged in the settlement of 1559. Under Archbishop Whitgift the machinery of the high commission court (instituted in 1559) was vigorously used against the P., but such severity came too late. The number of P. increased, the movement being helped because there undoubtedly still existed in the estab. church the abuses of simony, pluralism, and many ill-paid and ignorant lower clergy for which the Church of pre-Reformation times had been blamed. In 1582 a gathering of Puritan clergy, under the leadership of Cartwright, expressed its discontent with the present condition of the church in a formal document, but this solidarity was only momentary. While Elizabeth lived the P., though by no means quelled, were held in check.

On James's accession the P. became more active, and at the Hampton Court conference 750 clergymen set forth what became the basis of the Presbyterian form of Puritanism in England. James, however, rejected their demands. Laud's religious policy brought many moderates into the Puritan party, and Puritanism became very largely anti-episcopal as a result of the actions of Laud and his colleagues. During the Long Parliament, which assembled in 1640, Presbyterian Puritanism seemed on the eve of realisation. In 1642 bishops were deprived of their seats in Parliament; episcopacy, including the hierarchy of archbishops and bishops, deans and chapters, etc., was abolished in 1643; the Book of Common Prayer was thrown over and its use declared penal; finally, in the same year, the 'discipline' was estab., whereby an attempt was made to enforce government by presbyteries in all churches throughout the realm. But this was never enforced, for, except in a number of restricted localities, full Presbyterianism never gained a wide following in England. Its power in 1645 depended largely on the influence exercised by the Scottish Army. Eng. Puritanism had some of its roots in anti-clericalism, and the minister was thus as distrusted as the Anglican parson. In a sense, too, though it was itself intolerant, it was an expression of a secular individualism which Scottish Presbyterianism did not at that time possess. In the years covering the commonwealth and protectorate it became clear that many P., particularly those in influential places, wanted little more than a modified Anglicanism; and the use of the Book of Common Prayer could not in fact be eradicated. The more extreme P. were divided into numerous sects, of which the

Congregationalists (as they later became) were probably the most influential, though the various Baptist groups were numerically fairly strong.

With the Restoration of 1660 the insecure fabric of estab. Puritanism was swept away and Anglicanism, with the episcopal system and all that went with it, restored. But the P. had a lasting effect on the estab. Church and Eng. society as a whole, even though they failed to capture it. The 'Eng. Sunday' still retains some of the Sabbatarianism fought for by the P., as opposed to the so-called 'Continental Sunday.' Latitudinarians and Evangelicals are the descendants of Puritanism within the Church, while those who refused to conform with Anglicanism formed a powerful group of nonconformist sects whose very existence and ideas have influenced every aspect of Eng. life. It was no accident that the Eng. radical political thinkers of the eighteenth century came frequently from dissenting families. The P. of Elizabethan and Stuart times had an inborn hatred of religious rituals and ceremonies, and sometimes (as in the case of Cromwell and Sir Henry Vane the younger), though not always, a longing for greater liberty of conscience. After the Restoration, when it became obvious that the P. could never convert the whole country to their way of thought, they began to press more generally for religious toleration, aiming merely at securing acceptance for themselves and thus, by circumstance, they became the champions of freedom of worship. But the practical expression of early Puritanism, where it did gain supremacy, as in the seventeenth-century Massachusetts, shows that serious and high-minded P., who abandoned England because of consistent religious persecution, proved as intolerant to those of differing views as their Eng. opponents had been to them.

The P.'s noblest literary expression is in the pages of *Paradise Lost* and *Pilgrim's Progress*, while critics have pointed to a Puritan inheritance in the works of authors as different as Defoe, Hawthorne, George Eliot, Bernard Shaw, and Sinclair Lewis. Such a list illustrates the various and sometimes conflicting facets of Puritanism and the varying tendencies to which it gave rise. Thus while many P. were lovers of music, it is still true to say that the Puritan spirit was responsible for the temporary banishment of music from religious services. It was responsible, too, for the repeated outbreaks of iconoclasm which ruthlessly damaged and even destroyed historic churches and abbeys, and, in general, for that ill repute into which the arts and popular diversions alike fell. Until the twentieth century the theatre continued to suffer from this influence. On the other hand, the Eng. character is richer for the intellectual honesty and practical but simple faith which flourished alongside much that was undoubtedly destructive, in the greatest of the P.

See E. Dowden, *Puritan and Anglican*, 1900; W. Shaw, *A History of the English*

**Church, 1640-60, 1900;** S. R. Gardiner, *The First Two Stuarts and the Puritan Revolution*, 1902; S. R. Gardiner (ed.), *Constitutional Documents of the Puritan Revolution*, 1906; H. W. Schenk, *Social Justice in the Puritan Revolution*, 1949.

**Purley**, see **TOOKER, JOHN HORNE**.

**Purley**, urb. dist. (with Coulsdon) of Surrey, England, 2½ m. S. of Croydon, on the S. region of Brit. Railways. There are light engineering industries, and chalk quarrying. Pop. of Coulsdon and P. 63,000.

**Purmerend**, tn. in the Netherlands, on the N. Holland canal, 10 m. N. of Amsterdam. P. has important trade in cattle and cheese. Pop. 1,600.

**Purniah**, or **Purnea**, dist. and tn. of Bihar, India. In the Bhagalpur div. Over two-thirds of the area is cultivated, and rice is the main crop. The tn. lies 230 m. N.W. of Calcutta, and trades in jute. Area of dist. 4,998 sq. m., and pop. (dist.) 2,390,100, (tn.) 17,900.

**Purple Colours** are obtained by an admixture of red and blue light rays. The colours vary from scarlet to violet according to the predominance of the red or blue rays. In the case of *paints*, P. C. are obtained by mixing red and blue pigments in varying proportions. Tyrian P., which was held in great repute in the ant. world, was obtained from the juice of a shell-fish called *Murex* or *Conchylum*. Owing chiefly to the luxuriousness of the cloth made in those times, P. became a symbol of royalty, and the reference exists to-day for imperial purposes and for cardinals of the Rom. Catholic Church.

**Purple Emperor** (*Apurura iris*), handsome high-flying butterfly, with rusty black wings, lustrous in the male and with seven white spots and a transverse white band.

**Purple Goatsbeard**, see **SATURN**.

**Purple Heart**, military decoration of the U.S.A. It was the first decoration for conspicuous gallantry to be awarded by the U.S. Gov., being instituted by Washington in 1781. Later it fell into disuse, but was revived in 1932. During the Second World War it was given to all members of the forces who were wounded under circumstances entitling them to a wound stripe.

**Purpura**, genus of gastropod molluscs in the family of Muricidae, contains sev. sub-genera, and is itself typical of the sub-family Purpurinae. It is closely related to the stingwinkle and *Murex* (see **PURPLE COLOURS**). The species, often known as *whelks*, are all predatory, and *P. lapillus* feeds on the edible oysters after boring a hole through their shells.

**Purser**, officer in a ship's company who keeps the accounts and, usually, has charge of the provisions. In large passenger ships the P.'s dept. is of the greatest importance, and the P. will have as his assistant the chief steward and a personnel of between three or four hundred stewards. He is responsible for the entire victualling of the ship, amongst many other duties. He has to act as host to the passengers, a position requiring considerable tact. In smaller ships, such as cargo liners, a P. is not needed and a chief steward combines the two jobs. One of the duties of a P. is to make up the portage bill, which is a detailed account of the financial transactions of every member of the crew and the amounts due to each man when the ship pays off. The badge of a P. consists of two white sleeve-bands, that of a senior P. has three bands, and of an assistant P. one band.

**Purslane** (*Portulaca oleracea*), small succulent ann. herb, native of tropical Asia. It is grown in gardens, the tops of the young shoots being cooked and eaten as a vegetable or pickle. Winter P. (*Claytonia perfoliata*) is grown in France as a salad, and for cooking like spinach.

**Pursuivant**, third and lowest rank of heralds. Formerly Ps. were attendant upon the heralds from whom they learnt their craft, and many of the great nobles had their own Ps. who were often named after the armorial bearings of their masters. To-day the four Ps. of the College of Arms (Rouge Dragon, Rouge Croix, Bluenant, and Portcullis) have virtually the same functions as heralds.

**Purus**, tribe of Brazilian Indians occupying the lower course of the R. P. They are of nomadic habits and live in temporary huts erected on swampy ls.

**Purus**, riv. of S. America. It is a trib. of the Amazon, rising in E. Peru, and joins the Amazon 110 m. above Manaus. It is 1900 m. long and navigable for 1600 m.

**Purveillance**, see **PRE-EMPTION**.

**Pusan**, see **PUSAN**.

**Pusey**, Edward Bouverie (1800-82), Eng. cleric, b. at Pusey in Berkshire, his father, the Hon. Philip Bouverie, having taken the name of P. on his succession to the P. estates. He was educated at Eton and Christ Church, Oxford, and in 1824 was elected a fellow of Oriel. He then went to Germany, where he studied oriental languages and theology. His antagonism to Ger. rationalism, which was one of the main causes of his later action, was caused by his knowledge of rationalism in its chief home. It was with the object of stemming the rising tide of rationalism in England that he joined Newman in the issue of *Tracts for the Times* soon after their inception (1833), and became one of the leaders of the Oxford movement. His own contributions were treatises dealing with the subject in an exhaustive and scholarly fashion. In 1836 he commenced the Oxford Library of the Fathers, a series of trans. of the works of the early writers. It was P.'s influence that prevented the

results of Newman's secession and later efforts from being greater than they were, and that mitigated in some degree the effects of the Gorham Judgment in 1831. P. house, in Oxford, a theological centre, is a memorial to P.'s life and work. See lives by H. P. Liddon, 1893-97; G. W. E. Russell, 1907; and L. Prestige, 1933.

**Pushball**, game played with a large ball, 6 ft. in diameter and weighing about 50 lb. It consists of pushing the ball under, or heaving it over, the bar of a goal, raised on posts 7 ft. from the ground. The former achievement gains five points, the latter eight points. The team consists of eight or eleven a side, and the playing field is generally about 150 x 50 yds. in size. P. is popular on board ship and sometimes goes by the name of 'medicine ball.' The game may also be played on horseback. P. originated in the U.S.A.

**Pushkin, Alexander Sergeievich** (1790-1837), Russian poet, b. in Moscow, pub. his first poems at the age of fifteen. After his education at the Tsarskoe Selo lyceum, he was appointed to a post at the Foreign Office in 1817, and in 1822 went on official duties to Kishenev in S. Russia, partly to escape censure, if not exile, for a poem on liberty. A visit to the Caucasus inspired a romantic poem, *The Prisoner of the Caucasus* (1822), which was followed by the *Ode to Napoleon*, the *Lay of the Wise Oleg* (where the growing interest in national hist. is seen), and the fascinating study of gipsy life, *Tsugani*. P. became involved in various secret political societies, quarrelled with his chief, Count Vorontsov, and resigned his post 1824. In 1825 he pub. his fine tragedy, *Boris Godunov*, which marks the breaking with the Fr. tradition of the Russian stage and a movement towards Shakespearian drama. Though suspected of participation in the plot of the Dekabrista, his family influence was sufficient to save him. In 1828 appeared *Poltava*, a narrative poem of the times of Peter the Great and Mazeppa, followed by the account of the second visit to the Caucasus with charming lyrics. Receiving a gov. post in 1831, P. wrote his prose hist. of the Cossack revolt under Pugachev, his great prose romance, *The Captain's Daughter*, and what is probably his masterpiece, the poem *Eugene Onegin*, 1832, a mixture of humour, satire, and romance strongly reminiscent of Byron, whose influence is marked throughout P.'s works. In 1837 he fought a duel and was mortally wounded. P. was the founder of both Russian prose and poetry in its classic form, and the first link between Russian and W. literature. His deepest inspiration came from the heart of Russia—from Russian folklore, and he was the first to reveal the imaginative power and intuitive moral force of the Russian peasant. But, fundamentally, his talent was akin to W. culture, and influenced largely by the contemporary romantic school; and the spirit of this school mingled naturally with the Russian motive of pity, which, as a kind of inner revelation, solves the most complex moral problems. This is

shown markedly in those of his tales which illustrate his sympathy with Byronic Titanism, e.g. *The Pistol Shot* and *The Queen of Spades*. See lives by D. S. Musky, 1926; K. J. Simmonds, 1937; H. Troyat, 1946; and J. Lavrin, 1947.

**Pushkin**, tn. of the R.N.F.S.R., in the region of Leningrad, 15 m. S. of Leningrad city. Its original name was Detskoe Selo. It became the summer residence of the tsars and was renamed Tsarskoe Selo by Catherine the Great. After the revolution of 1917 the tn. was named P. Between July 1941 and Jan. 1944 it was held by the Gers., who devastated it before withdrawing. P. was famed for its fine imperial buildings housing works of art. Pop. 19,200.

**Pushtu**, language of the Afghanistan tribe of Pukhtus or Pathans. It is closely allied to the Iranian language, though modified to a large extent by Indian influences. See J. Darmesteter, *Chants populaires des Afghans*, 1888 90.

**Puteoli**, see POZZUOLI.

**Putnam's**. The New York publishing house of G. P. Putnam's Sons was founded in 1838 by George Palmer Putnam (1814-72) in partnership with John Wiley as Wiley & Putnam, changed two years later to G. P. Putnam, Broadway. A London branch was started almost immediately, and George Palmer Putnam for some years devoted much of his time to promoting the idea of international copyright. He arranged with Eng. authors for Amer. pub. of their work and voluntarily paid them royalties; indeed the stopping of 'piracy' of Eng. books by Amer. publishers was largely due to the pioneer work in the field of international copyright of George Palmer Putnam and his son, Major George Haven Putnam, who joined the firm after the civil war, and succeeded his father as head of it on the latter's death in 1872. He was joined by two brothers, when the house assumed the designation by which it is now known. In 1932 the firm came under the control of Melville Minton and Earle H. Balch, who merged with it their own publishing firm of Minton, Balch. The London branch of the firm became an independent Eng. publishing house in the early thirties under the style of Putnam & Company Ltd. and the chairmanship of Constant Huntington, who has directed its affairs for forty years.

**Putney**, suburb of London, opposite Fulham on the r. b. of the Thames, 6 m. S.W. of St. Paul's, London. The Univ. boat races, start from here, and rowing and sculling matches are held. The famous P. Heath, leading on to Wimbledon Common and Richmond, is 1 m. distant. Pop. 70,900.

**Putrefaction**, decomposition and decay of animal and vegetable matter. Chemical change is brought about by bacteria, ptomaines being formed and malodorous gases given off. Decay is prevented, as shown by Pasteur, if the organic matter is sterilised and kept free from bacteria by hermetic sealing and the like.

**Putrid Sea**, see AZOV, SKA OF, and CRIMEA.

**Putsch**, Ger.-Swiss word, meaning thrust or push, and originally used colloquially of a shower. Since the twentieth century it has acquired an international meaning as an unexpected revolt of limited size and duration, aiming at an overthrow of the existing gov. by force. The most famous P. was the 'Munich beer-cellar P.' of Adolf Hitler and his followers in 1923. Other P's. include the overthrow of Stambolsky's dictatorship in Bulgaria in 1923, and the ousting of the Khaled al-Azm Gov. in Syria by Marshal Zahni on March 30 (1949), followed by his own assassination in Aug. (1949) in Gen. Hinnawi's counter-*putsch*. There have been frequent Ps. in S. and Central Amer. countries.

**Püttiala**, see PATIALA.

**Putting the Weight or Shot**, sport of great antiquity which later came to be played with a cannon-ball or shot, classified as a 'weight,' i.e. 16 lb. The putting area of a 7-ft. square was in 1908 changed to a 7-ft. circle, edged in front with a toe-board, 4 in. high, the inside of which checks the putter's foot. The shot is held below the right ear, and the putter, balancing on his right leg, executes a sideways hop, landing near the centre of the circle on his right foot; the left leg follows through and is placed near the toe-board. The right leg bends; then both legs straighten; the shoulders are squared and the shot is delivered by straightening the right arm. A 'reverse' movement keeps the putter inside the circle. J. A. Torrance made the amateur world record in 1934 with 57 ft. 1 in. The Olympic Games record was made in 1918 by W. M. Thompson (U.S.A.) with 56 ft. 2 in.

**Püttlingen**, tn. of Saar Palatinate, Germany, 34 m. S.S.E. of Trier. Pop. 17,000.

**Putty**, plastic mixture of whiting and drying oil (linseed oil). It is used for glazing purposes and for filling holes in woodwork before painting. A paste of white lime and water is called plasterer's P.

**Putty Powder**, dioxide of tin, prepared from the scum or crude oxide formed on the surface of melted tin. This is removed, purified by calcination, and used as a polishing powder and for making white enamel and opal glass.

**Putumayo**, commissary of Colombia, occupying the drainage basin of the P. R. The cap. is Mocoa. Attention was drawn to the Peruvian rubber-growing districts of the P., owing to the reports of atrocities committed upon the native Indians employed in the collection of rubber by an Anglo-Peruvian company. The Brit. consul at Rio, Sir Roger Casement (q.v.), was sent to investigate, and reported in 1912, bearing out the truth of the reports. The Peruvian Gov. instituted reforms and estab. a commission to punish offenders. Pop. 15,800.

**Putumayo (riv.)**, see ICA.

**Puvls de Chavannes**, Pierre Cécile (1824-98), Fr. painter, b. at Lyons. He was educated at the Lyons College. Henri Scheffer was his first master, and then

Couture. In 1852 he estab. a studio for himself and organised an academy for his fellow students. He first exhibited in the Salon in 1850, but the next two years saw his work rejected. In 1859 the Salon accepted his 'Return from Hunting,' but he did not attract serious attention until 1862 when he produced 'Peace' and 'War,' which were acquired by the state. These two, with four panels, are in the great gallery of the museum at Amiens. In Paris he decorated the Pantheon, the *hôtel de ville*, and the amphitheatre of the Sorbonne. His work became grand and serene in style, and perfect in its proportions and simplicity. He developed an entirely new style of wall-painting. Among his prin. pupils were Ary Renan, Haudouin, and Cottet. See lives by R. Jean, 1914, and C. Manclair, 1928.

**Puy-de-Dôme**, dept. of central France, S. of Allier dept. Plateau and mts. occupy three-fourths of it, plain and valley the rest. Branches of the Cévennes and of the Auvergne Mts. over-arch the E. and W. of the dept. The multitude of conical hills or *puy*s, of basaltic and lava masses, and of craters, shows the volcanic nature of the soil. The prin. riv. is the Allier (a trib. of the Loire). The soil is, in general, light and poor; but its volcanic character fosters vegetation, and the splendid valley of Limagne is fertile throughout and well cultivated. The climate is uncertain; the mts. are often visited by severe storms, and more or less covered with snow for six or seven months of the year. The chief products are wheat, rye, flax, fruits. The high pasture lands support large numbers of cattle, sheep, and goats. The prin. minerals are iron, antimony, and lead. There are sev. hot and cold mineral springs; among the most frequented are those of St. Myon and Chateaudon. The cap. is Clermont-Ferrand and there are four arrons.: Clermont-Ferrand, Issoire, Riom, and Thiers. Area 3080 sq. m. Pop. 478,700. (See Illustration, p. 760.)

**Pu-yi**, Henry, see HOSAN TUNG.

**Puzzle**, see RIDDLE.

**Pwllheli**, seaport, municipal bor., and mkt. tn. of Carnarvonshire, Wales, on Cardigan Bay, 21 m. S.S.W. of Carnarvon. There is a small fishing fleet. Copper, manganese, and lead are found in the neighbourhood. P. became a bor. in the thirteenth century. Pop. 4300.

**Pyæmia** (πύωρ, pus; αἷμα, blood), disease due to the presence in the blood of pyogenic or pus-forming micro-organisms, usually streptococci and staphylococci. It differs from *septicæmia*, the general term for invasion of the blood by microbes, in the formation of metastatic or secondary abscesses. It is caused by the germs from an acute primary abscess shedding emboli, or particles of fibrin which are carried along in the bloodstream, where these emboli lodge; a metastatic abscess is formed, which is more or less dangerous according to its situation. The symptoms of acute P. are rigors and headache in the early stages; the skin becomes dry and hot, and

assumes a yellowish tinge; delirium and the breaking out of abscesses in various parts are characteristic of the later stages. The treatment should aim at maintaining strength by nourishing food, and stimulants should be unsparingly administered. Abscesses should be opened under antiseptic conditions and amputation should be resorted to promptly, if necessary. Sulphonamides, supplemented by penicillin if necessary, are extremely useful in the treatment of P. and septicaemia.

**Pyapen**, dist. and tn. of Burma, in the Irrawaddy div. Rice is grown. Pop. (dist.) 347,000; (tn.) 11,000.

a Rom. victory over Perseus, last king of Macedonia, in 168 B.C.

**Pyelitis**, inflammation of the renal pelvis, i.e. the expanded upper portion of the ureter where it is attached to the kidney. Infection may occur either from the blood-stream or from the bladder; the infecting organism is usually *Bacillus coli*, but it may be a streptococcus or staphylococcus. The attack is acute at first but may become chronic later. The symptoms of acute P. are abdominal pain, especially near the kidney; scanty deep-coloured urine, from which the bacteria can be cultured, and having a

D. McLeish

#### THE VOLCANIC PEAKS OF LE PUY, PUY-DE-DÔME

The nearer, 280 ft. high, is crowned by the church of St Michel d'Anguile dating from 962. The further, 435 ft. high, is surmounted by a gilded statue of the Virgin and Child composed of the metal of over 200 Russian cannon taken at Sevastopol.

**Pyatigorsk**, tn. of the Stavropol ter. of the R.S.F.S.R. on the Caucasian foothills. It is situated on the P. Podumsk, and has famous sulphur springs. It was in Ger. hands from Aug. 1942 to Jan. 1943. Pop. 62,800.

**Pyenogonidae**, or **Pantopoda**, small marine group of the Arthropoda found in large numbers in deep waters, and to a certain extent on the foreshore. The class includes numerous families. The commonest species is the *Pyenogonum littorale*, or common sea-spider, with four pairs of eight-jointed legs. It is found under stones at low water, but is often found clinging to an anemone in louse-like fashion. The largest form is the *Colossendeis gigas*, which measures nearly 2 ft. from tip to tip of its legs. This form is found only in the deep seas.

**Pydna**, anct. tn. of Macedonia, near the Thracian Gulf. Originally a colony from Euboea, it was conquered by Philip of Macedon, 356 B.C. It was the site of

characteristic fishy odour; high temp. and other generalised symptoms. Urinary antiseptics, such as hexamine, and also the sulphonamides, are used in the treatment of P.; the urine should be maintained alkaline and ample fluids given. The chronic form is liable to persist for a long period. P. is sometimes a complication of pregnancy.

**Pyeshkov**, Aleskei Maximovich, see GORKY, MAXIM.

**Pygmalion**, in Gk. legend: 1. King of Cyprus, son of Cillix and grandson of Agenor. He fell in love with an ivory statue of a girl he had made, and Aphrodite breathed life into her. By her P. was the father of Paphos. Her name of Galatea is unauthorised. 2. Son of Belus and brother of Ildo.

**Pygmies**, races of dwarf men whose average height is 57 in. for the men and 54 in. for the women. The cause of their small stature is not known. The Nerrillos, P. of the Congo forest, are probably

a branch of the Negro stock which separated at a remote period; those in the Kalahari region appear to be related to the Bushmen, and the Negritos, P. of Malaya, the Philippines, New Guinea, and the Andaman Is., are probably akin to the Papuans and an extreme variation of the E. Ulotrichi (Oceanic Negroes).

P. have been known since the third millennium B.C. when the Pharaohs sent S. for P. to dance before them (*see also* under DWARFS). In classical literature they are frequently mentioned by Homer, who speaks of them living on the shores of Ocean where their country was invaded by cranes in their winter migration, and by Aristotle, Herodotus, and others, all of whom suggest that they were distributed over a far larger area than at present.

In Africa they live mainly in the dense forest of the Congo basin within 6° of the equator, although some live further S. in the Bushmen's ter. Their skin is a reddish-brown or darker, their noses broad and flat, and their faces generally prognathous. They hunt with bows and poisoned arrows, trap game, and collect fruit. For cultivated produce such as maize the Congo P. rely on exchange with their Bantu neighbours who will accept their game. Sometimes a Bantu will become the patron of a small group of P. who do all his hunting for him. Both here and in the Kalahari they live on good terms with their neighbours. They live in small groups and belong to totemic clans, which are generally exogamous. The favourite totems are the leopard and chimpanzee and they will not kill or eat their totem, but it is doubtful whether they think themselves the descendants of the animal or that their spirit will pass into it after death. Their religion has been much influenced by their Bantu neighbours, and the Efé group at least believe in a power that they call *Tore*, who made all things and to whom all things belong. All the P. believe in a power associated with the ornament, the 'Lord of the Hurricane,' etc., and offerings of slain beasts and honey are made.

The Negritos are of similar physical type, but tend to be brachycephalic (round-headed), whereas the Negrillos tend to be dolichocephalic (long-headed). They also are hunters, except for the New Guinea group, who are vegetarians. In the Malay peninsula they use the blow-pipe and poisoned darts instead of the bow for hunting. On the Philippines there are sev. different groups of which the best known are the Aetas, a name which is sometimes applied to all. They live in small groups, in New Guinea, in vils. administered by a headman and elders. They are polygamous and divorce is common. A divorced woman can be recognised because the top joint of her first finger has been removed. Of their religion little is known. It is even uncertain whether they are totemic or not. They believe in spirits in rocks, trees, etc., but beyond that nothing definite can be said.

None of the P. has a written language and it is doubtful whether they have even a language of their own. They seem to use that of their neighbours. Nor have they any arts; only the group on the Andaman Is. know the technique of making pottery. They are a kindly, backward people, possibly representing an early human type, infantile both mentally and physically.

Vandonbergh, *On the Trail of the Pygmies*, 1922; S. S. Dornan, *Pygmies and Bushmen of the Kalahari*, 1925; C. G. Seligman, *Races of Africa*, 1930; P. Schebesta, *Among the Congo Pygmies* (trans. G. Griffin), 1932 *My Pigmy Hosts*, 1936; and *Revisiting my Pigmy Hosts*, 1936; R. P. Trillos, *Pygmées de la forêt équatoriale*, 1932; and I. H. N. Evans, *Negritos of Malaya*, 1937.

*Pyllades*, in Gk. legend, son of Strophilus of Phocis and nephew of Agamemnon. The close friend of Orestes, he aided him to revenge himself on *Agisthus* and *Clytemnestra*, and married his sister, *Electra*.

*Pylos*, *see* THERMOPILE.

*Pylos* (Gk. *πύλος*, gateway): 1. The mass of buildings on either side of the entrance to a temple in ant. Egypt, especially as exemplified by the two great P.s. of Edfu. The temple portal or P., as developed at Thebes, generally consisted of three parts, namely a monolithic corniced lintel on lofty side-posts, flanked by two truncated pyramidal towers with sculptured hieroglyphs. 2. Tower of lattice steel construction carrying overhead electric transmission lines in open country. The steelwork is supported on concrete foundations and protected by galvanising. The minimum clearance between the live wires and any part of the steelwork is 3 ft. 6 in. The standard single-circuit tower, type S<sub>1</sub>, is 66 ft. 3 in. high and 15 ft. in breadth; the standard double-circuit, type D<sub>1</sub>, is 78 ft. 3 in. high and 18 ft. 6 in. broad; both single and double have a cable span of 900 ft. The highest towers in the country are the double-circuit towers used for the Thames crossing at Dagenham; they are 487 ft. high, with a cable span of 3080 ft.; power is transmitted at 132,000 volts (being reduced to lower voltages in the areas where it is to be used). The suspension towers over the Forth are 338 ft. high, with a cable span of 3050 ft.

*Pylos Stenosis*, *see* under STOMACH.

*Pylos* (modern Navarino), ant. tn. on the W. coast of Messenia, Greece. It has been identified with the home of *Neleus* and *Nestor*. It was prominent during the Peloponnesian war, fortified by the Athenians in 425 B.C., and retained by them till its recapture by the Spartans in 409 B.C. *See also* NAVARINO.

*Pym, John* (1584-1643), Eng. statesman, b. at Brymore, Somerset. He studied at Broadgates Hall (later Pembroke College Oxford, and at the inner

Temple. He entered Parliament in 1614, and in a few years became one of the leading speakers in the House of Commons. He was a manager of Buckingham's impeachment (1626), a supporter of the Petition of Right (1628), and a vigorous opponent of the tonnage and poundage scheme (1629). He gradually became one of the most effective leaders against the gov.'s oppressive measures, and in 1640 was intimately associated with the impeachment of Strafford and Laud. He was amongst those who prepared the Grand Remonstrance (1641), and was one of the five members whom Charles I. came in person to Westminster to arrest (1642). It was P. who secured the Scots alliance. He was the most powerful man on the parl. side when war broke out. A great parliamentarian and an efficient organiser P.'s career is somewhat marred by his unscrupulous attack on Strafford, his former friend, during the attempt to impeach Strafford, and he would undoubtedly have taken an active part in the revolution. See life by S. R. Brett, 1943.

**Pyorrhoea Alveolaris** is an inflammation of the gums, causing a discharge of pus from the tooth sockets when in an advanced stage. The symptoms are swelling of the gums, which discolour to bluish, their softness, looseness, and inclination to bleed. The teeth loosen as the disease develops, and when far advanced may fall out. The pus may be swallowed with the food, or toxins may be carried in the blood and affect other parts, e.g. the heart. Sore throat and ulceration of the mucous membrane of the mouth sometimes indicate the approach of P. A. Persons under thirty years of age are seldom attacked. One of the possible causes is consistently inhaling through the mouth. Treatment can only be performed by dentists, and when advanced entails tooth extraction. *Gingivitis*, or inflammation of the gum margins, is a milder condition than P. A., and there is no discharge of pus.

**Pyramid**, stone structure on a polygonal or square base with triangular sides sloping to an apex. As an architectural form the P. belongs peculiarly to middle Egypt from before 3000 B.C. during the fourth to the twelfth dynasties. A few miles from Cairo, lying in the E. desert, are the three great P's. of Gizeh, famous throughout the civilised world. These were built as tombs for kings. The greatest is that of Khufu or Cheops; it measures to-day at its base 755 ft. on each of its four sides, and it is 151 ft. high, though originally the apex must have been 30 ft. higher, and the base 20 ft. wider on each side. About 6,000,000 tons of stone were employed in the building of this mighty monument. It covers 1½ ac. of land. Herodotus asserts that it occupied 100,000 men for twenty years. The material was hewn from the quarries, on the opposite side of the Nile, floated across during the time of inundation, and dragged up to the P. over a stone ramp that took ten years to construct. The reign of Cheops must have

been chiefly occupied in building this tomb for himself. It was accomplished with forced labour, and such a feat of building could only have been possible when the state was enjoying a very highly finished organisation. At the completion of the great P. the faces were smooth and polished, but they now present a series of great steps formed by the courses of stone, and are in some places (particularly in the middle of each face, and at the angles, and about the entrance) much broken. The ascent is easy though fatiguing, and at the summit, from which a fine view is obtained, is a platform about 32 ft. square. In the third P., known as Menkaure's, the sepulchral chamber was not altogether hewn out of the rock as in the case of the two greater, but has a mado roof constructed with cantilevers of stone, which by not pressing against each other along the central line leave room for pressure to delay the collapse of the roof as long as possible. Usually the passages leading to the central chamber have smaller rooms occurring occasionally, blocked by stone doors that turn on a pivot; these were for the priests who came at intervals to minister to the royal dead. In the P. of Cheops a red granite sarcophagus was found, supposed to have been brought from Syene for the king; it bears no inscription. The little chamber below was called the queen's chamber, but at no time have these tombs been used for family purposes, always being built for the one royal body; individual burial was always a matter of importance with the anc. Egyptians. The second P. of Chephren contained a sarcophagus, also without inscription. The third, or Menkaure's, P. contained a very fine basalt sarcophagus, ornamented with panel decorations; the body of the king was also found buried in rubbish, obviously having been removed from its coffin by the spoilers of the dead. A caliph in 1226 rifled the tomb and carried away a quantity of treasure. The sarcophagus was lost at sea on its way to England; parts of the body and fragments of the inner wooden coffin were saved and are now in the Brit. Museum. Blind passages and false doors were constructed in these tombs to secure the dead lying undisturbed; many valuable objects being buried with royalty, it was necessary to prevent thieves from committing sacrilege. But of the multitude of P's. that are scattered over Egypt, sixteen only have been satisfactorily identified. Menkaure's tomb was cased round the base with granite; it appears to have never been properly finished, and the workmanship is inferior to the two greater P's., but more art was employed in its decoration. Many legends were formerly attached to this tomb, Menkaure being the Mykerinos of the Gks. A huge treasure of precious stones and metals was hidden in one of the chambers for the help of the country in time of great need, and laid under a curse if a thief should take them. Tradition tells us that perhaps Cleopatra found the treasure; in

any case the caliph found plenty of gold when he ransacked the tomb. The P of Zoser at Saqqara known as the 'step P' because of the style of its construction, has a labyrinth of passages and chambers paved with granite. Another P, that of Unas contained a basalt sarcophagus of fine workmanship, the walls of which were lined with alabaster and painted in beautiful designs. The chamber itself was decorated with well cut hieroglyphs. The little P of Medum is historically extremely interesting. It is dedicated to Sneferu (fifth dynasty) and the miniature temple connected with the tomb is

They are mere mounds of earth of which much of the pyramidal form has gone with the action of time. The sun P. is some 700 ft on each side of the base and rises about 200 ft. There is evidence of staircases and terraces and it is thought that they were once crowned with temples (see also ZIGGURAT). See L. V. Grinsell, *Egyptian Pyramids*, 1947, I. E. S. Edwards, *The Pyramids of Egypt* (Pelican Books) 1947, and E. J. Baumgartel, *The Cultures of Prehistoric Egypt* 1947.

Pyramids (game), see under BILLIARDS.  
Pyramus and Thisbe, Babylonian legend. Ovid (*Métam.* iv 55-465) tells of

THE PYRAMIDS OF GIZA  
The Mena House Hotel is in the foreground

E 4

almost perfect. Many of the Ps have yielded great treasures to the archaeologist including the trinkets, jewellery, and furniture of the dead. The 1st tomb evolved gradually from the early first dynasty wood-lined chambers which grew to brick-lined mounds with earth then mounded with bricks, and so to the stone masses which are the typical 1s. These latter tombs were carefully planned before their building. Temples were placed to the W. of the tomb where the priests worshipped the departed king. Although it is known that bronze saws, set with jewels and diamond rock drills were employed, transport arrangements and organisation of the day to day work raise interesting problems. Various ancient structures found throughout Mexico include Ps, and many of these are at Teocuitatlan where the great earth Ps of the sun and the moon are situated.

Pyramus, a Babylonian youth who loved Thisbe. They had agreed to meet under a certain mulberry tree and fled together. Thisbe arrived first, but was terrified by a lion and ran away dropping her veil which the lion tore to pieces with its blood-stained jaws. This was found by Pyramus who thinking Thisbe was dead, slew himself. He returned and killed herself upon his corpse and the fruit of the mulberry was ever after red instead of white.

Pyrenean Dog (*Chien-berger des Pyrénées*) small sheep dog originating in the Pyrenées standing about 18 in. high. The 1 D is intelligent and agile, with long wavy sandy hair and proves an excellent sheep dog in mountainous regions.

Pyrenées, Basses-, frontier dept. of France formed out of the ancient provs. of Béarn, Navarre, and Gasconne. It

is bounded on the N. by Landes and Gers, on the S. by the Pyrenees, E. by Hautes-Pyrénées, and W. by the Bay of Biscay. The W. part belongs to the Basque Region. The prin. riv. is the Adour, which is fed by many mt. torrents. About one-fifth of the area is covered with dense forests, marshes are common, and pastureland is good. Maize is grown; wheat, vines, chestnuts, and flax are also cultivated. Salt and other mineral springs are numerous, the most popular being Eaux-Bonnes and Eaux-Chaudes. Marble, copper, and iron are some of the mineral products. There are three arrons., Pau, Bayonne, and Oloron. The cap. is Pau. Pop. of the dept. is 415,800.

**Pyrénées, Hautes-**, frontier dept. of S.W. France, formed from parts of Gascony, and divided into three arrons.: Tarbes, Argelès, and Bagnères-de-Bigorre. The S. part is very mountainous, containing ramifications of the Pyrenees, with the peaks of Vignemale (10,820 ft.). Pic de Néouville (10,145 ft.), and Pic du Midi de Bigorre (9440 ft.). Between the spurs are picturesque valleys, fertile in the lower parts. The hills gradually descend to a plain in the N. In the N.E. lies the desolate plateau of Lannemezan. The chief riv. is the Adour, with its tribs. the Arros and Gave de Pau. The Garonne is on the S.E. frontier. There is much forest land, and wheat, maize, vines, tobacco, flax, and chestnuts are grown. Marble and slate are quarried and lignite, zinc, manganese, and lead are found. There are mineral springs, and flour, saw, and paper mills, etc., in the dept. The cap. is Tarbes; other tns. are Lourdes, Luz, Vic, Bagnères-de-Bigorre, and Marbourget. Area 1749 sq. m. Pop. 202,000.

**Pyrénées-Orientales**, maritime and frontier dept. of S. France, lying at the E. extremity of the Pyrenees and formed from the old provs. of Roussillon and Languedoc. The surface is very mountainous, except for the plain of Roussillon in the E. Oranges and other fruits, including vines, are grown. There are three arrons., Perpignan, Céret, and Prades. The cap. is Perpignan. Area 1598 sq. m. Pop. 228,800.

**Pyrenees, Peace of**, the treaty arranged between France and Spain on an is. of the Bidassoa in Nov. 1659. The chief terms were the cession to France of most of Artois, parts of Flanders, Hainault, and Luxembourg, Roussillon and Cerdagne, Pinerolo, Clermont, Stenay and the duchy of Bar; and a marriage was arranged between Louis XIV. and the Infanta of Spain, Maria Theresa.

**Pyrenees, The**, after the Alps, the grandest mt. system of Europe. Stretching for some 250 m. from the Bay of Biscay to Cape Creus, they rise as a formidable barrier between France and Spain. Both to N. and S. their ridges present a regular terrace-formation, and are truly saw-like (sierra), for indentations are both sharp and shallow. The loftiest heights, including Néthou or Aneto (11,170 ft.) in the Maladetta group, Posets (11,047 ft.), Mont-Perdu (11,000

ft.), and Vignemale, are all in the central range. There are marked differences between the W. and E. sections. For instance, the precipitation is much greater on the Atlantic side, and this accounts for the wooded slopes and scenery here, which closely resembles that of the Ger. highlands. In the E. wild bare granite masses tower above vineyards, and olive groves, tamarisks, and aloes remind one of the proximity of Africa. The P. were mined in the times of the Carthaginians and Romans, and copper, silver, coal, lignite, lead, and iron are still found. Puigmal (9545 ft.) is the highest peak in this section. A comparison with the Alps will best throw into relief the characteristics of the P. (1) The latter range has only a few passes and those at a great elevation. Beyond the La Perthus (950 ft.), which extends from Figueras to Perpignan, the Col de Somport or the Port de Canfranc (5355 ft.), along which wound the old Rom. road from Saragossa to Oloron, and the Col de la Perche (5280 ft.) between the valleys of the Tet and Segre, there are only footways and bridle paths. (2) Though there are numerous mt. streams (*gaves*) and waterfalls like that of Gavarnie (1515 ft.), no rvs. of size, except the Garonne, find their source in the P. (3) The glaciers cling to the mt. crests and do not penetrate into the heart of the valleys as in the Alps. (4) 'Cirques' are peculiar to the P. These are great amphitheatres of rock and mt. which shut in the upper ends of valleys, so-called because of their cauldron shape. The cirques of Cotatuero and Gavarnie guard the steeply ramparted valley of Arzac on the Sp. and Fr. sides respectively, and the cirque of Pinède is part of the sublime scenery of Mont Perdu. (5) There are many mineral springs on the N. face, but there are no lakes to rival Lucerne, etc. Again and again the inaccessibility of the P. has made them a secure retreat; it was here that the Christian refugees made a last stand against their Moorish oppressors. Within the range lies the republic of Andorra. See Count H. Russell, *Hiarritz and the Basque Countries*, 1876; E. E. Lilborough, *Twist France and Spain*, 1883; H. Belloo, *The Pyrenees*, 1909; C. L. Freeston, *The Passes of the Pyrenees*, 1913; V. C. Scott O'Connor, *Travels in the Pyrenees*, 1913; C. Schuster, *Men, Women and Mountains*, 1931; V. Alford, *Pyrenean Festivals*, 1937; P. Arqué, *Géographie des Pyrénées françaises*, 1943.

**Pyrenomyces**, family of ascomycetous fungi, characterised by flask-shaped fructifications, which either open at top to liberate the spores or else decay. Some species are parasitic on plants, others on insect larvae, and some are saprophytes. *Claviceps purpurea* is the cause of the disease known as ergot of rye; *Cordyceps* attacks certain caterpillars. *Eurotium aspergillus* is the greenish mould which attacks jam.

**Pyrethrum**, genus of composite plants now usually included in *Chrysanthemum*, contains sev. well-known species. P. (or

C.) *Parthenium*, the feverfew, common in Britain and many other parts of Europe, was once a popular remedy against ague, and is said to be peculiarly disagreeable to bees. The dried flowers of *P. roseum*, and *P. cinerariifolium*, when powdered, are used to drive away insects.

**Pyrexia**, see under FEVER.

**Pyrgi**, anc. tn. of Etruria, Italy. It was the port of Cere. Stormed by Dionysius of Syracuse, 387 B.C., and became subject to Rome about 290 B.C.

**Pyrgos**, tn. in the dept. of Elis, Greece, 40 m. S.W. of Patras, with a port at Katakolon. Near it are the ruins of Olympia. Pop. 19,000.

**Pyrhellometer**, instrument for measuring intensity of solar radiation. In Ångström's P., devised in 1896, two thin similar platinum strips, of known area, have each a thermoelectric junction fixed to the rear for determining their temps. One strip is blackened and exposed to the sun and a measured current of electricity is passed through the other, and equality of temp. is indicated by a galvanometer connected with the thermal junctions. When this occurs it is assumed that the amount of heat introduced by the electric current is the same as that absorbed by the strip exposed to the rays of the sun. Knowing the former the latter can be determined. The solar constant (*q.s.*) is given in calories per square centimetre per min. Various corrections must be made to allow for loss of heat by reflection, by the effect of the air in carrying off some of the heat produced by the absorption of solar radiation on the blackened surface, and also by the re-radiation of great wavelength. More modern forms of P.s. have been devised to obviate these difficulties. See C. Maurain, *Étude pratique des rayonnements solaires atmosphérique et terrestre*, Gauthier-Villars, Paris, 1937; and C. G. Abbot, *The Smithsonian Standard Pyrheliometry*, Smithsonian, Misc. Coll., Washington, Vol. 110, No. 11, 1948.

**Pyridine**,  $C_5H_5N$ , aromatic base found in coal-tar oil (lower boiling fractions), bone-oil, or bone-tar, from which it is obtained by fractional distillation of the basic portion. It is a colourless mobile liquid (boiling point  $115^\circ C.$ ), miscible with water, soluble in alcohol, ether, benzene, etc., and possessing a pungent odour. It is a strong base, forming crystalline salts with acids, but is very stable, and is not attacked by boiling nitric or chromic acids. It forms substitution products with halogens. It is used as a solvent, a denaturant for alcohol, and a catalyst in dye manuf., and in insecticides and fungicides, etc.

**Pyrites** ( $FeS_2$ ), disulphide of iron, a commonly occurring mineral of a brassy-yellow colour, which crystallises in the cubic system (hardness 6-6.5). On heating in air it gives off sulphur, and is used in the manuf. of sulphuric acid and the sulphate of iron (copperas) of commerce. It may contain traces of gold and other metals, the former being profitably ex-

tracted from the residues of the 'wet copper' process. Identical in chemical composition and hardness is marcasite. Arsenical P. is the mineral mispickel ( $Fe(SAs)_2$ ). Pyrrhotine is magnetic P. and is found in hexagonal crystals (hardness 3-5 to 4) which are paler in colour. Chalcopyrite or copper P. is one of the chief ores of copper, and forms tetragonal brass-yellow crystals which easily tarnish.

**Pyritz**, see PYRZYCE.

**Pyrmont**, see WALDECK-PYRMONT.

**Pyrocatechin**, **Pyrocatechol**, or **Catechol**, dihydric phenol known chemically as *ortho*-dihydroxybenzene. It is prepared by heating phenol-*ortho*-sulphonic acid with alkali, or by heating gualacol (a solid contained in beech-wood) with hydriodic acid. It is a colourless crystalline solid, melting point  $104^\circ C.$ , soluble in water, its solution giving a green coloration with ferric chloride. Its alkaline solution acts as a reducing agent, and as such is used as a photographic developer.

**Pyrogallic Acid**, or **Pyrogallol** ( $C_6H_3(OH)_3$ ), trihydric phenol formed from gallic acid, is a colourless crystalline substance (melting point  $132^\circ C.$ ). It is readily soluble in water, the solution turning red with ferric chloride. Its alkaline solution rapidly absorbs oxygen, and becomes black, and for this reason is used in gas analysis. A powerful reducing agent, it is used extensively in photography for developers ('pyro').

**Pyrography**, see POKER-DRAWINGS.

**Pyrola**, or **Wintergreen**, genus of perennial plants (family Ericaceae), with flowers in a bracteate raceme. Four species are Brit., occurring somewhat rarely in woods in the N. These and others are frequently grown on the rocky and moist borders.

**Pyroligneous Acid**, crude liquor obtained from the destructive distillation of wood, from which acetic acid, acetone, and methyl alcohol are prepared.

**Pyromancy**, see DIVINATION.

**Pyro-metallurgy**, see METALLURGY (EXTRACTION METALLURGY).

**Pyrometer** (Gk. *πυρ*, fire; *μετρον*, measure), instrument for the measurement of high temps. For rough measurements of high temp., in commercial work *see* forms of discontinuous thermoscopes were formerly used. Wedgwood, for example, utilised the shrinkage of clay rods in testing furnaces for the manuf. of pottery, whilst Seger's cones of clay are still used in some porcelain and brick works. These cones are made of specially blended clays that soften at definite temp. Prinsep designed a series of fusible alloys, each member of which melted at a definite temp. to cover the range from  $700^\circ$  to  $1700^\circ C.$  for furnace work. In modern times it is not only necessary to measure temps. up to  $2000^\circ C.$  in commercial work, but it is also found to be economic to measure temps. scientifically. All temp. measurements are reduced to the absolute or thermodynamic scale, and for practical purposes the reading of a hydrogen thermometer approximate very closely to that scale. One of the most widely used types of P. is the **Platinum Resistance**

P., the readings of which can be reduced to the hydrogen scale and therefore to the absolute scale. This P. makes use of the fact that the electrical resistance of a platinum wire increases as its temp. is raised. The instrument is calibrated in the usual way (see THERMOMETER) by finding the resistance of the thermometer at the upper and lower fixed points, and, in order to reduce its readings to the hydrogen scale, a third reading is taken when the thermometer is immersed in vapour from boiling sulphur, i.e. at a temp.  $444.55^{\circ}$  C. on the hydrogen scale. The platinum wire is enclosed in a special silica case, and it is plunged into the furnace. The electrical resistance is then measured by means of a form of Wheatstone bridge (q.v.) and the temp. of the furnace is deduced. This form of P. may be used for temps. up to  $1200^{\circ}$  C. and it can measure to  $1/100^{\circ}$  C. The instrument is supplied for commercial direct reading work by the Cambridge Instrument Company. *Thermo-electric* P.s. are also very popular, and are made for direct-reading, continuous record work. Their mode of action depends on the fact that when a junction of two dissimilar metals is heated, a small electromotive force is generated in the circuit that includes the junction. The E.M.F. varies with the temp. of the junction, and the instrument is used in conjunction with a delicate galvanometer (q.v.). The instrument requires careful calibration, and this is done by the instrument makers. It has the big advantage of being able to measure the temp. at a precise point, since the dimensions of the junction are so small that it can be inserted in any small aperture. This convenience makes this type of P. popular for measuring temps. at different parts of rotating machinery, but they are not used for temps. above about  $1000^{\circ}$  C.

For temps. between  $1200^{\circ}$  and  $3000^{\circ}$  C. *Optical* P.s. must be used. These are properly called radiation instruments, since their measurements are based on the radiation emitted from hot bodies. They possess the advantage that it is not necessary to insert them into the furnace, thus exposing them to destructive heat; they are situated at some distance from the furnace, and the radiations from a small aperture in the wall of the furnace are allowed to fall on the instrument. The Cambridge Instrument Company supplies an optical P. of the 'disappearing filament' type for commercial work, in which a visual comparison is made between a standard electric lamp and the furnace viewed through absorption screens until exact matching is obtained. The temp. of the standard lamp filament is determined from a knowledge of the current supplied to it. Ferry has designed a P. that is based on the fact that the radiation from a 'black body' (see RADIATION) varies directly as the fourth power of its absolute temp. (q.v.). In this instrument the radiation falls on a delicate thermojunction, and the E.M.F. generated is recorded by a galvanometer. The galvanometer readings are calibrated to record the temp. directly. See E. Griffiths,

*Pyrometers*, 1926; F. Royds, *The Measurement of Steady and Fluctuating Temperatures*, 1926; and T. Preston, *Theory of Heat*, 1929. See also *Dictionary of Applied Physics*, ed. Sir R. Glazebrook, 1922.

Pyrone, name given in chem. to an important group of compounds, the simplest of which are:

Derivatives of P.s. occur in nature, e.g. coumarin, the fragrant constituent of the Tonka bean and of woodruff.

Pyrops, see under GARNET.

**Pyrosoma:** 1. Genus of compound *Tunicata*. The colony takes the form of a cylinder closed at one end, and may be of any size from 1 in. to 12 ft. long. The individuals are placed with their brachial apertures outward and their atrial apertures towards the central cavity. The colonies are phosphorescent, and move about just below the surface of the sea. 2. Parasitic protozoan, *P. bigemium* is the cause of Texas fever in cattle. The infection is carried from beast to beast by a tick, in which the parasite undergoes a somewhat obscure stage of development.

**Pyrotechnics**, art of making fireworks for amusement, public rejoicing, and, to a growing extent, for utilitarian purposes. A firework consists of a container, or 'case,' charged with a mixture so compounded as to be capable of burning without help from the oxygen of the air. At least one ingredient must contain a readily liberated supply of oxygen. From earliest times this function has been performed by saltpetre (potassium nitrate), but since the beginning of the nineteenth century potassium chlorate has been increasingly employed. Simple firework mixtures were known in China and the E. from very early times, but it was not until the principle of the gun was devised, in Europe during the fourteenth century, that a mixture, suitable for use as a propellant, came to be known as gunpowder. Pyrotechnic mixtures are of two types: those producing force and sparks and those providing flame. The effect of the former takes place outside the case; partly consumed material, in the form of sparks, is thrown out by internal pressure. To this class belong fountains, golden rains, squibs, the well-known rocket, which is driven into the air by the reaction of the internal pressure, and those units which give motion to wheels and similar devices employed in public displays. With flame units the thinner paper case is consumed as the mixture burns. These are used for illumination, in the form of Bengal or coloured lights, 'lances,' employed to outline the design in pictorial set-pieces, and in the small stars, which form the 'garniture' of aerial fireworks; rockets and shells. Colours were made possible by the introduction of mixtures containing potassium chlorate and the salts of

various metals. In England Nov. 5, 'Guy Fawkes Day,' is the occasion for general private firework celebration; in the U.S.A. July 4, Independence Day, is similarly observed. Pyrotechnic signals, illuminating and incendiary devices, play a large part in modern warfare. At sea distress rockets and flares, and line-carrying rockets, save many lives. In agriculture insecticide smoke mixtures are recent introductions of great value. See T. L. Davis, *Chemistry of Powder and Explosives*, 1944; G. W. Weingart, *Dictionary and Manual of Pyrotechny*, 1937; and A. St. H. Brock, *A History of Fireworks*, 1949.

**Pyroxene**, name given to a group of minerals which have allied chemical and physical characters. They are silicates of calcium and magnesium, with iron, alumina, etc., and crystallise in two systems. The monoclinic Ps. include augite, diaspore, diopside, coeselite, etc.; the rhombic Ps. are enstatite, bronzite, and hypersthene. In colour they are brown or green, ranging to black, and occur in basic igneous rocks. Ps. may change to amphiboles by weathering and metamorphism and vice versa. They form a parallel series with the amphiboles, from which they are distinguished by their cleavage angle (P. about 87°, amphiboles about 125°), feeble pleochroism, and high extinction angles.

**Pyroxylic**, or **Wood Spirit**, brownish inflammable liquid obtained by distilling the product of the dry distillation of wood after the tar has been separated, and the acetic acid removed by neutralising with lime. The liquid contains methyl alcohol, acetone, etc., and is used as a solvent and for 'denaturing' alcohol.

**Pyroxylin**, nitrated cellulose, produced by the action of nitric acid on cotton-wool. Nitric acid (18 volumes concentrated nitric acid with four volumes of water at 65° C.) is allowed to act on cotton-wool for about 10 min. The cellulose is converted chiefly into tetra- and penta-nitrates, which dissolve in a mixture of alcohol and ether (see GUN-COTTON). A solution of the mixed nitrates in alcohol and ether constitutes 'collodion,' which is used for photographic purposes. P. is also used in cellulose lacquers and in smokeless powders.

**Pyroxylin Plastic**, see CELLULOID.

**Pyrrha**, see under DEUCALION.

**Pyrrhic Dance**, war dance of the ancients. Lacedaemonians.

**Pyrrho** (c. 360-270 B.C.), Gk. philosopher, b. in Elis, founder of the sceptical or Pyrrhonian school of Gk. philosophy. He studied philosophy under the Gymnosophists in India and the Persian Magi. His doctrines are chiefly known through the writings of his pupil, Timon the Sillographer of Phlius. His main principle is an utter indifference to dogma. Nothing is real but sensation, and nothing can be denied or affirmed with regard to any assertion so that the only proper attitude to life is one of imperturbability. See E. Zeller, *Stoics, Epicureans, and Sceptics* (Eng. trans. 1892); C. Wachsmuth, *De Timone Philiastio*, 1859; and J. L. Robin, *Pyrrho et le scepticisme grec*, 1944.

**Pyrrhus** (Πύρρος): 1. King of Epirus (c. 318-272 B.C.). He was a great general and claimed descent from Achilles' son, the reputed founder of the race of the Molossians. As a child his right to the throne was upheld by Glaucias, and he was later assisted by Ptolemy of Egypt, becoming sole ruler of Epirus (295). He aimed at emulating Alexander the Great, and tried to win the throne of Macedonia; but though he acquired considerable territory in Macedonia, his brother-in-law, Demetrius, was chosen king. War broke out between them (291); Demetrius was forced to flee (287), but P. was soon superseded by the Macedonian Lysimachus (286). His next famous exploit was aiding the people of Tarentum against Rome (280). His defeat of the consul Laevinus at Heraclea was marked by such heavy losses that the phrase 'a Pyrrhic victory' came to mean a victory almost counterbalanced by misfortune. P.'s minister, Cineas, could not prevail on the Senate to make peace, and after defeating the Romans at Asculum (279) he went to Sicily to aid the Greeks against Carthage. On returning to Italy (274), he was crushed at Beneventum by the consul Curius, and forced to retire to Epirus. He made himself master of Macedonia again (273), and fell next year in a riot at Argos. See Plutarch's life; R. Schubert, *Geschichte des Pyrrhus*, 1891; and J. P. Mahaffy, *Alexander's Empire*, 1888. 2. Son of Achilles, see NEOPOLYMNUS.

**Pyrrrole**, colourless liquid of the formula  $C_4H_5N$ , boiling point 130° C. It smells rather like chloroform, and possesses both weakly acid and weakly basic properties. P. occurs in coal-tar and bone-oil, and can be synthesised by passing a mixture of acetylene and ammonia through a red-hot tube. Among important derivatives of P. are hematin, the red colouring-matter of blood, and chlorophyll, the green colouring-matter of plants. P. vapour turns a pinewood shaving moistened with hydrochloric acid a fiery red, hence its name (Gk. *pyrrhos*, fiery-red).

**Pyrus**, genus of trees and shrubs (family Rosaceae), which includes not only the apple, pear, quince, and medlar, but also a number of handsome trees and shrubs grown especially for the beauty of their bloom.

**Pyryzce** (Ger. *Pyritz*). tn. of Poland, formerly in the Ger. prov. of Pomerania, Prussia, 24 m. S.E. of Szczecin (Ger. Stettin). Its chief manufs. are sugar and machinery. Pop. 13,000.

**Pythchley**, vill. in Northamptonshire, England, 3 m. S. of Kettering, noted on account of the P. Hunt founded about 1750. See H. O. Nethercote, *The Pythchley Hunt*, 1888.

**Pythagoras** (c. 570-c. 504 B.C.). Gk. philosopher, b. at Samos, son of Mnesarchus. About 531 he emigrated to Croton where he estab. a religious society under the rule of which that city enjoyed the hegemony in Magna Graecia. A conspiracy of his enemies, however, forced P. to withdraw to Metapontum where he died. The mass of legend which even in

ant. times grew round the name of P. is wholly fanciful. P. wrote nothing, though various works, including the P. theorem of Euclid, were attributed to him. From casual references in later writers it is learnt that his central belief was that of metempsychosis; the soul is purified by study. Thus the way of life or religion taught by P. was a combination of asceticism and the investigation of nature. P. discovered the numerical ratios which determine the prin. musical intervals, and his school was thus led to interpret the world through number. See F. W. A. Mullach, *Fragmenta philosophorum Græcorum*, i., 485-509, 1860-81; R. Hercher, *Epitolographi Græci*, 601, 1873; E. Zeller, *Philosophie der Griechen*, 1876-1909; J. Burnet, *Early Greek Philosophy* (3rd. ed.), 1920; Sir T. L. Heath, *History of Greek Mathematics*, 1921; H. Dieis, *Die Fragmente der Vorsokratiker*, 1922; and E. Frank, *Plato und die sogenannten Pythagoreer*, 1923.

Pytheas (Gk. Πυθέας) of Massilia (Marseilles) (fourth century B.C.), Gk. navigator and astronomer, probably a contemporary of Alexander the Great. He sailed from anct. Gaul to the W. and N. of Europe, visiting Britain and sailing round its E. coast for a considerable distance to the N. He was credited with visiting 'Thule'—the name that was given to the groups of the Orkneys and Shetlands—but this view is no longer accepted, and it is believed that his knowledge of these is, was merely derived from hearsay; and on another voyage journeying from Cadiz to the Tanais (Don, or perhaps the Elbet). He is traditionally supposed to have been the first to connect the spring tides with the phases of the moon. Only fragments of his *Ocean* and *Periplus* are extant. See A. A. Argydson's ed. (1834); M. Fuhr's (1831-35); G. O. Lewis, *Historical Survey of the Astronomy of the Ancients*, pp. 466-80 (1862); P. H. Antichan, *Les Grands Voyages de découvertes des anciens*, 1881; F. Kähler, *Forschungen zu Pytheas*, 1903; M. Cary and E. Warmington, *Ancient Explorers*, 1929; and G. E. Broche, *Pytheas le Marseillais*, 1936.

Pythia, see DELPHI.

Pythian Games (Gk. τὰ Πυθια), one of the four great national festivals of anct. Greece, celebrated every four years at Delphi (Pytho) in honour of Apollo, to celebrate his destruction of the dragon (Python). Originally held every nine years, they were superintended by the Amphictyonic Council after 586 B.C. The laurel-wreath was first given as the prize in 582, and the various contests took place in the third year of each Olympiad. See A. Krause, *Die Pythien, Nemeen, und Isthmien*, 1841; T. Mommsen,

*Delphica*, 1878; and F. G. Schömann, *Griechische Altertümer*, ii., 1861-3.

Python (Gk. Πύθων), in Gk. mythology, serpent produced from the mud and slime of the flood in the time of Deucalion. It lived in the caves of Mt. Parnassus, and, according to some anct. writers, delivered oracles at Delphi till slain by Apollo.

Python, genus of large non-poisonous snakes, belonging to the family of the Boidæ. They are found in most of the tropical parts of the old world, and sometimes reach a length of 30 ft. The *P. reticulatus* is the commonest species in Indo-China and Malay, while further W. the *P. molurus* is more common. The Ps. of Africa are smaller than those of Asia. The smaller Ps. feed on small mammals and birds; the larger on mammals of considerable size.

Pyx, small box, generally of precious metal, in which the consecrated Host is reserved or carried to the sick.

Pyx, Trial of the (Lat. *pyxis*, box or chest), final and public weighing and assaying at the Mint of the gold and silver coinage of the realm, by way of public attestation of its standard purity. The first regular public T. of the P., according to Madox, took place as long ago as the reign of Edward I., when the king commanded the Exchequer barons to open the boxes of the assay of London and Canterbury, and make the assay in such manner as the royal council used to do. This reference to the royal council shows how anct. the ceremony was, and indeed prior to Edward I. the king's council, by its deputies, conducted a private assay within the Mint as a condition of sanctioning the delivery of the coins to the owner of the bullion. Apparently this private ceremony was not a sufficient guarantee of the integrity of the coins, and hence it early became the custom to submit the coins to a public trial by a jury, repeated at short enough intervals to check improper issues of money. The trial is now conducted periodically by a jury of goldsmiths under the supervision of the king's remembrancer. In the reign of Edward III. it seems that the trial was held every three months; after that it was held at uncertain periods, but o-day it is conducted annually.

Each coin is not assayed separately, however; samples only are taken. The term 'silver' is now only a courtesy title for coin that since 1947 has been made of cupro-nickel. The trial takes place before representatives of the Treasury and Mint, and the Board of Trade are also represented, as that dept. provides the scales and weights for weighing the coins and the standard plates of the alloy whereby the fineness is tested.

**Q**, seventeenth letter and thirteenth consonant of the Eng. language. It represents the Koppa of the earliest (Gk. alphabets, which (after the fifth century B.C.) survived only as a numerical symbol for 50. The Lat. alphabet adopted from Etruscan three signs having the phonetic value of *k*, *Q*, *K*, and *Q*. In time it dropped the *K*, and used *Q* for the sounds of *g* (the letter *i*, *q.v.*, was created at a later stage) and *k*, the letter *Q* being retained for the sound *k* when followed by *u*. In the oldest form of our alphabet there was no *q*, *cu* or *kw* being used for the sound of *qu*. In It. *q* is pronounced as in Eng., whilst in Fr. and Sp. *qu* takes the place of the absent *K*. Also in Eng. *qu* is in some words pronounced as *k*, *i.e.* pique, oblique, liquor, etc.

**'Q,'** see QUILLMAN, SIR ARTHUR THOMAS.

**Qain,** see KAIN.

**Qalūbiya**, div. of Lower Egypt. Area 361 sq. m. Pop. 690,000.

**Qarimathians**, see KARIMATHIANS.

**Qasim**, prov. of the Nejd, Saudi Arabia. It is a region of sand dunes with many oases in the hollows and lies S. of Jebel Shammar, from which it is separated by a steppe-desert. 'Anaiza is a large oasis and the chief city (pop. 20,000); the other large city is Buraidā (25,000), which has large palm groves. *Q*. has had a chequered hist. bound up with the rise of the Wahabi power. After a rebellion in 1782 *Q*. relapsed once more into subjection to the Wahabi state of the Nejd. Later, when Arabia was under the Egyptians, *Q*. fell under the easy dominance of Turkish pashas. By 1850 *Q*. had fallen under the effective rule of Faisal ibn Sa'ud, in whose reign may be seen the real beginnings of the modern Wahabi state. The Quwasimi pirates of the Oman coast were notorious, and at one time had to be suppressed by Brit. naval vessels.

**Qatar**, peninsula of low barren hills projecting due N. for 120 m. into the Persian Gulf. Physically it forms part of the S. Arabian desert, 'Ruh' al Khali. *Q*. is an independent sheikhdom of the coastal tract commonly known as Trucial Oman. The chief pt. is Doha, also the residence of the chief. The 'Abhan Arabs of the Hasa had a colony at Zubara on the *Q*. promontory whence, in 1783 they descended and seized the Bahrein Is. from the Persian garrisons which had held them by conquest from the Hawala Arabs since 1753. The leading family of the 'Abhan still rules the Is. under Brit. protection.

**Qattara Depression**, area in the N. Libyan desert, covering about 7500 sq. m., and below sea level. There is a steep escarpment on its N. edge. The *Q. D.* formed the left-flank protection of the Brit. forces in the Alamein battle of 1942.

**Qena**, div. of Upper Egypt. Area 703 sq. m. Pop. 1,107,900.

**Qisara**, see QISHARA.

**Qishm**, see KISHM.

**Q-Ships**, name given in 1916 to those vessels used to decoy enemy submarines during the First World War. With them the name of (Capt. (now Adm.) Gordon Campbell, V.C., D.S.O., will always be associated. Based on the supposition that U-boats would conserve their torpedoes when faced with an unarmed merchant vessel and, instead, surface to attack with the gun, these *Q*. or mystery ships were disguised as peaceful merchantmen to cruise on the trade routes. But, with the pulling of a lever, the disguise could be cast off, guns disclosed, and fire opened instantaneously. The aim was to induce the U-boat to surface, throw open her conning tower and approach to within point-blank range. To achieve this it was generally necessary to give the appearance of abandoning ship with 'panic parties,' leaving the captain, signalman, and guns' crews hidden on board. Success demanded the highest degree of nerve and discipline. During the First World War 180 mystery ships of all sorts were fitted out but the number of U-boats for which they accounted was only eleven. Others were probably damaged. Unfortunately the first two or three *Q*-ships gave away the secret and caused the Gers. to use greater caution when more were available. With the introduction of the convoy system in 1917, the lone ship was treated with even more suspicion and *Q*-ships lost their effectiveness. A similar method of decoying U-boats was tried at the beginning of the Second World War, but the Gers. were ready for it, declined to surface, and used their torpedoes. See Rear Adm. Gordon Campbell, *My Mystery Ships*, 1928.

**Quack**, abbreviation of *quack-salver*: an unqualified medical practitioner, a seller of nostrums. *Q*. is a representation of the sound made by the duck, and conveys the idea of voluble self advertisement; 'salver' means healer. The term corresponds to the Fr. *charlatan*, from the It. *ciarlatano*, to chatter.

**Quadi**, anct. tribe of Germany, forming part of the Suevi and inhabiting what is now Moravia. After being allies of Rome, they revolted in A.D. 167, together with the Marcomanni, the Chatti, and the Sazyges; they were subdued, but revolted again in 171; they were finally subdued in 173.

**Quadragesima** (Lat., forti-th), Lat. name for the season of Lent which begins forty days from Easter, without reckoning in the Sundays. The name is also given to the first Sunday in Lent by analogy with the Sundays that precede it.

Septuagesima, Sexagesima, and Quinquagesima. From it is derived the Fr. *carême*.

**Quadrant**, instrument formerly used by navigators to determine altitudes. It consists of a brass limb, the quarter of the circumference of a circle, and is graduated to one min. The zero of measurement, or the reading of a vertical line on the limb, was carefully determined in the fixed instruments, whilst in movable instruments of this type a plumb-line was used to mark the zero while an observation was being made. There were various varieties of Qs. besides the nautical, which were known either by the names of their inventors, as the Adam's, Collins's, Godfrey's, Hadley's, Gunter's, Sutton's Q., etc., or by the purpose for which they were intended, as gunners' and surveyors' Qs., or by special names, such as the mural Q., the horodietical Q., etc. The difficulty of constructing an accurate instrument and of making observations by the Q. led to the introduction of complete circle instruments, whilst the Q. for navigating purposes has been completely superseded by the sextant (*q.v.*).

**Quadrant Electrometer**, see ELECTRICITY.

**Quadratic Equations**, see under EQUATION.

**Quadratic Surd**, see under SURDS.

**Quadrature**, in astronomy, the position of a heavenly body, in which its direction, as viewed from the earth, makes a right angle with that of another heavenly body, usually the sun. In mathematics Q. is the process by which a square is found whose area is equal to that of a given figure. The problem is, of course, solved if the number of square units in the given figure is found. The problem of Q. has been associated from early Gk. times with the circle, and many intellects have been exercised and exhausted in fruitless efforts to 'square the circle.' The method of Qs. as applied to rectilinear figures presents no difficulty, as such figures can readily be reduced to rectangles. It is not possible to solve thus completely the problem of finding the area of a figure bounded by curves; but if a curve be regarded as made up of an infinite number of straight lines, it is possible to find its area without perceptible error. For example, the circle may be regarded as a regular polygon with an infinite number of sides, and there is a certain amount of justification for the assumption that what is true of all polygons will be true of the circle likewise. Now a polygon of  $n$  sides may be divided into  $n$  equal triangles; the area of each triangle is  $\frac{1}{2}bh$ , where  $b$  = base and  $h$  = perpendicular height from base to vertex. Area of polygon, therefore, =  $\frac{1}{2}nbh$ . But  $nb$  = perimeter of polygon, that is, in the case of the circle, its circumference, while  $h$  will be the radius. Area of circle, therefore, =  $\frac{1}{2}$  circumference  $\times$  radius. The circumference, however, is  $2\pi$  times the radius,  $\pi$  being an incommensurable quantity approximately = 3.1416. The area of the circle may therefore be stated as  $\pi r^2$ . The method of Qs. in Newton's time is the same as Leibnitz's method of integration.

**Quadrilateral**, in geometry, a plane figure bounded by four straight lines. The area of a Q. may be found by dividing it into two triangles by a straight line joining opposite angular points. Taking this line as a common base, the area of the Q. may be stated as the number of square units obtained by multiplying the number of linear units in half the diagonal by the number of linear units in the sum of the offsets.

**Quadrilateral**, military term applied to four fortresses forming, as it were, the corners of a Q., and mutually supporting each other. The most famous Q. is that formed by the fortresses of Peschiera, Mantua, Verona, and Legnago, the two former on the R. Mincio, the last on the Adige.

**Quadrille**: 1. Name of a square dance of Fr. origin; four couples take part, and there are five separate and complete figures (Le Pantalon, L'Été, La Poule, La Tréaise, and Finaie), the whole forming 'a set of Qs.' It was popular in the early nineteenth century in France at the court of Napoleon I. and in 1816 was introduced to England by Lady Jersey, a leader of fashion at that period, and at once became amazingly popular. Numerous Qs. were written, the music being based on some opera or other theme popular at the time. Thus Chabrier composed a set of Qs. on themes from *Tristan*. 2. An old card game, played by four persons with a pack from which the tens, nines, and eights were removed. It superseded ombre about 1726 and was in its turn superseded by whist.

**Quadrirème** (*quattuor*, four, and *remus*, oar), anct. ship of war which had four banks of oars instead of the more usual three of the trirème (*q.v.*). It was first introduced by Dionysius of Syracuse.

**Quadron**, see MULATTO.

**Quadrumania**, obsolete order of four-handed primates invented by Cuvier to include the apes, monkeys, and lemurs, but excluding man, who was placed in the order Bimana.

**Quadruple Alliance**, formed in 1718 between England, Austria, France, and Holland, with the primary object of thwarting the ambitious schemes of Cardinal Alberoni, the Sp. minister, who was bent on regaining for Spain some of the dominions she had lost by the terms of the treaty of Utrecht. The alliance was particularly advantageous to England, as it practically deprived the Jacobites of their hope of raising a successful insurrection by the aid of foreign troops. Spain was powerless against the Q. A., and her fleet, in spite of the absence of any formal declaration of war, was destroyed by Byng in the same year off Cape Passaro. In 1834 another Q. A., of Britain, France, Portugal, and Spain, was designed to exclude Dom Miguel from the Portuguese throne.

**Quæstor**, name common to two distinct classes of officers in anct. Rome: 1. The criminal *quæstores*, or, as Maito styles them, Rom. commissioners, were a body to whom the great Legislative Assembly or Comitia, delegated its criminal juris-

diction. Maine thinks that in the earliest times a *quæstio* (commission) of this sort was appointed only to try a particular offender like the *quæstiores paricidit*, who tried all cases of parricide and murder, though later commissions were appointed periodically without waiting for occasion to arise in the occurrence of some serious crime. Finally, when a *quæstio perpetua*, or permanent commission, was appointed, Rom. criminal jurisprudence had attained to a developed classification of crimes and a regular criminal tribunal. 2. The *quæstiores classici* were officers charged with the superintendence of the *fisc* or public treasury. A special body, the military Qs., accompanied the consuls to the field, took charge of the military chest, and exercised supervision over pay, provisions, and booty.

**Quagga**, small and extinct S. African equine animal. As late as 1850 it was quite common in Cape Colony, and its extinction occurred within a few years through being killed in excessive numbers for its skin. It roamed in enormous herds on the open plains. It was from 13 to 13½ hands high, the upper body was coloured pale rufous brown, darker upon the face and neck, the stomach and legs were pure white; dark brown striping extended from the head a little beyond the shoulder. The ears and white flowing tail were more equine than asinine.

**Quaglio**, It. family which has produced sev. generations of celebrated artists: *Domenico*, 'the elder' (1723-60), an historical painter, b. at Laino. *Angelo* (1731-1815), his grandson, an architect, designer, and painter. Two of his pictures are in the Munich Art Gallery. *Domenico*, 'the younger' (1788-1837), grandson of Domenico 'the elder,' landscape and architectural painter, b. at Munich. He engraved twelve plates of architectural monuments, and pictures by him were acquired by *Lorenz*, 'the younger' (1793-1869), brother of the preceding, b. at Munich, lithographer and genre-painter. He painted a 'Tyrolean Inn,' in the Berlin National Gallery. *Simon* (1795-1878), a brother of the preceding, b. at Munich. Architect, lithographer, and theatrical painter. See E. Hora, *Die Künstlerfamilie Quaglio*, 1932.

**Quaid-i-Azam**, title of the Pakistani leader, Mohammed Ali Jinnah (q.v.).

**Quail**, or *Columinus*, small genus of gamebirds, with a remarkably extensive range. The common Q. (*C. communis*) ranges over Europe, Asia, and Africa, and has been introduced into the U.S.A. and New Zealand. Great numbers spend the winter in N. Africa; and on starting in the spring to migrate northwards the flocks are lured by Q. calls and decoys, and are caught in huge nets extended along the shores of the Mediterranean. They are dispatched alive to various markets to be fattened and killed, the flesh being highly valued. The Q. is about 7 in. long, reddish-brown in colour, throat white with a black patch at the bottom; the breast is pale chestnut, and the belly yellowish-white. The nest is a small hollow in the ground, and in it are laid about ten yellowish-white eggs

blotched with brown. The bird feeds upon grain seeds and insects. The chestnut-throated species (*C. capensis*) is found in S. Africa. Another species, *C. japonica*, occurs in Japan and China. With both the common Q. freely interbreeds. The Virginian Q. (*Oryzopsis virginianus*) belongs to the sub-family Odontophorinae, with a hooked tip to the bill.

There are two small species of Indian bush-Q., genus *Perdicula*. These are the jungle bush-Q., *P. asiatica*, and the rock bush-Q., *P. argoondah*. The general colour of the former is brown above, with pale buff shaft stripes on the back, underparts white, with black cross-bars and throat rufous chestnut with whitish

QUAIL

edges. Like the jungle species the rock bush-Q. has the upper parts barred with buff and black or grey, but the rufous on the head and throat is dull brick colour and not bordered with white. The length of each is respectively 6.4 in. and 6.5 in. They have much the same wide distribution, but while the jungle bush-Q. affects forests and jungles, the rock bush-Q. prefers the dry rocky plains or low hillsides and barren sparsely cultivated districts. Very similar in size and general appearance is the painted bush-Q., genus *Microperdix*. There are three species: *M. erythrorhyncha*, which frequents the S.W. hills of the peninsula of India; *M. blewitti*, in the Central Provs.; and *M. manipurensis*, found in the S.E. Manipur Hills and Sikkim. They are marked by a well-defined white band between the eyes and tawny underparts, the last-named being the handsomest of the genus.

**Qu'aitis**, powerful tribe of the Hadhramaut, Aden Protectorate. Their fortunes began with their success in their protracted struggle with the Kathiris in the middle of the nineteenth century. It was not until 1877 that both sides, largely through the influence of the Brit. Gov. in India, arrived at an agreement by which Mukalla and Burum were handed over to the Q. for \$300,000. The Q. bound themselves not to dispose of any of the Hadhrami territory to any person or power other than the Brit. Gov. and, in 1888, a protectorate treaty was concluded. In 1902 the sultan's old title of jemadar was abolished and he was recognised by the title of sultan. See H. Ingram, *Report on the Hadhramaut*, H.M.S.O., 1936, and *Arabia and the Isles*, 1942.

**Quakers**, see FOX, GEORGE; FRIENDS, SOCIETY OF.

**Quaking Grass, or Maiden's Hair** (*Brya*) genus of grasses with a loose panicle of short, flat pendulous spikelets. *B. media* is common in moors and pastures particularly in poor soil. *B. maxima* is often grown in gardens.

**Qualitative and Quantitative Microanalysis**, see under MICROANALYSIS.

**Qualities, Primary and Secondary** The qualities or characteristics of material bodies were differentiated by Democritus and the distinction persisted in philosophy. Primary qualities followed from the atomic structure and were mathematical, e.g. shape and size, secondary qualities, colour, heat, smell etc. were the result of action of the body on the soul or its senses. The former are inherent the latter due to reaction. The distinction forms an important basis for the dualistic theory of mind and matter, and as such was upheld by Descartes in his mechanical theory of the universe. The objective reality of matter as deduced from its primary qualities was insisted upon by both Descartes and Locke. Berkeley, however, strongly contested the point insisting that the primary and secondary qualities alike are purely subjective; there is no proof of existence outside or separate from the mind. The modern philosophy is now generally adopted. The scientific attitude however has displaced the philosophic and physics deals with qualities in their objective sense, psychology making an effort to analyse them subjectively.

**Quamash** (*Camassia esculenta*), bulbous plant of the hyacinth section of the lily family (Liliaceae) with blue and white flowers. It is native to N. America where its roots were roasted and eaten by N. Amer. Indians.

**Quamooch**, or *Ipomoea* name of several twining Mexican plants (family Convolvulaceae) with cordate leaves and red flowers grown on the pillars of greenhouses.

**Quandary Peak**, mt. of Colorado U.S.A. with a height of 14,266 ft. It is in the Park Range.

**Quantification of the Predicate** Propositions in logic were classed by Aristotle by *quality* as affirmative or negative by *quantity* as universal or particular. Quantity had reference to the subject, thus, 'All quadrupeds are animals.' Sir W. Hamilton 'quantified' the predicate thus distinguishing propositions further. The one quoted does not state whether all quadrupeds comprise all animals or not and by quantifying the predicate we write, 'All quadrupeds are some animals,' thus stating whether the whole or only part of the predicate agrees with or differs from the subject. Aristotle considered affirmative propositions to have a *particular* predicate, and thereby excluded a whole class in which both terms were universal, e.g. 'The greatest truths are the simplest truths.' The number of propositions is largely increased, but many of the processes of logic are simplified. George Bentham, *Outline of a New System of Logic* (1827) introduced the subject. Dr Morgan, Thompson, and Boole used the system. See bibliography under LOGIC.

**Quantitative Magnetism**, see under MAGNETISM.

**Quantity Surveying** The work of the quantity surveyor consists of compiling a bill of quantities, a document containing a full description of each article and the quantity required for the erection of a particular building, prepared from a set of architects' plans. A recruit to the profession has to learn a new form of mathematics termed the 'duodecimal system' adapted for more speedy assessment of superficial and cubic quantities and in the 'working up' stage and to read architects' plans and 'take off' from them that a bill of quantities may be prepared all in accordance with an established method known as the *Fourth Edition of the Standard Method of Measurement*. In addition to compiling a bill of quantities it is necessary to be able to prepare an estimate of cost and thus give such information as will assist both the architect and building owner to arrive at their final decision. When a scheme is approved and the bills of quantities prepared these are then sent out to a selected list of building contractors usually between six and twelve, and then return the contractors' quantity surveyor fills in the bill and submits to the architect his estimated cost in the form of a tender.

The profession can be described as 'the backbone of the building industry' in addition to its sound knowledge of mathematics the quantity surveyor must have a technical training in building construction with a complete knowledge of materials, and of land surveying and levelling so that he can estimate the work to be carried out on building sites. Furthermore he must be conversant with Acts of Parliament in so far as they concern building and contract law and with local and local authority by laws which vary a great deal in England. There are two distinct types of work available to the beginner, viz. that of the professional quantity surveyor and of the building contractor's quantity surveyor. In the case of the former training is usually obtained by entering a professional office as an articled pupil. This necessitates a written agreement binding the pupil for a period usually from three to five years and involving a premium. The contractor's quantity surveyor obtains his training by entering a firm of building contractors at the age of sixteen or seventeen years. A premium is not usually required, and a small salary is paid at commencement. The student usually gains the necessary technical knowledge and education by postal tuition through a course with a correspondence college specialising in training for the profession or alternatively by attending evening classes at a recognised school of building technology.

The principal professional institutes are (1) the Royal Institution of Chartered Surveyors (R.I.C.S.) Great George Street Westminster, London S.W.1 which offers membership for all grades of surveyors including estate agents but only to the

professional applicant; and (2) the Institute of Quantity Surveyors (I.Q.S.), 98 Gloucester Place, London, W.1., which represents solely the interests of quantity surveyors and offers membership (by examination) to both the professional and contractor's quantity surveyor.

**Quantity Surveyors, Institute of,** see preceding article.

**Quantock Hills,** range of coastal hills in N.W. Somersetshire, England, extending 8 m. towards Taunton. They form a series of irregular ridges from which extensive views of the Welsh hills can be obtained, and they consist chiefly of greywacke and limestone. The chief height is Willsneck, 1270 ft. At Nether Stowey, 8 m. W. of Bridgwater, there are two cottages where the poet Coleridge lived from 1797 till 1800. Much of his best poetry was written here, including *Rubia Khan, The Ancient Mariner*, and the first part of *Christabel*.

**Quantum Theory.** This theory was first proposed by Max Planck (*q.v.*) at the beginning of the present century following his investigation on 'black body' radiation (see *RADIATION*). The laws of classical dynamics had failed to account for the distribution of the radiant energy from a 'black body' between the various wave-lengths in the spectrum of the radiation. Planck made the bold, tentative assumption that the energy emitted by any 'vibrator' was parcelled out in discrete multiples of some fundamental unit or quantum of energy. Sir James Jeans has happily compared this idea with the manner in which an automatic machine can only deliver its goods in units. Such a machine will deliver a quantum of chocolate or a quantum of toffee, but it cannot deliver fractions of a bar of chocolate or of a packet of toffee. Expressed in mathematical form Planck's theory states that if  $E$  is the amount of radiated energy of wave-length  $\lambda$ , then  $E = nh\nu$ , where the symbols have the following meanings:  $\nu$  is the frequency of the radiation corresponding to the wave-length  $\lambda$ , and is equal to  $c/\lambda$ , where  $c$  is the velocity of light in *vacuo*, almost  $3 \times 10^{10}$  cm./sec.;  $n$  is any integral number, 1, 2, 3, etc.; and  $h$  is Planck's Constant. The value of  $h$  is very small—only  $6.55 \times 10^{-27}$  sec./erg. (see *ERG*). Jeans gives a very useful comparison of the magnitude of  $h$  in *The New Background of Science* (chap. v.). He points out that in the complete oscillation of the pendulum of a grandfather clock about  $66 \times 10^{20}$  times the energy of  $h$  is expended. As an example of the use of the energy formula given above, suppose we require the energy in a particle of light—a *photon*—of wave-length  $10^{-4}$  cm.; this implies a frequency of  $3 \times 10^{10}/10^{-4} = 3 \times 10^{14}$ . Hence  $E = 3 \times 10^{14} \times 6.55 \times 10^{-27} = 19.65 \times 10^{-13}$  erg. A photon of light of half this wave-length or twice the frequency would have twice this energy. It should be noticed that there is no fraction of  $h$ , which represents the minimum of energy that can be delivered—the quantum, and that  $E$  varies according to the total number  $n$  of quanta taken

into consideration. The only justification at the time for Planck's ingenious idea was an important one—it worked, but naturally this Q. T. of radiation was accepted with some hesitation, since it involved a declaration of the failure of classical dynamics to cope with the problem. Modern physics, however, has developed at an enormous rate since then, and each advance in the field of atomic physics has emphasised the importance of the Q. T. One of its earliest applications was to the phenomenon of photo-electricity (*q.v.*). The photo-electric effect shows no time lag, i.e. it begins as soon as the metallic surface is illuminated. Further the velocity of the ejected electrons depends only on the wave-length of the illuminating light, not on its intensity. These facts defy explanation by means of the wave-theory of light, but Einstein explained them by means of the Q. T. Briefly the velocity with which an electron is ejected in the photo-electric effect is given by the Q. T. equation of Einstein:  $\frac{1}{2}mv^2 = h\nu - W$ ,  $m$  being the mass of the electron,  $v$  its velocity, and  $W$  the work done in breaking loose from the surface of the metal when the latter is illuminated by

light of wave-length  $\lambda = \frac{c}{\nu}$  where  $c$  is the

velocity of light in *vacuo*. The equation shows that the kinetic energy  $\frac{1}{2}mv^2$  possessed by an electron is obtained from the energy  $h\nu$  of a light quantum.

In 1913 the theory was applied by Bohr for the calculation of the frequencies of light emitted by atoms in the gaseous state (i.e. their characteristic line spectra). To account for the stability of atoms which are made up of a positively charged nucleus and negative electrons, it appeared necessary to assume that the electrons moved at high speed around the nucleus, each atom forming, in effect, a miniature solar system. According to classical theory there was no reason why orbits of particular dimensions and energy should be more stable than others, whereas the fact that only light of particular frequencies was emitted indicated that only particular energy losses as radiation could occur. With the aid of the Q. T. Bohr produced models of atoms which explained very successfully much of the detail of the characteristic spectra, although it still remained a mystery why only certain orbits were possible. The Bohr theory was extended by Sommerfeld and others, and was applied to X-ray spectra, as well as spectra of the visible, ultra-violet, and infra-red regions. The Q. T. also proved highly successful in connection with theories on such diverse subjects as those of specific heats, electrical conduction, chemical combination, and the periodic table of the elements.

Nevertheless certain difficulties remained. In the first place it appeared impossible to explain certain characteristics of spectra unless somewhat artificial assumptions were made; in the second, although such particles as electrons and protons apparently always behaved

as particles and never as waves, radiation had perforce to be regarded sometimes as particles and sometimes as waves. In 1924 de Broglie put forward views which, when developed by Schrödinger, Heisenberg, and others, led to the new Q. T. According to this theory electrons and protons are themselves to be regarded as a wave motion. This surprising conception has been completely justified in experiments that have shown that beams of electrons or protons can give rise to diffraction effects, and so possess one of the fundamental attributes of wave motion. The new theory explains why electron orbits in atoms can have certain magnitudes and no others, and has been completely successful in problems where the older one appeared to lead to anomalies. See E. U. Condon and P. M. Morse, *Quantum Mechanics*, 1929; L. I. Frenkel, *Wave Mechanics*, 1936; L. I. Schiff, *Quantum Mechanics*, 1919; also Sir J. Jeans, *The Mysterious Universe*, 1931, and *The New Background of Science*, 1934; and P. Karlson, *You and the Universe*, 1934.

**Quantz, Johann Joachim** (1697-1773), Ger. flautist and composer, b. at Oberscheden in Hanover. He made a tour of the different European caps., charming all hearers with his dexterity of performance. He secured the patronage of Frederick the Great, whom he had instructed when Crown Prince. He composed 300 flute concertos and a number of smaller pieces: his *Guide to the Flute* has been universally popular. See studies by A. Quantz, 1877, and A. Raskin, 1923.

**Quanza**, see COANZA.

**Quarantine** (Fr. *quarantaine*, period of forty days), period during which a ship suspected of having cases of infectious disease on board is detained from communication with the shore. As originally instituted Q. was practised for the plague, and later for yellow fever and Asiatic cholera. The first Act of Parliament concerning Q. in England was passed in 1710, but Q. in the original sense is abolished now in England, America, and sev. European states, though the name is still applied to the modern detention methods which have superseded it. In England the Public Health Act, 1896, vested Q. powers in the Ministry of Health. The initial steps in detaining a vessel may be taken by officers of the customs, coast-guard, or Board of Trade. All persons on board the suspected ship are examined by the medical officer of the port; those infected are removed, if possible, to a hospital; those in immediate attendance on the infected cases are detained for forty-eight hours; and the ship is then thoroughly disinfected.

The importation into Great Britain of certain animals, once any necessary licence has been obtained from the Board of Trade, is subject to various Q. regulations outlined in a form issued by the Ministry of Agriculture and Fisheries (Animal Health Div.). In the case of dogs and cats a licence is required, under the Importation of Dogs and Cats Order

of 1928, to authorise the landing of the animal for Q. in Great Britain. Every such licence requires the detention and isolation of the animal for six months after landing on premises approved by the minister.

**Quaregnon**, tn. in Hainaut, Belgium, 4 m. W. of Mons. It has important coal-mines and quarries of limestone. Chief industries are the production of coke, iron, steel, copper, and engineering. Pop. 17,800.

**Quare impedit**. When an eccles. benefice becomes vacant by the death, cession, etc., of the incumbent, unless the patron present his clerk, that is, a clergyman, to the bishop of the diocese for institution within six calendar months, the right will lapse to the bishop, who may collate to the vacant benefice. But if a presentation be made within this time and the bishop refuse to institute, the patron may obtain redress for this interference with his right of patronage by applying for a writ of Q. I. ('why he hinders').

**Quarenghi, Giacomo** (1744-1817), It. painter and architect, b. at Valle Imagna, Bergamo. He migrated to Russia, where he exercised a great influence over the development of architectural art.

**Quaritch, Bernard** (1819-99), Eng. bookseller and publisher, b. in Worlby, Saxony. He came to London in 1842, and after working for a few years under Bohn, the publisher, set up for himself in a small second-hand business off Leicester Square. He began purchasing rare books in 1858, and in 1873 pub. a catalogue of the earliest productions of the printing-press of all countries, entitled *Bibliotheca Xylographica, Typographica et Palaeographica*. He moved to larger premises in Piccadilly, and was a bidder for all the rare eds. of books at sales, and gradually developed the largest trade in old books in the world. The various catalogues pub. by him are of great bibliographical value.

**Quarles, Francis** (1592-1614), Eng. poet, b. at Romford, Essex, and educated at Christ's College, Cambridge. In 1613 he became cup-bearer to Princess Elizabeth of Bohemia, and was later appointed secretary to Ussher, archbishop of Armagh, Ireland. About 1633 he returned to England and began preparing his *Emblemes* (1635), the work by which he is best known; they consist of paraphrases from passages of Scripture and the Christian Fathers, concluding with epigrams. In 1639 Q. was made chronologer of the city of London. Other works are *Hadassa* (1621); *Stons Sonets sung by Solomon and periphra's'd* (1625); *Hieroglyphikes of the Life of Man* (1638); *Enchiridion* (1610-41), etc. A complete ed. of Q.'s works was pub. by A. B. Grosart (1880-81).

**Quarrel of Ancients and Moderns**, see ANCIENTS AND MODERNS.

**Quarry and Quarrying** (O.F. *quarriere*; Low Lat. *quadraria*; Lat. *quadratus*, square), place from which stone is excavated; the process of excavating. The term 'quarry' is susceptible of somewhat loose restriction and extension; it is usually but not always restricted to workings in the open air, as distinguished

from mines; it is sometimes used in connection with material not directly used for construction of buildings, e.g. chalk. The suitability of a stone for quarrying depends on (1) its quality or value; (2) cheap and ready conveyance to a large market; and (3) its inclination and depth below the surface. The principal deposits worked by quarrying are sandstones, limestones, ironstones, slates, granite, etc. The sandstones are classified as flagstones, freestones, and tilestones. A thick deposit of sandstone may provide all three classes of stone at different levels or 'lifts.' (The mechanised underground quarries at Bath produce about a quarter of Britain's building stone.) Deposits that outcrop on the surface are best won by open-pit work or quarries, while thick or deep deposits are worked by underground methods. In open-pit work it is sometimes necessary to remove the soil or waste rock over the valuable stone before excavation can start.

In most rocks there are planes or joints along which the material will split or part readily. Even in a massive rock like granite there are vertical or highly inclined 'joints' which extend for long distances. Sedimentary rocks have bedding planes along which the stone can be readily divided. To 'cleave' means to split into laminae or leaves. Slate is the best-known example of a cleaved rock. It was deposited originally as a clayey bed which in time hardened into shale. Later this shale was submitted to immenso lateral or side pressure, and its tiny particles rearranged so as to give the rock a slaty cleavage. The cleavage-planes are perpendicular to the direction of pressure. The best slates are obtained from various parts of N. Wales. The quarries are mostly 'open,' but sometimes the slate occurs at some depth which necessitates underground methods to extract it. The slate is cut into large blocks, which are divided by splitting into slabs about 3 in. thick. These go to the sawing tables where they are cut to dimensions suitable for fine splitting, which reduces them to thin sheets about one-seventh of an inch in thickness. This operation may be performed by hand or the slabs can be split, sawn into shape, and planed smooth by machinery. A slate quarry provides roofing-slates and thick slabs used for tombstones, cisterns, and billiard-tables.

The nature of the deposit and general conditions determine the method of excavation and machinery to be used. Small quarries still employ manual methods, such as pick, shovel, and wheelbarrow, with carts and lorries. The stone is excavated by drilling and blasting with gelignite. Large quarries may employ power shovels, bulldozers, drag-line or bucket excavators, and locomotive cranes on tracks. The power shovel, which is employed extensively, is mounted on tread tractors and operated by electricity or by a Diesel engine. The shovel can handle from 1 to 5 cub. yds., depending on its capacity and the material quarried. A machine mounted on cater-

pillar tracks with a cutting chain, known as the arc-shearer, can cut the stone horizontally or vertically. Automatic jacks lift the machine for top or over-cutting. Electric cranes are then used to remove the blocks of stone, which are swung on to trucks or wagons. A rock planer is sometimes used in limestone quarries which 'shaves' or planes off portions of the stone at the rate of 50 tons per hour, with only two men in attendance. Mechanical picks worked by compressed air or electricity are also used extensively. The excavated stone is then hauled to market or to the screening, crushing, or refining plant by lorry, wagon, or road locomotive.

**Quart.** Eng. measure of capacity, being equal to two imperial pints and the fourth part of a gallon. In the old measures a Q. of beer contained 70.5 cub. in.; a Q. of wine 57.75 cub. in.; and a Q. 67.2 cub. in. A Q. of water contains 69.3185 cub. in. and weighs 2½ lb. avoirdupois. It is equal to 1.1359 litres. See WEIGHTS AND MEASURES.

**Quarter Days**, appointed for the payment of house and land rents, and for the incoming and outgoing of tenants, occur on March 25 (Lady Day), June 24 (Midsummer Day), Sept. 29 (Michaelmas Day), and Dec. 25 (Christmas Day).

**Quarter-deck**, originally a smaller deck placed above the half-deck and covering about a quarter of the vessel. It is now used for that part of the spar deck extending between the poop and the mainmast, used by officers only and in passenger vessels by first-class passengers.

**Quartering**, see under HERALDRY.

**'Quarterly Review'**, Tory review of essays, politics, and general literature, estab. in 1809 by the celebrated publisher John Murray, as a competitor of the Whig *Edinburgh Review*. The first editor was Wm. Gifford (q.v.) who held that post till 1824, and one of its most prolific early contributors was Robert Southey. Other celebrated contributors were Scott, John Taylor Coleridge, a barrister, who became editor for a short while, Wm. Hazlitt, J. G. Lockhart (Scott's son-in-law, who succeeded Coleridge as editor), Canning, Gladstone, Salisbury, Ruskin, Borrow, Dean Stanley, Layard, Wiltshire, Cromer H. A. L. Fisher, Sir F. Pollock, Sir James Fraser, and others. Gifford was also a contributor; but the critiques and satirical poems which appeared in the *Q. R.* while he was editor were marred, like his attacks on Hazlitt, Leigh Hunt, and Charles Lamb, by their intention to annihilate every one who held views contrary to Peel, Canning, or other Tory ministers of the day. Subsequent editors included Whitwell Elwin, Sir Wm. Smith (of dictionary fame), R. E. Prothero (afterwards Lord Ernle), Sir George Prothero, and Sir John Murray, who died in 1928 and was succeeded in the editorship by his son, the present Sir John Murray. It was in the pages of the *Q. R.*, in 1831, that the party was first called Conservative, and Lord Baldwin, when Prime Minister, once called it the 'godfather of the Conservative party.' It still continues its

literary and political career, but age has perhaps mellowed its auct. 'savage and tartarly' methods which Byron said helped to kill Keats.

**Quartermaster.** In Brit. Army the officer in charge of all rations, supplies, and stores in a battalion or corresponding unit. He is not responsible for pay, weapons, or ammunition. In the navy a petty officer who is concerned with stowage, steering, soundings, etc., of the ship.

**Quartermaster Corps.**—In U.S. Army perform the same function as the Brit. R.A.S.C., R.E.M.E., and R.A.O.C. in so far as the last is not solely concerned with the supply and repair of weapons.

**Quartermaster-General.**—The senior administrative officer in charge of army supplies. The head of the 'Q' branch of the staff, who is represented at all headquarters, but whose deputy at lower level is also the deputy of the adjutant-general (q.v.).

**Quarten,** name used for the fourth part of certain Brit. measures. Thus a quarter of a pint in liquid measure and a quarter of a peck in dry measure are called a Q., as is also a 4-lb. loaf.

**Quarter Sessions,** see COUNTY SESSIONS; **SESSIONS OF THE PEACE, JUSTICES OF THE PEACE.**

**Quarterstaff,** stout pole from 6 to 8 ft. long and 1½ in. in diameter. It was grasped by one hand in the middle and by the other midway between the middle and end; it was much used in England by the peasantry as a weapon, and was manipulated by the movements of the lower hand.

**Quartet,** musical composition in four parts, vocal or instrumental, of which each part is essential. It originated with Haydn, was developed by Mozart and Beethoven; the latter perfected the art of part-writing. Qs. for stringed instruments are written generally in sonata form, and arranged for viola, violoncello, and two violins (string Q.), or for violin, viola, violoncello, and pianoforte (piano-forte Q.). Vocal Qs. are a great feature in opera and oratorio works written up to the time of Wagner.

**Quarto:** 1. Sheet of paper so folded as to make four leaves, or a book printed on paper so folded; usually abbreviated to 4to. The usual varieties are Crown Q. (10 by 7½ in.), Royal Q. (12½ by 10 in.), and Fool-cap Q. (8½ by 6½ in.). 2. In Portugal a liquid measure approximating to 3½ litres. 3. In Italy a dry measure, approximately just over 2 bushels.

**Quartz** (silica, silicic acid, SiO<sub>2</sub>), most abundant mineral in the crust of the earth. It has a vitreous lustre, cannot be scratched with a knife, but scratches glass (H. = 7); it is insoluble in HCl, H<sub>2</sub>SO<sub>4</sub>, or HNO<sub>3</sub>; it may be fused by the blowpipe, exhibits no cleavage, but chips easily with conchoidal fracture. No alteration is shown under the microscope, and it remains colourless except for liquid inclusions; refractive index low; polarisation tint pure but rather weak. Q. occurs as an ingredient of acid igneous rocks, such as granite, and of gneiss; being soluble in natural waters, it is found deposited in

veins in rocks, especially Archean and Palaeozoic; conglomerates and sandstones are usually chiefly composed of Q., and its crystals line most metamorphic lodes. The crystals are mostly hexagonal prisms terminated by hexagonal pyramids, being mostly combined growths of two or more simple crystals; when highly heated and allowed slowly to cool, they are oppositely electrified at alternate edges and corners. If a thin strip of crystal cut at right angles to the longitudinal axis is placed between vector prisms, the plane of polarisation is rotated. Q. occurs in three species. *Q. proper* (rock crystal, amethyst, rose Q., citrine, cairngorm, morion, occidental sapphire, occidental emerald, milky Q., prase, ferruginous Q.); *chalcedony* (chrysoprase, sard, carnelian, agate, onyx, sardonyx, cat's eye, plasma, flint); *jasper* (common, Egyptian, and ribbon; heliotrope and lydian stone). The colour varies with the impurities; blue, green, yellow, purple, pink, and brown; when good they are used instead of precious stones. Rock-crystal (sp. gr. 2.65–2.8) is used for vases and other ornaments and for spectacle glasses. Ornamental forms contain pyrites, silver, or gold, in spangles, needles, or leaves; or hair-like threads of hornblende, asbestos, iron oxide, or the oxides of titanium or manganese. Q. in the oxy-hydrogen flame can be drawn into threads of great tensile strength, 50 to 70 tons per sq. in. of section; these are used for torsion balances and galvanometers. They alter very little with heat and do not crack with sudden change of temp.; on account of this, fused Q. is a substitute for glass in some scientific instruments, such as thermometers. See also CAIRNGORM STONE.

**Quartz Crystal Oscillators.** Quartz is a mineral of crystalline structure and is found naturally in various parts of the world, especially in Brazil. When thin plates are cut along specific axes of a crystal they exhibit a piezo-electric effect (q.v.). This property is also possessed by the mineral tourmaline which is akin to quartz in its applications to radio communication. The piezo-electric effect becomes apparent when a quartz plate is placed in an electric field when it is found to undergo mechanical deformation. Conversely if the plate is compressed a potential difference will appear between its faces.

Like a tuning fork, the natural resonance frequency of a crystal plate depends upon its physical dimensions, and this property is utilised, for example, to control the frequency of a valve oscillator within fine limits. Due to its piezo-electric effect, the crystal behaves like a tuned circuit having a very sharp response and as such can, in a suitable oscillator, replace the usual inductance and condenser combination. Such an oscillator will run at a frequency determined by the controlling crystal which, because of its sharply tuned characteristic, can hold the frequency constant over wide ranges of other circuit variations.

Crystals having fundamental frequencies up to some 15 megacycles can be produced easily, and higher frequencies,

using tourmaline, have been made, but are expensive. Furthermore above this frequency the plate becomes extremely thin and fragile and its power handling capacity is very small. It is more customary therefore, when frequencies in excess of 15 megacycles are needed, to employ a low frequency crystal oscillator followed by multiplier stages.

Plates of quartz can be cut from the parent crystal in sev. ways which are

DIAGRAM OF SIMPLE CRYSTAL CONTROLLED OSCILLATOR CIRCUIT USING TRIODE VALVE  
1, crystal plate, 2, circuit tuned to output frequency, 3, grid leak providing bias.

usually referred to four axes mutually at right angles, namely, X, Y, and Z where the last named is along the length of the crystal. Simple plates are often referred to as 'X cut' or 'Y cut.' Plates can be cut at angles to these main axes, having improved performance in output and temp. coefficient, and such cuts as 'AT,' 'BT,' 'CT,' etc., are made, each accentuating some particular property. 'AT' cut plates, for example, possess a better temp. coefficient and greater harmonic output than either 'X' or 'Y' cut.

Since crystals can be used to simulate electrical tuned circuits of both parallel and series types they have another important application in electric filter design. Their sharp response enables filter circuits to be included in the intermediate frequency (I.F.) amplifiers or communications receivers to give responses of as narrow as a few cycles. In multi-channel carrier telephony crystal filters are widely used and they can be employed as electro-mechanical transducers for supersonic work and echo-sounders.

**Quartz Glass,** or silica glass, is fused quartz that has been allowed to cool to a vitreous, amorphous mass. It is widely used for gas globes, scientific apparatus, etc., since it has a small coefficient of expansion and may therefore be quickly heated or cooled without breaking. Unlike ordinary glass, it is transparent to the ultra-violet rays. The pioneer in its use was W. A. Shonstone, F.R.S.

**Quartz Porphyry,** see PORPHYRY.

**Quartz Rock,** or **Quartzite,** metamorphic rock of sedimentary origin, found most abundantly in the oldest geological strata. It forms int. masses, and then shows evidence of crushing and recrystallisation. As *quartz schist* it exhibits a foliated

structure. It is white, grey, yellow, or red; largely found as an infiltrated constituent of sandstone; felspar, mica, chlorite, and iron oxide are often its impurities. It is resistant to weathering, hard, smooth, and vitreous, insoluble in acids, and exhibits a splintery fracture. Under the microscope the grains show apparent fusion, but the structure is crystalline, and rock-crystals are often developed in it. In veins it is usually metalliferous, containing pyrites and gold.

**Quasimodo Sunday,** see LOW SUNDAY.

**Quassia,** name given to two distinct species of tree. *Q. amara* is a native of Guiana, with curious winged stalks to the leaves and large terminal racemes of bright scarlet flowers, sometimes grown in the stovehouse. The Jamaica *Q.* (*Picramnia excelsa*) yields 'Q. chips,' extracts of which have medicinal uses.

**Quaternary,** or **Post-tertiary,** geological period from the Tertiary to the present day. It consists of the Pleistocene, containing many extinct mammals, and the Recent, with only a few, both divisions being characterised by molluscs not yet extinct. The deposits are sand and shingle, alluvium, river gravels, brickearth, and clay-with-flints. The ice sheet (see GLACIAL PERIOD) extended S. to mid Europe and mid N. America, driving before it animals and plants, so that just N. of the Mediterranean there existed Tundra (*q.v.*), there were successive glacial advances and retreats, and the ice then retreated gradually to its present position, the climate becoming milder. The evidence beyond fossils include moraines, raised beaches, erratic blocks, sands and gravels with lacustrine deposits, boulder clay or till, polished or striated rocks, and particularly by the skeletal remains, tools, and art of early man. In Britain the correlation of human cultures and the glacial phenomena has received much attention by archaeologists who have based their work on researches undertaken in Sweden, the Alps, France, and Spain.

**Quaternions.** The subject is difficult to explain in a short article and the brief exposition which follows must be regarded as a mere outline of a few of the more elementary principles. Starting with a vector, this can be defined as the representative of transference through a given distance in a given direction, and the transference from *A* to *B* is represented by *a*, the transference from *B* to *A* is represented by  $-a$ . If the line *AB* is taken as *a* units in length the unit vector along *AB* being denoted by *i*, the vector along *AB* is *ai*, and the length of the line is termed the *tensor* of the vector—a name given to it by Sir Wm. Rowan Hamilton, the founder of the science of *Q.* more than a century ago. By means of vector addition and subtraction many geometrical problems are easily solved without depending on previous propositions, as in Euclid's *Elements of Geometry*. The subject becomes more complicated when we deal with vector multiplication and division, the term 'multiplying into' is meant that the first written symbol in a sequence is the operator and the second is operated

on, so that  $\alpha\beta$  denotes the result of  $\alpha$  operating on  $\beta$ . To explain this symbolism take two axes  $Ox$  and  $Oy$  at right angles to each other,  $Ox$  being drawn to the right and  $Oy$  vertically upwards, and imagine a third axis  $Oz$  drawn at right angles to the plane of the other two, that is, at right angles to the plane of the paper. Vectors measured in the directions  $Ox$ ,  $Oy$ ,  $Oz$  are positive, and those measured in the directions  $xO$ ,  $yO$ ,  $zO$  are negative. The usual convention about rotation is adopted, that is, it is positive if anti-clockwise and negative if clockwise. Hence the positive direction of rotation is from  $y$  to  $z$ ,  $z$  to  $x$ , and  $x$  to  $y$ , and the negative direction is from  $z$  to  $y$ ,  $x$  to  $z$ , and  $y$  to  $x$ . Let  $i$ ,  $j$ ,  $k$  be unit vectors along the axes  $Ox$ ,  $Oy$ ,  $Oz$ , respectively, then by definition  $i$  is the turning of  $j$  through a right angle in the plane perpendicular to  $i$ , so that  $ij = -k$ . In the same way  $jk = -i$ , and so on. The associative law of multiplication is retained, that is, it is indifferent in what way operations are grouped so long as the order remains unchanged, so that  $ijk = -1$ , etc. The commutative law of multiplication assumed in ordinary algebra is inapplicable, so that  $ij$  is not the same as  $ji$ . Actually  $ij = k$  but  $ji = -k$ , so that  $ij = -ji$ . From this it is easy to deduce the following:  $iji = iij = i^2j$ . But  $iji = ik = -j$ , and hence  $i^2 = -1$ , or the square of unit vector along  $Ox$  (and as  $Ox$  may have any direction it is possible to generalise) or along any direction is  $-1$ . This simply informs us that the repetition of turning through a right angle reverses a vector. From the preceding the following are obvious:

$$\begin{aligned} ij &= k = -ji & ki &= j = -ik \\ jk &= i = -kj & ii &= jj = kk = -1 \end{aligned}$$

In the case of vectors which are not at right angles let  $OA$  and  $OB$  be unit vectors  $\alpha$  and  $\beta$  respectively, and let the angle  $AOB$  be  $\theta$ . Let  $\epsilon$  be unit vector perpendicular to the plane  $BOA$ , then it can be shown that  $\alpha\beta = -\cos\theta + \epsilon\sin\theta$  and also that  $\beta\alpha = \cos\theta + \epsilon\sin\theta$ . If  $\alpha$  and  $\beta$  are not unit vectors but contain  $T_\alpha$  and  $T_\beta$  units, respectively, the above expressions become  $\alpha\beta = T_\alpha T_\beta (-\cos\theta + \epsilon\sin\theta)$  and  $\beta\alpha = \frac{T_\beta}{T_\alpha} (\cos\theta + \epsilon\sin\theta)$ . The product or quotient of two vectors  $\alpha$  and  $\beta$  is seen to consist of two parts—a numerical quantity  $-T_\alpha T_\beta \cos\theta$  or  $\frac{T_\beta}{T_\alpha} (\cos\theta)$ , and a vector portion,  $T_\alpha T_\beta \epsilon \sin\theta$ , or  $\frac{T_\beta}{T_\alpha} \epsilon \sin\theta$ . Hamilton called the first of these the scalar part and the latter the vector part.  $\beta\alpha$  or  $\cos\theta + \epsilon\sin\theta$  as an operator turns  $\alpha$  through the angle  $\theta$  and is known as the versor through the angle  $\theta$ . If  $\theta$  is  $90^\circ$  it is obvious that results similar to those obtained previously for vectors at right angles follow. The method of Q. is of great value in geometrical and dynamical problems, and has in part come into general use among physicists and in the problems of engineering. See Sir

W. R. Hamilton, *Lectures on Quaternions*, 1853; E. B. Wilson, *Vector Analysis*, 1901 (expansion of *The Elements of Vector Analysis*, by J. W. Gibbs); P. Kelland and P. G. Tait, *Introduction to Quaternions*, 1904; and J. B. Shaw, *Vector Calculus*, 1922.

Quatorzain, poem of fourteen rhymed iambic pentameters, divided into three quatrains of alternate rhymes, and ending with a rhymed couplet.

Quatrain, four rhymed lines which may be of any length, but linked by a unity of thought, as, for example, in an epigram, for which the Q. is often used.

Quatre-Bras, vil. of Belgium in S. Brabant, situated about 10 m. from Waterloo. It was the scene of a battle on June 16, 1815, between the Brit. under Wellington and the Fr. under Ney, when the latter was repulsed. Simultaneously Napoleon was attacking Blücher at Ligny as part of the plan to separate and destroy in detail the allied Brit. and Prussian forces. A bronze lion was erected here to the memory of the duke of Brunswick in 1890.

Quatrefages de Bréau, Jean Louis Armand de (1810-92), Fr. naturalist, b. at Berthezème (Gard), the son of a farmer. Having taken his M.D. and D.Sc. degrees at Strasbourg, he accepted, in 1833, the chair of zoology at Toulouse, but in 1840 was drawn to Paris, where he eked out a livelihood by illustration and also by writing articles, as, for example, that 'sur les caractères zoologiques des rongeurs,' for the *Revue des deux mondes*. In 1855, after lecturing for five years at the Lycée Napoléon, he was appointed to the chair of anatomy and ethnology at the Musée d'Histoire Naturelle. Among his scientific pubs. may be cited his *Charles Darwin et ses précurseurs français* (1870), in which he opposes the evolutionists; *Crania ethnica* (1875-82), in which Dr. Hany was his collaborator; and *Histoire générale des races humaines* (1886-89), a valuable contribution to anthropology. Eng. trans. of his works include *Metamorphoses of Man and the Lower Animals* (1864); *The Prussian Race* (1872); *The Human Species* (1879); and *The Pygmies* (1895).

Quatrefoil, in architecture an ornament used in tracery, etc., consisting of four 'leaves' somewhat similar to the four-leaved clover. It is also used in heraldry.

Quattrocento (It. 400, contraction for 1400, cf. Cinquecento), term applied to the It. literature and art of the fifteenth century. Artists of that period, who are called Quattrocentists, include Donatello, Ghirlandajo, Brunelleschi, and Fra Lippo Lippi.

Quaver, musical note and measure of time, equal to half a crochet or the eighth of a semibreve. In time-signatures it is symbolised by the figure 8: e.g. 3-8 indicates bar-lengths of three Qs.

Queanbeyan, tn. of New S. Wales, Australia, in Murray co., situated on the Murrumbidgee R., 55 m. S.W. by S. of Goulburn. It is the centre of an agric. and mining dist., producing copper, lead, iron, silver, gold, etc., Pop. 5000.

Quebec, the largest prov. of Canada,

bounded on the N. by Hudson Strait (the boundary was extended in 1912 so as to include the dist. of Ungava), on the W. by the R. Ottawa, and on the S. by the U.S.A. and New Brunswick. From 1535 to 1763 it was known as New France or Canada; until 1790 as the prov. of Q.; until 1846 as Lower Canada; and in 1867 became once more known as the prov. of Q. On the E. the prov. has a coastline of 325 m. on the Atlantic, and covers in its northward extension from the St. Lawrence and Ottawa Rs. to Labrador and the Hudson Strait over 17° of lat. and an area (as amended by the Labrador Boundary

prin. are the St. John, the Mistassini, and the Abitibi on the N., and the Temiscouata, the Memphremagog, and the Mégantic on the S. of the St. Lawrence. The climate is more severe than that of Ontario, but owing to the dryness of the air it is unquestionably healthy, and has been found beneficial for consumptives; There are two sanatoria for consumption, one at St. Agathe, the other at Lake Edward. The soil is very rich, and the prin. crops grown include wheat, barley, oats, rye, maize, potatoes, hay, clover, turnips, beet, and alfalfa; grapes, tomatoes, apples, plums, and other fruits

*Aluminium Company of Canada*

**SHI'NSHAW, SAGUENAY RIVER, QUEBEC: THE GREATEST HYDRO-ELECTRIC DEVELOPMENT IN CANADA**

No. 2 powerhouse and headblock, 875 feet long, houses twelve generators with a total capacity of 1,200,000 h.p.

Award) of 591,960 sq. m. (523,860 sq. m. land and 71,000 sq. m. water). Of this area 351,760 sq. m. represent the ter. of Ungava, annexed under the Quebec Boundaries Extension Act, 1912. Anticosti and the Magdalen Isles in the gulf of St. Lawrence are attached to Q. The surface of the prov. is diversified: there are vast stretches of forest, many rivers and lakes, and much agric. land. Q. belongs almost entirely to the basin of the St. Lawrence; the two prin. ranges of mts. run parallel with the course of the riv., S.W. to N.E., the Notre Dame Mts. being on the S. and the Laurentian Mts. on the N. In addition to the St. Lawrence itself, the prin. rivs. are its tribs., the Ottawa (forming for much of its course the boundary between Ontario and Q.), the St. Maurice, and the Saguenay on the l. b., and the Richelieu, the St. Francis, and the Chaudière on the r. b. There are a large number of lakes, of which the

are also grown, especially in the E. Most farmers own their farms, and the outstanding crops grown are hay, oats, and potatoes. In 1947 the total area under cultivation was 6,390,100 ac., and the value of the crops was \$162,410,000. Throughout the prov. mixed farming is a general practice. The rearing of livestock is also carried on, and the raising of beef cattle is a business of considerable importance in the E. townships. Dairying is one of the most important industries, dairy products being valued at \$153,651,000. The butter of Q. is internationally renowned for its flavour; the value of agric. capital in 1942 was \$1,148,000,000. The fisheries of the prov. are very important, especially along the St. Lawrence; their value in 1942 was \$4,194,000 (the total for the dominion being \$75,000,000). The prin. fish are cod, mackerel, lobsters, and salmon. The mineral deposits of Q., particularly those of asbestos, have long been

known for their quality and extent, while deposits of copper, gold, and zinc have been developed in Rouyn and the neighbouring townships in the W. part of the prov. In 1946 a titanium ore deposit was discovered on the shores of Lake Tio. The asbestos deposits, which, geologically stated, occur in altered peridotite in S.E. Q., are the most productive in the world. The most important deposits are those at Black Lake, Thetford, Robertsonville, E. Broughton, and Danville. Numerous plants manufacture asbestos products, including asbestos paper and millboard, roofing and building materials, pipe insulation and insulating sheets and blocks, and packing for steam, oil, and hydraulic operations. In 1946 asbestos production (\$24,291,000) reached its peak and exceeded that of gold (\$21,544,000) in value for the first time since 1930. The prov. offers an attractive diversity of geological formation, including the Keweenaw, Laurentian (see LAURENTIAN ROCKS), and Huronian, containing, besides asbestos and copper, gold, silver, lead, nickel, iron, zinc, phosphate, mica, and granite. There are many millions of tons of iron magnetite sands containing a high percentage of iron, along the N. shore of the St. Lawrence at Morle, Mingan, Natashquan, and other places in Saguenay co. There are a number of bog iron ore deposits in the St. Lawrence valley, remarkably free from sulphur and phosphorus, and iron ore deposits also exist along the Gatineau R. in Hull township, near Ottawa. The value of mineral production in 1946 and 1947 was \$92,213,636 and \$110,627,000 respectively. There are over 264,000 sq. m. of forests (including forests leased, 78,000 sq. m., timber lands not leased, 15,000 sq. m., freehold forest, 26,600 sq. m., township forest reserves, 2700 sq. m., wood lots under location tickets, 1000 sq. m.). The forest service of the Dept. of Lands and Forests administers the lumber lands but forest protection is under a separate organisation. Q. produces more than half of the Canadian output of pulp and paper. In 1947 over 3,750,000 tons of pulp and 3,099,000 tons of paper were produced, gross value \$346,120,000. There were 1768 fur farms in Q. in 1946, fur production for 1945-47 being valued at nearly \$4,000,000. Water power is very important turbine installations producing over 5,800,000 h.p. in 1948. In 1944 the most important plants and distribution systems were taken over by the Q. Hydro electric Commission.

There are two distinct systems of education in Q., in each of which religion occupies a prominent position, i.e. the Protestant and the Roman Catholic systems. In the former the curriculum and the general system of education are similar to those in the other provs., except that the highest grade is Grade XII from which students are matriculated to McGill Univ. and Bishop's College, the two Protestant English-speaking univs. In the Roman Catholic schools, mainly French-speaking, the administration is in the hands of the Catholic Committee of the Council of

Public Instruction, under a Fr. secretary. There are four univs. McGill Univ. (Montreal), founded in 1821, and Bishop's College (Lennoxville), both Protestant; Laval Univ. (Q. city), founded in 1852, and Montreal Univ., opened in 1876 as a branch of Laval and granted autonomy in 1919. The Polytechnic School of Montreal was founded in 1873. The Protestant univs. have over 9700 students and the Catholic over 20,000. Secondary education is given in forty-two classical colleges for Catholics, and in three colleges for modern secondary education, with over 17,000 students. The high schools of both denominations are included with primary education. The primary schools include 8800 Catholic schools (543,000 pupils) and 534 Protestant schools (67,000 pupils). The entire primary school organisation in Q. is under the immediate control of the superintendent of public education, who is under the prov. secretary. More attention is given to-day to education that has a direct bearing on industry and commerce. The ordinary schools, those for primary, secondary, and superior education, are augmented by a number of special schools for giving instruction in agriculture, forestry, household science, domestic handicrafts, furniture-making, graphic arts, textiles, social service, music, and dramatic art. These come under a dept. of social welfare and youth, recently created to supervise social policies and to aid youth in preparing for its future by means of technical education. Large gov. grants are made to technical schools in Montreal, Quebec city, Three Rivers, Hull, Lacune, Sherbrooke, Shawinigan Falls, and Beauportville, so that scientific and practical training may be given to apprentices, journeymen, foremen, clerks, salesmen and others, following an industrial and commercial life. These special schools mark a departure from the concentration on classical education which for long dominated education in Q. and they reflect also a response to changing social and economic conditions among which not the least important is the increase of the prov.'s industrial pct. during the Second World War by the requirements of labour in factories in Montreal Q. city, and other cities.

Q. shared in the remarkable manufacturing progress of Canada after the First World War, including sugar, mineral and manufactured products. The pulp and paper mills are the most important manufacturing unit in the prov. Steel and lumber production is increasing, as also is the output of textile, stock clothing and furniture factories. The industrial structure, long based on half a dozen main industries, has been enlarged to include the manufacture of many new products. Next to pulp and paper the leading industries are non-ferrous metal smelting and refining, chemical products, cotton yarn and cloth, clothing, railroad rolling stock, shipbuilding, electrical apparatus, brass and copper goods, aircraft, butter and cheese, meat packing, cigars and cigarettes and machinery. The pulp and

are the cap., Q. (for which see separate article), pop. 150,700; Montreal, the commercial metropolis, 903,000; Verdun, 67,300; Three Rivers, 42,000; Sherbrooke, 36,000; Hull, 33,000. The prov. gov. is in the hands of a lieutenant-governor, assisted by a legislative council of twenty-four members appointed for life, and a legislative assembly of ninety-two members elected for five years; twenty-four senators and sixty-five members of the House of Commons represent the prov. in the Dominion Parliament. Women were enfranchised in 1940. The pop. in 1941 was 3,331,882 (estimated pop. in 1948, 3,792,000), of which the majority were of Fr. descent (Brit. born, 91,900). According to religious beliefs 2,894,600 were Rom. Catholics; 162,000 Anglicans; 100,000 United Church; 65,700 Jews. For list, and details of gov. of the prov., see CANADA.

See B. Willson, *Quebec, the Laurentian Province*, 1913; J. C. Sutherland, *The Province of Quebec*, 1932; A. L. Burt, *The Old Province of Quebec*, 1934; R. Rumbly, *Histoire de la province de Québec* (16 vols), 1940-45; W. P. Percival, *The Lure of Quebec*, 1941; E. C. Hughes, *French Canada in Transition*, 1943; S. B. Ryerson, *French Canada*, 1914; and gov. reports. See also CANADA, Bibliography.

Quebec (Quebec City), the cap. of the prov. of that name, and formerly cap. of Canada, is situated on the l. b. of the St. Lawrence, at the mouth of the St. Charles R., 180 m. N.E. of Montreal. It is picturesque situated, occupying a promontory between the two rvs., its citadel crowning the precipitous front of Cape Diamond, and is divided into two sections, an upper and a lower tn., the upper built entirely on the cliff, the lower spread out on the littoral surrounding Cape Diamond and up the valley of the St. Charles R. The former is the residential, the latter the business portion of the city. The lower tn. is characterised by winding, steep, and narrow streets where may still be seen the strong stone houses built before the time of Wolfe. Q. occupies the most important military position in Canada and its citadel has been termed the Gibraltar of Canada. By the beauty and number of its monuments and sites, by its old houses of an archaic style of architecture, by the absence of order in the planning of its ensemble, which lends it the appearance of some of the oldest cities of Europe, the city of Q., more than any other in America, has kept its old Fr. aspect and remained a paradox for the lovers of hist. and poetry. To the S.W. are situated the Plains of Abraham, where a monument has been erected to Gen. Wolfe. The Plains of Abraham are situated in what is called the National Battlefields Park, which also comprises Avenue des Braves and the Park of Sainte Foy where Lévis defeated Murray in 1760. Also situated to the S.W. is Wolfe's Cove, where tradition says that Wolfe landed his troops in 1759 to take Montreal by surprise. Among other historic sites are Montmorency Park, at the top of Mountain Hill, which occupies the site

of the first Canadian Parliament, where the Pact of Confederation was signed in 1867; the Seminary Gardens, enclosing the site of the dwelling of Guillaume Couillard, son-in-law of Louis Hébert, the reputed first settler of Canada; and Dufferin Terrace covering the site of Château St. Louis, the corner-stone of which was laid by Champlain in 1620. The château, in which Champlain died in 1635, was destroyed by fire in 1834. Among the existing houses dating from the Fr. regime and the first years of Eng. rule are the Kent House, built in 1650 by Governor d'Alleboust; the Montcalm House, 1677 (erroneously believed to have been the scene of Montcalm's death); Montcalm's residence, situated on the ramparts and built in 1737, and occupied by Montcalm in 1758-59; the Judge Sewell House (1803); the Valée House (1818); and the Garrison Club (1820) in St. Louis Street. The fine Prov. Parliament Buildings are situated in extensive grounds, and among other noteworthy buildings are the city hall, court house, the imposing palace of the Rom. Catholic cardinal, the Rom. Catholic and American cathedrals, the custom house, church hall, and the Ursuline Convent. The oldest church in the city is the Basilica of Notre Dame, which was built first in 1647, destroyed by fire and rebuilt thrice. After the fire of 1922 the architects took their inspiration for its remodelling from the Renaissance and Corinthian styles. Notre Dame des Victoires was built in 1688 and 1699, after the defeat of Phips, named Notre Dame de la Victoire; in 1711, after the defeat of Walker's fleet, it received its present name. It contains some very fine paintings and many memorial tablets. Another noted feature is the famous shrine of Ste. Anne de Beaupré close by the city. The educational institutions are Laval Univ., the Q. Seminary, and the Q. High School, whilst there are many benevolent and charitable institutions. The city is the seat of a cardinal archbishop and an Anglican bishop. Q.'s many monuments to the memory of discoverers, warriors, prelates, and statesmen include the Champlain (1898) which is on Dufferin Terrace, by Paul Chèvrel and Paul de Carle (both of Paris); the Wolfe-Montcalm obelisk in the du Fort Garden; the Laval, in front of the post office, erected in 1908 to the memory of Q.'s first bishop, and done by Philippe Hébert; the Cartier, in Montmorency Park (1920), by G. W. Hill; the Cardinal Taschereau, in the Basilica Square, by Vernare and Roisin (both of Paris), erected in 1923 to the memory of Canada's first cardinal; and the Cross of Sacrifice, near St. Louis Gate, erected in 1925 to the memory of the soldiers who fell in the First World War. A few miles above the city the Q. Bridge, a wonderful engineering feat, spans the St. Lawrence. The bridge, of the cantilever type with suspended central span, has a total length of 3239 ft., the central span being 640 ft. The cantilever arms extend out over the water a distance of 1160 ft.;

the total width is 88 ft., taken up by two railway tracks, two footpaths, and a roadway, opened Sept. 22, 1929, for the accommodation of motor and horse-drawn traffic.

Electrical power is provided by the Montmorency Falls, a few miles distant, as well as by the vast Isle Maligne plant at the head of the Saguenay R. The prin. manufs. are iron, steel, and leather goods, clothing, boots and shoes, paper, tobacco, wooden ware, biscuits, etc., whilst timber is largely exported. Q. has one of the largest dry docks in the world. It is a noted centre for the export of lumber and also of wheat. The deepening of the St. Lawrence to Montreal has retarded the growth of shipping at Q., but the commerce of the city is considerable. In 1944 the total net registered tonnage of vessels entered at Q. was 1,774,697. The railway communication inland is good, and Q. is the head of ocean steamship navigation to Europe. It sends three members to the Legislative Assembly of the prov., and three to the Dominion House of Commons. Before the arrival in Canada of any European explorers, the Indians had chosen this exceptional site for the construction of an entrenched camp, which was visited by Champlain a few years before he founded Q. in 1608. Q. was captured by the Eng. in 1629 and again in 1759 and finally ceded to England in 1763. Pop. 150,700. See A. G. Doughty, *The King's Book of Quebec* (memorial vols. of tercentenary celebrations of July 1908), 1911; M. J. Pelton, *Natural Resources of Quebec*, 1923; W. Bovey, *Canadians*, 1933; and R. Traquair, *Old Architecture of Quebec*, 1947.

**Quebec Act, 1774**, Act of the Brit. Parliament 'to make more effectual provision for the government of the province of Quebec,' in effect of Canada. It extended the prov. boundaries of Quebec on Canada to include all the Old Northwest, which comprised the ters. bounded by the Ohio and Mississippi Rs. and the S. boundary of the ters. granted to the Hudson's Bay Company in 1670, it substituted the Fr. civil code for the Eng. civil law, it gave freedom of worship to the Rom. Catholic Church in Canada and, in effect, endowed it by ordaining that the Rom. Catholic clergy should continue to receive their accustomed dues and rights.' But it made no provision for calling a 'legislative assembly,' deeming it expedient to continue government by governor and council. The granting of part of the W. ter. to Quebec and the recognition of the Rom. Catholic religion greatly angered the Amer. colonies, but the Act kept the Fr.-Canadians from making common cause with the Amers. in the Amer. War of Independence. The motives for this legislation are not clearly estab.; some historians think that the purpose of the Act was essentially military, but others think that it was inspired by the same liberal policies as have conduced to the steady evolution of the Brit. Commonwealth of Nations. The Act is still cherished by the Fr.-Canadians as the

charter of their liberties. See R. Coupland, *The Quebec Act: a Study in Statesmanship*, 1926; H. Metzger, *The Quebec Act: a Primary Cause of the American Revolution*, 1936; and A. L. Burt, *A Short History of Canada for Americans*, 1942.

**Quebec Marmot**, see under MARMOT.

**Quebracho**, S. Amer. tree of the family Apocynaceae. From the bark is made white Q., a drug used for dyspepsia, bronchitis, and phthisis.

**Quecha Language**, see under SOUTH AMERICAN NATIVE LANGUAGES, *Caribbean Area*.

**Quechuas**, see QUICHUAS.

**Quesad**, see KEDAH.

**Quedlinburg**, tn. of Saxony-Anhalt, Germany, 56 m. S.E. of Brunswick, near the N.W. base of the Harz Mts. A horticultural centre, with a trade in vegetables and seeds. There are manufs. of iron, brass, and cloth goods. Q. was founded as a fortress by Henry the Fowler about the year 924. His tomb, and that of his wife Matilda, are in the anc. Schlosskirche (dedicated in 1129). The old tn., with its turreted wall, recalls the days when Q. belonged to the Hanseatic League, whilst a new city with four suburbs represents the industrial activities of to-day. It is the native place of both Klopstock (b. 1724) and Karl Ratter (b. 1779). Pop. 28,200.

**Queen**, see KING, SOVEREIGNTY.

**Queen Alexandra's Imperial Military Nursing Service**, see MILITARY NURSING.

**Queen Anne's Bounty**, see BOUNTY, QUEEN ANNE'S.

**Queenborough**, bor. of Kent, England, situated on the R. Swale, Isle of Sheppey. It is a deep-water port importing coal and exporting manufactured goods. Here the copperas factory was first estab. in England. There are pottery, chemical, and glue works. Q. has thirteen royal charters, the first dated 1369. Pop. 3200.

**Queen Charlotte Islands**, archipelago in the N. Pacific, off the N.W. coast of Brit. Columbia. Canada, from which it is separated by Hecate Strait on the E. and Dixon entrance on the N. A Brit. dependancy, it consists of two or three large is., Graham Is., Moresby Is., and Kunghit. The first two measure with North and Prevost 180 m. in length and 60 m. at the greatest width. Lying in lat. 52° to 54°, long. 132° to 134°, they were discovered by James Cook in 1778. In 1787 Capt. George Dixon, R.N., explored the is. and named them after his ship, *Queen Charlotte*. Two years later Gray named them in Washington, and that is how they are marked on Ingraham's chart of 1791, but the first name has survived. Juan Perez had landed on them in 1774 and named the N. point Cabo de Santa Margarita. The inhab. are known as Haida and number some 5000. Minerals are known to exist. The people are chiefly engaged in agriculture (especially the cultivation of potatoes), fishing and game hunting, and lumbering. There is another group of is. known as Q. C. in the S. Pacific Ocean, which were discovered by Capt. Carteret. See F. Poole, *Queen Charlotte Islands*, 1872.

**Queen Charlotte Sound**, strait in the N. Pacific Ocean, dividing Vancouver Is. from the mainland and forming the first of a series of inlets along the N. and E. of the Is.

**Queen Consort**, see **CONSORT**.

**'Queen Elizabeth'**, former Brit. battleship, launched Oct. 1913. It was the first battleship to dispense entirely with coal and to use oil alone; 600 ft. long, 27,500 tons displacement; speed, 25 knots; turbines, 60,000 h.p.; guns, eight 15-in., firing a shell weighing nearly 2000 lb., and sixteen 6-in. When during the First World War the idea of attacking Turkey via the Dardanelles was being considered, it was thought that the guns of the *Q. E.* would be more than a match for the forts; but this proved to be erroneous, as some of the forts were so constructed that she could not reach them without exposing herself. After doing some good work she was recalled to England. In the early years of the Second World War the *Q. E.* served in the Mediterranean, and was sunk in Dec. 1941 by U-boat mines attached by it. 'frogmen.' She was raised and repaired, to become the Mediterranean fleet flagship, and in 1945 served off Burma as flagship of the E. Indies fleet. In 1948 the *Q. E.* was scrapped.

**'Queen Elizabeth' (liner)**, see under **CUNARD STEAMSHIP LINE**.

**Queen Margaret College**, Glasgow, was given over to the Univ. of Glasgow in 1892, but in 1893 the college was dissolved. The name *Q. M. C.* remains as the designation of the women's dept. of the Univ.

**'Queen Mary'**, former Brit. battle-cruiser of *Lion* type; built by Palmers of Jarrow; launched in 1912; displacement 27,000 tons; eight 13.5-in. and sixteen 4-in. guns. Just before the battle of Jutland (q.v.) she was at Rosyth as a unit of the 1st B.C. Squadron under Adm. Sir David Beatty. In the early stages of the battle she was hit by a salvo from the Ger. battle-cruiser *Derfflinger* which caused an explosion from which she sank.

**'Queen Mary' (liner)**, see under **CUNARD STEAMSHIP LINE**.

**Queen Mary Land**, region of Antarctica, E. of Kaiser Wilhelm II. Land, extending from 91° E. to 102° E. where it joins Wilkes Land. It was discovered and its coastline charted by the Australasian Antarctic expedition of 1911-12 under Sir Douglas Mawson (q.v.). The W. coastal party of this expedition, when travelling from Mt. Gauss to Haswell Is., 100 m. eastward, had to ascend to an elevation of 2580 ft. in long. 91° 30' E., and therefore this stretch of coast appears to be unapproachable from landward. From Cape Meliner 68° 32' S. lat. and 91° 50' E. the coast trends eastward for nearly 50 m. to Helen glacier. The bight lying westward of this glacier is named Wright Bay. Haswell Is. is remarkable for its wonderful bird life, almost all varieties of Antarctic birds being found. Near the Is. is the largest Emperor penguin rookery known to exist. Denman glacier, flowing into the S.E. side of Robinson Bay, is a major Antarctic glacier, its main

channel being 9 in. wide. Its final descent to sea level is by way of a huge ice-cascade, at the base of which it reforms and presses through Shackleton shelf ice. The latter is an immense shelf of ice fronting the coast for over 160 m. eastwards from Junction Corner (the point where the W. side of the shelf meets the land ice-cap). Westward of Shackleton shelf ice and southward of the pack-ice belt, the Mawson expedition found open water during the summer months. This area was named Davis Sea, after a member of the Mawson expedition commanding the *Aurora*. The mainland S. of the shelf ice rises to about 3000 ft. and is entirely ice-covered. Another large glacier is the Northcliffe, which flows into the S.W. side of Robinson Bay. On the S. side of this bay, at a spot 200 ft. above the surface of the Northcliffe glacier, Wild (see under **SHACKLETON**) took possession of *Q. M. L.* for the Brit. Crown on Dec. 25, 1912. Among other is. off the mainland are Masson, Henderson, David, Bowman (700 ft., discovered in 1931 by the Brit., Australian, and New Zealand expedition), Mill (discovered in 1936 by the research ship *William Scoresby* (see **DISCOVERY COMMITTEE**), and Drygalski (44 m. N. of Haswell Is., 1200 ft. above sea level and about 9 m. in diameter). See *The Antarctic Pilot* (Hydrographic Dept., Admiralty, 1948).

**Queen Mary's Army Auxiliary Corps**. The name given to a corps of women war workers formed in 1917 by the Army Council, when man-power was becoming seriously reduced, to provide women substitutes for certain male workers in units and offices administered by the Army Council at home and at the bases and on the lines of communication. They wore khaki uniform, and the number of officials and members enrolled was about 45,000, of whom 17,000 served in France and Flanders, while others were employed in Salonika, Italy, and Ireland. The corps, which was popularly known as the W.A.A.C.s, was disbanded early in 1920. Technically the corps was not under military discipline, and hence injuries received overseas were compensated for under a special Act. Some 300 awards were made to members of the corps for long service and devotion to duty. In the Second World War the Women's Auxiliary Military Corps was known as the Auxiliary Territorial Service (A.T.S.) (q.v.).

**Queen Maud Land**, region of ice and snow in Antarctica lying on the S.W. side of S. Georgia and claimed by Norway. Queen Maud Bay, which was named after the queen of Norway, is entered northward of Cape Nuñez, but the bay affords no anchorage. Between Cape Nuñez (lat. 54° 16' S. and long. 37° 25' W.) and Cape Disappointment the coast is little known. A small expedition of Brit., Norwegian, and Swedish scientists left for the region in the autumn of 1949. The idea of the expedition originated with Dr. H. Sverdrup, director of the Norwegian Polar Institute.

**Queen-of-the-Meadows**, see **MEADOW SWEET**.

**Queens**, bor. of New York city, covering an area of 11,739 sq. m. It was constituted in 1898, and the estimated pop. in 1940 was 1,297,600. It includes the former tns. of Jamaica, Flushing, New Town, and Long Island city. It has a number of libraries and schools.

**Queensberry, Earls of.** The title was bestowed upon Sir Wm. Douglas of Drumlanrig, Dumfriesshire, in 1633 by Charles I. This Douglas traced his descent from the Douglas who was slain at Otterburn. The third earl, whose name also was Wm., was an important personage in the hist. of Scotland during the latter half of the seventeenth century.

dukedom of Q. passed to his cousin Wm., earl of March. He became known as Old Q., and was a well-known character of the latter end of the eighteenth century. He was a great supporter of the turf and the opera, and was practically the founder of horse-racing. He died without legitimate issue, and his honours and titles passed to various members of his family. The duke of Buccleuch received the dukedom, Sir Charles Douglas became marquess of Q., and the title of earl of March passed to the earl of Wemyss.

**Queensberry, John Sholto Douglas,** eighth Marquess of (1814-1900), authority on the rules of the prize ring, of which

QUEENS' COLLEGE, CAMBRIDGE

Valentine & Sons Ltd., Dundee

In 1680 he was lord chief justice of Scotland, and he was created in turn marquess (1682) and duke (1684). He did not share the Catholic sympathies of James II. with the result that two years before the revolution he was deprived of all his offices. His son the second duke, who was also created duke of Dover, joined William of Orange and fought for him in Scotland. He ultimately became the keeper of the privy seal. He was one of the king's commissioners to Scotland after the failure of the Darien scheme, and ultimately became one of the joint secretaries of state for Scotland. He was implicated in a Jacobite plot, and compelled to resign his offices, but in 1707 he resumed them, and after the union was practically the director of all Scottish affairs. He received, in addition to the dukedom of Dover, the titles of marquess of Beversley and earl of Ripon. His son, the third duke, married a daughter of the earl of Clarendon; but with his decease the Brit. title became extinct, and the

he was a great patron. He was the originator of the famous Q. rules which govern prize contests at the present time. See also WHITE, OSCAR.

**Queensbury**, part of the urb. dist. of Q. and Shelf in the W. Riding of Yorkshire, England, 4 m. N. of Halifax. Textiles are made; coal mined, and stone quarried. Pop. (with Shelf) 9000.

**Queenscliff**, seaside tn. and port in Victoria, Australia, situated on Port Phillip Bay.

**Queens' College, Cambridge**, was founded in 1448 by Margaret of Anjou, wife of Henry VI., and re-founded seventeen years later by Elizabeth Woodville (Woodville) wife of Edward IV. According to the present constitution the society consists of a president and eleven foundation fellows. The fellowships are tenable for six years from the date of election, and no fellow may hold a college living of which the net ann. value exceeds £400. A regular proportion of the college revenues is devoted each year to the scholarship fund. Famous

members include Bishop Fisher, Whitgift, and Erasmus.

Queen's College, Oxford, was founded in 1340 by Robert Eggesfield, chaplain to Philippa, queen of Edward III., after whom the college is named. Under the statutes of 1882, the college consists of a provost, from fourteen to sixteen fellows, about twenty-five scholars, and two Bible-clerks. Of the scholars, four or five, called Eggesfield scholars, are by preference to be natives of Cumberland, Yorkshire, or Westmorland. Robert Eggesfield was himself a native of Cumberland, and held the rectorate of Burgh in Westmorland. Famous members include Henry V., Wycherley, Addison, Bentham, and Pater. See R. H. Hodgkin, *Six Centuries of an Oxford College*, 1949.

Queen's College for Women, London, is situated at 43 Harley Street, W. Founded in 1848 and incorporated by royal charter in 1853, its object being the general education of women and the granting of certificates. Under the same management is the Queen's College School, to which boys are admitted up to the age of nine.

Queen's County, *see* LEIX.

Queensferry, royal burgh and coast tn. of vicinity, Scotland, situated on the firth of Forth, 8 m. N.W. of Edinburgh. At this point the ferry was formerly the prin. means of communication between Edinburgh and the N. of Scotland, and it is here there is the famous Forth Bridge. The harbour is good and always accessible. There are two piers, one on the E. and the other to the W. of the tn. The naval base of Port Edgar is at Q. There are large oil-works in the vicinity. Abercorn, to the W. of Q., was the site of an auct. monastery, and from 681 to 685 the see of the earliest bishopric in Scotland. Other buildings of note are a Carmelite priory and Dundas Castle. Pop. about 2500.

Queensferry, North, vil. of Scotland, in Fifeshire, situated on the Forth, at the end of the Forth Bridge. It is the N. side terminus of the ferry passage. It is noted as a bathing resort, and has whinstone quarries. Pop. 1200.

Queen's Hall, home of London's classical music for nearly fifty years, built by F. W. M. Ravenscroft on the site of property he owned in Langham Place, W., and opened on Nov. 27, 1893, with a concert by the Royal Amateur Orchestral Society. The best-known concerts held there were the 'promenade' concerts conducted by Sir Henry Wood and begun on Aug. 10, 1895. Nearly every musician of note appeared at one time or another on its platform. Here Richard Strauss introduced himself to London audiences, and here too Toscanini made his bow. In 1930, Paderewski was once paid a record fee of £1000 for a single orchestral-piano piece there. The Q. H. was hit by a Ger. bomb in 1941 and burnt out.

Queenshead, *see* QUEENSTOWN.

Queensland, N.E. state of the Commonwealth of Australia, situated between 10° 40' and 29° S. lat., and 138° and 153° 30' E. long.; it includes the adjacent

is. in the Pacific Ocean and in the gulf of Carpentaria. It is the second largest state of the Commonwealth, the area being 670,500 sq. m. Q. was included in the colony of New S. Wales from 1788 to 1859. The coastline, which is about 2250 m. in length and has many good harbours, is bordered by the Great Barrier Reef as far as 22° S. lat. The reef extends from near Port Curtis to the coast of New Guinea, and is impassable except through narrow channels, which are separated by considerable intervals. The reef has been investigated by a committee (the Great Barrier Reef Committee) at Brisbane, and reports have been issued.

*Physical Features.*—The surface of the country is fairly flat to the W. of the mts., the soil being very rich and eminently suited for pasturage. The Main Dividing Range is a coastal range of old rocks which runs N. and S. from New S. Wales to Cape Melville, being a continuation of the Australian Alps of Victoria and the Blue Mts. of New S. Wales; the highest peaks are Bellenden Ker (5500 ft.), near Cairns, Mt. Dalrymple (4250 ft.), and Mt. Lindsay (4040 ft.), whilst the average height of the range is 2000 ft. To the N. of Cape Melville the coastal range yields to a flat ridge capped with sandstone, which runs through Cape York Peninsula and gradually declines in elevation until it reaches Cape York. The great W. plain extends from the coastal range to the S. Australia border, and from New S. Wales to the gulf of Carpentaria. Two main watersheds of low elevation stretch from the coastal range westward; these include fertile riv. valleys covered with excellent soil. The rivs. which flow from the Dividing Range flow E. to the Pacific, N.W. to the gulf of Carpentaria, and W. to the interior. S. to the Murray-Darling system. From the southerly part of the coastal range flow the Albert, Brisbane, and Logan Rs., all emptying into Moreton Bay, the Burnett and Mary, which flow into Hervey Bay, and the Boyne into Port Curtis. The Darling Downs, lying W. of the range, are drained by the Condamine and its affluents; while the S.W. plains are drained by the affluents Maranoa, Warrego, and Paroo Rs., all flowing into the R. Darling. Northward of the more southerly watershed the Comet, Dawson, and Nogoa Rs. join the Mackenzie and Isaac Rs. and, flowing southward, form the northerly watershed, the Fitzroy, emptying into Keppel Bay. The Burdekin, the chief riv. of N. Q., flows southward, and after being joined by the Helyando and Sutor, empties into the Pacific near Cape Upstart by a mouth obstructed with sandbanks. Other rivs. further W. are the Barcoo, Diamantina, and Georgina, the latter two having their source in the Barkly Tableland. The Herbert, Johnstone, and Mulgrave Rs. rise from the E. slope of the N.E. coast range; the Gilbert, Lynd, and Palmer Rs. from the W. slope, flow into the gulf of Carpentaria. Yet further W. are the Norman, Flinders, Leichardt, and Albert Rs., also flowing into the gulf of Carpentaria. None of the

rivers is navigable for a great distance; those flowing into the gulf of Carpentaria are of little use to navigation at all, while those flowing into the interior are lost in the desert or its salt lakes.

**Climate and Rainfall.**—The climate of Q. presents great varieties, being tropical and sub-tropical, but on the whole very healthy. The summer heat is great, but is not aggravated by the hot winds found in other countries. The climate is regarded as effectual in checking pulmonary diseases. The rainy season extends from about Christmas time until March. The

Queensland Government

BARRON FALLS, CAIRNS RAILWAY, NORTH QUEENSLAND

precipitation on the E. coast amounts to as much as 135 in. a year at Innisfail, but is no more than 40 in. S. of Port Curtis. The average rainfall of the Darling Downs is about 35 in., and on the W. border about 8-9 in. Since 1893, when a hydraulic engineer's dept. was organised, the W. plains have everywhere been tapped by artesian wells, the waters of which are suitable for stock, irrigation, and household purposes in some cases; in others for only one or two of these purposes.

**Fauna and Flora.**—The fauna and flora of the state are typically Australian. The forests of Q. are extensive, eucalypti, pine, walnut, cedar, yellow-wood, silky oak, tulip-wood, and beech being grown.

**Products.**—The mineral wealth of Q. is great, and among the minerals found, though in varying quantities, are gold, silver, copper, coal, tin, lead, zinc,

limestone, opals and gems, arsenical pyrites, cobalt, fluorspar, and fireclay. The most important sources of gold are now those in Mt. Morgan, Craow (120 m. inland from Maryborough), Charters Towers, and Dittmar. Copper is found in Mt. Isa and Mt. Morgan. Ipswich is the main coalfield, followed by Bowen, Blair Athol, Callide, and Maryborough. Most of the tin is alluvial, the chief source being at Mt. Garnet, N. Q. Lead and zinc production increased with the development of Mt. Isa. Rutile-zircon-ilmenite (used for munitions and welding rods) is produced from beach deposits on the S.E. coast. Mineral production has always yielded the state a fairly large income. Since 1872, it had never been less than £1,000,000 a year. From 1905 to 1918 the value (excluding quarry products, £113,000 in value in 1913-14) reached over £4,000,000 in some years and was always at least £3,000,000. It then decreased for sev. years and commenced to improve from 1933, till in 1937 it approximated £4,000,000 as against £1,241,000 in 1930. From 1910 to 1912 the value exceeded £5,000,000, and over the five years ended 1914 £4,800,000. The average output and value of the chief minerals for the six years 1939-44 was as follows: gold, 82,000 oz., £1,022,500 (output and value have steadily declined, being only about one-third in 1944 of the output and value in 1939); coal, 1,509,000 tons, £1,839,000; copper, 8800 tons, £787,000 (showing a steady increase throughout); tin, 1000 tons, £203,500; silver, 2,677,000 oz., £299,000 (showing a steep decline in 1943-44); lead, average for 1939-42 42,500 tons, value £760,000; zinc, average for 1939-42 27,000 tons, value £470,000; rutile-zircon-ilmenite, 14,000 oz. in 1914, valued at £124,000.

The land between the coast range and the ocean is, generally, very fertile. It was formerly covered with jungle or rain-forest, locally termed 'scrub.' Large tracts, however, are mere waste. Westward of the coast range the state land is open forest country or downa very suitable for wool-growing. Here, the rainfall being adequate, cattle are pastured in large numbers. The introduction of prickly pear into Australia in 1788 and 1824 has notoriously proved to be disastrous to the Commonwealth, and to no state more than Q., but happily the unremitting efforts of biologists have resulted in counteractive measures which have won back large areas to cultivation, the most promising destructive agents being the *cactoblastis* (genus of pyralid moth) and the *coccus indicus* ('wild cochineal'). The prin. crops are sugar-cane, maize, wheat, sorghum, green forage, hay, peanuts, potatoes, pumpkins, tobacco, orchard fruit (apples, peaches, apricots, custard apples, plums, etc.), plantation fruit (bananas, papaws, pine-apples), vegetables (beans, tomatoes, etc.). The production of sugar-cane is the leading feature of Q. agriculture and it occupies most of the riv. flats and fertile valleys near the coast. Irrigation is practised at Inkerman and in the Bundaberg area; cultivation is intensive and the produc-

tion per acre is high. The production of sugar per acre of cane grown has increased with greater efficiency. The high price of cotton during the Amer. civil war estab. cotton-growing in Q. in 1861-65, but after 1871 the industry rapidly declined and only revived in 1920-23. In 1944 only about 17,000 ac. were harvested for a production of 8,500,000 lb. of seed cotton. The present production of cotton comes from for the most part from the Rockhampton and Maryborough divs. Green sorghum, a summer-growing crop, has made rapid strides in Q. in recent years. The gross value of the leading crops for 1918 was sugar, £23,198,000; maize, £1,044,000; wheat, £5,300,000 (including bounty); green forage, £2,152,000; hay, £1,292,000; tomatoes, £618,000; pumpkins, £499,000; fruits, £2,612,000.

Of the total area of the state, 22,655,000 ac. have been alienated, whilst 5,118,000 are in process of alienation. Both unconditional and conditional selection of land is allowed, the latter being the more general. Some 429,120,000 ac. remain the property of the Crown. Land is made available for selection in (a) agric. selections, or perpetual leases; (b) grazing selections, or grazing homesteads and grazing farms; and (c) perpetual lease, prickly-pear selections. The largest area that may be acquired by any one person as a perpetual lease selection is 2560 ac. A number of pastoral properties are still held in large leases, areas of 500 sq. m. being not uncommon for sheep, and for cattle 1500 sq. m. or more, particularly where the country is far removed from the railway or is rough or dry country with a lower stock-carrying capacity. Grazing selections represent the closer settlement of the more accessible and better quality pastoral lands and are made available in areas of about 20,000 ac. for sheep and up to 60,000 ac. for cattle. Grazing homesteads and grazing farms have a term of lease up to twenty-eight years in seven-year periods. The area of prickly-pear selection may not exceed 2560 ac., and during the first period of the lease no rent is payable, but the prickly-pear must be eradicated and the land cleared. A large proportion of the area is leased in squatting runs for pastoral purposes, amounting to 243,174,000 ac. in 1947, besides 83,000,000 ac. in grazing selections. The average numbers of livestock in the five years 1940-45 (excluding 1912) were: cattle, 6,425,000; sheep, 23,865,000; horses, 407,000; and pigs, 117,000. The wool production, expressed as greasy was in 1939-40 195,770,000 lb., valued at £10,000,000; in 1944-45, 178,719,000, valued at £11,967,000; and in 1946-47 144,819,591, valued at £13,791,369.

The quantity of wood cut in the various saw-mills in 1946-47 was (in superficial feet) pine, 72,096,000; hardwood, 93,425,000; cabinet timber, 28,024,000; total value, £3,787,928. Some 87,180,000 cu. ft. of plywood were produced, valued at £1,000,358. There are some 24,000,000 ac. of commercial timberland in Q., of which 6½ million have been reserved for forestry purposes. A high proportion

of the secondary industries are works for processing primary products, among them being sugar mills, butter factories, saw-mills, and meat works. Other industries are railway workshops, and rubber mills. The value of production in 1946-47 was £34,238,000. The gross value of Q. primary production during the same years was over £73,000,000. Wool is easily the most valuable single item of the state's overseas exports, followed by sugar, meat, and butter. When sugar, meat, and butter are added to wool, the remaining items are normally of relatively little significance. Before the Second World War, in 1938-39, £21,148,625 (73.8 per cent) of Q.'s overseas exports of £28,651,842 went to the United Kingdom, which took £3,953,199, or 89 per cent of the meat, £3,380,596, or 39 per cent, of the wool, £7,343,482, or 97 per cent, of the butter, £3,685,747, or 88.7 per cent, of the raw sugar, and £1,524,219, or 75.6 per cent, of all minerals. Largest items amongst exports to foreign countries were wool, for which France and Belgium, with over £1,000,000 each, were the biggest customers, and copper concentrates, £398,990, all to the U.S.A. The total value of exports (£A) in 1946-47 was £11,195,353, as against £32,195,000 in 1939-40; exports in 1947-48 totalled £17,845,723.

In 1938-39, the last complete year before the Second World War, overseas imports were valued at £7,955,818 sterling, of which 42.7 per cent came from the United Kingdom, 15.5 per cent from other Brit. countries, and 41.8 per cent from foreign countries. Principal imports from the United Kingdom were motor vehicles, machinery, hardware, drugs and chemicals, textiles and piece goods, paper and stationery, and various manufactured articles. The largest items from other Brit. countries were motor vehicles and paper; while petroleum, motor vehicles, and machinery and textiles were the main items from foreign countries. In 1946-47 overseas imports totalled £11,840,551 sterling. The United Kingdom supplied only £5,206,713 of this total, the chief item being textiles and piece goods, valued at £1,296,799. Foreign countries accounted for £1,185,123 of the total, the chief items being petroleum spirit, £1,214,919; lubricating mineral oil, £296,736; other oil, £276,859; motors, cycles, and parts, £237,923; hardware, etc., £248,422. Interstate exports in the year ended June 30, 1947, were £24,911,346 (including among the chief items various goods for trade use or for sale, largely raw sugar, gold, livestock and wool, groceries, builders' materials, machinery (excluding farming, meats and fish, fodders, etc.). Interstate imports were £10,862,963 (including goods for trade use or sale, groceries, clothing, haberdashery, boots and shoes, tobacco, cigarette, etc., builders' materials, etc.).

**Education.** *Constitution, etc.*—Education is free and compulsory and secular, the public expenditure in 1946-47 being £2,986,000. There are 1500 state primary schools, with an enrolment of 138,000;

19 state high schools and 17 high depts. attached to primary schools, with an enrolment of about 5380. There are also a number of private grammar schools, intermediate schools, rural schools, and correspondence schools. The state-aided univ. of Q., at Brisbane, was estab. by an Act of 1909 and opened March 14, 1911. There are now faculties of art, science, engineering, commerce, agriculture, law, dentistry, medicine, and veterinary science, with 3800 students. There are 12 technical schools with 12,300 students. Responsible government was conferred on Q. in 1859 when the state was separated from New S. Wales. Legislation and taxation are vested in a Parliament of one House, the Legislative Assembly, which comprises 75 members, returned for three years, and paid at the rate of £1000 per ann. There is a male and female adult franchise subject solely to twelve months' continuous residence in the state. Before 1922 there was also a legislative council, but this was abolished. There is a governor and Lieutenant-governor, with an executive council of ministers, each of the latter receiving a salary of £2250 a year. The net revenue of the state in 1948-49 was £31,457,235 and expenditure £31,442,430. There is no state church in Q., and the religious bodies, in their numerical order, are Church of England, Rom. Catholic, Presbyterian, Methodist, Lutheran, Baptist, and Jews. The prin. denominations retain free of charge the valuable land-granted to them before 1861. There are 6567 m. (1947) of gov. railway open in the state, with a gauge of 3 ft. 6 in. The cost of construction and equipment amounts to over £50,000,000.

The cap. is Brisbane, pop. 402,170, or some 36.3 per cent of Q.'s pop. Other towns with pop. at the end of 1944: Townsville, 34,200; Rockhampton, 35,000; Two Woomba, 33,300; Ipswich, 26,200; Cairns, 16,600; Bundaberg, 15,900; Maryborough, 14,400; Mackay, 13,500; Gympie, 8400; Charters Towers, 7600; Warwick, 7100; Southport, 8400; Gladstone, 5200; Ayr, 6000; Charleville, 3500; Dalby, 4000; Ingham, 3500; Innisfail 4000; Mt. Morgan, 3800; Mt. Isa, 3000; Redcliffe, 6800. There are many ports, but the contour of the coastline and the relative position of the inland dists. militate against any centralisation similar to that at Melbourne, Sydney, and Adelaide. Total pop. of Q., 1,091,200.

*History.*—Q. was visited by Capt. Cook in 1770, but little was known of the country until 1823, when Surveyor-General Oxley discovered the R. Brisbane. Cook landed at Round Hill Head, the S. point of Bustard Bay, and an obelisk with commemorative tablet has been erected on this spot. The Federal authorities have also placed a commemorative obelisk on Possession Is. in Endeavour Bay, where Cook formally took possession. The first settlement was at Moreton Bay in 1824, but in 1842 the penal settlement was finally broken up, and from that year free settlers were admitted to the country, since when progress has been remarkably

rapid, though checked during the depression of 1931. Pastoral occupation of the Darling Downs was commenced in 1840, and the Mary R. was occupied in 1843; but the aborigines murdered the shepherds, and so prevented permanent settlement for many years. A surveyor, J. C. Burnett, while seeking an overland route to the N. Australian settlement at Port Curtis, discovered the riv. which now bears his name, and, two years later, Wide Bay and Burnett dists. were settled. In the same period Warwick and Drayton on the Darling Downs were surveyed, and Maryborough on the Mary R. was settled in 1848. The first emigrant ship direct to Moreton Bay was the *Artemisia*, which arrived in 1848. A noted name in Q. exploration is that of Leichhardt, whose journey to Port Essington in 1844-1846 resulted in making known the existence of the Dawson, Comet, Mackenzie, and other rvs. Another notable explorer was Sir Thomas Mitchell, who visited the Maranoa and Warrego dists. in 1846-47. Ten years later squatters founded stations in the country around Rockhampton. There were many murders of squatters by the 'blackfellows,' but a force of black police, organised in 1848, afforded much protection. The progress made by settlers led to the separatist movement, and the N.E. part of the colony of New S. Wales (as it then was) was created a separate colony with the name of Q. by letters patent of June 8, 1859. The fatal journey of the celebrated Burke and Wills, and the relief expedition of John McKinlay, W. Howitt, and others opened up the W. dists. between the gulf of Carpentaria and the S. Australian border, and many pastoral settlements were made on the Warrego and Flinders Rs. Gold was discovered in 1868 at the head of the Mary R., where the Gympie field came into existence. Droughts have not seldom hampered the progress of Q., as in 1901. Political unrest ensued on this occurrence, and a Labour party made its appearance in the House. This party came into office in 1915, and among the changes it effected was the abolition of the Legislative Council in 1921.

*Queen's Metal*, alloy, of which the chief ingredient is tin. It is similar to Britannia metal, and answers the same purposes, being somewhat harder than pewter; the proportion of the ingredients varies.

**Queen's Own Royal West Kent Regiment, see WEST KENT REGIMENT, QUEEN'S OWN ROYAL.**

**Queen's Remembrancer, see REMEMBRANCER.**

**Queen's Royal Regiment (West Surrey), see SURREY REGIMENT.**

**Queenstown:** 1. Tn. of Cape Prov., S. Africa, on a 3500-ft. plateau near the Great Kei R., 132 m. by rail from East London. It is the centre of one of the richest wool-producing areas in S. Africa, and the social, educational, and commercial centre of Cape Eastern area. Q. was founded in 1853 as a link in the chain of border outposts, and the central feature is a hexagon originally intended as a rallying point in case of native disturbances, but now a garden. Pop., European, 8100; non-European, 15,400. 2. Tn. of Tasmania, Australia, in Montague co., on the Queen R., 22½ m. by rail from Strahan, its port. The most important mining dist. of the state, the chief ores mined and commercially utilised are copper, silver, and gold; the ann. copper production is 15,000 tons. The Mt. Lyell Mining and Railway Company Ltd. is the pre-eminent enterprise. Pop. 4000. 3. Tn. of Elire, *see* **ELIRE.**

**Queen's University, Belfast,** was founded as a college of the Q. U. of Ireland and reconstituted a separate univ. in 1909. It has approximately 150 full-time profs and lecturers and nearly 3000 students. It has a new assembly hall, designed by J. MacGheagh, with Edward Maufe as consulting architect. The hall stands independently between the main building and the road. It is named after Sir Wm Whitla (d. 1930), a Belfast physician and for many years prof. of materia medica and therapeutics, whose bequests to the univ. have enabled the hall to be built.

**'Queen, The,'** ladies' magazine, estab. in 1861, the outstanding features of which are up-to-date coloured fashion-plates from Paris, enclosures of work-patterns of original design, and general export information on matters of dress. Originally a weekly, at 1s., it now appears fortnightly at 2s.

**Queen Victoria (water-lily), see VICTORIA REGIA.**

**Queen Victoria School, Dunblane, Perthshire.** Built as a memorial to Queen Victoria and opened in 1908. The school educates and maintains without charge the sons of Scottish soldiers, sailors, and airmen. Selection is made by his majesty's commissioners for the school; the age of entry is nine years. The school is under the direction of a commandant (a retired regular officer), assisted by a headmaster and administrative officer. The education is under the direction of the headmaster, an officer of the Royal Army Education Corps, assisted by R.A.E.C. officers and civilian teachers.

**Queiroz, Jose Maria Eoa de (1843-1900),** Portuguese author, b. at Villa do Conde. He attracted attention by his writings for the *Gazeta de Portugal*, but soon he left Lisbon for Evora, where he became editor of the *Distrito de Evora*. It was in this backward place that he learned the

manners, customs, and superstitions of a people quite different from those of the big cap. In 1875 his greatest book, *The Sin of Father Amaro*, appeared as a feuilleton in the *Revista Occidental*, and was pub. in book form in 1876. It is an attack on the manners and morals of the priests in a prov. tn., and was an immediate success. The Rom. Catholic Church put it on the Index. For many years his heirs did all they could to prevent the book being disseminated, but in 1930 a complete trans. into Ger. was pub. in Berlin. The rest of the writer's official life was spent in the consular service at Bristol, England, Havana, and Paris, in which latter city he died. He also wrote *Nephew Basilus*, a chronicle of Lisbon family life, pub. in 1878; the fantastic novel, *The Mandarin* (1879); *The Maias*, episodes from the romantic periods of Portuguese hist. (1880); and *The Celebrated House Ramires* (1900). *The Reliquie* was pub. in 1877 and also placed on the Index.

As a writer Q. started out as a romantic, specially fascinated by the irony of Heine and the flaming verses of Victor Hugo. Later his outlook was changed by his admiration of Flaubert.

**Quelpart (Koran, Tayetsyn),** is. of volcanic origin, about 45 m. long and 21 m. broad, lying S.W. of Korea at the entrance to the Yellow Sea; discovered by the Dutch. Pop. 150,000.

**Quenching, see under METALLURGY (METALLURGICAL HEAT TREATMENT).**

**Que Que, tn. of S. Rhodesia, 1515 m.** by rail from Bulawayo, stands at an elevation of 3980 ft. It is a gold-mining centre and is also in a good farming and pastoral dist. High-grade iron ore and limestone occur in the dist. There are Anglican, Rom. Catholic, and Congregational churches, a public school, and mine hospital. White pop. 1100.

**Quercia, Jacopo della, see DELLA QUERCIA.**

**Quercin, or Quercite,** saccharine substance obtained from the liquid extracts of acorns.

**Quercus, genus of deciduous and evergreen trees (see OAK).**

**Querey, name of a dist. in S. France** before the revolution, forming the present depts. of Tarn-et-Garonne and Lot. It was so called from the Cadurci, a Gallic tribe, and gave its name to cadurcum, a light linen.

**Queretaro:** 1. Central state of Mexico, enclosed by Mexico, Michoacan, Guanajuato, San Luis Potosi, and Hidalgo States, on a plateau between tribs. of the Lerma and the Tollman Panuco. It has silver, mercury, and copper mines. Cottons, grain, fruit, pottery, and iron wares are produced. Area 4432 sq. m. Pop. 244,700. 2. Cap. of the above state, 50 m. from Guanajuato and 150 m. N.W. of Mexic. city by the Central Mexican Railway. It is interesting historically, not only as the site of a pre-Aztec settlement but as the bp. of Mexican independence. It was captured by Sp. conquistadores in 1536 and made a city in 1655. In 1848 it was the venue of a

congress by which peace between Mexico and the U.S.A. was ratified. In 1807 the movement for Mexican independence was launched here, and it was here that the Emperor Maximilian, after his trial, was shot on the Cerro de las Campanas. Q. is a well-built tn. with a cathedral, fine churches, and convents, notably that of Santa Clara, a Franciscan monastery, hospitals, and old palaces. These latter include the federal palace and gov. palace, both built of basalt, and the municipal palace with romantic associations with the war of independence. Q. has a cotton mill which was estab. in 1840, an important opal mine, flour mills, and tanneries. Pop. 33,600.

Querfurt, tn. of Saxony-Anhalt, Germany, 20 m. W. of Merseburg on the R. Querne. Formerly the cap. of a small independent state, in 1635 it became a part of Saxony, and was transferred to Prussia in 1815. Cotton is manufactured and there are breweries and sugar refineries. Pop. 6500.

Querido, Israel (b. 1874), Dutch novelist and critic, b. in Amsterdam. He began his literary career principally in the field of criticism, where his judgments have been much esteemed in Holland. He has also achieved a popular reputation as a writer of fiction. Among his works are *Meditaties over Literatuur en Leven* (1898); *Menschenwee* (Toil of Men) (1903); *Literatuur en Kunst* (1906); *Kater Don Juan* (1930), etc.

Quern (O.E. *cweorn*), hand-mill, used before the invention of water- or wind-mills for grinding corn. A usual kind consisted of two circular stones, the upper being pierced by a hole in the centre and revolving on a wooden or metal pin inserted in the lower. The grain was dropped into the opening, and the upper stone revolved by a stick in a hole near the edge. Small ones are sometimes used for grinding pepper or mustard. The saddle-quern, a two-handed mill, allowing a backward and forward motion of the upper stone, is found in Neolithic cultures and frequently in the Late Bronze Age and Early Iron Age. Rotary Qs. were used in the Early Iron Age, and much developed by Rom. agriculturalists; in the latter period they were often made from lava derived from Andernach on the Rhine.

Quessada, com. and tn. of Jaén prov., Andalusia, Spain, on the Sierra de Cazorla, 40 m. from Jaén, with salt-mines near. Pop. about 10,000.

Quessal, or Long-tailed Trogon (*Pharomacrus mocino*), large bird, native of Central Amer. forests, and of extraordinary beauty of plumage. The male has a tail about 3 ft. in length, the outer feathers of which are white with black bases, contrasting brilliantly with the rich metallic or golden-green of the head, back, and tail coverts; the breast is bright scarlet. The head bears a large rounded crest, and over the wings hang a number of fine drooping plumes. The female is much smaller, and lacks the long tail and decorative plumes. The diet is chiefly fruit.

Quesnay de Beaurepaire, Jules (1837-

1923), Fr. jurist and writer, early served as a soldier and a journalist. He was *avocat-général* at Paris (1883), and connected with most of the *causes célèbres* of the day, preparing the accusation against Gen. Boulanger before the high court (1889). *La Cocarde*, *L'Intransigeant*, and other attacks were written against him by the Boulangerist press. His work in connection with the Panama scandals was rewarded by his appointment as president of a section of the Cour de Cassation (1893-99). He resigned (1899) on account of disagreement with his colleagues during the reinvestigation of the Dreyfus case. Author of *Le Panama et la république* (1899); *Français et cosmopolites* (1901); *La Conspiration* (1907); and, under the pseudonyms of 'Jules de Glouvet' and 'Lucie Herpin', the novels: *Le Forestier* (1880); *Le Berger* (1881); *La Famille bourgeoise* (1883); *L'Idéal* (1884); *Le Père* (1886); and *Marie Fougeré* (1889).

Quesnay, François (1694-1774), Fr. economist and physician, b. at Méré, near Paris. He studied medicine and surgery in Paris, graduated M.D. in 1744, and was appointed physician to Louis XV. and to Madame Pompadour. He devoted himself to economic studies, and founded the sect of the 'Economistes', which included amongst its numbers Mirabeau, Baudeau, Larivière, etc. Q.'s theories are set forth in his articles on 'Fermiers' and 'Grains' in Diderot's *Encyclopédie*; and in the *Physiocratie* of Dupont de Nemours, a discourse on the law of nature. He wrote *Recherches sur l'évidence des vérités géométriques* (1773); and in the field of medicine his chief work was *Essai physique sur l'économie animale* (1736). His collected works, *Oeuvres économiques et philosophiques*, with introduction by A. Oncken, were pub. in 1883.

Quesnel, Pasquier (1634-1719), Fr. Jansenist theologian, b. in Paris, joined the Fr. Oratory (1657). His ed. of the works of Leo the Great (1675) was condemned for Gallicanism, and accordingly placed on the Index (1676). Q. was banished from Paris for his Jansenist views (1681), and having refused to subscribe to a decree condemning Jansenism (1684), fled to Brussels, where Arnould (q.v.) befriended him. The Jesuits were always hostile, and had him imprisoned (1703), but he escaped to Amsterdam, founding there the still-existing Jansenist congregation. His *Nouveau Testament avec les réflexions morales* (1693-94) were condemned by the papal bull *Unigenitus* (1713). His *Lettres* were ed. by Le Courayer (1721-23). See L. Seebé, *Les Derniers Jansénistes*, 1891; Mme Albert le Roy, *Un Janséniste en exil*, 1900; A. Maulvault, *Répertoire de Port Royal*, 1902; and J. Pasquier, *Le Jansenisme d'après les sources*, 1909.

Quesnoy-sur-Deûle, old fort. tn. of the dept. of Nord, France, 8 m. from Lille, on the Deûle. Pop. 3600.

Quételet, Lambert Adolphe Jacques (1796-1874), Belgian astronomer and meteorologist, b. at Ghent, became prof. of mathematics at Brussels Athenaeum (1819). He superintended the construction of the

Royal Observatory there (1826), becoming its director (1828). Q. held the chair of astronomy and geodesy at the Brussels Military School (1836), and was secretary of the academy from 1834. He is best known as a statistician. His works include *Sur l'homme et le développement de ses facultés* (1835, 1869); *Sur la théorie des probabilités* (1840) (see Herschel in *Edinburgh Review*); *Du système social et des lois qui le régissent* (1848); *L'Anthropométrie, ou mesure des différentes facultés de l'homme* (1871). See *Mémoires* and *Bulletins* of the Brussels Academy; E. Mailly, *Essai*, 1875; and M. Halbwachs, *La Théorie de l'homme moyen*, 1913.

**Quetta**, cap. of Baluchistan, Pakistan, lies at an elevation of over 5000 ft., 20 m. N.W. of the Bolan Pass. Regular troops of the Brit. Army in India were stationed at Q. before the Brit. evacuation of India in 1947. It is the headquarters of administration, and possesses an Indian staff college (opened 1907), a museum, a brewery, a gov. distillery, and flour mills. There are manufs. of felts, blankets, and rugs, and some coal is mined. The N.W. railway sends one branch from Q. to Chaman on the Afghan frontier and another from Sibi through Q. to the Persian frontier at Hoston. On May 31, 1935, some 20,000 people were buried in the ruins of their homes by an earthquake, and 10,000 others were killed by the havoc wrought by the earthquake in the surrounding dists. The city and the civil and railway areas were totally destroyed, while in the cantonment area the R.A.F. barracks collapsed and all remaining buildings were destroyed or rendered uninhabitable. The work of relief was accompanied by investigations of a reconstruction committee. The gov. accepted the recommendation to rebuild Q. on the old site as far as possible, the share of the cost from public funds to be £6,000,000. The probability was that the Pakistan Gov. would commandeer the college on terms to be agreed with the Brit. Gov. Pop. (1935) 49,000.

**Quetta Bond**, method in brickwork in which steel reinforcing bars are placed in cavities, filled with concrete, in the thickness of a wall.

**Quetta-Pishin**, dist. of Baluchistan, Pakistan, with chief tn. Quetta. Part of the soil is fertile, producing melons and other fruits, vegetables, and cereals. Area about 5310 sq. m. Pop. 156,000.

**Quetzal**, bird (*Pharomacrus mocinno*) of the Trogon family, of remarkably beautiful plumage, whose feathers were chosen for adornment of Guatemalan and Peruvian chiefs. The bird forms the badge of Guatemala.

**Quetzalcoatl** (from *quetzalli*, green feather, and *cohuatl*, snake), hero-god of the anc. Mexicans, especially worshipped at Cholula. He is sometimes represented as one of the four chief Mexican gods, controller of the air and winds, who assisted in the creation of man, or more frequently as a man with supernatural attributes who tried to abolish human sacrifices. According to a Toltec legend, Q. was a fair-skinned man who disappeared

across the sea, promising to return at a future date. Cortez made use of this legend. Jesuit authors embellished the myth, and sometimes identified Q. with St. Thomas. See W. H. Prescott, *The Conquest of Mexico*, 1878, and D. H. Lawrence, *The Plumed Serpent*, 1928.

**Quezaltenango**, or **Quezaltenango**: 1. Dept. of S.W. Guatemala, Central America, bounded S. by the Pacific Ocean and Chorrera R., W. by Naranjo R. Of its volcanoes, Santa Maria (in eruption 1902-3) is the most noted. Coffee and sugar-cane plantations are in the S.E. Hides, rubber, maize, and wheat are also exported. Pop. about 241,500. 2. Cap. of above (founded as Xenahu or Xelahu), about 72 m. from Guatemala, at the foot of the Santa Maria volcano. An earthquake did much damage in 1902. Cottons, linens, and woollens are manufactured; coffee is the chief export. The sulphur baths of Almolonga are much visited. There is a radio station. Pop. 45,700.

**Queuille, Henri** (b. 1884), Fr. statesman, b. in Corrèze, where his father was mayor. He studied medicine, then took to local politics, became mayor himself, and gradually rose through the co. council to represent his neighbourhood in the chamber of deputies. From 1933 he was minister of agriculture in eight different govts., twice minister of public works, twice minister of health, once minister of posts and telegraphs, and finally minister of finance in 1940. His 'chief' was always Edouard Herriot and agriculture his forte. After the collapse of France in 1940 he crossed to England and took his place in Gen. de Gaulle's administration. Yet before he became Prime Minister in 1948 he was comparatively little known to the general public, in spite of having been a deputy for over thirty years and served in twenty-six govts. His opportunity came with the acute domestic crisis of mid 1948. With France more sharply divided than ever between Communists and non-Communists, the 'third force' evoked by the Socialists and the Popular Republicans ceased to count as a political factor. But the upward sweep of prices and rising inflation against a political background of Communist agitation and de Gaulle's intransigence was precisely the political situation which demanded a man of middle-class liberal outlook, free from extreme ideological bias, and of lifelong experience in public administration, and Q. exactly fulfilled these conditions, besides possessing an excellent working knowledge of the Fr. peasant and agriculture. His predecessors were Schuman (Popular Republican), André Marie (Socialist Radical), Paul Reynaud (g.r.), and Schuman for the second time, or four govts. within a few weeks. Q. succeeded Schuman as Premier on Sep. 12, 1948, and remained in office until 1. 1949 when he was succeeded by M. Bidault.

**Queux, Sir**, see KAY.

**Quevedo y Villegas, Francisco Gómez de** (1580-1645), Sp. satirist, poet, and dramatist, b. in Madrid, and brought up at court, his father being secretary and

his mother lady of the bedchamber to the queen. He was educated at the univ. of Alcalá. He was an accomplished swordsman, and in 1611 the fatal issue of a duel drove him out of Spain. He went to the court of the duke of Ossuna, viceroy of Sicily and later of Naples, who made him his minister of finance. At Ossuna's fall in 1619 Q. was imprisoned, but was released and allowed to go to the Sierra Morena. In 1623 he returned to Madrid and joined the court of Philip IV., where his political writings sev. times brought him into trouble, especially with Olivares, who had him imprisoned at Leon from 1639 to 1643. His work was varied and facile, but he wrote little of permanent value. His political works include *Política de Dios* (1626), an attack on the gov., and its apologue, *Hell Reformed* (1628). His best work is a brilliant picaresque novel, *Vida de Buscón Píbelos*, or *Gran Tacaño* (1626). It was trans. into Eng. by J. Davies (1657), by Capt. John Stevens (1697-1707), and by Watts as *Pablo de Segovia* in 1892. It is run close by his *Las Visiones* (1627), a vol. of fantastic philosophical essays, trans. into Eng. by Roger l'Estrange (1667, 1901). He also wrote sev. devotional prose works, sev. interludes and comedies, and occasional verse. The best collected eds. is in the *Biblioteca de Autores Españoles*. See lives and studies by J. Juderías, 1923, and L. Astrana Marín, 1925.

Quezon, Manuel Luis (1880-1941), first president of the Philippine Is., b. in humble circumstances in Luzon. He studied at the univ. of Santo Thomas but left to join the insurgents under Aguinaldo. Later he returned to the univ., was called to the Bar and became dist. attorney in Mindoro. A member of the first native Filipino Assembly, he began his long political association with Sergio Osmeña, another young lawyer, whom Q. had appointed speaker in the assembly. Osmeña estab. himself as the champion of the native movement for independence while Q. went to the U.S.A. as resident commissioner in Washington to plead for independence. Q. soon realised that the security of the Is. depended on strengthening their ties of friendship with the people of the U.S.A. His efforts resulted, in 1916, in the passing of the Jones Act, providing for a measure of autonomy and eventual independence. He then returned to Manila, becoming a senator there. But financial chaos now prevailed and the U.S. Gov. tightened their control over the Is. affairs with the result that Q. withdrew from politics until 1931. This time Osmeña went to Washington to obtain terms for an agreement, but Q. regarded them as inadequate and, being successful at the polls, himself went to Washington once more and, with the Democrats in office, had no difficulty in procuring a treaty increasing Filipino powers of self-gov. with a promise of freedom after ten years. In 1935 he was elected the first president of the commonwealth of the Philippine Is. by an overwhelming vote. He then invited Gen. MacArthur to become his military adviser

and to organise the Philippine armed forces. His second term was inaugurated in an air-raid shelter in Dec. 1941, and it was not until a personal message from President Roosevelt reached him in 1942 that he left the Is. and, with his family and Cabinet members, joined MacArthur in Australia. A Bill was passed in Congress to enable him to retain the office of president until the Is. were cleared of the Jap., but he died from tuberculosis in New York in 1944. Q. lacked administrative experience but exercised his office with enthusiasm and dignity.

Quia Emptores (literally 'whereas purchasers,' from the opening words), statute passed in 1290 to stop the practice of subinfeudation. The Act directed that upon all sales of land the feeoffee (grantee) should hold the same, not of his immediate feoffor (grantor) but of the chief lord of the fee (or fief), of whom such feoffor himself held it. By granting out the whole or part of his estates to an under-tenant, any feudal tenant could, prior to 1290, escape his feudal obligations to his own overlord. The effect of the Act was to stereotype as from that date the number of fee simple (see ESTATE, FREE) estates or 'manors' in the country and to make freehold rent-service (see RENT) possible only as incidental to the reversion.

Quia Timet. A Q. T. action (lit. 'because he fears,' from the words in the form of the petition) in a court of equity (see EQUITY) has for its object the prevention of apprehended wrong. Instances of equitable remedies granted in such an action are the appointment of a receiver, the making an order to pay a particular fund into court, a garnishee order on money in a bank, an injunction (see INJUNCTION).

Quiberon, peninsula, fishing tn., and seaside resort of the dept. of Morbihan, Brittany, France, opposite Belle Ile. The peninsula (an Is. before the Middle Ages) is united to the mainland by an isthmus defended by Fort Ponthièvre. In the bay of Q., Hawke defeated the Fr. fleet under Confians (1789). In 1795 the Republicans under Hoche crushed the Royalist insurgents under D'Hervilly and Pélissier, supported by the Chouans and the Em. fleet, and suppressed their attempt to stir up La Vendée and Brittany against the Convention. There is a daily ferry to Le Palais (Belle Ile). Sardine fisheries are exploited. Pop. 3300.

Quiché, dept. of Guatemala, Central America. Its cap. of the same name (or Santa Cruz del Q.) is 90 m. W. of Guatemala city and stands 6500 ft. above sea level. The ruins of Utatán, the Indian city which the Spaniards destroyed, are near by. Pop. 18,000. Some 54 per cent of the pop. of Guatemala are pure Indians of twenty-one different groups descended from the Maya-Q. tribe.

Quichuas, or Quechuas, were an anct. Peruvian tribe whose original country was a dist. to the N. of the present dept. of Ayacucho. This tribe, under the Inca sovereigns during the thirteenth and fourteenth centuries, subjugated all the country from Ecuador to Bolivia and

Chili. They rose to a high state of civilisation, the gov. being a theocratic tyranny, and the king aided by an hereditary aristocracy; but the rule of the dominant caste was enlightened. Floods were made, and the use of metals known, whilst in architecture they excelled. Their religion was a form of sun-worship. Writing was unknown, but hieroglyphics were used, and records, etc., kept by a system of knots in cords. At the fall of the Incas they submitted to the Spaniards, rebelling in 1780, but being suppressed. The Q. language is a rich agglutinative tongue. The people themselves, mostly engaged in agriculture, now number about 3,000,000, being of medium stature, olive in colour, with aquiline noses and straight black hair.

**Quickens**, or **Quick Grass**, see **COUCH GRASS**.

**Quicklime**, see **CALCIUM**.

**Quicksand** (*quick*, living, moving), bed of mass of loose, moving sand, saturated with water to such an extent that it readily yields to pressure and cannot support the weight of people or animals. It is usually very fine, mixed with clay or calcium carbonate. Sometimes fine mud with a thin layer of sand is called Q. Small tracts occur fairly frequently at riv. mouths (especially in the rivs. of Ireland), or along the coast, differing little in appearance at a glance from the shore of which they form part. Old writers sometimes gave the name to the drifting sands (of a desert or the seashore) carried by the wind over the neighbouring cultivated land.

**Quicksilver**, see **MERCURY**.

**Quickswood**, Baron, see **KEIL, LORD HIGH RICHARD HILTHOUT**.

**Quidde**, Ludwig (1858-1911), Ger. historian and pacifist, b. at Bremen, who, in 1892, led the Ger. peace movement, founding and editing the *Deutsche Zeitschrift für Geschichtswissenschaft* (1889-95). An outspoken democrat, he was imprisoned for a short term in 1894 for attacks on the militarism of imperial Germany in a book entitled *Caligula*. He became a member of the Republican Reichstag in 1919, was president of the Ger. Peace Society from 1914 to 1929 and of the Ger. Peace Cartel from 1920 to 1929, being the recipient (with Ferdinand Bausson) of the Nobel prize for peace in 1927. His publs. also include *Folkerverband und Demokratie* (1920) and *Die Schuldfrage* (1922).

**Quid Pro Quo**, in law, the giving of one thing of equal value for another; or the mutual consideration and performance of both parties to a contract. See **CONSIDERATION**; **CONTRACTS**.

**Quietism**, name given to a form of mysticism which has shown itself at different times in the Christian Church. The fundamental tenet of Q. is that the final state of union with God is reached when the soul is in a state of perfect inaction, and that in this union the soul is purely passive under the action of the Divine Light. The belief was held by many heretical sects of the early Church in both E. and W., and its affinity with

the Neoplatonic doctrine will at once be seen. The name, however, was first used in connection with the adherents of the Sp. priest, Molinos, whose book, *The Spiritual Guide*, was condemned in 1687. Mme Guyon is one of the best known of the Quietists, and through her similar views were accepted by Fénelon till they were condemned by Innocent XII. in 1699, when he repudiated them. The Quakers' doctrine of the inward light is very similar to that held by the Quietists. See J. Denis, 'Quietisme,' in *Mémoires de l'Académie de Caen*, 1891; H. Hoppe, *Geschichte der Quietistischen Mystik in der Kathol. Kirche*, 1875; and A. Farges, *Mystical Phenomena*, 1926.

**Quilca**, tn. and port of Peru, 30 m. by sea N. of Mollendo, is a deep and safe port, but suitable only for small craft. A road through Camana links it with the Pan-Am. Highway. The port serves the Camana valley, a cotton-growing centre, and other products include cattle and wine. The pop. of the valley, 20 m. distant over the coast road, is 9000.

**Quilimane**, or **Kilimane**, port of Portuguese E. Africa, on the Quilimane R. (Kwa-Kwa, N. branch of the Zambezi), about 8 m. from the sea; unhealthy owing to the surrounding mangrove swamps and rice-ground. Above Q. the riv. is navigable by canoes to Mopeia. Exports include ivory, copra, rubber, wax, coffee, oil-seeds, skins, and ground nuts. Pop.: tn. about 7000; dist., with Chinde about 530,000.

**Quiller-Couch**, Sir Arthur Thomas (1863-1944), Eng. author and prof. of Eng. literature, b. at Bodmin, Cornwall, eldest son of Thomas Q.-C.; and grandson of Jonathan Couch, of Polperro, 16th-centuryist. Educated at Newton Abbot College, Clifton College, and Trinity College Oxford, and while at the Univ. he pub. in 1887, *Dead Man's Shoes*, which met with considerable success, and enabled him to enter upon a literary career. This 'thriller' undoubtedly owed much to the influence of R. L. Stevenson, whose unfinished *St. Ives* he completed about this time. He went down from Oxford in 1887, after having been a lecturer in classics at Trinity for a year. After four years in London in literary adventures he returned to the W. country. In 1889 he married a daughter of John Hicks, of Fowey, and Cornwall was his home for the rest of his life. *The Astonishing History of Troy Town* (1888) introduced his favourite tn. Fowey under the name of Troy. In London in 1889 he joined the staff of the Liberal weekly, the *Speaker*, thus gaining some journalistic experience. In the *Speaker* he wrote weekly about current literature, his articles being collected in a vol. entitled *Adventures in Criticism*. Like Dr. Johnson Q.-C. made no fundamental distinction between good literature and good journalism. However trivial the subject, he always wrote with style. It is nevertheless true that his prominence as a critic dates from the pub. of his *Oxford Book of English Verse* (1900), which was on all hands recognised as the true

successor of Palgrave's *Golden Treasury*. In his early days he wrote under the pseudonym of 'Q.'. He was knighted in 1910, and in 1912 he was appointed King Edward VII. prof. of Eng. literature at the univ. of Cambridge, being elected a fellow of Jesus College. His inaugural address as prof. was delivered in Jan. 1913, and was followed by a series of lectures which now for many years have been well known and admired as books entitled *On the Art of Writing* (1916) and *On the Art of Reading* (1920). Amongst his books are *The Ship of Stars* (1899); *The Adventures of Harry Revel* (1903); *Hetty Wesley* (1903); *Sir John Constantine* (1906). He ed. *The Golden Pome*

SIR ARTHUR QUILLER-COUCH

Eng. lyrics, 1895); *The Oxford Book of English Verse* (1900); *The Oxford Book of Ballads* (1910); *The Oxford Book of Victorian Verse* (1912); *The Oxford Book of Prose* (1925); *The Poet as Citizen* (1934); and *Q's Mystery Stories* (1937). He was also general editor of the *Kings Treasures of Literature* (258 vols.), begun in 1920, and ed. with J. D. Wilson the comedies in the New Cambridge ed. of Shakespeare. His professorial lectures have been printed under the following titles: *Studies in Literature* (3 series, 1915), etc.; *Shakespeare's Workmanship* (his greatest work of criticism, 1920); and *Charles Dickens* (1925). There is a cheap collected ed. of his tales and romances, and a '*Q's Anthology*, ed. by F. Brittain (1948). His poems were collected in 1929. His unfinished autobiographical *Memories and Opinions* was pub. in 1944. See life by F. Brittain, 1917.

Quillota, tn. in the prov. of Valparaíso, Chili, about 26 m. N.E. of the tn. of Valparaíso. Its chief products are wine and copper. Pop. about 15,000.

Quilmes, industrial tn. of Argentina, on the Itoca railway. Noted for its large brewery, its other products include textiles, rayon, and glass. It has an Eng. college and a high school for girls. It is also a favourite summer resort. It has many Brit. residents. Pop. 100,000.

Quiloa, see KILWA KISIWANI.

Quilon, seaport tn. of Travancore, India, situated about 37 m. W.N.W. of Trivandrum. It is an old tn., and originally held a position of some importance. Pop. about 25,000.

Quilter, Roger (b. 1877), Eng. composer, b. at Brighton and educated at Eton. He studied music with Knorr at Frankfurt. He has never held any official musical posts. His works include opera *Julia*; radio opera *The Blue Boar*; incidental music for Shakespeare's *As You Like It* and the children's fairy-play *Where the Rainbow ends*; *Children's Overture* on nursery tunes; serenade, *Three English Dances*, etc., for orchestra; song-cycle *To Julia* (Herrick), songs to words by Shakespeare, Tennyson, and others, etc. Q.'s songs are especially and deservedly well known. His artless melodic invention has a refined and distinctive harmonic spirit which outweighs distinct limitations of manner.

Quilting, see under EMBROIDERY.

Quimper, or Quimper-Corentin, cap. of the dept. of Finistère, France, situated about 36 m. S.E. of Brest on the R. Odet. Its cathedral, dating from the thirteenth century, is a beautiful example of Gothic architecture. It is a fishing tn., and manufactures pottery and paper. Pop. 20,100.

Quimperle, tn. in the arron. of Quimper, Finistère, France, situated about 27 m. S.S.E. of the tn. of Quimper. Pop. 10,700.

Quin, James (1693-1766), Eng. actor, son of an Irish barrister, b. in London, and educated at Dublin. He made his first appearance on the stage in 1710 at Dublin, and in 1714 was seen at Drury Lane Theatre, London, in small parts, making his mark in Nicholas Rowe's *Tamerlane* the following year. In 1716 he went to the theatre in Lincoln's Inn Fields, where he remained for fourteen years. The rest of his career was divided between Covent Garden and Drury Lane. He was acknowledged to be the finest actor in England till the appearance of Garrick in 1741. Falstaff in *King Henry IV.* was the character in which he excelled. See anonymous life, 1887.

Quin, Windham Thomas Wyndham-, see DUNRAVEN AND MOUNT EARL, EARL OF.

Quince (*Cydonia vulgaris*), low spreading tree (family Rosaceae) with white or pink flowers, followed by fragrant but bitter yellow fruit, which when mixed with apples makes an excellently flavoured preserve, and is often used in pies and tarts. The tree is surface-rooting, making a large number of fibrous roots, and is therefore an excellent stock on which to graft pears. The Jap. Q. (*C. japonica*) is a small tree, bearing oval leaves and fine red flowers, for which it is frequently grown in gardens. It is probably a native

of Persia, and has been cultivated from a remote period.

**Quincey**, Thomas de, *see* DE QUINCEY.

**Quineux**, arrangement of five objects set so that four are at the corners of a square or rectangle and the other at the centre (e.g. the five on dice or cards); it is frequently adopted in plantations. In medieval astrology the word was used to describe an arrangement of planets when at a distance from each other of five signs, or 150°.

In botany *Q.* denotes a particular arrangement of the leaves which is found in certain trees such as the apple, pear, and cherry. The sixth leaf on a stem is vertically above the first, after two turns of the spiral. *See also* under ROMAN ARMY.

**Quincy**, Josiah (1772-1864), Amer. statesman and patriot, b. at Boston, graduated at Harvard, and called to the Bar in 1793. He became a leader of the Federalist party in Massachusetts in 1800, and remained in Congress till 1812. He possessed fine oratorical powers, and a statesmanlike grasp of affairs. In 1822 he was appointed judge of the municipal court of Boston, and in 1829 president of Harvard Univ., a position he retained till 1845. His last years were spent in retirement, chiefly on his farm in Quincy. Amongst his pubs. are *History of Harvard University* (2 vols.) (1840); *The Municipal History of Boston* (1852); and *Memoir of John Quincy Adams* (1858). *See* *also* by E. Quincy, 1867.

**Quincy**: 1. Co. seat of Adams co., Illinois, U.S.A., on the Mississippi, 95 m. from Springfield. It has fine public buildings and parks. Manufs. include stoves, vehicles, agric. implements, incubators, and tobacco, and there is trade in grain. Pop. 40,000. 2. City of Norfolk co., Massachusetts, U.S.A., on Q. Bay, 8 m. from Boston, noted for fine granite quarries. There are shipbuilding yards and foundries, and manufs. of oils, chemicals, boots and shoes, ironware, etc. It has historical interest and was the bp. of John Hancock, John Adams, and John Quincy Adams. Pop. 72,000.

**Quinine**, alkaloid found in the bark of various species of cinchona, from which it is obtained by mixing the bark with milk of lime, treating with boiling alcohol, and extracting the alkaloid in the form of the sulphate by adding dilute sulphuric acid. The sulphate, which is the form most generally met with, is soluble in 780 parts of cold water, but is more readily soluble in hot water and in alcohol. It is used in medicine as a tonic, an antipyretic, and a specific in malaria, in which disease its value is most pronounced. It acts as a stimulant to the nervous system, lessens the ameboid movement of the white corpuscles, and lowers the temp. If it is higher than normal. Taken in excess, it produces ringing in the ears, disturbance of the vision, headache, and irritation of the digestive tract. Its chemical formula is  $C_{20}H_{24}O_2N_2 \cdot 3H_2O$ , and its molecular structure has been elucidated by Koenigs and other chemists. It has recently been synthesised by Woodward and Döring

from hydroxyisoquinoline. *See also* CINCHONA BARK, ALKALOIDS.

**Quinoa** (*Chenopodium quinoa*), herb, allied to the common Brit. goosefoot, cultivated in Chili and Peru for its seeds, which are boiled like rice for eating, or are roasted to produce a coffee-like decoction known as carapulcr.

**Quinol**, or **Hydroquinone**, colourless crystalline solid (m.p. 169° C.), known in chem. as paradihydroxybenzene. It is prepared by reducing quinone (q.v.) with sulphurous acid (q.v.), and owing to its strong reducing powers it is used as a photographic developer.

**Quinoline** ( $C_8H_7N$ ), aromatic base occurring with its isomer, *isoquinoline*, in the fraction of coal-tar collected between 236 and 243° C.; it is usually prepared by the 'Skraup' reaction, viz. heating a mixture of aniline and glycerol with concentrated sulphuric acid and nitrobenzene. *Q.* is a colourless liquid, boiling at 239° C. It has a pleasant smell, is sparingly soluble in water, but dissolves readily in alcohol, ether, and chloroform. *Q.* itself is used as an insecticide, and certain of its derivatives are valuable medicinally. *See also* LERCOIN.

**Quinones**, class of organic compounds known as the *Qs*. The simplest member of this class, benzoquinone ( $C_6H_4O_2$ ), is obtained by oxidising aniline with potassium dichromate and sulphuric acid. It is a yellow crystalline solid, melting at 116°, has an irritating smell, is volatile in steam, dissolves sparingly in water but readily in alcohol and ether. Many other *Qs* can be obtained by the oxidation of certain hydroxy- and amino-compounds with chromic acid. They possess the same general physical properties. Anthraquinone,  $C_{14}H_8O_2$ , is important as the source of many valuable dyestuffs, while benzoquinone (often known simply as '*Q.*') yields the photographic developer quinol (q.v.), when reduced with sulphurous acid.

**Quinquagesima** (Lat. fiftieth), Lat. name for the Sunday before Ash Wednesday. Counting roughly, this Sunday is fifty days before Easter, and on this account receives its name. It is rather difficult, however, to explain satisfactorily the names of this and the two preceding Sundays, as the time of beginning Lent varied very considerably in the early church.

**Quinquereme**, anct. type of warship propelled by five banks of oars on either side. It is said to have been introduced by Dionysius of Syracuse about 400 B.C.

**Quinsy**, *see* under TONSILS.

**Quintain** (from Lat. *via quintana*, the place for exercise in a Rom. camp), name given to an object, mounted on a support, to be tilted at, a pastime in vogue in the Middle Ages. It was generally a swinging bag, although the post itself had sometimes to be struck so as to smash the lance.

**Quintal** (connected with Lat. *centum*, 100), weight used in Spain, Italy, Portugal, and Argentina. It equals 100 libras, but as these vary somewhat it is equivalent in Spain and Portugal to 101·4 lb.

and in the Argentina to 101.27 lb. The old Fr. Q. was equal to 100 livres (108 lb.) and the metrical Q. is 100 kilograms (220.49 lb.).

**Quintana de la Serana**, tn. in the prov. of Badajoz, Spain, about 66 m. E.S.E. of the tn. of Badajoz. Pop. 8000.

**Quintanar de la Orden**, tn. in the prov. of Toledo, Spain, about 57 m. S.E. of the tn. of Toledo. Pop. 9000.

**Quintana Roo**, federal ter. of Mexico, in the Yucatan peninsula, with the Caribbean Sea to the E. Constituted in 1902, it has an area of 19,438 sq. m. Cap. Chetumal. Pop. 18,800.

**Quintero**, Serafin Alvarez (1871-1938), and Joaquin Alvarez (1873-1944), Sp. dramatists, brothers, b. at Ultrera, Seville. In their graceful plays they revived the traditional humour of Rueda's *pasos*. Most of their pieces have a background of Andalusian life. Some are *Los Galeotes* (1900); *Las Flores* (1901); *Malvaloca* (1912); and *La Calumniada* (1919). They are not remarkable for deep moral or social purpose, nor indeed for characterisation, but the dialogue is always irresistible. See Helen and Granville Barker, *Four Plays by Joaquin and Serafin Quintero*, 1923.

**Quintet**, musical composition, written for five parts, vocal or instrumental, in which each part is essential to the rendering of the whole work, more particularly a chamber work in sonata form for five instruments, usually pianoforte and string quartet (pianoforte Q.) or five stringed instruments (string Q.). Of vocal Qs., the most famous is that which occurs in Wagner's *Meistersinger*. Qs. for stringed instruments have been composed by Mendelssohn, Schubert, Beethoven, and others, while Qs. for other instruments have been written by Mozart, Raff, Brahms, Schumann, and Schubert.

**Quintilian** (Marcus Fabius Quintilianus) (c. 40-c. 100), Rom. critic and rhetorician. Probably b. at Calagurris, N. Spain, and educated at Rome. In 68 he returned to Rome in the train of Galba, and obtained a high reputation as a pleader and teacher of oratory. His great work is *De Institutione Oratoria*, a treatise in twelve books on the education of a rhetorician. It is written in a clear though ornate style, exhibiting excellent judgment, taste, and learning. The best eds. are by G. L. Spalding, C. T. Zumptius, and E. Bonnell (1798-1834). C. Halm (1868-69), F. Meister (1887), and A. Radermacher (1917-35), and there are Eng. trans. by Guthrie (1756), J. Paterson (1774), J. S. Watson (1855-56); and F. H. Colson (1924). See J. Cousin, *Etudes, sur Quintilien*, 1936.

**Quintinus**, or Quentin, St. (d. 287), traditionally supposed to have been a Rom. by birth. A missionary to Gaul, he converted the inhab. of the Amiens dist., being martyred at the tn. now called St. Quentin.

**Quintuple Treaty** (1839). Celebrated 'scrap of paper,' the breach of which was the immediate cause of the entry of Great Britain into the First World War. It was by this treaty that the neutrality of

Belgium was guaranteed by the great powers after Belgium had revolted from the union with the Netherlands in 1830. The Q. T. imposed a moral obligation on each signatory to respect its provisions irrespective of whether these were violated by any other signatory. Strictly there were two treaties: the first, wherein the king of the Netherlands agreed with the five powers (Austria, France, Great Britain, Prussia, and Russia) to recognise the existence of Belgium as 'an independent and perpetually neutral state, bound to observe neutrality toward all other states'; the second (not signed by the Netherlands), whereby the five powers guaranteed the provisions of the first treaty. An important feature of this treaty is that it omitted provisions in previous agreements (which were of a temporary nature) for the occupation of Belgian fortresses by Great Britain and Prussia. Thus no signatory contemplating a breach could start with this definitive advantage over the other signatories. In 1866-67 a draft second treaty was concluded between France and Prussia by which Napoleon III. proposed that he should annex Belgium in consideration of facilitating the union of Germany with and under Prussia in the 'North Ger. Confederation.' Bismarck betrayed this conspiracy and gained his object without paying the price. When the Franco-Prussian war of 1870 broke out the Brit. Gov. asked the belligerents to state their intentions with regard to Belgium. Neither wished to invite Great Britain's intervention and hence each disavowed any intention of crossing the Belgian frontier, and duplicate treaties were signed to that effect, the Brit. Gov. undertaking at once to declare war on the party infringing this proviso. These treaties were to be operative during the war and twelve months after, the independence and neutrality of Belgium depending on the expiration of that period, as heretofore on the treaty of 1839. To whatever degree this treaty was made in the interests of the guarantors it was clearly as much to Belgium's advantage. Its violation by Germany was not seriously defended by the Ger. Gov. See BELGIUM; NEUTRALITY.

**Quintus Calaber** (Calabar or Smyrnaeus), Grk. poet of the fourth or fifth century A.D., so called because his epic, *Paralipomena Homeri* or *Posthomerica* (continuing the Trojan war from Hector's death to the return of the Grks.), was discovered at Otricoli in Calabria in the fifteenth century. His materials were mainly derived from the cyclic poets, especially Lesches and Arctinus. The first ed. of Q. was printed with Tyrphodorus and Coluthus (probably his contemporaries) by Aldus (c. 1505). See eds. of T. C. Tychsen (1783, 1807) and H. A. T. Koehly (1853); and A. Byce, *Select Translations*, 1821. See G. W. Paschal, *A Study of Quintus of Smyrna*, 1904.

**Quintus Curtius Rufus**, see CURTIUS. **Quintus of Smyrna**, see QUINTUS CALABER.

**Quipu** (Peruvian *quipu* knot), also

*quippu*, *quipo*, *quipos*, *quipus*, or *kipus*, was a knot device of communication employed in anct. Peru. It generally consisted of a number of threads or cords of different length, thickness, and colour, mainly of twisted wool, hanging from a top-hand or crossbar. It was used as a method of recording historical events and edicts, reckoning accounts, and sending messages. The number, size, position, distance apart, and colour of the knots all had particular meanings. Some other anct. peoples (in China and Tibet) and some primitive tribes of the present day have also employed similar mnemonic devices of communication.

**Quirinal**, one of the seven hills on which Rome was built, N. of the Palatine, and one of the oldest quarters of the city. On it stands the Rom. palace of the kings of Italy, known by the same name.

**Quirinus**, see ROMULUS; MARS.

**Quirites**, name which the citizens of Rome assumed in their civic capacity. It is connected with Quirinus, an anct. Rom. deity possibly associated with Mars.

**Quisting, Lauritz Vidkun Abraham** (1887-1945), Norwegian politician, b. at Eysedal, graduated in 1911 from the Norwegian royal military academy. From 1921 to 1926 he worked for Nansen and for the League of Nations, residing mainly in Moscow. He entered politics on his return to Norway in 1929, proving a rabid anti-Communist, though few Norwegians ever regarded him seriously. He became defence minister in 1931, later founding a Fascist party, the Nasjonal Samling; but his activities as a minister were criticised continuously and his motives were suspected. His actions during the Second World War gave a new name to the old crime of treason. In April 1940 Dr. Brauer, Ger. minister in Oslo, insisted, after the Norwegians had repulsed the Ger. motorised force sent against Oslo, that Q. must lead any administration the Gers. were willing to accept. But although Kolst, the Norwegian foreign minister, appeared ready to consider a change of gov. which would make possible collaboration with Germany, this submission to a discredited puppet was too much to ask and the king refused Brauer's demand. After the betrayal by Q. public opinion was so strong against him that even the Gers. could not ignore it. Hence Q. was shelved and did not reappear until Sept. 1910, when the Gers. made their capital blunder of restoring Q. to power at the same time as they disposed of all the political parties except Q.'s party, Nasjonal Samling. Having shelved Q. for the first time the Gers. tried to win the Norwegians over by assuming the role of friendly 'protector.' This was Norway's most dangerous hour, but the people were intransigent and the opposition stiffened. By the end of Sept. 1940 Terboven, the Ger. governor, threw off the mask, and, in a series of so-called decrees, 'deposed' King Haakon, dissolved the gov., abolished all political parties except Q.'s own, and set up a puppet gov. entirely composed of quis-

lings. After the surrender of Germany the Q. or traitor 'gov.' fled the country (though Q. stayed), and the Norwegian Gov. returned to Oslo from its temporary refuge in London. Q. was eventually tried for treason and executed. See NORWAY, History.

**Quisqualis**, genus of climbing shrubs (family Combretaceae), with terminal clusters of white or orange-red flowers, natives of India and the Malay Archipelago. *Q. indica* is grown in stovehouses.

**Qui Tam**, in law the name given to a penal action (see PENAL STATUTES) in which part of the penalty is given to the Crown and the other part to the common informer. So called because the writ describes the plaintiff as one '*qui tam pro domino rege quam pro se ipso sequitur*' ('who sues as well for himself as for the king').

**Quito**, city in the prov. of Pichincha, and the cap. of Ecuador, situated about 160 m. N.N.E. of Guayaquil. Nearly 10,000 ft. above sea level, it enjoys a temperate climate, though close to the equator. Although, indeed, Q. is almost on the equator, the air is always chilly owing to the altitude; the average monthly temp. is 51° F., with a range of less than one degree. Q. is well arranged, and has sev. large squares among them the Plaza Mayor. The centre of the tn. is the Plaza Independencia, a plaza of gardens, fountains, and tropical trees. The city is old and was originally the cap. of the Incas, estab. on the site of an old Indian vil. on the slopes of the volcano Pichincha. The volcano is no longer active, and on its lower, gentler slopes are small farms devoted chiefly to grains and potatoes. Q. has a univ. and a fine cathedral, the see of an archbishop. The chief manufactures are shoes, woollen and cotton materials, saddles, blankets, and carpets. The railroad to Q. has its terminal on the E. bank of the Guayas R. There is an air service between Q. and Guayaquil. During the colonial period Q. was administered first from Lima and later from Bogotá. When the wars of independence freed the colonies from Spain, Q. was included with Colombia and Venezuela in a 'Greater Colombia,' which Bolívar vainly attempted to form and administer from Bogotá. Pop. 142,100.

**Quit Rents**, one of the peculiar remaining incidents of copyhold tenure. The name is also given to freehold or 'chief-rent' (see QUIA EMPHOUS). By the Conveyancing Act, 1881 Q. R. may be redeemed by paying to the person absolutely entitled the price certified by the Ministry of Agriculture.

**Quixote**, Don, see under CERVANTES SAAVEDRA, MIGUEL DE.

Qum, see KUM.

**Quoins**, blocks at the corners of buildings, which together make up the external angles. When projecting a little, they are termed *rustic* Qs. (see MASONRY). Also short blunt wedges used by compositors to secure the type in the chase. Mechanical Qs. worked by a central screw operating an expanding device are sometimes used. The term is applied in many

trades, etc., to pieces of wood, stone, etc., used for wedging.

**Quoits**, game having some resemblance to the anct. practice of discus-throwing, though it is more skilful and does not require so much strength. The game is played as follows: two iron or steel pins or 'hobs' are placed in the ground at a distance of 18 yds. apart, and round each of them a circle of 3 ft. diameter is drawn. Play may be from either end, as in bowls. The object of the game, which may be played by any number of players divided into sides, is to throw the Q. as near the pins as possible. A ringer (or quoit surrounding the pin) counts two points, and the quoit nearest to the hob one point. The curling and bowling principles of driving away opponents' balls are followed. The quoit is, as a rule, about 7-9 lb. in weight, not more than 8½ in. in diameter, and with a hole of about 2½ in. diameter for the thumb or forefinger. Q. dates from the fifteenth century, and is played now in Britain, principally in Scotland, Lancashire, and the Midlands. It is also played in America.

**Quorn**, one of the most famous hunts and hunting packs in England, named from Quorndon (q.v.), though its actual centre is at Melton Mowbray.

**Quorndon**, par. and tn. of Leicester-shire, England, 2 m. from Loughborough, 1 m. from Barrow station. Pop. about 3100.

**Quorra**, see NIGER.

**Quorum**. In law a justice of the peace is said to be of the Q. when the commission appointing him expresses that he is one of those whose presence is necessary to constitute a bench, as at quarter sessions. The term Q. in this context is derived from the words in the Lat. form of the commission: 'Quorum unum A. B. esse volumus' ('Of whom we will that A. B. be one'). Hence by analogy, in any assembly, committee, etc., when it is necessary that a certain number of officers or members should be present to give validity to its acts, that number is said to constitute a Q.

**Quota**, commercial term in international trade. In treaties negotiated after the First World War it signified the quantities of essential commodities for which export and import licences were issued respectively by the countries concerned. Also, after the First World War, immigration Qs. based on preferences for certain races—such as the Nordic in America—as immigrants were estab. in the U.S.A. and in other countries (see IMMIGRATION). The Brit. Colonial Office in 1934 introduced a Q. scheme for imports of secondary goods into the Crown colonies in order to restrict the excessive importation of 'sweated' goods from Japan (the introduction of higher tariffs was out of the question as being incompatible with the Congo Basin treaties governing preferential tariffs in the import trade of African dependencies and providing, *inter alia*, for completely free trade within the area to which the treaties applied). Great Britain also has a film Q. establishing

the proportion of Brit. films which must be shown. The Brit. Gov. also applied the Q. system to the importation of wheat and other foodstuffs after the First World War. In Great Britain the term also refers to the proportion of home-grown wheat to be used by millers under the provisions of the Wheat Act in making flour. See further under AGRICULTURE, A. during and since the First World War.

**Quotidian Fever**, see MALARIA.

**Quo Vadis?**, see SIENKIEWICZ, HENRYK. **Quo Warranto**, old writ formerly issuing from the king's bench div. against any one who claimed or usurped any office, franchise (q.v.), or liberty, to inquire by what authority he supported his claim, in order to determine the right. It lay also in case of non-user or long neglect of a franchise, or abuse of it, and commanded the defendant to show by what warrant he exercised such franchise, having never had any grant of it or having forfeited it by neglect or abuse. The judgment on a writ of Q. W. was final and conclusive, even as against the Crown. It has long ago fallen into disuse, having been superseded by an *information* (a mode of criminal prosecution) filed by the attorney-general. The term is especially applied to a unit of inquiry set up in 1278 by Edward I., who desired to examine the warrants by which barons and corporations owned land and exercised jurisdiction, in an attempt to prevent encroachments on the privileges of the Crown.

**Qurna**, El, or Kurna, tn. of Iraq, 45 m. N.W. of Basra, on the Tigris. The reputed site of the Garden of Eden is in the dist. The tn. has strategic importance, and stands on an anct. site.

**Qutb-ud-din Aibak** (d. 1210), founder of Muslim dominion in India. He fl. in the late twelfth and early thirteenth centuries, during Mohammad Ghori's invasion of India. Q., in his youth, had been brought as a slave from Turkestan, but after being sold to the local governor of Nishapur, passed into the hands of Mohammad. He was a fine rider and a good archer, was well enough educated, and rose to the highest rank in the service of Mohammad, who appointed him viceroy of his N. conquests. After the death of Mohammad Ghori Q. became independent and ruled N. India until his death in 1210 from an accident at polo. The royal line he estab. on an insecure throne is known in Indian hist. as that of the 'slave kings' from the origin of Q. His death was followed by revolt among both the Muslims and Hindus and, in 1211, the Muslim nobles offered the throne to Shams-ud-din Iltutmish, son-in-law of Q. and a member of a prominent Turkman family. Q. and Iltutmish between them erected on an enclosed space at Delhi the magnificent buildings known as the Jamī mosque (Jamī Masjid), the first to be built in India, and the Kutb-ud-din or Quwwat-ul-Islam mosque. See Sir H. Sharp, *Delhi: its Mosques and Buildings*, 1926; J. A. Page, *A Guide to the Qutb (Delhi)*, 1936; and Sir G. Dumbkar, *A History of India* (new ed.), 1943.

## R

**R**, the eighteenth letter of the Eng. alphabet, was the nineteenth in the numerical, seventeenth in the ordinary, (Gk. alphabet, seventeenth in the Rom., and twentieth in the Phœnician. The earliest form of *r* was the Phœnician 𐤓; in Gk. the symbol became *ρ*, a short tail being at one time added, from which the Lat. and Eng. *R* is derived. Other forms of *r* were introduced at different times. The Semitic name of the letter is *rēsh*, meaning 'head' (*rōsh*), but it is doubtful whether this letter ever had the form of a head. The value of the character is always the same, a continuous sonant utterance made between the tip of the tongue and the roof of the mouth at a point more or less removed from the upper front teeth. The sound of *r*, however, varies more than that of any other consonant, accordg. to language or dialect. A syllabic *r* is found in many languages, and was probably present in the Indo-European mother-tongue. The Semitic *r* was probably trilled, whilst the *r* of modern India is a cacuminal *r*. In Chinese the sound *r* does not appear. In Great Britain Scotsmen and Welshmen trill their *r*'s more than Englishmen; Ger. and Fr. *r*'s are on the whole uvular. In chem. *R* is often used as a symbol for an alkyl group,  $C_{n+1}H_{2n+1}$ , while *Ra*, *Rb*, *Rc*, *Rd*, *Rn* and *Ru* are the symbols for one atom of radium, rubidium, rhenium, rhodium, radon, and ruthenium respectively.

**R101**, see under **ARSHIP**.

**Ra**, see **Egypt (HISTORY)**.

**Raab**, see **Gyor**.

**Raabe, Wilhelm** (1831-1910), Ger. novelist, *b.* at Eschershausen, Brunswick. He was a student at Berlin Univ., where he took up philosophy, and while there pub. his first work, entitled *Die Chronik der Sperlingsgasse* (1857), which was well received. At Stuttgart he wrote *Der Hungerpastor* (1863); *Abu Talfan* (1868); and *Der Schudderdump* (1870). His later works, among which were humorous novels and historical tales, written at Brunswick, include *Höracker* (1875), considered by most people to be his masterpiece, and *Hasenbeck* (1899). His collected works were ed. by H. Klenum (3rd ed., 1935). See life by W. Herz, 1926, and F. Hartmann, *Wilhelm Raabe, Gedanken und Erinnerungen*, 1927.

**Raamsdonk**, com. in N. Brabant, Netherlands, 10 m. N.W. of Breda. Pop. 6000.

**Raasay**, is. of Inverness-shire, Scotland, close to the is. of Skye. It has rich deposits of iron ore. Length 12 m.; breadth 1 to 3 m.

**Rab**, see **ARBE**.

**Rabanus (Hrabanus, or Rhabanus) Magnentius 'Maurus'** (c. 776-856), Ger. Benedictine savant and prelate, of Fr.

parentage, *b.* at Mainz. He studied at Tours under Alcuin, returning to Fulda in Hesse (801), and founding there the first public convent school in Germany. He was made abbot (822-42), and became archbishop of Mentz (Mainz) in 847. He condemned Gottschalk (848) for his views on the doctrine of predestination. *R.* wrote commentaries on the Bible, martyrologies, homilies, and poetry, including the *Veni Creator Spiritus*, and was a prominent scholar of his era. See his 'Opera omnia' in J. P. Migne's *Patrologiae* and *Latinae Cursus Completus* (vols. cxi.-cxli.). See also the studies by T. Spengler, 1856; A. Köhler, 1870; and E. Dümmler, 1898.

**Rabat**: 1. (*R'bat el F'tah*, camp of victory), cap. and seaport of Morocco (W. coast), N. Africa, (Gharb prov., opposite Sali (Sallee, Sla), serving as the port of Fez, 110 m. W. Textiles, carpets, and pottery are manufactured; other exports are wool, skins, wax, cork, slippers, and beans. A bar at the mouth of the Bu-Regreg makes the entrance to the port dangerous. It was founded in 1190, and contains barracks, an arsenal, and an aqueduct. The most important feature is the half finished tower, 143 ft. high. The ruins of the anct. Shella or Sali Colonia are close by, with tombs of the Almohade and Marinide sultans. *R.* is an educational centre, and has an Institut de Hautes Etudes Marocaines, a school formerly maintained by the It. Gov., and the Institut Scientifique Chérifien, for research work. In 1928 teachers' training courses were started at the high schools for boys and girls. *R.* is on the route of the air service between Toulouse and Casablanca. There are modern port installations. During the allied landings in N. Africa, in the Second World War, Amer. forces occupied *R.* on Nov. 11, 1913, and the tn. became a base for the allied advance. Pop. 57,000. 2. Suburb of Mdina (q.v.), Malta, stretching along the spur from the fortified walls of that anct. tn. It covers much of the site of the Rom. city, and has various relics of that period, including the excavated Rom. villa, which, partly restored, is now a museum. The chief anct. monuments are the series of catacombs in which the dead of all periods have been buried. There are many churches. The par. church of St. Paul was founded in 1575 above the Troglodyte Church, which may have been one of the earliest places of Christian worship in the is. *R.* has a fine series of monasteries. Chief of these is the Dominican, with a baroque church and a fine cloister of late sixteenth-century date. The Augustinian has a church designed by Jerome Casar, engineer to the order at the time of the great siege and creator of many of the great buildings of Valletta. The Franciscans also have baroque

churches. The approach to the tn. under the walls of Mdina was ornamented by eighteenth-century grandmasters with fountains; near by are the tribunals, from which they watched horse-racing along a lane below. In the W. hills is Verdala Palace, 1586, a fortified tower, which forms the summer residence of the governor of Malta. On the hill of Mtarfa is a military hospital and barracks. R. is a large par., covering much of the lonely W. uplands scarred with anct. rock-tombs and troglodyte dwellings, many of which are still occupied. The high-perched eighteenth-century church of the Immaculate Conception looks out over the finest prospect in Malta.

**Rabaud, Henri** (1873-1949). Fr. composer, b. in Paris. He learned composition under Massenet, and in 1884 won the Grand Prix de Rome with a symphony and an oratorio entitled *Job*. He is best known by his operas, particularly *Méfistopheles*, first performed in 1911 at the Opéra-Comique, and *L'Appel de la mer*, based on J. M. Synge's *Riders to the Sea*, also first performed at the Opéra-Comique. He composed three other operas, *La Fille de Roland* (1904); *Roland et le mauvais garçon* (1934); and *Marine* (1947). *Eclogue*, which was suggested by Virgil's *First Eclogue*, and *Divertissement*, on Russian themes, are among his instrumental works. He also wrote two symphonies, film music, songs, etc. He was director of the conservatoire from 1920 to 1941, succeeding Gabriel Fauré in the post, and was also conductor at the opera.

**Rabaul**, chief port of the Australian mandated ter. of New Guinea, Pacific Ocean, in N.E. New Britain, with a fine land-locked harbour. The harbour may once have been a great volcanic crater, which became broken at one side, and consequently is connected with Blanco Bay. It is deep and offers excellent protection for ships of any size. About the harbour lies a semicircle of mts., of which The Mother and The Daughters are a part, and in fact the tn. of R. lies at the foot of The Mother. It was estab. in 1910 by the Gers.

R. is merely a vil., but in these remote is., with their small pop. of white officials, traders, and planters, it is a place of some importance and almost the only one possessing W. amenities. In June 1937 most of R. was threatened with destruction by an eruption of the volcanoes Mother and N. and S. Daughters. These eruptions covered the tn. with mud and forced the surviving inhab. to flee, and the authorities then sought some better location for the archipelago's headquarters, the administration moving to Salamaua in 1938. New Guinea was captured on Jan. 23, 1942, by the Jap., who surrendered to the Australians on Sept. 13, 1945, but R. had been eliminated as a base by June 1944. In 1947 the Australian minister for external ter. announced that Kokopo was to be the administrative cap. Pop. (1936) 83,000 (Europeans 26,000; natives 57,000). Present pop. (non-indigenous) 4700. See also under PACIFIC CAMPAIGNS IN SECOND WORLD WAR.

**Rabba**, see under NUPE.

**Rabbet**, or **Rebate**, groove or slot cut along the edge of a board to receive the edge of another board or a tongue. See JOINTERY; CARPENTRY.

**Rabbi** (Heb., 'my master'), title given to teachers of the law among the Jews. In N.T. times its use was not restricted, but in the course of the first century A.D. it became restricted to the president of the Sanhedrin if he wore of the family of Hillel. After the destruction of the Temple, and the rise of the Rabbinic schools, it finally became extended to all those authorised to decide legal and ritualistic problems.

**Rabbi ben Ezra**, see IBN EZRA.

**Rabbit** (*Lepus cuniculus*), herbivorous rodent, which, by its extreme fecundity, its great adaptability, and the decrease in its natural enemies, has spread rapidly and widely in temperate zones of the world. In Australia control has been, and is, costly, although cold-storage developments have made possible a large export trade in Rs. for the table. The wild R. resembles the hare but is smaller, with shorter head, ears, hind legs, and feet, is greyer in colour, and lacks black tips to the ears. Rs. are gregarious and promiscuous, burrowing extensively in the soil. They start to breed at about six months. Gestation lasts twenty-eight days. There are four to eight litters in the year with three to nine young per litter, born almost naked, blind, with closed ears, and completely helpless. In Great Britain young are born the year round, the largest litters in summer and the smallest in winter. There is apparently a pop. cycle also, increase, abundance, and decline taking five to seven years. In agriculture the R. ranks second only to the rat as a pest. Destruction is a legal obligation. The most effective methods are: (1) trapping, snaring, and ferreting in autumn and early winter, followed by a blocking of holes; and (2) gassing, by placing calcium or potassium cyanide powder in all re-opened holes. Under domestication Rs. may be kept as pets or bred for exhibition, fur, or for meat. Domestic Rs. are larger than wild Rs., more variable in colour and in features, such as pendent or lop ears, and length of coat.

**Rabbit-keeping**.—Rs. are kept commercially for meat production, fur, and pelts. For meat large cross-breeds such as Flemish Giant and Belgian Hare may be kept, but it is more profitable to rear dual-purpose breeds for meat and fur. The best breed for meat is the Chinchilla, which also gives a valuable skin or pelt. The best fur breeds for pelts are Rex varieties such as Chinchilla Rex, Lynx Rex, Sealrex, Sablerex, Havana Rex, and Lilac Rex. The pelts are more valuable than the meat carcasses. The long-coated Angora is excellent for wool, for which there is an unsatisfied demand. The yield averages 12 to 14 oz. yearly per rabbit, the useful life being three years. Rs. need constant attention, twice daily feeding, and once weekly cleaning-out. Feeding is economical, as the food consists largely

of waste leafy greens and roots (brassica leaves, carrots, turnips, pea haulms, red clover, chickory, etc.) and only needs the supplement of hay, straw, or cooked potato-and-bran mash in times of shortage. Food should be fresh, fed frequently and in small amounts. If Rts. are to thrive well. The size of the unit should be regulated by amount of food economically available in winter, but should include not less than six breeding does to be worth while, yielding about ninety Rts. annually. Housing consists of breeding hutches with compartments 27 in. wide, 22 in. deep, and 42 in. long; colony hutches such as small sheds, allowing 2 sq. ft. of floor space per R.; and finishing hutches with compartments 18 in. wide, 17 in. deep, and 22 in. high. Hutches should face S. or S.W., but be shaded from hot sun and sheltered from draughts. Breeding begins by mating up early in the year, late Jan. or early Feb., and three litters are usual, spaced throughout the year. Young Rts. are weaned at four to eight weeks, segregated as to sex, and placed in colony hutches. At about four and a half months bucks need to be placed in single hutches for finishing and to prevent damage to fur by fighting; the does need moving at about five to six months for finishing. Although valuable for their meat, the greater return comes from their pelts, and the R. should be pelted when in its best coat.

See J. Stimpson, *The Wild Rabbit*, 1908; R. Byng, *Angora Rabbit-breeding*, 1926; Ministry of Agriculture, *Modern Rabbit Keeping*, 1941; G. A. Townsend, *Practical Rabbit Keeping*, 1941; C. J. Davies, *Rabbit Keeping*, 1942; F. W. Jones, *The Rabbit*, 1944; and L. R. Brightwell, *Rabbit Rearing*, 1941.

Rabbit Berry, see SIKKERRIDIA.

Rabelais, François (c. 1490 c. 1553), Fr. satirist and humorist, b. at Chinon, in Touraine. He was trained for the religious life by the Franciscans, having been, according to the story, at the convent school of La Baume, near Angers, with the Du Bellays. In 1519 his name is found signing a purchase of the monastery of Fontenay. In 1521 he was licensed to be transferred to the Benedictines at Maillezeaux, and in 1530 gave up the regular for the secular priesthood. In 1531 he studied medicine at Montpellier, and later at Lyons, where he ed. works of Hippocrates and Galen. In 1532 he re-edited a popular medical romance chronicling the deeds of the great giant Gargantua (see below). In 1531 and 1535 he was at Rome in the suite of Cardinal Jean du Bellay, ambas. to the papal court. He obtained a papal licence to return to the Benedictines, and became a canon of St. Maur. He apparently studied medicine in various univs., and during the suppression of heterodoxy by the Sorbonne in 1516 he fled in Metz. In 1550 he returned, and obtained the curacy of Meudon, near Paris.

Works. As has been seen, R. ed. or re-edited in 1532 a book entitled *Les Grandes et Inestimables Chroniques du grand et enorme géant Gargantua*, which must be

distinguished from the later *Gargantua*, that formed the first part, but was probably written later than the second part (*Pantagruel*, the adventures of Gargantua's son) of his great work. *Pantagruel* appeared in 1533, was written by 'Alcofribus Nasier,' an anagram of F. R. Gargantua was pub. in 1535. In 1542 *Gargantua* and *Pantagruel* were pub. together in a revised ed., and in 1546 a third part came out. A fourth part appeared in 1552, and in 1562, nine years after R.'s death, came a fifth, of which the authenticity has been questioned, though it is now regarded generally as in essence by R., though possibly ed. and revised by another hand. *Gargantua* is the giant son of a giant father, Grandgousier. The first part tells of his education, which is a satire on the earlier teaching and an epitome of the new humanistic education; the abbey of Thelema is estab. on a model the exact reverse of the degraded monasticism of which R. was a devoted opponent. In the second book we are introduced to Pantagruel, Gargantua's son, his education and his meeting with Panurge, the beloved vagabond, a truly Falstaffian character, composed of wit, humour, raceality, and common sense. The other parts deal with the voyages in search of the lost 'Pantagruellion,' usually taken as an allegory of humour, and of the Oracle of the Bottle which answers with the enigmatic solution *Tringa* (drink). The voyages give a satire on every side of contemporary life and culture. This marvellous feast of rich humour and satire, and of profound human sympathy, educational ideals, and learning, is to modern minds defaced by its obscenity and grossness, an essential, it must be remembered, to the humour of the Middle Ages and later. It is frank and open, and has not the prurient nastiness of eighteenth-century wit and satire. R.'s writings reflect the struggle of the Renaissance against the Church, and their improbability and disproportion are but a cloak to cover his attacks. His characters are simple and unrefined. His doctrine may be summed up as advocating the development of both mind and body, and his rule of conduct was *Fay ce que voudras*. The exuberant humour and rich epic life of his *Gargantua* and *Pantagruel* doubtless have a deeper meaning than appears on the surface and R. himself tells the reader that he must 'break the bone in order to suck the marrow' if he wishes to find the hidden truth! In the same passage, however, he alludes to the 'doctrine absence' and 'myseries horribles' in his story, but this bombast indicates plainly that he is jesting, particularly at the mania of the Middle Ages of trying to interpret all things allegorically. R. relates much merely out of love for his theme, especially the coarse jests and obscenities with which his work abounds, and those who seek some esoteric meaning here will seek in vain; and the opinion that R.'s book is a complicated puzzle cannot be too much guarded against. His style is racy and picturesque, full of original imagery, but his power of verbal

invention beguiles him and then his language becomes a verbal feast of metaphors, neologisms, latinisms, synonyms, and proverbs jumbled together in indigestible confusion. Great writer as he is, R. is quite devoid of any feeling for beauty. The word 'Rabelaisian' connotes writings marked by exuberant imagination and language and coarse humour and satire. The great Eng. trans., a classic in its way, is that of Sir Thomas Urquhart, 1653, completed by Motteux. It has been issued in Everyman's Library. The best Fr. ed. of R.'s works is that of Marty Laveaux, 1868-1903. See Sir W. Besant, *Rabelais*, 1879; L. Sainéan, *La Langue de Rabelais*, 1922-23; S. P. Putnam, *Rabelais: Man of the Renaissance*, 1929; and lives by A. France, 1930, and J. C. Powys, 1943.

**Rabener, Gottlieb Wilhelm** (1714-71), Ger. satirist, b. at Wachau, near Leipzig. In 1741 he entered the office of the tax-collector at Leipzig. In 1763 he went to Dresden. He wrote for most of the popular periodicals, including the *Bremer Beiträge*. His *Sammlung satirischer Schriften* (1751-55), trans. as *Satirical Letters* (1757) are mildly satirical, marked by clearness, purity, and force, but somewhat marred by 'direct irony,' according to Goethe's criticism. See the ed. by C. F. Weiss, 1777; P. Richter, *Rabener und Liscow*, 1884; and study by W. Mühlhaus, 1908.

**Rabia I. and Rabia II.**, months of the Islamic calendar. For the Hegira year 1369 R. I. corresponds to Dec. 22, 1949-Jan. 20, 1950, and R. II. to Jan. 21, 1950-Feb. 18.

**Rabies, or Hydrophobia**, fear of water. This name is given on account of the spasm resulting from an attempt to drink, owing to the extreme irritability of the muscles of the neck concerned in swallowing. So irritable is the neck that the mere fact of blowing upon it will bring on the spasm. R. is contracted chiefly from dogs, but appears also in the cat, fox, skunk, and other animals, which come in contact with, or bite, humans. R. due to the wolf is particularly fatal, probably on account of the ferocity of the animal's attack, which is especially directed to the throat and face of its victim. Although, in medical language, there is no 'positive' proof of the presence of a virus, there is extreme probability that R. is due to an ultra-microscopic organism, which is so small that it can pass through a filter. Owing to the popular dread of the disease the legislature of the United Kingdom has permitted the muzzling of dogs, so that R. is practically extinct at the present time. As the result of similar measures in other countries and the estab. of Pasteur Institutes, R. is gradually being stamped out throughout the world. In the case of an animal suspected of being able to convey R. a definite diagnosis should be made, by examining the animal, or its head, at a Pasteur Institute, and the person bitten should receive preventive treatment. There is a probability, amounting almost to certainty, that R. will not result from a freely bleeding

wound. Moreover if the wound is treated with an antiseptic fluid R. is practically impossible. As an additional measure of precaution, however, stronger applications, or even the actual cautery, may be used by a medical attendant.

**Rabaisio, Tommaso da**, see MODENA.

**Rabshakeh**, title given in the O.T. (2 Kings xviii., xix.; Isa. xxxvi.-xxxviii.) to the officer sent by Sennacherib to demand from Hezekiah the surrender of Jerusalem.

**Rabutin-Chantal, Marie de**, see SÉVIGNÉ.

**MAIRQUISE DE.**

**Racalmuto**, tn. in the prov. and 12 m. N.N.E. of Girgenti, Sicily; has salt, sulphur, and quick-silver mines. Pop. 13,300.

**Racahout**, Arab word for a farinaceous food prepared from the acorn of the Barbary oak (*Quercus ballota*). The Arabs sweeten it and use it as a form of chocolate.

**Racconigi**, tn. in the prov. of Cuneo, Italy, on the Meira, 21 m. S. of Turin; it has manufs. of silks, woollens, and shoes. Pop. 8500.

**Raccoon**, or 'Coon (*Procyon*), genus of carnivorous animals allied to the bears. The common R. (*P. lotor*) ranges over the greater part of the U.S.A., though more plentiful in the S. states. It spends the day in hollow trees, not leaving them until nightfall to hunt for food, which consists largely of young birds, small animals, and also molluscs and other aquatic creatures. It is a handsome animal, resembling an arboreal fox, about the size of a large cat, and an excellent swimmer. The fur is brown in colour, and is long and thick, and consequently valuable. The tail is bushy and about 10 in. long, and is ringed with black and white. The muzzle of the head is sharply pointed, and the ears are small and round. The R. and the opossum are hunted at night with a pack of dogs trained to their pursuit, the R. being capable of a good pace, and making game fight if overtaken on the ground. The crab-eating R. (*P. cancrivorus*) ranges from Panama throughout a large part of the S. Amer. continent. Its fur is shorter than that of the common R., and its general shape more slender.

**Race**, see ETHNOLOGY; SPECIES.

**Race, Cape**, see NEWFOUNDLAND.

**Racehorse**, see HORSE; HORSE-RACING.

**Raceme**, inflorescence in which the elongated rachis bears pedicels of equal length, each with a flower.

**Race-meetings**, see HORSE-RACING.

**Racemic Acid**,  $C_4H_4O_6.H_2O$ , optically inactive form of tartaric acid. It may be obtained by evaporating a solution of the two optically active modifications of tartaric acid, dextrotartaric acid and levotartaric acid. The dextro-rotatory and levo-rotatory forms compensate each other in the product, which has therefore no action on the plane of polarisation, and is alternatively known as *d-l-tartaric acid*. It. A. melts at  $201^\circ C.$ ; its crystals show some difference in form from those of *d-* and *l-tartaric acid*, but chemically they are identical. Racemates can be formed with various bases; but in the case of the

sodium ammonium salt, if it be allowed to crystallise at a temp. below 27° C., the resulting crystals can be sorted into the dextro- and levo-forms. R. A. may be synthesised by the action of moist silver oxide upon dihomosuccinic acid:  $(\text{CHBr.CO}_2\text{H})_2 + 2\text{AgOH} = (\text{CHOH.CO}_2\text{H})_2 + 2\text{AgBr}$ .

Rachel, younger daughter of Laban, sister of Leah, and chosen wife of Jacob (Gen. xxix.). Jacob was deceived by Laban into marrying Leah to avoid the stigma of the younger sister marrying before the elder. R. was also given him on condition of service. R. for long remained childless, but at length she bore Joseph. The two sisters stood by Jacob in his dispute with Laban and accompanied him in his flight, R. carrying off her father's teraphim (images) (Gen. xxxix.). During their journey from Bethel to take up their abode in Hebron R. died in giving birth to Benjamin (Gen. xxxv. 16 20). There Jacob set up a monument over her grave. R.'s tomb, a white-domed sanctuary, is shown to-day on the W. side of the road from Jerusalem to Bethlehem. This is an almost certain site, and it is venerated alike by Christians, Jews, and Muslims.

Rachel, Elisa (1821-58), pseudonym adopted by Elizabeth Félix, Fr. tragic actress of Jewish descent, b. at Munt, Aargau, Switzerland. At the age of nine she was singing in the streets of Paris, where she came under the notice of Choron, founder of the conservatoire, who took her as a pupil. Her dramatic gifts proved even greater than her vocal, and in 1837 she made her début at the Gymnase in *La Vendémme*. The following year she appeared at the Théâtre Français in Cornuilles' *Horace*. Her two greatest triumphs were achieved in Racine's *Phèdre* and Scribe and Legouvé's *Adrienne Lecouvreur*, in 1843 and 1849 respectively. She met with equal success in her tours abroad, especially in England and Russia, her popularity waning only in 1855 on the advent of Adelaide Ristori. See lives by Mrs. A. Kennard, 1885; F. H. Gribble, 1911; and J. Agate, 1928; and Matthew Arnold's three sonnets.

Rachitis, see RICKETS.

Rachmaninov (Rakhmaninov), Sergei Vassilievich (1873-1943), b. at Oneg, Novgorod, of the old Russian landed gentry, his father being a retired cavalry officer, one of the Moscow school of musical composers and a virtuoso pianist, pupil of Zverev, Taneyev, Arensky, and Silioti. From the age of nine to eleven he studied in St. Petersburg Conservatoire, afterwards at Moscow Conservatoire. Arensky's harmony lessons proved to be a great help to him and, after a few years, he began to give music lessons for a living. He composed an opera, *Aleko*, for his final examination, obtained the gold medal in 1892, in which year Tchaikowsky helped him to produce *Aleko* in the great Moscow theatre. He taught at the Maryinski Institute in Moscow, 1893-96, and conducted private opera in Moscow for Mamontov, 1897-98. The failure of his first symphony, when played in St. Peters-

burg, appears to have greatly depressed him; but in London in 1899 he recovered his spirits when he played sev. of his pianoforte pieces, and conducted his fantasia for orchestra, *The Rock*. But on his return to Moscow his old despondency returned until 1901, when he was cured by treatment. It was then that he wrote his Second Concerto in C minor, the Preludes for Pianoforte, and some twelve songs, which last were written in great haste to earn money for his honeymoon. He conducted the Moscow opera from 1904 to 1906, and then came two years in Dresden, with touring intervals. In Dresden he composed his second symphony, E minor, the first sonata for pianoforte, the Symphonic Poem for orchestra (*The Isle of Death*), and the third concerto for pianoforte and orchestra. He was vice-president of the Russian Musical Society, 1908-11. His second symphony was first performed at Leeds in 1910, R. himself conducting. After the Russian Revolution he settled in the U.S.A., where he worked as a pianist and conductor. His work also includes some excellent chamber music, and a quantity of smaller vocal and instrumental pieces. As a pianist R. stands in the very first rank. As a composer his more personal works are saturated with beauty to an extent too obvious for some tastes. Yet, as in the third symphony, there is another quality of resignation and bitterness. His strength lay less in the harmonic than in the melodic field. See O. von Riesenmann, *Rachmaninoff's Recollections*, 1934; W. Lyle, *Rachmaninoff*, 1939; W. R. Anderson, *Rachmaninov and his Pianoforte Concertos*, 1947; and J. Culshaw, *Sergei Rachmaninoff*, 1949.

Racial Distinction, see COLOUR BAR.

Racine, Jean (1639 99), Fr. dramatist, b. at La Ferté-Milon (Aisne), the son of a solicitor; educated at the Collège de Beauvais, at Port Royal, and at the Collège d'Harcourt. He went to Paris, where he made the acquaintance of La Fontaine, Chapelain, Boileau, and Molière. In 1661 he attempted to get a living from his uncle, the vicar-general of Uzés in Languedoc. He married Catherine Romanet, and was made historiographer to Louis XIV. His work previous to this time was very varied. In 1660 he began his career with an ode on the king's marriage, *La Nymphe de la Seine*, and his friendship with Boileau dated from another ode, *La Renommée aux Muses*. His first play, the tragedy of *La Thibaut, ou les frères ennemis*, was acted by Molière's company at the Palais Royal in 1664 with some success. His second, *Alexandre le Grand* (1665), was produced by the same company, but later given to the rival actors at the Hôtel de Bourgogne, thus leading to a rupture with Molière. His peculiar genius was revealed in *Andromaque* (1667); this was followed by the successful comedy of *Les Plaideurs* (1668), and the tragedies of *Britannicus* (1669); *Bérénice* (1670); *Rajazel* (1672); *Mithridate* (1673); *Iphtigénie en Aulide* (1674), probably his best work and a masterpiece of pathos; and *Phèdre* (1677), a particularly painful

drama. He was admitted into the Fr. Academy in 1673. His life after his marriage was affluent and happy. He had many literary friends and was for some years gentleman-in-ordinary to the king. His work during this period includes *Esther* (1689), written at the request of Mme de Maintenon for her school-girls at St. Cyr; *Athalie* (1691), another excellent tragedy; four *cantiques spirituels* (1694); and *L'Abrégé de l'histoire de Port Royal* (1742, 1767), written in neat and clear prose. Among the best Fr. eds. of his works are those of Count G. Garnier with commentary by M. la Harpe (1807); J. L. Geoffroy (1808); Aimé Martin (1820); Paul Mesnard (1865-70; new ed., 1929); and A. France (1874). Eng. trans. by

RACINE

R. B. Boswell & Co., 2 vols. (1889-1890). See lives and studies by his son Louis, 1747; Marie Beyle, 1851; G. le Bidon, 1901; F. Mauriac, 1928; A. Tilley, 1933; and A. F. Clark, 1940; also M. Turnell, *The Classical Movement*, 1947, and V. Orgill, *A New View of the Plays of Racine*, 1948.

**Racine**, cap. of R. co., Wisconsin, U.S.A., 23 m. S.E. of Milwaukee, on Lake Michigan. Its chief manufs. are boilers and agric. implements; it trades in lumber. Pop. 67,200.

**Racing**, see ATHLETICS; HORSE-RACING; ROWING; YACHTING, etc.

**Racing, Point-to-Point**, see POINT-TO-POINT STEEPLECHASES.

**Rack**, instrument of torture, consisting of an oblong frame of wood slightly raised from the ground. At one end was a fixed bar and at the other a movable one (sometimes both were movable). The bar was extended by a windlass until the victim's joints were dislocated, or he died, or answered the questions of his torturers. The R. was known to the Egyptians and early Gks. and Romans. The duke of Exeter is supposed to have been responsible for its introduction into England, whence it was popularly known as the 'Duke of Exeter's daughter.' It was

much used in Henry VIII's and Elizabeth's reigns, but declared illegal in 1628, when it was proposed to rack Charles Felton.

**\* Rack-a-rock**, powerful explosive consisting of potassium chlorate mixed with nitrobenzene. It is principally used in blasting operations.

**Racket, Ranket, or Sausage Bassoon**, obsolete instrument of the bassoon type. Its long tube was folded many times, so that its actual size seemed small.

**Rackets**, see RACKET.

**Rackham, Arthur** (1867-1939), Eng. water-colour painter and illustrator, son of Alfred Thomas R., Admiralty marshal. Educated at the City of London School and Lambeth School of Art. In his twenties he drew illustrations for *Fall Mall Budget* and *Graphic*. He developed a delicately fantastic style, his execution being a matter of ink lines and colour washes, and his subjects, with elves and gnomes, having a Gothic touch. He illustrated eds. of *Rip Van Winkle*, 1905; *Peter Pan*, 1906; *Ingoldsby Legends*, 1907; Wagner's *Ring*, 1910-11; Dickens's *Christmas Carol*, 1915; *Sleeping Beauty*, 1920; *The Tempest*, 1920; *Picnic of Wakefield*, 1929; *The Complete Angler*, 1931; Andersen's *Fairy Tales*, 1932; *The Arthur Rackham Fairy Book*, 1933; *The Pied Piper of Hamelin*, 1934; *Hoe's Tales of Mystery*, 1935; *Peetr Hynt*, 1936, and many other books.

**Rack Rent**, see RENT.

**Racoozy**, see RAKOCZY MARCH.

**Racoon**, see RACCOON.

**Racoonda**, name given to the fur of the Coypu (q.v.).

**Racquets**, or **Rackets** (through Fr. *raquette* from Sp. *raqueta*, a battledore; ultimately, perhaps, connected with Arabian *rāhāl*, palm of the hand), game played in an enclosed court with a ball by two or four persons. The early variety of the game, as described in *Puckwick Papers*, was played on courts open at the sides, and was practised only by the lower classes of the community. This game originated in Eng. jails, and was played by the prisoners against a wall. Robert Mackay, a debtor, was probably the first holder. After 1800 the game became more seriously known, and from a game of skill developed also into one of hard hitting. The racquet, with which the game is played, and from which it derives its name, is about 2 ft. 6 in. long and weighs from 8 to 12 oz., with a head almost circular in form of about 7 or 8 in. diameter, and strung with catgut. The ball, which weighs about 1½ oz., is small, round, and hard. There are no specified dimensions for racquet courts, although no great disparity is found. If the court is 60 ft. long and 30 ft. wide a white line is drawn across the floor 38 ft. from the front wall; this is the short line. From the centre of the short line a line is drawn to the centre of the back line, dividing the back portion of the court into right and left courts, while lines are drawn on the floor parallel to the short line and the side wall respectively at a distance of 8 ft. from the points where they meet, thus forming two squares known as service

boxes. The front wall is boarded for a height of 27 in. and has another line at a height of about 9 ft. the former is the play line the latter the service or cut line below which no service is allowed. Priority of innings is decided by tossing, this is a great advantage as the service often decides the game at R. and only the player who is 'in' or serving can score. The server must have one foot in the service box, and must not strike the ball twice. The ball must strike the wall above the service line and fall within the opposite court after which the server's opponent must return it above the hand i.e. the play line before it has touched the floor twice. When either player fails to return his opponent's stroke or turns it below the hand either an 'out' is scored to the server or the server is 'knocked out' and his opponent serves as the case may be. Two consecutive 'faults' in serving cause the service to change hands, the service is taken alternately from the two boxes so long as one player's innings continues. In the cases of unavoidable hindrances or 'lets' (decided by the marker) the server serves again without scoring. A game consists of fifteen points or aces, when both players are thirteen he who first reached that score has three options: either 'no set' which means that the score goes on up to fifteen in the ordinary way (except that another option may arise at fourteen all) or 'set three' (game being sixteen with no further options) or 'set five' (game being eighteen with no further options). At fourteen all the first to reach fourteen has two options: 'no set' (i.e. one point only) or 'set three'. When four players are engaged the receivers stand one in each court while the server's partner stands by the door in the middle of the back wall. At the beginning of every game the serving side has 'no hand' only.

It is a table-tennis-like game played in India and in America (also in China, Bombay, Ceylon, Malaya and Burma). A great disadvantage is that it is not a cheap game and the strains and stresses of the twentieth century have led to a decline in its popularity. If it such a magnificent game has not been allowed to lie on its side primarily due to the efforts of the Tennis and Rackets Association combined with those of the public schools at the leading public schools in England. See also *SQUASH RACQUETS*. See also *A. L. L. Tennis Rackets*. See also *1810 A. L. L. Tennis Rackets*. See also *The Raguel Game* 1930. **Radach, Radak, or Ralok** see MARSHALL ISLANDS.

**Radar** a neologism derived from the phrase radio detection and ranging and synonymous with radiolocation. Both words were coined to denote a process whereby distant objects are detected and their directions and ranges measured by means of wireless wave echoes reflected back to detecting apparatus which is often also the source of the wireless waves. The rapid development of R was largely due to its importance in war and in the

years preceding 1939, and during the Second World War enormous progress was made. Fortunately for the Allies then it was throughout the whole period, substantially in advance of that of their enemies and this was certainly a major factor and possibly a vital one in their success. The uses of R in peace, if less spectacular are likely to be as numerous as in war and it has already proved of great value for the navigation of ships and commercial aircraft at night and in foggy and cloudy weather and in dock and harbour control (see AIR NAVIGATION and NAVIGATION).

**The Principles of Radar.** The principles on which R is based are simple. The human eye sees an object illuminated by a searchlight beam. Rays of light are reflected from the object to the eye. Such rays do not penetrate mist, cloud or smoke however and in clear weather the object may remain invisible at relatively small distances merely because insufficient light is reflected. Wireless waves travel at the same speed as light (186 000 m per sec.) are unaffected by atmospheric conditions and if of sufficiently short wave length, are reflected by objects just as is light. Hence, if a narrow beam of short waves is sent from a transmitter in the direction of a distant object a reflected group of waves will return to the starting point after a time equal to that required for waves to travel to the object and back again. Observation of the direction from which the echo comes shows the direction of the object and if the delay between transmission and the arrival of the echo is measured the range is also known. The operation of the apparatus is unaffected by darkness or the state of the weather and since the incoming signals can be highly amplified it can be used at ranges up to several hundred miles.

To be effective the beam transmitter must use short wave lengths certainly not more than a few metres and preferably only a small fraction of a metre. One reason for this is that long waves can only be concentrated into a narrow beam by the use of transmitting antennae of prohibitive size and if the beam is broad only a small fraction of it will impinge on and be reflected from an object. So it is a distant aeroplane. Of equal importance parts of a wide spreading beam will be simultaneously reflected from each of a group of aeroplanes flying together so the echo will not reveal whether one or several are causing it. Moreover it is only short waves can provide accuracy of vision. If only a weak beam is needed the production of short waves presents no special difficulty, but since a distant aeroplane reflects only a minute fraction (perhaps only a few parts in 100 000 billion) of the transmitted energy back in the direction of the receiver the beam must be intense. In the early years of the war the difficulty of generating sufficient power limited the wave length to 100 metres. Later the development of a device called the cavity magnetron enabled much shorter waves to be used with a marked gain in utility.

as well as other advantages. The equipment, however, must allow for the reception of the weak echo as well as the transmission of a powerful beam. For this and other reasons the pulse system was adopted at an early date. With this system the radio frequency oscillator is coupled to the antenna for a brief period of a millionth of a second or so, during which time a short burst of waves or pulse is sent out; the receiver meanwhile being disconnected. The oscillator is then turned off sharply, is disconnected from the antenna and for about a thousandth of a second the receiver is coupled to the antenna for the reception of echoes; the receiver is now disconnected, and the process is repeated over and over again. (The pulses must begin and end sharply because of the high speed of the wireless

brief period after the electrons have impinged upon it. When an echo is received the beam of electrons is diverted a short distance vertically, causing a V to appear in the otherwise straight line at a point whose position depends upon the time lag before the receipt of the echo and hence upon the range of the object causing the echo. Other types of indicator record the echoes in such a way that the illuminated parts of the face of the cathode ray tube present what is, in effect, a map showing the positions of the objects causing them, such indicators were used for bombing in conditions that precluded the use of optical bomb sights.

*Radar and Air Defence*—When the Luftwaffe launched in 1940 its heavy daylight raids on Britain the Germans were in command of a chain of air bases situated

RADAR PRINCIPLES OF ITS SCANNING APPARATUS

An aerial mounted in a position that can rotate on its axis in every second so that it can face in all directions. The reflections from the face of a clock. The reflections from the face of a clock. The reflections from the face of a clock. The reflections from the face of a clock.

of the great production of waves like a fan. It is very much in the vertical plane. The aerial rotates on its axis in every second so that it can face in all directions. The reflections from the face of a clock. The reflections from the face of a clock. The reflections from the face of a clock. The reflections from the face of a clock.

waves, the accurate timing of the echo and hence the measurement of the range would otherwise be impossible. Moreover, while the appropriate portion of space is being scanned by the beam, that the beam is directed in turn to all parts of this space. The scanning, usually involves rotation of the antenna and since to provide a sharply defined beam the dimensions of the antenna must be many times as great as the wavelength, the movement is only possible in a confined space such as that available in aircraft if the wavelength is very small. The echo signals received after amplification are registered by the indicator. In one form of indicator a beam of electrons is directed on to the face of a cathode ray tube, here, if no echo is received the beam impinges successively upon successive points along a horizontal line although the beam impinges in turn on the various parts of the line producing a succession of illuminated points, the whole line appears bright because of the persistence of vision and because the coating of the tube continues to emit light for a

only a few minutes flying time from the English coasts. Unless some form of warning system had been in operation to allow the defence to be alerted long before the bombers approached the coast, insufficient time would have been available for fighters to take off, climb and intercept and disperse the invaders. In fact, in 1940, it would have been impossible. Fortunately, however, a series of ground stations, begun many years earlier, were already functioning and they supplied information not only of the approach of raiders and their course but also when and where they were forming up prior to the actual raid. The fighters could therefore take off in good time and find their way to the best positions for interception. Probably because their own R. was far inferior, the Germans underestimated its value and made no serious effort to put the stations out of action. The heavy losses inflicted on the bombers caused the Germans to change their tactics and resort to night attacks. With the apparatus then in use the interception of night bombers by fighters posed additional problems for the defence. In

daylight it was sufficient for the R controller at the ground station to direct his fighters to the general vicinity of the enemy force and to leave to the pilots the choice of particular targets. Night fighters carried their own R but his was of too limited range to allow the same tactics to be used. The controller therefore chose a particular bomber as target, coached a fighter (identified by a special radio identification device) into a position behind and below the bomber and sufficiently close for the fighter to use its own

employed to light enemy aircraft above cloud as assistance to night fighters in attacking them. The apparatus consisted of a R transmitter working about 300 megacycles using a directional 'yagi' aerial aligned with the optical beam of the searchlight. Four similar aerials mounted above, below and either side of the light received the reflected pulses. Alignment on the target was assured once the received signals in opposite aerials had been equalised by steering the light with its aerials towards it. Subsequent

THE ZULU SET ON THE CATHODE RAY SCREEN

As the Zulu set on the cathode ray screen, the R controller at the ground station put up a searchlight beam to illuminate the target. A searchlight beam of this type is used to illuminate the target in the night. The searchlight beam is used to illuminate the target in the night.

The searchlight beam is used to illuminate the target in the night. The searchlight beam is used to illuminate the target in the night.

P during the further stages of approach and attack. Later improvements of airborne P made it possible to dispense with the assistance of the ground controller but the heavy bombing of German piloted aircraft was then already past.

The introduction of the flying bomb introduced a new menace for while fighters equipped with H.E. did and did shoot down the flying bombs in suitable weather there were many days when fog prevented fighters from taking off. Moreover the bombs could be launched in a steady stream so as to tire out and weaken the fighter defence. Here however R controlled and I directed anti-aircraft fire proved very successful and before long only a small percentage of the flying bombs directed at London were penetrating to the target area.

Early in the war equipment was developed suitable for attachment to searchlights. This enabled them to locate and align an aircraft before exposing the light and, once aligned to follow the target despite its efforts to use cloud cover to escape. This latter method was often

developed enabled the light to follow the target automatically once the beam was directed on it by the crew.

**Radar and the U-Boats**—At the outbreak of war the convoy system was adopted for merchant shipping in the Atlantic. The merchantmen were formed up into a group that steamed faster than submerged submarines could do while ahead of the merchantmen sped out as a fast escort for submarines. Then sound detectors prevented submarines from slipping through the protective screen and, even during daylight this system is highly successful. It could not however prevent submarines from surfacing at the side of a convoy at night and using their superior surface speed to close and launch attacks. The introduction of shipborne R enabled surfaced submarines to be detected at night or in foggy weather as readily as by day and its use marked the end of heavy losses in convoy. It also prevented ships from straggling and losing their convoy.

during the darkness, and greatly reduced the risks of collision.

It, moreover, was a vital factor in the attack upon submarines, particularly by aircraft, and its use caused a great decline in the morale of the submarine crews. Although U-boats, to avoid detection by searching aircraft, could cruise submerged during daylight, they had to surface at some time to recharge their batteries. During the early years of the war they ran little risk in doing this at night, but as R. developed it became practicable for aircraft to search wide areas during darkness, while the same R. guided them in high-speed attacks before their prey could submerge. The effectiveness of these attacks convinced the Gers. that R. was being employed, and in 1912 they captured intact one of the longer wave R. sets then used by coastal command. Apparatus was installed in the U-boats to enable them to detect the R. beam, which now served as a warning, and allowed them time to submerge. The sense of security engendered in the U-boat crews by their detector was rudely shattered when the Allies put into service a new type of R. working on much shorter wave-length (one-tenth metre), and incapable of detection by the Ger. apparatus; in three months of 1943 nearly 100 U-boats were sunk, chiefly by aircraft. Only after a prolonged delay did the Gers. discover what means of detection was in use by the Allies, and the menace of the U-boats steadily declined during the remaining period of hostilities.

**Radar and Naval Warfare.**—R. has played a large part in solving the special problems of the defence of warships and aircraft carriers against air attack. It has to a large extent revolutionised battles between naval vessels themselves. By its use a fleet can detect the presence of other vessels at night or in fog, can identify them as enemy, engage, and sink them without ever seeing them except as signals on the fluorescent screens of the R. apparatus.

**Radar and the Air Offensive.**—As a navigation aid in the early Brit. bombing of Germany, radio pulse signals were used, but as the system did not make use of echoes it could perhaps not be classed as R. Two ground stations in England sent out pulses, and the aircraft carried apparatus that picked up these signals, and after a brief, and accurately timed delay, emitted other signals in response. From the delay period between the time when a pulse was sent from, and the response was received at each ground station, the distance of the aircraft was known. The accuracy was such that the controller at the ground station knew the position of a bomber over the Ruhr to within a few yards, and could signal to the bomber the appropriate instant for the release of bombs or target flares to serve as markers for other bombers. R. proper, using short waves and an indicator that presented a map of the ground below, was used extensively from 1943 onwards by the heavy bombers of the R.A.F. and U.S. air forces.

R. also provided valuable aid to the long-range fighters sent out to protect Amer. bombers during their daylight operations. Owing to their higher speed and inability to remain airborne as long as the bombers, such fighters could not accompany the bombers throughout their missions, but relays of fighters were dispatched to guard the bombers at various parts of their course. The difficult problem of bringing the fighters into contact with the bombers at the appropriate time and place was enormously simplified by R. which, working from friendly ter., allowed a ground controller to follow for some 200 m. the courses of bombers and fighters. With its aid enemy fighters ascending from their aerodromes to attack the bombers could also be detected, and protecting fighters could be diverted to intercept them far from the bomber stream.

**Meteorological Uses.**—Sometimes R. waves are refracted abnormally towards the ground, hills, and coasts much further away than usual appearing on the screen. This can occur when there is an intense inversion of temp. (increase instead of the normal decrease with height) and for a large decrease in water-vapour content with height. The necessary decrease in water-vapour content is more frequently found than the necessary rate of increase of temp., but they can both work together, as when hot dry air flows over a comparatively cool sea picking up moisture and lowering the temp. of the lowest layers, thus forming just above these layers a 'duct' with abnormal refraction of the R. beam. Such ducts have often been observed over the Mediterranean in summer when hot dry air flows from the Sahara and over the Indian Ocean during the N.E. monsoon which is also hot and dry. A. Perlot has suggested that the advance of the abnormality, which can be mapped easily on a R. screen, can thus be followed more accurately by the meteorologist than with the normal land and ship observations. With centimetric R. echoes from raindrops can be picked up, the largest drops producing the brightest echoes; therefore rain-producing clouds, such as cumulonimbus and nimbostratus, and particularly thunderstorms and tropical cyclones or tornadoes, show themselves very clearly on a R. screen, and the movement of such important weather phenomena can be watched closely, as on a map, anywhere within 100-150 m. of the R. set.

R. is also used to measure winds at high levels. To an inflated rubber balloon, often also carrying a radio-sonde (q.v.), is attached a small R. target, sometimes consisting of a metallised nylon mesh enveloping the balloon or, more frequently, of plane metallised paper sheets or nylon nets set mutually at right angles (see figure in RADIO-SONDE article). No matter at what angle a R. beam strikes this target it will be reflected directly back to the transmitter, producing a bright echo on the screen of a receiving apparatus; its position (including height) can then be determined at any moment, and

since the balloon drifts only with the wind the velocity of the balloon is a measure of the wind strength. Since the R. beam can penetrate cloud, winds can then be measured up to very great heights regardless of the weather conditions obtaining at the time of measurement.

**Astronomy.**—One of the early applications of R. for astronomical purposes was to find the time that radio echoes took to return from the moon, and from this to verify the distance of the moon from the earth. The results were quite satisfactory and showed that astronomers might be able to utilise this new discovery in various ways. Its use for the detection of meteors has produced remarkable and unexpected results. Meteors are very small particles, mostly like specks of sand or smaller, which revolve around the sun in various forms of elliptical orbits—usually very eccentric—so that their velocity at the distance of the earth from the sun is about 25 m. per sec. As the earth's orbital velocity is 18½ m. per sec. the actual velocities of encounter with the earth may vary between about 7 to 41 m. per sec., but since the earth's gravitational attraction accelerates the speeds of these bodies, more especially the slower ones, the velocities lie between 10 and 45 m. per sec. Such high speeds are accompanied by a considerable rise in the temp. of the molecules of the atmosphere at varying heights—60 m. or more—and ionisation takes place. The free electrons reflect the radio-waves back to the earth and so meteors can be studied when the sky is clouded over and even by daylight. Meteors can be seen only by night, and hence if the 'radiant'—a term well known to all meteor observers—rises and sets about the times of sunrise and sunset, respectively, although there may be very extensive showers, visual observation could not detect them. A well-known shower takes place in the early morning hours, soon after the radiant rises, during the first week in May, and is known as the  $\gamma$ -Aquarids, but it cannot be seen for long owing to sunrise soon after its activity is observed. In 1917 R. was used at Jodrell Bank, the research station connected with Manchester Univ., to observe this shower, and not only was it successful, but as the R. continued to be used during daylight, it was found that there were other meteor showers much more prolific, which had not previously been known. Throughout May, June, July, and Aug., other daylight showers of great intensity were discovered of which nothing had been suspected before the use of R., and subsequent work in later years has confirmed the earlier discoveries. It is now possible to study meteors by R. by night or by day, and further research on these minute specks, many hundreds of millions of which strike our atmosphere every day, may yet assist the cosmologist in his speculations regarding the origin of the solar system, on which there is still no consensus of opinion. In addition, the use of R. to study cosmic rays may some day enlighten us on some of the mysteries of these enigmatic, in particular

on the seat of their origin—in stars, or in the far off nebulae or in interstellar space.

See R. W. Hollows, *Radar: Radio-location simply explained*, 1916; Physical Society and Royal Meteorological Society, London, *Meteorological Factors in Radio-wave Propagation*, 1916; and I.M.S.O., *Science of War*, 1918.

**Radautz**, tn. in Bukovina, Rumania, 32 m. S. of Czernowitz. It has a cathedral, and there are machinery, glass, and paper works. Pop. 17,000.

**Radclyffe, Ann, née Ward** (1761–1823), Eng. novelist, b. in London. She pub. her first book, *The Castles of Athlin and Dunbayne*, in 1789, and it deservedly attracted little or no attention. Her next story, *A Sicilian Romance* (1790), was much superior, and Scott said it was the finest modern Eng. example of the poetical novel. This was followed by *The Romance of the Forest* (1791); the more celebrated *Mysteries of Udolpho* (1794); and *The Italian* (1797), an impressive novel in which the demoniac villain Schederio plays his part. Her novels are historical only in a negative sense; for whether the background be the age of chivalry or that of the Inquisition, it is always the manners of her own time that are reproduced. See C. F. MacIntyre, *Ann Radcliffe in Relation to her Time*, 1920, and A. S. Wren, *Mrs. Radcliffe her Relation towards Romanticism*, 1926.

**Radclyffe, or Radclyffe, James**, see DERWENTWATER, EARL OF.

**Radclyffe, John** (1650–1711), Eng. physician, b. at Wakefield. He was educated at Univ. College, Oxford, became a fellow of Lincoln College, Oxford, in 1669, and began his medical practice in that tn. In 1684 he removed to London, and was very successful. In 1686 he became physician to the Princess Anne, but about 1695 was displaced by Wm. Gibbons. He bequeathed funds which provided for the building of the R. Observatory and Institution, Oxford, the enlarging of St. Bartholomew's Hospital, London, and for travelling fellowships in medicine. The R. Camera, the reading-room of the Bodleian Library (*q.v.*), bears his name.

**Radclyffe**, tn. of Lancashire, England, on the Irwell, 7½ m. N.N.W. of Manchester. The chief industries are cotton-weaving, finishing and dyeing, paper-making, and engineering. Pop. 27,000.

**Radeberg**, tn. of Saxony, Germany, 11 m. N.E. of Dresden. It manufs. paper, glass, nails, and sales. Pop. 15,300.

**Radegunde**, St., Frankish queen, daughter of the pagan king of Thuringia. She was baptised, educated, and eventually married to Clotaire I., the Frankish king. She left him after much ill treatment, culminating in the murder of her brother, and ultimately founded the nunnery of the Holy Cross at Poitiers.

**Radek**, Karl (b. 1885) (otherwise Karl Sobelsohn), Russian revolutionary, b. at Lvov, then in Austria-Hungary. Imprisoned in Russia, 1905–6, he was active in Germany as an anti-militarist during the First World War, and later resided in Switzerland. In 1917 he was in Sweden

as a Bolshevik agent. In Germany in 1918 he was among the Spartacists; he was imprisoned there, and returned thither in 1922. In 1926 he was rector of Sun Yat Sen Univ. for Chinese in Moscow. In Jan. 1928 he was banished with Trotsky, and sent to the Ural, but in 1930 he was reinstated. In 1937 he was tried with others for conspiracy and sentenced to ten years' imprisonment, but was released in 1941 in order that his talent for skilful propaganda might be employed.

**Radetzky, Johann Josef, Graf von Radetzky** (1766-1858), Austrian soldier, b. at Trerbnitz in Bohemia, and joined the arm. as a cadet in 1785. He served in the Turkish and revolutionary wars, and was made a colonel in 1799. In 1805 he was promoted to major-general, and in 1809 lieutenant-field-marshal. He took part in the battles of Trebbia, Novi, Marengo, Aspern, Wagram, Leipzig, etc. His chief claim to fame rests on his masterly defence of the Quadrilateral (q.v.), and his subsequent crushing victories at Custoza and Novara over Charles Albert, king of Sardinia. See life by E. Schwall, 1938.

**Radenvormwald**, tn. in the Rhineland, Germany. Mannf. include steel goods, woollen goods, and general hardware. Pop. 13,690.

**Radhakrishna, Sir Sarvepalli** (b. 1888), Indian philosopher and educationist in England. Educated at Madras Christian College, he was prof. of philosophy, Presidency College, Madras, 1916-17; George V. prof. of philosophy, Calcutta, 1921-31 and 1937-41; and vice-chancellor of Benares Hindu univ., 1939-48. R. was also a member of the international committee on intellectual co-operation of the League of Nations, 1931-39, a fellow of All Souls, Oxford, and member of the Constituent Assembly for India. Among his numerous publs. are *The Reign of Religion in Contemporary Philosophy* (1920); *The Philosophy of the Upanishads* (1924); *The Hindu View of Life* (1927); *East and West in Religion* (1933); *Eastern Religions and Western Thought* (1939); *Religion and Society* (1947); and *The Bhagavad-gita* (1948).

**Radhappur**, cap. of the state of R. Saurashtra, India. It is a trade centre of some importance for N. Gujarat and Cutch. Area of state 1159 sq. mi. Pop. 67,700; (of tn. 13,100).

**Radial Artery**, artery in which the pulse is felt at the wrist. The brachial artery on passing the elbow divides, the two branches follow the radius and ulna respectively. The former reaches the wrist near the surface, runs to the back, then forward into the palm of the hand, where it joins a branch of the ulna artery.

**Radial Engine**, see AERO-ENGINES.

**Radiant**, see under METEORS.

**Radiation**. The ramifications of the subject of R. extend to all branches of physical science. Whether heat, light, electricity and magnetism, matter and its properties, astronomy, or astrophysics are concerned the questions concerning R. and matter are the ultimate ones to be

answered. Since the time of Clerk Maxwell (q.v.) we have come to know that all Rs. are electromagnetic in character and that they are all propagated with the same velocity, that of light, namely 186,000 m. per sec. *in vacuo*. The Rs. that reach us from the furthest star and cause the sensation of sight on entering our eyes; the Rs. from a fire or the sun that produce the feeling of warmth; the Rs. from the sun that are known as ultra-violet light that produce the effects of sunburn, and are believed to be so beneficial to general health— all these are identical in character with the Rs. that reach the aerial of a radio receiving set from the broadcasting station. The shortest wave-length Rs. known are the cosmic Rs. They are shorter waves than the  $\gamma$ -rays emitted from radioactive bodies during their spontaneous disintegration.  $\gamma$ -radiation is the shortest wave-length R. from terrestrial sources, being of the order of  $10^{-10}$  cm. In the scale of wave-lengths they are followed by X-rays, the hardest of which have a wave-length of the order of  $10^{-8}$  cm., while the softest and least penetrating X-rays have a wave-length of the order of  $10^{-6}$  cm. Ultra-violet R. from mercury arcs is of the order of  $10^{-6}$  cm., while the ultra-violet R., the wave-length of which is just too short to cause the sensation of sight, is  $4 \times 10^{-6}$  cm. The visible spectrum consists of R. of wave-lengths between  $4 \times 10^{-6}$  cm. and  $8 \times 10^{-6}$  cm., while the infra-red R. that produces a sense of warmth, but does not cause the sensation of sight, extends from  $8 \times 10^{-6}$  cm. to waves of much greater length. The shortest wireless waves are  $10^{-2}$  cm. long, and the longest are of the order of  $10^6$  cm.

In the article on SPECTRUM reference is made to the present theories of the origin of visible Rs. as well as the origin of ultra-violet and infra-red Rs., while in the article on X-RAYS the origin of that form of R. is discussed. The present state of knowledge of R. is undergoing fundamental changes because of the difficulty of reconciling the quantum theory (q.v.) with that of the undulatory theory of light (see LIGHT). It is interesting, therefore, to trace the development of the knowledge of the infra-red Rs., known as radiant heat, in this article, for this branch of R. led directly to the difficulties mentioned above. The researches of Melloni and Tyndall during the latter part of the last century revealed the fact that those Rs. from hot bodies that are responsible for producing the sensation of warmth are identical in character with ordinary light. That is to say, radiant heat obeys the laws of refraction, reflection, etc. Newton had made an attempt to determine the law governing the rate at which a body loses heat, and he discovered that the rate of cooling varied directly as the difference of temp. between the cooling body and its surroundings. Dulong and Petit subsequently discovered Newton's law to be only approximately true, but they too were really dealing with the cooling of a body under other influences besides R., such as conduction and convection. In simplifying the nature of the problem and

in concentrating on the loss of heat of a body by *R.* alone, three names stand out from all others, viz. Prevost, Stefan, and Planck. Prevost enunciated the Law of Exchanges that recognises that all bodies are simultaneously and continuously losing heat by *R.* Thus a cold object brought into a warm room is losing heat by *R.* to the room, but it is absorbing heat radiated from the room at a faster rate, and the net result is that the temp. of the cold body is raised to that of the room. Even then *R.* does not cease; the exchange still proceeds, but the body now radiates heat at exactly the same rate at which it receives it from the room and the net result is no change in its temp. In developing this law of Prevost, Ballou, Stewart and Kirchhoff were led to the consideration of the nature of the *Rs.* from bodies inside an enclosure that was impervious to heat. It follows that a stage is reached at which, by the exchange of radiant energy, all the bodies reach the same common temp. It also follows that there can be no subsequent changes of temp. within that enclosure, so that every body is receiving heat at exactly the same rate as that at which it is radiating heat. Now it is fairly well known that a black body absorbs radiant heat more readily than a white body or a polished body under identical circumstances. The black body is black because it absorbs practically all wave-lengths that fall on it, just as a white body is white because it reflects practically all wave-lengths that fall on it. But in an enclosure like the one described above it is clear that, when all temp. differences have disappeared, the black body radiates all wave-lengths that it absorbs as its temp. remains unchanged; the white body reflects and radiates all the wave-lengths that fall on it. In fact the net *Rs.* from all bodies within such an enclosure are identical and include all wave-lengths. Such *R.* is known as 'black body' or 'full' *R.* It is the *R.* that would be emitted by a body perfectly black under the same circumstances. The law of *Rs.* now sought was the law of black-body *R.*, and Stefan discovered that the *R.* within such an enclosure followed the law that now bears his name and also that of Boltzmann who established Stefan's empirical law from theoretical considerations: The rate at which a perfectly black body radiates heat is directly proportional to the fourth power of its absolute temp. (*q.v.*).

Research now proceeded rapidly, and by means of the bolometer and radiometer it was possible to examine the distribution of the radiant energy from a body among the wave-lengths in the spectrum. The result of the experimental researches could not be accounted for by the existing dynamical laws, and Planck was led to formulate the now famous quantum theory in order to account for this distribution. See T. Preston, *Theory of Heat*, 1920; G. Birtwistle, *The Principles of Thermodynamics*, 1927; and J. B. Hart, *Introduction to Advanced Heat*, 1931.

*Electric Heaters*; HEAT, *Modes of Transference of Heat*; HEATING.

**Radical**, in chem., is a group of atoms of two or more elements which take part as a whole in chemical reactions, passing from compound to compound without disintegration, yet being incapable of existing alone. Thus the *R.* methyl  $\text{CH}_3$  does not exist as such, although the double formula  $\text{CH}_3\cdot\text{CH}_3$  represents the gas ethane. *Rs.* may be acidic (electro-negative) in type, e.g.  $(\text{NO}_2)$ ,  $(\text{HCO}_2)$  monovalent, and  $(\text{SO}_4)$  divalent; or they may be electro-positive as illustrated by the *Rs.* ethyl  $\text{C}_2\text{H}_5$ , phenyl  $\text{C}_6\text{H}_5$ , ammonium  $\text{NH}_4$ , etc. Organic chem. is particularly associated with the chem. of compound *Rs.*

**Radical**, in politics, a term which came into general use as a synonym for 'Liberal,' but is capable of application to any politician or political supporter whose political creed involves some root-and-branch reform. In England the term historically applies to the political reformers of the last decade of the eighteenth century and the earlier period of the nineteenth century. The *R.* proper may be said to have been partly the product of the ideas germinating in Europe from the philosophy of Rousseau after the Fr. Revolution, and partly an inevitable outcome of the rising *ts.* The name *R.* reformers appears first to have been assumed by Hunt, Cobbett, and others of this period, who were bent on influencing the people at large in the direction of great and popular constitutional changes. By the time of the Reform Bill, 1832, the *Rs.* had gained a definite and permanent footing in the House of Commons, where they were represented by at least fifty members. From this time forward the term became gradually interchangeable with 'Liberal.'

**Radio** (or **Wireless**, as it was originally called) embraces to-day a wide variety of applications which have developed since its first use for communication. Radar, *R.* frequency heating, ionospheric measurements, and television are all dependent, basically, on the science of *R.*

**History.** — *R.* has its origins far back as 1873 when Clerk Maxwell published a set of differential equations which showed that electromagnetic waves could be propagated through space in a similar manner to those of light. Hertz in 1888 was able to give a laboratory demonstration of the production and detection of *R.* waves, using a Leyden jar connected to a spark gap and coil of wire as his transmitter. The simple receiver consisted of a circular brass rod with brass knobs forming a spark gap. When the Leyden jar was discharged small sparks passed between the knobs of the receiver, which was not connected to the transmitter in any physical manner. Contemporary workers were Sir Oliver Lodge (*q.v.*) and E. W. Morley, who invented the first real detector or coherer. The coherer was a tube, loosely packed with metal filings, in which two electrodes were embedded, and it was connected in series with a battery and galvanometer. The resistance of the

coherer was caused to change in the presence of electromagnetic waves and thus such waves could be detected by the change in reading shown by the galvanometer. It was, however, necessary to subject the coherer to slight mechanical vibration after each train of waves had been detected in order to separate the 'cohering' particles of metal. This piece of apparatus was soon followed by an improved magnetic detector invented by Marconi and, subsequently, by a number of mineral detectors of the permanent and semi-permanent variety (see RADIO RECEIVERS). It was not, however, until 1904 when Sir Ambrose Fleming, followed by Lee de Forest in 1907, invented the first R. valve (*q.v.*) that R. was able to advance from the limited field of spark transmitters (see TRANSMITTERS, RADIO) and simple detectors. The Fleming diode or two electrode valve could be used as a detector, and Lee de Forest added a third electrode, the grid, to produce the first triode valve. The triode valve could be used as an amplifier, oscillator, or detector, and from these beginnings the whole technique of modern R. science has developed.

**Propagation of Radio Waves.**—R. waves are electromagnetic waves which, when propagated, travel through space with a speed equal to that of light, i.e. 186,000 miles per sec. Their characteristics are sometimes compared with the waves in a pond when a stone is dropped into it. They travel outwards from the point of entry of the stone, travelling at a constant speed. If the initial disturbance be great the waves will be high, and if small there will be but small ripples as a result. The distance from the crest of a wave to the crest of an adjacent one is termed the wave-length. If the velocity at which the wave travels is called  $V$  metres/sec. and  $n$  waves per sec. pass a fixed point, it follows that the wave-length  $\lambda$  metres of each wave will be  $\frac{V}{n}$ , so that it is seen that  $V = n\lambda$  where  $n$  is termed the frequency and is measured in cycles or, as is more usual in R., kilocycles per sec. For R. waves the relation between wave-length and frequency is given by  $f(\text{Kc./s.}) \times \lambda (\text{metres}) = 300,000$ , i.e. a broadcasting station operating on a wave-length of 300 metres will have a frequency of  $\frac{300,000}{300} = 1000$  Kc. s.; this is often referred to as 1 megacycle, or abbreviated to 1 Mc.

**Uses of Radio in Broadcasting and Communications.**—The R. spectrum used for communication and other purposes extends from some 10 Kcs. at the low frequency extreme to 30,000 Mcs. at the upper limit beyond which lies the region occupied by X-rays (*q.v.*) and light-waves (i.e. they range from 30,000 metres to 1 cm. wave-length). The science of R. is normally associated with broadcasting and communications, and it was in this direction that the major developments first occurred. In this connection it is invariably applied to the conveying of intelligence beyond the limits of ordinary

sound-waves or light-signals. To do this a transmitter may use telegraphy or telephony (see MODULATION). The transmitter generates R. frequency power at a chosen frequency, and the intelligence fed to it from the programme source at the broadcasting station varies the output which is then fed to an aerial system from which it is then radiated into space (see AERIAL; BEAM WIRELESS).

Apart from spacing transmitter frequencies in the spectrum so that they interfere mutually as little as possible, different orders of frequencies in it have widely different characteristics. Those between 150 Kc./s., 285 Kc./s., and 525-1605 Kc./s., for example, accommodate broadcasting stations in the long and medium wave-bands of the familiar domestic R. set. For long-distance communication frequencies between 3 and 30 Mc./s. are employed because, in addition to the direct or 'ground' wave which can be received from the transmitter, the waves undergo reflection from the upper atmosphere, so that they are returned to earth at distances well beyond the limit of the 'ground' wave. This reflection from the upper or 'Heaviside' layer (there is, in fact, more than one reflecting layer, and these exist at different heights, although they all, under certain conditions, reflect R. waves) may take place in more than one cycle, so that world-wide communication becomes possible. These phenomena were originally discovered by amateur transmitter operators to whom the 'short waves' were assigned originally, as they were thought to be of little value for communication purposes. It is as a result of their work that world-wide communication and broadcasting (*q.v.*) by short waves owes its inception.

**Ionospheric Science.**—Above 30 Mc./s. the reflecting layers only behave as such during exceptional periods of ionospheric conditions, and as the frequency is raised true reflection ceases and communication is almost entirely confined to quasi-optical conditions. The laws governing the propagation of light-waves apply more exactly to very high frequency (V.H.F.) and ultra high frequency (U.H.F.) R. waves. The science of forecasting ionospheric conditions to determine the optimum frequency for a given path of communication for a particular season and time of day has become highly specialised in recent years. The main disturbing influences on short-wave R. are magnetic storms which have their origin on the surface of the sun. Their source is often visible from the earth as 'sun spots,' and it has been found that, when these appear, they produce streams of charged particles which, when they reach the reflecting layers, completely alter their normal characteristics and prevent the reflection on which short-wave R. depends. The effect can be most severe and results in a complete fade-out of long-distance signals which may last an hour or occur intermittently for sev. days. Their occurrence is, however, infrequent.

**How Sound is sent and received by Radio.**—It has now been shown that there is a

chain of circumstances which must exist to enable words, music, or other intelligence to be conveyed by it. The sound is produced in the studio and is picked up by a microphone (q.v.), it is amplified (see AMPLIFIER) and modulates (see MODULATION) a transmitter (q.v.) which delivers modulated R. frequency power to an aerial system. If the correct frequency has been used the R. waves will arrive at the aerial of the receiving station where they will induce in it a R. frequency voltage similar, but infinitely smaller, than that which left the aerial of the transmitting station. The receiving aerial is connected to a receiver which can be 'tuned,' or, in other words, made to respond only to the frequency of the wanted incoming signal. The receiver amplifies the signal, and finally removes from the R. or 'carrier' wave, as it is called, the intelligence which was impressed upon it by the sounds from the studio. This intelligence, which is now an audio-frequency voltage, is again amplified and passed to a loud-speaker (q.v.), which delivers sound-waves that can be heard by the human ear. See RADIO RECEIVERS.

**V.H.F. Mobile Radio Systems.**—So far only broadcasting and fixed communication have been considered, but R. has a number of other applications which are no less important. Much development has taken place in the field of V.H.F. radio communication, and this has found very practical expression in the R. telephony networks used by police, fire services, taxi companies, and others. The frequencies employed are, as a rule, between 70 and 200 Mc./s., and amplitude modulation (A.M.) and frequency modulation (F.M.) are in use (see MODULATION). It is usual for a fixed headquarters station to be in communication with mobile stations fitted in cars, etc., whose movements it controls. The control station is invariably situated on high ground to give the widest service area, since it is the ground wave that is important for communication. The service area is sometimes extended by the use of relay or 'slave' transmitters located outside the coverage of the main station. Where a slave is used its frequency is locked closely to that of the main station so that no retuning need be done by the mobile receiver when passing from the service area of the control to the slave transmitter.

**Direction Finding.**—R. direction finding (q.v.) has been used as a navigational aid for many years both for ships at sea and aircraft. Some of its uses, however, have been superseded by Radar, but it still has important aspects.

**Radar.**—By means of Radar exact information can be obtained regarding the position of ships and aircraft without the necessity of their having to transmit R. signals on which bearings, etc., are taken. Conversely ships can obtain their positions relative to land, buoys, and other vessels by its use, and navigation through fog and bad visibility is thus shorn of many of its dangers. A continuous Radar chart can be presented to the navigator as distinct from bearings obtained inter-

mittently using a direction finder, as Radar gives, not only an azimuth bearing, but an accurate range of all surrounding objects simultaneously. There are other applications of Radar (q.v.). See NAVIGATION.

**Radio Frequency Heating.**—Apart from communication and navigation, R. has proved itself capable of serving mankind in other ways. R. frequency heating (q.v.) is used for local heating of objects not amenable to the more commonplace methods. The R. valve-making industry itself, for example, uses it to rid heat the component parts of a valve after assembly and inclusion in the glass envelope which would be impossible by other means. The output from a R. frequency generator is led to a coil which is placed over the valve envelope and the high-frequency currents induced in the metal assembly of the valve by it causes them to become heated to a temp. at which they will give up any occluded gases which would be detrimental to the working of the valve subsequently. Such methods are used for hardening gear teeth, joining plastics, and even cooking food.

**Diathermy.**—The medical profession, too, employs R. frequency generators to give diathermy treatment to patients suffering from deep-seated ailments which do not lend themselves to other forms of heat application or to operation. The generator is connected either to the two plates of a condenser, between which the area to be treated is placed, or to a coil which can be placed over the part if it be an arm or leg. Both methods of application subject the part under treatment to a high R. frequency field of energy, so that the dielectric losses caused by the flesh and bone appear as heat. This heat is produced not on the skin surface but throughout the treated part and is very deep-seated in origin. Thus the healing effect of heat can be produced inside the part of the body where it can do most good.

**Television.**—One of the most popular uses to which R. has been put, and one which promises to play an increasing part in the daily life of the community, is television (q.v.). It has for many years been possible to send pictures by R. and, indeed, the press relies on such a service for much of its picture material from abroad. While many of the aspects are akin to television, the process of transmission is relatively slow, and it may take some 20 min. to transmit a complete picture. The picture transmission service, however, is applicable to the normal communication systems, while television is not. By virtue of the fact that in television the process of picture transmission has to be speeded up to give a continuously repeated picture which is completed twenty-five times per second, it will be seen that the amount of intelligence to be conveyed by this means is many times greater than that for press picture work. This necessitates the use of a wide band of frequencies which are only available above about 30 Mc./s. In the United Kingdom the band 40-70 Mc./s. is used, and each station may

require some 4 Mc.s. to enable the picture and its accompanying sound to be transmitted.

Other uses for R. are appearing with great rapidity as time goes on, and its potentialities are by no means fully explored, so that further advances may be confidently foreshadowed in the years to come.

See A. S. Ranshaw, *Radio, Television, and Radar*, 1945; M. Shurzberg and W. Osterheld, *Essentials of Radio*, 1948; R. W. Hallows, *Wireless Simply explained*, 1949; M. Gorham, *Television*, 1949; and H. E. Penrose and others, *Outlines of Radio*, 1949.

**Radioactivity** refers to the phenomena that accompany the spontaneous transmutation of unstable elements. There is a fairly large number of radioactive substances, classified in three distinct families—the uranium family, the actinium family, and the thorium family. Besides the substances included in the above groups, the elements potassium and rubidium are feebly radioactive. The phenomenon was first discovered in 1896, when Becquerel observed that some photographic plates, although securely wrapped up, became fogged when placed in close proximity to certain uranium compounds. A closer investigation showed that thin metal coverings were unable to protect the plates against this fogging. It was supposed that the uranium compounds emitted some radiations, known at that time as Becquerel rays, that were able to penetrate such coverings opaque to ordinary light. Becquerel's discovery of this natural phenomena closely followed Röntgen's discovery of X-rays (q.v.), and since the fogging of photographic plates was common to both these new types of rays, intensive research was begun on the compounds of uranium. M. and Mme Curie soon succeeded in isolating a new element far more active, in the sense described above, than the original uranium. This element was named polonium; shortly afterwards, by a brilliant piece of chemical research, they separated another new and much more powerful radioactive element, radium. While research was continued, with the result that the actinium and thorium families were discovered, attention was directed to investigating the nature of these mysterious radiations. It was found that they caused certain substances, notably barium platinocyanide and zinc sulphide, to phosphoresce, just as X-rays did, but in 1899 Rutherford made the first of a series of important discoveries that made him the foremost investigator in this branch of physics. He found that the radiations from these substances were complex in character. Some of the rays were absorbed by very thin screens of paper or by a few centimetres of ordinary air; to these he gave the name  $\alpha$ -rays. The more penetrating radiation that could pierce metal sheets of aluminium sev. millimetres thick he called  $\beta$ -rays. There remained a third type of radiation that Villard first discovered could penetrate thick blocks of aluminium and even layers

of lead sev. centimetres thick that easily absorbed both  $\alpha$ - and  $\beta$ -rays; to these the name  $\gamma$ -rays was given. Subsequent research has failed to identify any other types of radioactive rays.

$\alpha$ -Rays are now known to consist of material particles carrying a positive charge of electricity. They are the nuclei of helium atoms (see NUCLEUS), and they are expelled from radioactive substances with a velocity of the order of 10,000 m. per sec. The charge carried by an  $\alpha$ -particle is equal in magnitude to twice the charge on an electron.  $\alpha$ -particles will penetrate only a few centimetres of atmospheric air before being reduced to rest.

$\beta$ -Rays are also material particles. They are electrons, and have therefore a mass only about  $\frac{1}{1836}$  that of the lightest atom known, hydrogen. The velocities with which they are expelled from radioactive substances are enormous, the fastest  $\beta$ -particles known having velocities approaching 186,000 m. per sec., the velocity of light.

$\gamma$ -Rays are not material particles. They are light rays of very high frequency. Light waves in the visible spectrum have wave-lengths of the order of  $10^{-5}$  cm.; X-rays have wave-lengths of the order of  $10^{-8}$  cm.; the hardest  $\gamma$ -rays have wave-lengths of the order of  $10^{-11}$  cm., and they are the shortest waves known, being at the opposite extreme of the scale of electromagnetic waves from the long wireless waves.

$\alpha$  rays can be deflected by intense magnetic fields that deflect  $\beta$ -rays in the opposite direction, a fact that led to the discovery of their real nature, but  $\gamma$ -rays do not suffer such a deflection.

**Rutherford and Soddy's Theory of Radioactive Disintegration.**—The three types of radiation from radioactive bodies have one feature in common: they ionise the air they traverse by knocking out one or more electrons from the atoms of the gas. This led to an easy method of determining the intensity of such radiations by measuring the degree of ionisation produced by means of a sensitive electrometer (q.v.). Rutherford and Soddy found that the 'activity' of any radioactive substance gradually decreased according to a definite law. If  $T_0$  is the measure of this activity at some arbitrary zero of time, then after a time  $t$  the activity was found to be given by  $T = T_0 e^{-\lambda t}$ . The theory they proposed was that the activity was directly proportional to the number of radioactive atoms breaking up per second. In other words, in the notation of the differential calculus if  $N$  is the number of radioactive atoms present in a sample of the substance at any time  $t$ , then  $N = N_0 e^{-\lambda t}$ , where  $N_0$  is the original number of radioactive atoms, and we deduce by simple differentiation of this last equation with regard to the variable  $t$ ,  $\frac{dN}{dt} = -\lambda N$ , i.e. the rate of decrease of the number of radioactive atoms in any sample is directly proportional to the number of such atoms present. This law of radioactive disintegration is simply a

law of probability, that is the disintegration of radioactive atoms is spontaneous and governed only by the laws of chance. No known chemical or physical agency can control increase, or diminish the rate of this disintegration. If radium, for example, is subjected to fierce heat or the extremities of cold produced by immersion in liquid hydrogen, the disintegration is not affected. Or, again, if radium is caused to enter into chemical combinations to form radium salts such as radium bromide or radium chloride, the rate of disintegration is not affected.

Rutherford and Soddy's law is found to hold good also in more complex cases where several radioactive substances are present at the same time and there is no doubt that the phenomenon of it is the witnesses of the breaking up of individual atoms. It is illuminating to follow out the series of radioactive transformations that takes place in the uranium family. The disintegration of the original parent uranium takes place slowly. After  $4.5 \times 10^9$  years it has only run half its course, so that the original amount of uranium half remains after that length of time. After many generations we arrive at radium. It must not be supposed that we have to wait all that time before any radium appears. Some radium will be present in any sample of uranium but the amount is infinitesimal (Radium). The half-life of radium then proceeds as follows:

$\text{Ra} \xrightarrow{\alpha} \text{Rn}$	$\text{Ra} \xrightarrow{\beta} \text{Ac}$	$\text{Ra} \xrightarrow{\alpha} \text{Rn}$
1600 years	5 days	10 mins
	$\text{RaB} \xrightarrow{\beta} \text{RaC}$	
	26.8 min	11 min

Leading from the left we see that any sample of radium is only half exhausted after 1600 years. An atom of radium breaks up by the emission of an  $\alpha$  particle producing a new element known as radon (or radium emanation), a chemically inert gas that is itself radioactive.

Any sample of radon is half exhausted after 3.8 days. An atom of radon breaks up by the expulsion of an  $\alpha$  particle to produce a new radioactive element, RaA. The table can then be followed until we come to the intensely active substance RaC. Thereafter the series continues as follows:

Thus the end of these performances is the formation of lead.

The importance of the study of R can not be over estimated. It led to the formulation by Rutherford of the nuclear theory of the atom, and it has resulted in the discovery of the nature of atomic nuclei. Radioactive substances provide evidence of their own nuclear structure by their disintegration, but the commoner elements are more stable, and their nuclei

cannot be broken up by ordinary means. A close study of the tracks made by  $\alpha$  particles rushing through gases has revealed the information that these fast-moving 'bullets' rarely collide with any material part of the gaseous atoms. Only about 1  $\alpha$  particle out of 10,000 makes a direct hit on a nucleus of such gaseous atoms. The only possible conclusion from such evidence is that an atom is very largely empty space. The central nucleus with its positive charge is separated by relatively enormous distances from its orbital electrons. Researches initiated by Rutherford and C. L. R. Wilson and carried on by Blackett concentrated on the tracks of these direct hits so rarely registered by an  $\alpha$  particle on a atomic nucleus. They found that in such cases the nucleus broken up by the collision, that the nuclei of all atoms consist of a collection of protons and neutrons.

Rutherford computed by direct counting that an gramme of radium yields no fewer than  $3 \times 10^{10}$   $\alpha$  particles per sec. The exact cause of the disintegration of radioactive atoms is not known. It must be due to an inherent instability of the collection of protons and neutrons that form the nucleus of such an atom. That the upheaval that accompanies the disintegration is colossal is seen from the speed with which  $\alpha$  and  $\beta$  particles are driven at their maximum observable rate in which the kinetic energy of such a substance is converted into heat in the course of its decay.  $10^{10}$  is the spectrum of radium break up per gram but the disintegration is beyond our control. The recombination with the nucleus in no longer exists after a transformation it becomes unstable until it disintegrates by the expulsion of an  $\alpha$  or  $\beta$  particle into a new nucleus but the question of its ending up to that nucleus is as yet unknown.

In recent years it has become possible to produce streams of atomic nuclei traveling at speeds as high as even much higher than those of  $\alpha$  particles, and these properties can be used to produce by collision with other atoms, transformations similar to those due to collisions of  $\alpha$  particles. Moreover since many times more particles can be provided it is possible to get in the transmuted atoms in quantities that if small are nevertheless sufficient to be put to use. Much larger quantities of transmuted atoms can be obtained by bombarding materials by streams of neutron  $\gamma$  particles, whose mass is similar to that of the hydrogen atom but which since they bear no electric charge, are capable of penetrating readily into the charged nuclei of atoms. The products of such changes are sometimes merely atoms of the same kind as have long been familiar to scientists, but frequently are  $\alpha$  are produced which while chemically similar to those normally found in nature are yet unstable, and so radioactive. In this way it is possible to produce, for example, radioactive sodium and phosphorus and other elements that are found in the living body. Extremely minute quantities of radioactive materials

can be detected by suitable electrical apparatus, and by introducing small quantities of such materials as radioactive phosphorus into food it is possible to follow the course of the chemical changes undergone by the same element in the living body. The potentialities of such experiments are immense, and are likely to lead to an enormous increase in our knowledge of biological processes.

See also ATOM AND ATOMIC THEORY; ELECTRON; PROTON; NUCLEUS; RADICAL. The classic work on the subject is *Radiations from Radioactive Substances* (1930) by E. R. Rutherford, J. Chadwick, and C. D. Ellis. See also M. Curie, *Traité de radioactivité*, 1910, and J. Chadwick, *Radioactivity and Radioactive Substances*, 1928.

**Radio-Astronomy**, see RADAR, *Astronomy*.

**Radio Direction Finding** is the name applied to the science of using a radio receiver with a special aerial system to determine the direction of arrival of radio waves. It should not be confused with RADAR (*q.v.*), which is a specialised version of R. D. F. not involving the co-operation of the wireless station to be located. R. D. F. is mainly of use as an aid to the navigation of ships and aircraft, and equipment for this purpose is invariably carried nowadays in vessels of any size and all passenger-carrying aircraft. The action of a direction finder depends upon the specialised properties of the aerial system associated with it. Any aerial other than a plain vertical wire will receive more efficiently from some directions than from others, and there are directions from which reception may be a minimum. By suitable aerial arrangement this minimum can be made extremely well defined, and for this reason the minimum is invariably used for bearing determination in preference to the maximum. The indicator from which the bearings are determined in simple direction finders is a plain azimuth scale oriented with true N. and marked in degrees over which swings a pointer attached to the rotating aerial system. The null signal position is determined either on headphones or a signal strength meter associated with the automatic volume control circuits of the receiver. The simplest arrangement consists of a loop aerial free to rotate about a vertical axis, and coupled through a suitable balancing circuit to the input of a radio receiver. The polar diagram or electrical response of a loop aerial is a simple cosine or figure eight with two minima 180° apart. If a vertical aerial is combined with the loop in the correct phase relationship a cardioid pattern with only one minimum will result. Greater accuracy still is given by the spaced loop direction finder, which has the two loops mounted in a vertical plane at either end of a swinging beam, whose direction can be related to an azimuth scale. For medium and long-wave direction finders the Bellini-Tosi crossed loop direction finder has been in use for a number of years.

Where space is available, and a per-

manent direction finding station is required, the Adcock direction finder offers a high degree of accuracy with ease of control. The signal between spaced vertical aeriels is compared by means of a radio goniometer and the design eliminates, as far as possible, all signal pick-up by the horizontal elements interconnecting the vertical aeriels by the expedient of burying the feeder lines in the earth to a depth of sev. feet. Sev. semi-automatic direction finders have been developed based on the Adcock system, one of the most noteworthy being the spinning goniometer cathode-ray direction finder. With this can be associated the radio compass, for on both types a direct indication of bearing is available either on an oscillograph or phase meter suitably calibrated in azimuth bearings. Like all forms of measurement direction finding is liable to errors which the more highly developed and complicated equipments mentioned have been designed to minimise. The simple loop can determine with fair accuracy the direction of signals arriving normal to its axis of rotation, but it cannot discriminate signals arriving along its axis. Thus signals in which the vertical component is of any magnitude produce poorly defined or flat minima with resulting inaccuracy. Large metal objects or trees or buildings introduce errors by distortion of the wave front adjacent to the direction finder, and for this reason careful siting of a direction finding station is essential. In general a fixed direction finder has an accuracy of the order of one degree, while in a mobile direction finder two degrees are more usual. An important application of R. D. F. is that of aircraft blind-landing systems, of which there are sev. These rely on radio signals sent out from aeriels at the airport in sharply defined directions, so that an aircraft can follow them in by travelling along the beam of radio waves so formed. In addition vertical beams are made to intercept the main navigational beam to indicate to the pilot his distance from the point of landing. The beams themselves are modulated so that they may be identified as to their particular purpose. In this way a pilot in fog or bad weather can be brought into the beam and thereafter bring his aircraft down to reach the end of the runway by the correct use of the radio signals sent out from the system. Although the applications of R. D. F. are many and varied they all depend basically for their working on the directional properties of aerial systems, which in themselves often become highly complex, especially as the frequency becomes higher and the physical size of the aerial decreases. See R. Keen, *Wireless Direction Finding*, 1937.

**Radio Drama**, term applied to forms of dramatic writing intended for, or adapted to, broadcast production. In the early days of broadcasting it was found that of all types of broadcast programme drama required the most careful adaptation to the medium. The broadcast of the stage production of a play is liable to become

bewildering to a listener who cannot see the action fitted to the words. New techniques of writing and production were developed, and what was virtually a new art form came into being. Valuable work was done by the 'Columbia Workshop' studios in the U.S.A. In Great Britain, after ten years of broadcasting, R. D. reached a degree of elaboration which made Brit. broadcasting prominent in this field. This result is to be credited to the invention of the dramatic control panel. The various parts of a play, pieces of dialogue, sound effects, music, etc., may be enacted in separate studios, and the producer operating the dramatic control panel is able to bring to the listener the output of each studio either in sequence or simultaneously as may be required in presenting the play as a whole. This is known as the multiple studio technique. The process of switching from one studio to another, the equivalent generally of changing from one scene to another, is called the 'fade,' sound being faded in or faded out, abruptly or gradually, as the action of the play may demand. In an early radio play by Val Gielgud entitled *Ecstasy*, broadcast by the B.B.C. in 1930, as many as eight studios were used. The technical possibilities of R. D. were so tempting in the early days of experiment, a period which may be put, say, between 1928 and 1935, that there was some danger of over-elaboration. This brought a reaction, partly one of taste, but mainly in Great Britain the result of broadcasting under wartime conditions from 1939 to 1945. Simplification became a practical necessity. At the same time the potential audience for R. D. enormously increased. During the war years many other forms of entertainment were curtailed with the result that more and more people turned to broadcasting to satisfy their interest in plays of all kinds. R. D. gained, and has since kept by its merits, a popularity which would have seemed visionary to the experimenters who laid the foundations in the early thirties. While some forms of drama are more appropriate to the stage than to radio it is equally true that there are other kinds for which broadcasting is a more effective medium than any other. Fantasy, expressionistic drama, the play of illustrated discussion, find a natural medium in radio. The opening of a radio play should be such that interest is aroused at once. Time and place must be clearly 'exposed,' and all characters should be easily identifiable throughout. The play is likely to be most successful which proceeds surely from its initial action through a series of well-conceived minor climaxes to a major climax. Among other technical requirements are the following. Entrances and exits may be covered with lines or sound. Attention should be adequately motivated. As a rule short speeches are preferable, and the style of writing should be taut and to the point. There should be no unnecessary characters. In a stage drama the audience may be easily transported from one scene to another by visual representation. In R. D., while there is no

limit to the scenes in which the action may be laid, the producer has the problem of deciding the technique he should employ to direct the imagination of the listener. Sound effects, informative dialogue, music, or narration may be employed, or any combination of these. Ideally each of these techniques has its particular application. Sound effects are often useful to indicate either a change of locale, or the movement of characters from one scene to another, but too great a dependence on their efficacy may weaken their dramatic purpose. Music is invaluable for giving the desired emotional tempo, and in many successful radio plays, e.g. *Music for Miss Rogers* (1941) by Margaret Gore Brown, and *Music at Dusk* (1939), by Val Gielgud, it is used as an intrinsic part of the action rather than as an extraneous device. In some types of play narration is the only right means of setting the scene and linking the action; in others it is a confession of defeat. To be suitable for broadcast transmission a play should have a plan as definite as a proposition in Euclid, for the producer can hardly create an effective programme in sound unless he is clear on the plan. Having clearly ascertained the outline of the plot the producer can proceed to plan the pacing, tempo, and interpretation of the whole play on that basis, making evident which scenes are merely expository, imparting facts which the audience need to know, and which are vital in the element of conflict in the drama. It is from this study of structure that the producer arrives at his conclusions about characterisation, interpretation, and casting. Many broadcast plays are, of course, plays originally written for the stage and adapted to the new medium, but many are written in the first instance as radio plays. A number of writers, among whom may be mentioned Philip Wode, Du Garde Peach, Mabel Constanduros, and Norman Edwards, have gained a reputation principally as radio playwrights, while many others, whose main effort lies in other directions, have experimented successfully in this medium. In late years also R. D. has given a new-found popularity to the play in verse, and in this connection mention may be made of the work of Louis MacNeice, Geoffrey Bridson, and Edward Sackville West. See Val Gielgud, *How to write Broadcast Plays*, 1932, and *Radio Theatre*, 1916; H. Thomas, *How to write for Broadcasting*, 1940; and F. Felton, *The Radio Play*, 1949.

**Radio-facsimile Newspapers**, see under NEWSPAPERS.

**Radio-frequency Heating**, production of heat in materials by the application to them of electromagnetic fields of frequencies similar to those used in radio transmission. The process is applicable to metals and also to non-conductors of electricity. For the heating of metals the object to be heated is placed close to a coil in which is generated a periodic magnetic field of suitable frequency; currents are then induced in the object, and are practically confined to the surface layers nearest the coil. In this way very intense local

heating can be produced in a period of a second or so, and the surfaces of tools, gear wheels, etc., can be made white hot and then rapidly cooled and hardened, without appreciable heating of the objects as a whole; the process is therefore rapid and economical, and causes no risk of distortion of the objects to which it is applied. Non-conductors that are to be heated are placed between the plates of an electric condenser, and a high-frequency alternating electric field is generated between the plates. Some of the power supplied electrically is converted into heat in the body of the non-conductor, the rate of generation of heat being characteristic of the material, and dependent also on the strength of the applied field and its frequency. This process is particularly useful in that it can be used to heat poor conductors of heat throughout their bulk, and so avoid the long delay that occurs if heat is to be conducted to them from their outer surfaces; it is employed therefore for purposes such as that of heating thermoplastic materials (see PLASTICS) to bring them into a condition suitable for moulding. A further advantage is that the heating of non-conductors, like that of metals, can be highly localised within the space between the electrodes, so that processes akin to the soldering and welding of metals can be applied to thermoplastic materials. R. H. is also applied to the drying of certain porous materials; because heat is generated throughout the material, and lost from the exterior only, the interior becomes hotter than the outside, and the water is expelled by the higher steam pressure within. For ordinary purposes R. H. is expensive, and costs sev. times as much as heating by conventional methods, but it has proved a valuable tool for special applications, such as those enumerated above. See L. L. Langton, *Radio-frequency Heating*, 1949.

**Radiography**, see RADIOLOGY; **VACUUM TUBES**; **X-RAYS**, also MASS RADIOGRAPHY.

**Radiolaria**, order of rhizopod Protozoa with numerous long and slender pseudopods which issue from the body mass in a radial direction. They are closely related to the Foraminifera, from which they differ by forming their shells and skeletons of silica and arcanthol. The shell contains the inner part of the protoplasm, which communicates with the outer part through pores. The skeleton in some species is merely a series of needles embedded in the protoplasm, but in others is connected to form beautiful designs. Existing forms mostly live far from land in the tropical oceans, and as they die their shells collect in vast deposits of radiolarial ooze, which, when cemented into rock, forms beds of chert. They have been found alive at greater depths than 500 fathoms.

**Radiolocation**, see RADAR.

**Radiology**, in its widest sense, is the science of emanations, but the term is usually restricted to the science concerned with the production and use of X-rays (q.v.). During his investigation of cathode rays Röntgen (1895) discovered certain rays able to penetrate glass and metal, to

act on photographic plates, and to cause certain salts to fluoresce. These rays, named X-rays, have proved invaluable to doctors and surgeons in aiding them to diagnose, from radiographs of the affected parts, many 'internal' afflictions. The essential part of the X-ray apparatus is the focus tube, and many forms of this are in use. The tube, made of glass, tungsten, or molybdenum, is fitted with one or more anodes inclined at an angle of 45° to the axis of the tube. Electrons are emitted from a heated tungsten filament and, after being accelerated to a high speed, fall on the anode where they produce X-rays. These diverge and pass out through the glass. A radiograph showing the bones may be obtained by interposing a hand or other bony part of the body between the tube and a sensitised plate. Considerable danger, often resulting in loss of life, attended the use of these rays during the first thirty years after their discovery. Owing to the adoption of recommendations of the Brit. X-ray and Radium Protection Committee, radiologists may now safely pursue the science. Great advances have been made in the use of these rays by the medical and dental professions. Radiological diagnosis, not only of diseases and deformities of bone, but of certain affections of the circulatory, respiratory, digestive, and urogenital systems may now be made after appropriate impregnation of the cavity or tissues with substances rendering them opaque, and so making it possible to obtain radiographs of them. See also MASS RADIOGRAPHY. See J. W. McLaren (ed.), *Modern Trends in Diagnostic Radiology*.

**Radiometer**, instrument devised by Sir W. Crookes, 1873-76, consisting of four very thin disks of glass, mica, or metal carried on aluminium arms at right angles to each other, and pivoted so as to rotate with as little friction as possible in a glass globe partly exhausted. The disks are coated with lampblack on one side so that on rotation bright and black surfaces succeed each other alternately. On exposure to a source of light or heat the black surfaces absorb heat in greater quantity, and their temp. is raised; the molecules of air coming in contact rebound with greater energy, and the greater reaction between the molecules and the black surfaces causes the disks to rotate, their black surfaces receding from the source of radiant energy. The speed of rotation increases with exhaustion up to a maximum, slackens, and finally stops with further exhaustion.

**Radio-micrometer** (electricity), combination of thermocouple and galvanometer, devised by D'Arsonval and C. V. Boys, and used for detecting and measuring feeble radiation, such as that received from heavenly bodies.

**Radio Receivers**. Modern R. R. exist in a large number of versions but are of three main types. The purpose of a receiver is to accept a desired radio signal to the exclusion of all others, to amplify it so that the intelligence may be abstracted from it, and finally, when this is

done, to present the intelligence in a form in which it can be used. To do this the radio signal must be selected, amplified, detected, or demodulated (*see* MODULATION) and the audio frequency output passed to some form of transducer. The simplest receiver consists of a tuned circuit (coil and condenser), a signal rectifier, and a pair of headphones. The non linear electrical characteristic of the rectifier (which may be germanium, germanium, or a diode) serves to demodulate the carrier wave, passing the audio component to the headphones as shown. The advent of the valve (*q.v.*) revolutionised receiver design and made it possible to increase sensitivity by means of amplifying stages so that very weak signals could be picked up. These 'straight' or tuned radio frequency receivers as they are called consist of three separate parts, namely, a radio frequency amplifier, a signal detector, and an audio frequency amplifier. Such receivers, while possessing a high degree of sensitivity, are relatively unselective, i.e. they are not able easily to discriminate between a wanted station and one on an adjacent frequency. An increase in selectivity with such a receiver is complicated, involving as it does many circuits which must be capable of being tuned to the signal. To-day, however, nearly all receivers are of the superheterodyne type (superhets). In these a frequency changer is employed in which the wanted signal is mixed with a locally produced signal to give two products, one being a signal of frequency equal to the sum of the frequencies of the wanted station and the local oscillation and the other being the difference between them. One of these products is fed to a fixed tuned amplifier known as the intermediate frequency or I.F. amplifier. All incoming signals are converted to the I.F. by keeping the local oscillator in step, but separated from the signal frequency by an amount equal to the I.F. The advantage is that the I.F. can be pretuned and made both sensitive and selective. In this way the receiver is easily controlled and is more efficient than its tuned radio frequency counterpart. A broadcast receiver must not be too selective or the quality of the received music or speech will suffer, but there is another class of receiver for communications work where output quality is of secondary importance compared with its ability to discriminate against unwanted signals and noise. It must have a sensitivity of a few micro-volts and be able to reduce interference from a station separated by only a few cycles from the wanted one; it must be able to receive both telephony and telegraphy signals and feed its output either to a loudspeaker or headphones. To do this such a receiver will generally have one or two tuned radio frequency amplifiers before the frequency changer stage, then one or more stages of I.F. amplification, a detector diode and another diode for detecting automatic volume control (A.V.C.) voltage and, finally, one or two audio frequency stages. The normal upper frequency limit of

such receivers is around 30 megacycles, and above this special variations of the normal superhet technique are encountered. The process of frequency changing is often carried out twice with two separate I.F. amplifiers of different frequencies to give adequate gain and selectivity. Crystal mixer stages, grounded grid triode radio frequency stages, and special valves have all made their appearance recently and superhet development for very high frequency (V.H.F.) use is advancing rapidly to keep abreast with present-day demands. The early type of receiver for V.H.F., the super-regenerative detector, has now largely disappeared because of its inability to give adequate selectivity and its inherent noise. It also suffered from bad radiation and it emitted a rough signal of its own unless suitable precautions were taken.

Television receivers call for separate consideration since they must accept wide bands of frequencies equally and are reviewed under TELEVISION.

Radio-sonde, instrument-carrying free balloon which measures the state of the atmosphere at different levels and transmits the information to the ground by means of radio. The normal weather elements measured are pressure, temp., and humidity. In addition, the R.-S. may be traced by direction-finding radio or radar methods, thus determining the winds at levels traversed by the balloon. In 1915 the first attempts were made in France to transmit data from captive balloons, but without much success. Further attempts were made in Germany and America with free unmanned balloons, with only limited success; and in 1927, using transmitters on a wave-length of 42 m., with good success by the Frenchmen, Idzac and Bureau. These were experimental balloon ascents. The first ascents made immediately available for practical use were, however, in Jan. 1930, when Moltchanov succeeded in obtaining data from balloons which penetrated into the stratosphere above Slutsk in Russia. Further improvements followed rapidly in many countries, the main developments being by P. A. Moltchanov in Russia, Jt. Bureau in France, P. Duckert in Germany, V. Väisälä in Finland, at the Blue Hill Observatory, Harvard Univ., and by H. A. Thomas in England. With the outbreak of war in 1939 mass production began to be achieved.

Pressure is measured in all R.-S. by means of a lever mechanism attached to an aneroid capsule. Temp. is usually measured by a bimetallic coil connected to a lever, but in some of the later instruments the variation in electrical resistance of a metal or liquid is used. Humidity measurements are still unreliable owing to time-lag and hysteresis, the usual methods being the variation in length of human hair or gold-beater's skin. The observations are transmitted to the ground by a variety of methods. In 1923 Moltchanov began experiments with a method in which levers from the meteorological units are allowed to slide over a system of

contacts rather like the teeth of combs. Each comb is connected to a simple rotating mechanism (which may be driven by clockwork) so that an identifying letter in the morse code is heard corresponding to the comb or combination of combs in contact. The actual values of the temp., pressure, and humidity are recognised by knowing the order in which the levers make contact with the combs as the temp., pressure, and humidity change. This

type of R.-S. is known as 'Kammgerät,' after the Ger. word for 'comb.' Other types of R.-S. work on a chronometric principle. By means of a revolving cylinder or rotating arm a signal may be transmitted from fixed reference points or moving levers from the meteorological instruments. The time between a fixed-reference signal and a signal from a contact with, say, the pressure lever, depends on the speed of rotation of the cylinder or arm and on the distance between the fixed reference and the lever. This time can be measured mechanically and calibrated to give a measure of the pressure or any other element. The main difficulty in this type of R.-S. is in obtaining a cheap clockwork mechanism that works at a uniform speed in widely varying

atmospheric temps. Many R.-S., including the instrument in use in the Brit. Meteorological Office, convert the values of pressure, temp., and humidity into varying musical notes (audio frequencies) which after transmission by the R.-S. can be measured at the surface. The first Brit. instrument, invented by Thomas, transmitted two notes together, one for pressure and one for temp., the frequencies being measured by ear at the ground. This was unsatisfactory and the present Meteorological Office R.-S. has a windmill-operated switch which allows each element to be broadcast in turn. An Amer. instrument omits the windmill and audio-frequency circuit for pressure incorporating instead a pressure-switching device which, at known pressures, changes from temp. measurement to humidity measurement or occasionally to fixed references, and back again at other known pressures. The audio frequencies from the Brit. R.-S. are compared individually with a controlled frequency by means of a cathode-ray oscillograph. In a very similar Finnish R.-S. invented by V. Vaisala, and in the Amer. type, the frequencies are plotted mechanically on a chart.

Radar targets, consisting of three-plane metallised sheets or nylon nets arranged mutually at right angle are also attached to modern balloons so that the position of the balloon at any moment can be determined by radar. Since the balloon drifts horizontally only with the winds the winds at the various heights traversed by the balloon can easily be determined. The radar method has superseded direction-finding radio methods, because of greater accuracy and cheapness.

Rockets. Recently meteorological instruments have been attached to rockets of the V2 type. Much heavier instruments can be placed in the head of the rocket, but the speed with which the rocket is moving and the very low pressures at the heights reached add to the difficulties. Since the pressure varies from 1000 mb. at the surface to about 1/100 000 mb. at great heights the normal aneroid capsule fails and electrical gauges are used which depend on the variation in resistance of a hot wire at low pressures or on the variation of ionisation of the air at the lowest pressures. The temp. is measured by variation of electrical resistance or by thermocouples. Because of the high speed of the rocket and the difficulty of separating pressure and temp. readings, the pressure and temp. gauges are placed at varying points on the outer skin of the rocket and the true air pressure and temp. calculated from the gauge readings, using complicated formulae which include the velocity of the rocket. The velocity of the rocket is known because the rocket can be followed by radar, so that its position is known at all times.

Radio-therapy, see under RADIUM.

'Radio Times,' weekly journal of the Brit. Broadcasting Corporation, was first issued on Sept. 28, 1923, ten months after the beginning of an organised broadcasting service. The first issue sold 200 000 copies, and by 1933, when there were

7,000,000 licence-holders, a weekly sale of 2,500,000 copies was achieved. Before the introduction of paper rationing the *R. T.* had some eighty to eighty-eight pages, and contained complete sound and television programmes, with pictures, articles, and advertisements. Shortage of paper reduced the size, though by 1948 the weekly demand could be supplied, the contents being regionalised on the same scheme as was broadcasting, and an average sale of 7,000,000 copies being maintained. At first printed and pub. by George Newnes and Company Ltd., from 1937 it was printed by Waterlow & Sons Ltd., in specially erected works.

**Radio Transmitting, see TRANSMITTER.**

**Radish, or *Raphanus sativus***, cruciferous plant, the root of which is a valuable salad plant; it has been cultivated from a remote period.

**Radium** (Ra, atomic weight 226.05, atomic number 88), element discovered by Mme Curie in 1898 when working with her husband on the radioactivity of uranium compounds. By testing the group precipitates of a complete analysis of pitchblende, an impure oxide of uranium, she found that the barium sulphate precipitate contained the active constituent and separated it by fractional crystallisation. She obtained radium chloride practically free from the barium salt. R. is similar in its properties (apart from its radioactivity) to the alkaline earths, calcium, strontium, and barium. The most profitable source of the element is pitchblende, and this is discovered in large quantities in Czechoslovakia at Joachimsthal. About 6 tons of pitchblende produce 1 gramme of R., a fact that accounts for the present price of £15,000 per gramme. Other sources of R. that are profitably worked are the Carnotite mines in Colorado and the Autunite mines in U.S.A. The metal itself may be obtained by electrolytic separation from R. chloride. It is white, resembling metallic barium, and melting at 700° C. It is rapidly attacked on exposure to air, and is generally sold in the form of R. chloride or bromide, both white salts. The 'half period' of R. is about 1600 years, but the decay per annum is only about 0.04 per cent. The immediate product of its disintegration is radon, a chemically inert gas, and it disintegrates by the expulsion of an  $\alpha$ -particle. The rate of its disintegration cannot be controlled by any chemical or physical agency (see RADIOACTIVITY). One gramme of R. emits more than  $3 \times 10^{10}$   $\alpha$ -particles per sec. and it generates 100 calories per hr.

The R. Institute in London was founded by Sir K. Cassel and Lord Iveagh, and the present supplies are sufficient for treatment in all large tumours. See also RADIOACTIVITY; RADON; URANIUM; X-RAYS.

**Radio-therapy** is the treatment of disease by means of X-rays and radium. The gamma rays from radium, which are those used therapeutically, consist of electromagnetic vibrations (waves) which are of the same essential nature as the 'hard' or 'deep' X-rays (i.e. those of very short wavelength); radium and X-ray

treatment are indeed to a certain extent interchangeable, and the same unit of dosage (the Röntgen) is used for both. Radio-therapy can be used in the treatment of various diseases, e.g. for ringworm, for removing scars (cholooids) resulting from burns, for epilation, etc., but its chief value is in malignant tumours (cancers). The different types of cancer (q.v.) vary in their susceptibility to radio-therapy, and moreover those which are highly susceptible may recur in other sites. Good results are obtained with cancers which are slow growing and moderately radio-sensitive, e.g. those of the face, lip, mouth, breast, bladder, and uterus. Surgery remains the best form of treatment in cancers of the stomach, intestine, and rectum; surgery and radio-therapy are frequently used in combination.

A radio-active isotope of iodine ( $I_{131}$ ) undergoes absorption by the thyroid gland in the same way as ordinary iodine ( $I_{127}$ ), and is now being used not only for investigating the function of this gland but for the treatment of malignant growths in it. See R. Paterson, *The Treatment of Malignant Disease by Radium and X-Rays*, 1948, and J. Walter and H. Miller, *A Short Textbook of Radio-therapy*, 1950.

**Radius**, in anatomy, is the smaller companion bone to the ulna in the fore-arm. Its larger end is attached to the wrist, the smaller to the elbow. The biceps muscle is attached to it just below the crook of the arm. Colles's fracture occurs at the wrist end, some 1 in. from the articulation.

**Radius, see under CIRCLE.**

**Radius of Gyration**, in mathematics, is the distance from the axis to the point where the mass of the body is supposed to be concentrated. The moment of inertia is the product of the mass into the square of the R. of G.

**Radius Vector**, in astronomy, the line drawn from the controlling body to the focus to a planet or satellite, etc., in any position in its orbit. The motion in the orbit is such that the R. V. sweeps out equal areas in equal times.

**Radley, vil. of Berkshire, England, 2½ m. N.E. of Abingdon.** It is the seat of the well-known Church of England Boarding school, St. Peter's College, founded in 1847, incorporated in 1890, and accommodating some 400 boys. Pop. 600. See Lord Latymer, *Chances and Changes*, 1931.

**Radnor, Earl of, Brit. title borne by the family of Robartes from 1679 to 1757, and subsequently by that of Pleydell-Bouverie.** Wm. Bouverie, second Viscount Folkestone (1725-76), created Baron Longford in 1747, a wealthy Huguenot, was created earl of R. in 1765. His son Jacob assumed the name of Pleydell-Bouverie and his descendants still hold the title. The chief seat is Longford Castle, near Salisbury. The eldest son of the earl is called Viscount Folkestone.

**Radnorshire (Sir Feasified)**, co. of S. Wales, bounded N. by Montgomery and Shropshire, S. by Brecknock, E. by Hereford, W. by Brecknock and Cardigan. Over one-half of the co. is 1000 ft. or more above sea level, the highest point 2166 ft.

on Radnor Forest. The prin. rivs. are the Wye and its tribs., and the Teme, all excellent for trout, and the Wye for salmon. The only important industries are agriculture, forestry, and quarrying; sheep-raising predominates. Presteigne (1250) is the co. tn., where the assizes have been held since 1542. Llandrindod Wells (1250), a noted spa, and entirely modern tn., has been the administrative centre since 1889. Knighton and Rhayader are important mkt. tns. Near the latter are the Eilan valley reservoirs of the Birmingham Corporation (a miniature lake dist.). R. with Brecknock returns one member to Parliament. Welsh, which was the prevailing language up to about 1750, is now practically extinct. Area 470 sq. m. Pop. 20,000. See W. H. Howse, *Radnorshire*, 1949.

**Radon**, Niton, or Radium Emanation, unstable radioactive gaseous element, symbol Rn, atomic number 86, atomic weight 222. It is a colourless gas, boiling at about  $-62^{\circ}\text{C}$ ., and rapidly disintegrates into helium and a radioactive solid (radium D). R. is used in radiotherapy, and is obtained by dissolving a radium salt in water. R. is spontaneously evolved by radium.

**Radulescu**, see HILIADE-RADULESCU, JOAN.

**Rae Bareli**, see RAI BAREIL.

**Raeburn**, Sir Henry (1756-1823), Scottish portrait painter, b. at Stockbridge, Edinburgh, and at an early age began to paint. Reynolds saw great promise in his work, and persuaded him to study abroad. R. settled in 1787 at Edinburgh, and soon acquired fame. All the Scottish notabilities of the day, except Burns, sat to him. In 1814 he sent a picture to the Royal Academy, and was immediately elected an associate, and in the following year a member. His work earned for him the title of 'the Scottish Reynolds.' See lives by W. E. Henley, 1890; his great-grandson, Wm. Raeburn Andrew, 1894; Sir W. Armstrong, 1901; and E. R. Dibdin, 1925. See also the essay in R. L. Stevenson's *Virginibus Puerisque*.

**Raeder**, Erich (b. 1876), Ger. admiral. He joined the navy in 1894, and was chief of staff in the First World War. He took part in the battles of the Dogger Bank and Jutland, and in bombardments against the Brit. coast tns. He was made admiral in 1923, grand admiral in 1930, commander-in-chief of the Ger. Navy 1935-43, being superseded by Donitz (q.v.), inspector of war fleet from Jan. 1943, but was virtually in retirement after 1943. In the fifteen years during which he commanded it he built up and directed the Ger. Navy. At the Nuremberg trial he was sentenced (1946) to imprisonment for life.

**Radia**, see RHEDIA.

**Raffaello Sanzio**, see RAPHAEL SANTI.

**Rafia**, see RAPHIA.

**Raffles**, Sir Thomas Stamford (1781-1826), Eng. administrator, founder of Singapore, b. at Fra off Port Morant,

Jamaica. He was educated in London, and in 1800 became clerk in the secretary's office of the E. India Company. In 1807 being appointed assistant secretary at the presidency of Penang. In 1810 he proceeded to Calcutta, where he remained four months, and persuaded Lord Minto that the conquest of Java from the Fr. was a necessity. In 1811 an expedition for this purpose was sent out, and on the conquest of the is. being completed, R. was made lieutenant-governor, remaining there until 1816, and ruling with conspicuous success. The following year he pub. his *History of Java*. From 1818 to 1823 he was lieutenant-governor of Sumatra, the E. India Company acquiring Singapore on his advice in 1819. See lives by H. Egerton, 1899; R. Conpland 1926, 1946; and Emily Mahn, *Raffles of Singapore*, 1947.

**Rafflesia**, genus of parasitic stemless plants, producing enormous flowers more than a yard across. *R. arnoldiana*, the finest species, is parasitic on the roots and trunk of species of *Clusia*.

**Ragged Schools**, institutions first begun by John Pounds, a Portsmouth schoolmaster, in 1820, which supplied free education, and sometimes bodily necessities for destitute children. Some regard Robert Raikes, who estab. the first Sunday school at Gloucester in 1750, as the pioneer of the R. S. movement in England. In Scotland Dr. Guthrie took steps in the same direction in the middle of the last century. After the foundation of the Ragged School Union in 1844 by Lord Ashley (subsequently the earl of Shaftesbury), agencies for the education of the poor, especially children, became a permanent element in Eng. social life, but with the introduction of free compulsory education in 1870 the work of the R. S. lost their importance.

**Raghuvamsa** (Sanskrit family of Raghu), epic poem by Kalidasa, describing the hist. of Raghu and his forefathers and descendants. It dates from about the fourth century A.D., and has been ed. repeatedly. See Eng. trans. by P. de L. Johnston, 1902.

**Raglan**, Lord Fitzroy James Henry Somerset, first Baron (1788-1855), Brit. soldier, the youngest son of the fifth duke of Somerset, b. at Badminton, entered the army in 1804, and four years later went to Portugal as aide-de-camp to Wellington, with whom he was officially connected for sev. years. He was wounded at Waterloo, and had his right arm amputated. He was military secretary at the Horse Guards from 1827 until 1852, when he became master-general of the ordnance, and was raised to the peerage. He went to the E. in 1854 to command the Brit. troops sent against Russia in the Crimean War. He died of dysentery before Sebastopol, being, as Sir Evelyn Wood has written, 'the victim of England's unreadiness for war.' He was a fine soldier and an able administrator.
